According to Bokhari (1998), the privatization process became effective in Pakistan in 1991 but again privatization process got its track when the government set the foundation of ‘privatization Commission’ that enlist the name of 106 state-owned companies eligible for privatization proceeds in Pakistan (Yoganandan, 2010). Government announced privatization as its primary objective of economic policy in November 1990 and declared the agenda of privatization to cover the fields like banks, tele-communications, industries, development finance institutions and infrastructure facilities (Bokhari, 1998). The concept of privatization of public owned financial institutions was introduced in the early 1990s and two government owned banks (Muslim Commercial Banks and Allied Commercial Banks) were privatized (Khalid, 2006). The first banking sector reform initiated in late 1980s, while in 1992, two main financial institutions (Muslim Commercial bank and Allied bank of Pakistan) started their working under the liberalization policy in Pakistan (Yoganandan, 2010). Government of Pakistan constituted “Pakistan Telecommunication Corporation Ordinance” in 1991, for the purpose to develop private competition and licensed cellular phone companies. Total telecom sector was privatized and liberalized but PTCL was not. In 2006, 26% management share of PTCL was sold for 2.6 billion US dollar by Government of Pakistan to Etisalat, a UAE based company, and in this way; PTCL became totally private organization (Shah, Haroon-Ur-Rashid, Ullah, and Ahmed, 2009); ADB, 2008).

The period between 1992 to 1994, Pakistan privatized assets worth near to Rs. 120 billion and between 2001 to 2002 about Rs. 65 billion (Shah, Haroon-Ur-Rashid, Ullah, and Ahmed, 2009). In Feb 2002, government involved general public by creating their shares in public enterprises through a useful program to enhance their interest towards privatization in Pakistan (ADB, 2008). Until December 2006, notable planned sales in the sectors of finance, energy, electricity and manufacturing, have been made in Pakistan. The assets value PKR 418.6 billion had been privatized from 49 dealings (ADB, 2008) but in early 2007, the privatization program faced a hindrance when the privatization of the Pakistan Steel Mills (PSM) was stopped by the Supreme Court of Pakistan because of some major political and economic issues (ADB, 2008).

4. Needs for Privatization in Pakistan

Privatization is important to improve efficiency and to decrease financial burden of the government. The performance and development of state owned enterprises (SOEs) were not satisfactory; therefore, Government took the step of privatization of these enterprises for their betterment (Kikeri, Nellis, & Shirley, 1992). According to Joshi (1999), the need of privatization was usually based on 3 major reasons:

i. Increased the number of private enterprises in overall economic growth;

ii. Enhancement in the economic development and employment; and

iii. Decrease in the financial deficits.

But it was realized after two decades that nationalization was unrealistic and the results were not in the favor of Pakistan (Ishrat Husain, 2005). The size of public owned undertakings was increased unmanageable extent when nationalization policy was adopted in 1970s in Pakistan (Bokhari, 1998).
It was also observed that the reasons of privatization was that whenever a government manager was come to lead a company, his 1st objective was to hire the labor on political basis rather then merit (Aftab& Nasr, 2008). In Pakistan, the public offices were loaded with a large number of un-skilled employees selected on the basis of political references and highly paid, low morale of workers and lack of check and balance system created the need of privatization (Yoganandan, 2010) and the incompetency at public owned organizations was connected to the surplus of employees hired on the behalf of politicians. Continuous government control also became the cause of decrease in integrity and proved helpful to build constant pressures for advancing the loans toward preferred borrowers, and has a negative affects on earnings aspects of the banks (Caprio, Gerard, Fiechter, Litan, & Pomerleano, 2004). Therefore, there was a need to take serious steps to enhance the outcomes of state-owned organizations by making reasonable changes in our policies regarding privatization and open the doors for new entry in this sector (Kikeri, Nellis, & Shirley, 1992).

5. Impact of Privatization in Pakistan

Privatization has purely emphasis on economic goals rather then political goals, which let us to expand the market economy (Filipovic, 2005). The privatization or liberalization policies gave a great change in financial sectors (Khalid, 2006). Privatization of state-owned assets was anticipated to reduce waste, decrease corruption, and expand the attention and excellence of services such like financial sector (ADB, 2008). The impact of the privatization process was admirable in Pakistan. In Pakistan, Privatization was the cause of many successful improvements in the fields of banking, textile, telecom, sugar, cement and fertilizers. As a result, about 77 percent of commercial banks and 100 percent of telecom and textile companies are now handed over to private sector (ADB, 2008). The performance of privatized sectors like automobile, power generation, cement and financial institutions are satisfactory, improving in quality and financial health by new successful management (Bokhari, 1998).

Most of the developing countries have used privatization as an instrument to improve the performance of state-owned enterprises that shows relatively poor performance as compared to private enterprises (Kikeri, Nellis, & Shirley, 1992). Previous studies illustrated that not more then 79 state-owned companies of various developing countries displayed a remarkable change in profitability and efficiency from 1980 to 1992 and dramatically increase in productions, efficiency, profit, investment opportunities of the firms being privatized and they offered good returns on investment to their investors as private firms do, due to the privatization (Megginson, 2000) and workers have also benefited in terms of higher salaries and better working conditions (Bokhari, 1998).

It was observed that government encouraged the privatization policies to enhance efficiency, create competition, promote foreign direct investment and raise revenue for the government (Megginson, 2000). Privatization also provides a way for foreign direct investment (FDI) to come in and it also plays an important role in the growth and development (Filipovic, 2005). The privatization of PTCL and increasing number of cellular companies open many ways for foreign investors (ADB, 2008). Privatization can also helpful to diminish financing deficits arise mostly because of continuous losses of public enterprises and subsidization by the state (Joshi, 1999). In Pakistan, a major portion of the proposal value for privatization was used for payment of golden handshakes (Kemal,
Privatization helps us to gain efficiency, better financial results and growth in accessibility of credit for private owned firms (Filipovic, 2005). The performance of Pakistan Telecommunications Company Limited (PTCL) was increased after privatization and development came through technological changes, wireless communication technology and innovation in wired (Shah, Haroon-Ur-Rashid, Ullah, and Ahmed, 2009). In Pakistan, the formation of Pakistan Telecommunication Authority (PTA) and strong government policies regarding privatization of telecom sector were the key factors of the success of Pakistan Telecommunication Limited (PTCL) after its privatization in 2006 and it still lead the market with 98% of total market share (ADB, 2008). The performance of Karachi Electric Supply Corporation (KESC) was going to be improved after shifting of its control towards private sector from Government (ADB, 2008). The efficiency and performance of Kot Addu Power Company (KAPCO) had increased after its privatization in 1996 (Humayun & Anjum, 2000). The government concentration towards public sector lead inefficiency in banking zone (Haque, 1997) and it was a fact that the shift of ownership from public to private investor can bring a straight forward change in reward and labor policies in the boundaries of privatized entities, the power was shifted towards management and it discouraged the labor unions (Megginsen, 2000). In Pakistan, the part of labor union has been significantly reduced as privatization of a public enterprise (Joshi, 1999).

According to a recent survey, it was observed that more then 60-80 percent people felt that their living standards becoming worse after privatization process (Kikeri, Nellis, & Shirley, 1992). The policy of privatization was going to be shocking when Supreme Court of Pakistan issued a decision against the privatization of Pakistan Steel Mill due to controversy in the process of privatization (The News, 2006; MCB Bank Limited; and Shah, Haroon-Ur-Rashid, Ullah, and Ahmed, 2009). It was concluded by one of the researcher that high un-employment, low performance of agriculture-trade sectors, increase poverty and many other problems were the results of privatization process in Pakistan (Yoganandan, 2010). The privatization of some sectors like roti plants and edible oil was not so result oriented (Bokhari, 1998). Privatization generally leads to bad economic fluctuations, worse liberalizing policies and deficiency of public information (Kikeri, Nellis, & Shirley, 1992).

6. Impact of Privatization on Banking Sector in Pakistan

In Pakistan, the privatization of financial sector became more effective when there was a remarkable change in ownership towards private sector from public sector and its aggregate assets worthiness had increased from 44% to 77% during 2000-05 (ADB, 2008). Also the share in the assets of government owned banks was reduced from 92 percent in 1990 to 41 percent in 2002. The share in the deposits of private banks reached from 0 to 45 percent in 1990 and the share in deposits of public owned banks was reduced from 93 percent in 1990 to 43.5 percent (Khalid, 2006). In the time of Nationalization, banking sector was badly affected by the incompetent management control, overstaffing and inefficient policies. This situation creates the need of privatization of banking sector of Pakistan (ADB, 2008).

7. Conclusions

The aim of our study was to know, how privatization can affect the outcomes of an organization. Research questions were used to support our findings and it was concluded that there was a deep and positive impact of privatization process on the performance of various entities in Pakistan. Our past showed that privatization always shaped desirable results regarding various industries such as auto-mobile, cement, telecom and power generation organizations. Volume, profit, efficiency, progress; promoted FDI and investment opportunities increased; and improved working conditions in the organizations and living standards of the employees also increased due to privatization and there was a highly significant impact of privatization on the performance of financial institutions especially in banking sector. Privatization also produced many strict rules and regulations regarding labor and working environment but it can be improved by making flexible policies. The limitation of our study was that it discussed the performance analysis of banking sector of Pakistan only but it opens many doors for future studies about other sectors of Pakistan like power generation companies, cement industries, telecommunication companies that are being privatized till date.

Effect of Personal's Performance Assessment System (PPAS) on Human Resources Productivity (HRP) in Isfahan Province Telecommunication Company

Mohammad Hossein Moshref Javadi (Ph.D.)
(Faculty member, department of business administration, university of Isfahan)

Amin Sedaghat Rostami
(Graduate student of Industrial Management)

Abstract

Nowadays, management in organizations seeks for establishment of those systems which ensure appropriate conditions for increasing productivity in order to reach intended goals. Among the main systems in an organization is personal's performance assessment system (PPAS) which analysis personal's behavior, their qualifications and development to reach goals of the organization, clearing personnel training needs and presenting necessary feedback to them. Personal's performance assessment helps in realization and development of organizational knowledge level goals and productivity. It can result in human resource upgrading and development. The objective of this research was to make an analysis of the effects of personal's performance assessment system on human resources productivity. The research framework and Performance has been assessed in view of the components of Hersi and Goldsmith Model. The related data has been gathered from Isfahan Telecommunication Company. The survey hypothesis was "there is a relationship between personal's performance assessment and human resources productivity". The research is considered applicable, descriptive-analytical, survey type. It has been implemented in a cross-sectional with statistical sampling of 114 personnel from Isfahan Telecommunication Corporation, which has been achieved using improbable sample taking method. To gather the data a questionnaire has been distributed. For analyzing the data and testing hypothesis descriptive statistical methods (frequency table, mean and etc) and inferential statistical methods (variance analysis and T-test) have been used. SPSS software has been used in all phases for data analysis. In general, the results of the tests done and those achieved from analysis of data in Isfahan Telecommunication Company indicated that there is not a significant relationship between PPAS and HRP in this Company. Accordingly, it means that PPAS has no effect on HRP in the Isfahan Telecommunication Corporation.

Key words: Personal’s Performance Assessment (PPA), Human Resources productivity (HRP), Performance Management and Human Resources.
Introduction
Compiling and executing of an appraisal program of employees' effective performance is one of the actions that will be leaded to individual performance improvement and organizational effectiveness. Appraisal in human resources management is one of the key tasks through which the existent situations of human forces are studied and their weakness and strength points are identified. Every individual in each organization needs to understand his situation for progression and attaining of his determined job purposes. Such understanding helps him to be aware of his weakness and strength points and apply necessary and proper modifications or arrangements so that his attempts would be effective.

Research literature
Too many topics and issues have been mentioned in the ground of appraisal. It is certain that appraisal has been considered as one of the main tasks and performances of modern management and even classic management in the scope of management performance and tasks. Today, this situation still continues to be the same. Practical and operational planning on the organization's personnel will be effective when they are evaluated based on a proper appraisal system and their deficiencies are removed.

Appraisal process includes the task of a formal series of actions for studying of employee's performance during a certain time period which consists of all the behaviors of individual in relation to his function during the time period (Soltani, 2005).

Appraisal resources of employees' performance
1- Direct leaders and managers
2- Partner
3- Subordinates
4- Self-evaluation
5- Committee appraisal

Concept of performance management
Performance management plays a major role in human resources development as a modern management attitude. It is possible to provide the necessary grounds for implementation of process of resources development by performance management. It is a process based on a series of activities and has been constructed to improve efficiency and organizational effectiveness through securing of continuous improvement of individuals and groups' performance. Performance management is a part of human resources management (HRM) that its task is to create relation among management and also considers individuals' creativities and innovations in performance appraisal process (Soltani, 2010).

Generalities about various aspects of productivity
The term "productivity" was proposed for the first time in an article by Quensnay in 1776. Subsequently, in 1883 Litter defined productivity as of "power and ability of production that states concept of enthusiasm for production. This term obtains a more precise concept as of the relationship between output and applied factors and tools in order to produce that output.

Effective factors on increasing productivity level
Enhancement of productivity needs comprehensive planned attempts and is obtained through applying of different criteria of productivity in practice that are:
1- qualitative improvement of the work factor
2- modifying the manager and employees' relations and accurate leadership
3- applying of employees' opinions and suggestions
4- achievements of technology  
5- Increasing of investment in equipments and machineries.  
6- savings resulted from production in extensive scale (Imaee,1996)

**Models expressive of effective factors on human resources productivity**

In addition to the viewpoints that are considered in relation to the effective factors on productivity, it is possible to propose models in the form of working performance of the organization and especially human resources (as the creator of productivity). Two samples of it are presented here:

- Murray Inswurth and Neivil Smith model  
- Hersey and Goldsmith model

Given the current conditions and factors in Isfahan Electronic Communications Company, Hersey and Goldsmith model is used as framework for this survey.

**Introducing Hersey and Goldsmith model**

**Achieve** model has been designed by Hersey and Goldsmith in order to help managers to determine the reason for performance problems and establishing change strategies for solving such problems.

The manager will evaluate the manner of impact of the current or potential performance of employees and improving of their productivity in the field of a certain task by means of Achieve model. Then he must take the necessary steps according to unique condition of that specific problem. There are seven current actions in this model along with the conventional remedies in order to solve such problems. (Hersey, 1997)

<table>

<th>3- assistance (organizational support)</th>
<th>4- motivation</th>
<th>5- appraisal (education and performance feedback)</th>
<th>6- authenticity (authentic and legal acts of the personnel)</th>
<th>7- environment (environmental proportion)</th>
</tr>
</thead>
</table>

**Research background**

In 2010 a thesis entitled "comparison of performance appraisal system and human resources productivity in Financial Affairs and Electric Communications Company in Ardebil province" has been performed by M. H. Madani. The major purpose of this research was to measure the amount of impact of performance appraisal system on human resources productivity. Performance appraisal was measured with regards to two aspects of being fair and the individual's awareness from his performance. Obtained results of human resources productivity in two organizations revealed that there was a significant difference between various levels of performance appraisal and human resources productivity. Also productivity average in Financial Affairs was more than the Electric Communications Company but was not significant.

**Research hypotheses**

Every research is based on a series of questions that the researcher intends to test them. This survey is not excluded from this general principal, so it has one primary hypothesis and seven secondary hypotheses.
Primary hypothesis:
Appraisal system of employees' performance has relation with human resources productivity.

Secondary hypotheses:
1) Appraisal system of employees' performance has relation with component of "ability".
2) Appraisal system of employees' performance has relation with component of "clarity".
3) Appraisal system of employees' performance has relation with component of "assistance".
4) Appraisal system of employees' performance has relation with component of "motivation".
5) Appraisal system of employees' performance has relation with component of "appraisal".
6) Appraisal system of employees' performance has relation with component of "authenticity".
7) Appraisal system of employees' performance has relation with component of "environment".

Research methodology
In terms of content this research is of applied type and the researcher has established his research methodology on "descriptive-analytical, survey basis. It is survey in the way that the researcher intends to study and investigate in order to identify the situation of performance appraisal in the organization and its relation with human resources productivity and to represent a picture of it. The desired data has been obtained through sampling from the statistical population that will be used and analyzed.

Statistical population and statistical sample
All men and women employed in the Electronic Communication Company of Isfahan province participated in this survey that total number of them was 1985 persons. One hundred fourteen (114) persons were specified as statistical sample after calculations.

Reliability and validity of the research
In order to enhance the validity of the questionnaire, it has been tried to design questions simply and clearly so that not being ambiguous and incomprehensible for those taking part in the case study. Also, at the beginning a preliminary questionnaire was distributed among the employees and after gathering it was studied by professors of Isfahan University and guiding professor of the survey and experts of Electric Communication Company too. Some modifications were done for improvement and were confirmed by them. Reliability of the questionnaire was measured using cronbach alpha that was equal to 0.96.

Data analysis
Data analysis was done at two descriptive and inferential levels. Average central tendency index, frequency distribution table, standard deviation and diagram mapping were applied at descriptive level. At the inferential level T-parameter test was used in order to test the hypotheses and variance analysis of the repeated measures was applied.
to study the difference impact of performance appraisal system on each of the components of human resources productivity.

Conclusion
Given to the results obtained from analyzing of data related to the impact of performance appraisal on human resources productivity in the above company, it was concluded that performance appraisal had no impact on human resources productivity. It means that performance appraisal system had no impact on increasing of productivity in employees' viewpoint; rather it had been leaded to establishment of a relation-oriented viewpoint based on relations in this system. In this regard employees' attitude towards this system has been pessimistic and some of them feel that the above system is implemented traditionally without any purpose or especial program. Therefore, it was recommended to Electronic Communication Company specially and all of the traditional organizations generally to focus on performance appraisal system. Managers of each organization makes decisions according to obtained results of the performance appraisal system that has been designed and compiled by the related experts in each period to both facilitate enhancement of qualitative level of the work which shall result in increasing employees' satisfaction and consent. It was also recommended to managers to avoid involving their personal judgments in performance appraisal and execute it so that every employee is evaluated based on his performance. This could be leaded to establishing of a system in which meritocracy is dominant and this issue will certainly be ended in employees' satisfaction and following that productivity of employees will be increased. Also it was recommended that employees be acquainted with results of their performance to find out their working weakness and strength points. Performance appraisal gives helps individual performs his working performance accurately and precisely without the need for a continuous supervision. Similarly, it reinforces employees' motivation and causes employees to resort to job and professional skills proportional to their job. As a result, sense of cooperation and participation will be established and increased in the organization.

Exports and Economic Growth: Empirical Evidence from Canada

Muhammad Akram, Abdul Jabbar Khan
Hailey College of Commerce, Faculty of Commerce
University of the Punjab, Lahore – Pakistan

Muhammad Atif & Muhammad Faisal Shafique
Hailey College of Commerce, University of the Punjab, Lahore – Pakistan

Abstract
The purpose of this paper is to assess the effects of exports and public expenditure on economic growth of a developed economy i.e. Canada which is the 10th largest exporter in the world, for the period of 1985-2009 with annual frequency. Ordinary Least Square (OLS) method to know the relationship between exports and economic growth of Canada has been adopted. To deduct the problem of multicollinearity, heteroskedasticity and autocorrelation, various diagnostic tests have been applied. Empirical findings show the positive relationship of both, exports and public expenditure on economic growth. Exports have significant relationship in terms of one $ increase in exports leads $ 2.03 increase in economic growth, similarly one $ expense on public expenditure also has significant effect on the development of economy. Government decision makers may find it supportive.

Keywords: Exports, Economic growth, Canada, Public expenditure.

1. Introduction
Exports are vital element for economic growth. All the countries around the globe, including many developed nations, achieved remarkable growth due to expansion in their exports in past few decades. Exports also play an important role in enhancing the labour skill, achieving economies of scale, productivity in local as well as international markets. Moreover, exports help in the development of industrial network that leads to infrastructure development and employment opportunities. Jin (1996) also share the view that exports have significant importance for the economic development of any country, generally speaking all the nations which are considered developed these economies have major contribution in their growth from trade sector. In the current era if any country wants its appearance at international markets level it has to come up with quality products which in turns provide specialization for specific product to a specific country and contributing in growth.

Canada is one amongst the developed nations of the world and its exports contribute up to 30% in its GDP. Being the 10th largest exporter in the world and its major exports are high tech products and natural resources as compared to developing and less developed nations which have common and not high tech goods for exports, contributing less significantly towards economic growth. Canada has major export partnership with US, UK and New Zealand, due to its geographic location major partner of exports is USA which accounts for 73% of its exports. Canada experienced growth in its exports when trade barriers had been removed and free trade era came; regional trade agreements, preferential tariffs and North America Free Trade Agreement (NAFTA). After the removal of all trade barriers and quotas the country experienced a non stop undisrupted growth in its development. After these facts the trend of growth remained positive continuously, even in the period of world financial crises it observed growth. Wernerheim (1999) argues that these factors allowed continuous growth and contribute towards economic development of Canada. The trend of growth over the period of 25 years from year of 1985-2009 is depicted as under which shows continuous up-ward trend in growth.
To study the effects of exports and public expenditure on the economy of Canada which is holding the position of 9th developed nation in the world and having the pool of natural resources, how it has sustained this position among developed economies, despite the fact that it has limited trade partners USA, UK and New Zealand. Background endogenous growth theory declares exporters more productive than non exporters so this paper is to study whether this endogenous growth theory applies in case of Canada.

This study refers to a developed nation who is member of G8 group. The paper aims to study the effects on exports in the period of financial crises when all the countries experienced chaos in their economic development due to reduction in exports. The method used for empirical findings is ordinary Least Square method which shows how much exports influence the economic growth from the year of 1985-2009. The overall model includes GDP as dependent variable, exports and public expenditure as independent variables.

The paper organized in various sections, apart from first section, rest of the paper consists on the following sections: section 2 shows literature review section 3 elaborates data and methodology, section 4 discusses empirical findings, and section 5 includes conclusion and policy implications.

2. Review of Literature

2.1 Exports and Economic Growth

To explain the relationship of exports and growth of economy is an interesting subject matter among the researchers now days. There is a consensus on theory that exports lead economic growth after industrialization of countries. The hypothesis that exports lead economic growth is widely appreciated and also provide basis for devising economic policies (Feder, 1982 and Krueger, 1985:1990) and help developing countries to improve their growth (World bank development reports, 1987:1992). Whereas there is differing opinion among researchers that exports and growth has some complex context of relationship (Watanabe, 1985; Sayron and Walsh, 1968 and Kavoussi, 1985). However there is a consensus among most of the researchers and policy makers that exports are one of the vital elements that determine economic growth of any country (Wadhra, 1998; Prasad, 1997 and Nilanjan, 2001). Jones (1998) suggests endogenous growth theory also
plays an important role in enhancing the exports of country; endogenous growth theory focuses on expenditure for the development of different sectors that are directly related to exports.

A large number of evidences are available in literature on the role of exports in enhancing the growth of countries. Exports expansion allows a country to increase allocation of resources, increase in efficiency, enhance optimal capacity utilization, and provide opportunity to achieve economies of scale. Balassa (1985:1988) suggests that increase in exports leads to infrastructural improvement help in proper allocation of resources and decrease unemployment rate. Some other scholars also share his point of view (Tyler, 1981; Bhagwati and Srinivasan, 1979; Krueger, 1980 and Helpnan and Kregeman, 1985). Besides economies of scale, expansion in exports enables the country to increase research and development efforts that helps in innovation among the products and provide a way to sustain in market for a longer period of time, Human capital development in terms of skills that leads towards labour specialization and also helps in improvement by applying the concept of learning by doing. Romer (1987:1991), Barro (1991) and Mankiw (1995) shared the view on research and development expenditure matter a lot in growth of exports and ultimately effects economic growth.

Yang (1998) reported that product differentiation does matter in exports. Exporters with differentiation of goods compete imperfectly in goods market. These countries have some kind of power in price setting and monopoly in their markets. To maintain its competitive position in the market exporters need to be innovative with having a handsome stock of innovative ideas that can attract the market and gain market share to maintain or gain sustainable position in market.

Other factors that are considered much important for the growth of exports are technology and innovation. Any country which comes up with new ideas and variety of products it experiences better effect on its growth due to increase in exports (Edwards, 1992:1993). Innovation can be materialized in to two forms of products; one is imperfect alternative of existing products and second form is perfect alternative of existing products. In first kind of innovative product the economy size increases horizontally because of new products are being entered in product line. While in second form the economy expands in vertical manner because new and innovative products make the already existing products obsolete (Grossman and Helpman, 1991).

The relationship between exports and growth basically depends on economic structure and development level. In a very poor economic structure and development, the expansion of exports does not have significant effect on growth. On the other side when development and economic structure is up to the mark or certain level, exports do have significant relationship with growth. This is called in fact minimum development hypothesis. Yaghmaian and Ghorashi (1995) and McNab and Moore (1998) also support this hypothesis that there should be existence of minimum level of infrastructure development and economic structure that can support increase in exports base of any country.

Public expenditure can be defined as the expenses incurred for employment arrangement, pension benefits, infrastructure development and human welfare, here in this study for the sake of public expenditure general government final consumption expenditure are considered in this regard. Some researchers are of view that public expenditure and economic growth has weak relationship but mostly scholars suggest strong relationship. Higher the public expenditure more the growth there would be because deprived part of society got benefits from these expenditure (Anand and Ravallion, 1993; Chakraborty, 2003 and Qureshi, 2008).

From the above concise and brief theoretical framework the clear idea that can be derived is that exports are very much necessary for the economic growth. Exports can be said as the
backbone of the Canadian economy because its contribution up to 30% in total GDP. Being the developed country and the 10th largest exporter country of the world it has positive relationship between exports and growth of the economy. Natural resources, technological innovations all the factors are contributing towards exports. In the case of Canada it lacks its exports in utilities and trade relationships with developing countries also the limited their portfolio. They are just focusing on high tech products and natural resources in raw form.

2.2 Empirical Literature Review:

The importance of exports in economic growth has been demonstrated by many researchers in literature. They are all of the view that exports play an important role in the development of developing as well as developed nations (Emery, 1967; Balassa, 1978; 1985; Rana, 1988; Rana and Dowling, 1990; Fosu, 1990; Salvator, 1983 and Fajana, 1979). Expansion in exports led the economic growth in Hong Kong, Singapore, South Korea, and in Taiwan (Jin, 1996). Recent studies on India perspective shows that the direct relationship between exports and economic growth (Gill and Ghuman, 1982; Wadhva, 1998; Prasad, 1997; Bhattacharyya, 2001; Kaushik and Paras, 2000 and Nilanjan, 2001). The study on Oil producing countries also gives the positive result between exports and the economic growth (Roshan, 2007). Exports have a greater contribution towards GDP of the economy. In financial crisis the GDP of U.S economy collapsed due to fewer exports in that year (Baldwin and Evenett, 2009). Here are some empirical evidences from a survey of 45 studies on 33 countries from the year of 1995-2006 that suggest that exporters are more productive than the non exporter countries (Wagner, 2007).

The literature review describes that the exports have received a considerable attention from the researchers in the perspective of economic growth. All of the studies carried out so far, related to developed and developing nations. Least study is conducted on this country exports which has top 69 largest companies of the world out of top 100 and also a member of G8 group. The study focused to fill this gap. Here is a table below showing the relationship of exports and economic growth. Mostly scholars found positive relationship that exists between exports and economic growth and a few people found negative relationship. Similarly public expenditure also has direct relationship with growth.

Table 01: Exports and public expenditure relationship with GDP reported by some major studies

3 Data and Methodology:

3.1 Data and Variables

This paper includes three variables – Exports (EP) and Public Expenditure (PE) are independent variables whereas Economic Growth (EG) is taken as a dependent variable. The theoretical and empirical findings of our study are explained below in detail. The data used in paper is secondary in nature and obtained from an online data source of World Bank known as World Development Indicators (WDI) mark 2010. The frequency of data that is used for this study is on annual basis form year of 1985 to 2009.

3.1.1 Exports

Exports are most important element in the development of country. Exports of any country matters a lot in its economic development and contributes positively in terms of achieving economies of scale, optimal production, competitiveness, reduction in unemployment, and contributes towards infrastructure development. (Bhagwati and Srinivasan, 1979; Krueger, 1980; Helpman and Krugeman, 1985). Endogenous theory of growth also support that there is a positive effects of export on economic growth. Exports allow any country long term growth that causes ultimately specialization in those particular sectors, increase in Research and Development and human capital formation. All these factors are very much critical for growth. (Romer, 1987; Rivera-Batiz and Romer, 1991; Grossman and Helpman, 1991; Krugman, 1991; Barro, 1991; Mankiw et al., 1992, Barro and Sala-I-Martin, 1993, Mankiw, 1995; Sachs and Warner, 1995). Recent studies provide evidences that as the exports increases and country go for liberalization, its economic growth also increases (GOI, 2005). If the economy is closed as was during the period of 1952-1978 there was no economic growth in countries but when the deregulations came in world the economies boost up (Pyle, 1997). As the exports increases foreign reserves also improves that increase the purchasing capacity and provide opportunities to target the world international markets and capture more share. Inflation that makes product and services costlier also results in exports instability. The expected relationship between economic growth and exports is positive with positive sign. Study is using exports of goods and services (current USD) as proxy of export.

3.1.2 Public Expenditure

The sole purpose for inclusion of this variable in the model is to put light on the significant relationship that exists between public expenditure and economic growth. Government incur such expenditures to fulfil certain goals like increase in per capita income that is efficient indicator of economic growth. Historical wisdom tells, as the public expenditure increases the economic growth in return also increases. Keynes (1936) and his supporters, also support the view that use of fiscal policies i.e. expansion in public expenditure increase the overall output. In research background different theories can be found related to public expenditure whether they are having positive or negative relationship with growth. Aschaur (1989) and Barro(1990:1991) found positive relationship between public spending and output of economy. Public expenditure is considered endogenous to economic growth because as the EG increases Public expenditures are also tend to increase (Wagner, 1883). We also support their view because as government spend for the welfare and infrastructure of the economy the economic growth increase by all means. For long term growth of economy, public expenditures are inevitable (Scully, 1989). Human resource is most important factor of growth for any country if the government is likely to spend more on its human resource it would result in increased growth, satisfaction of all the sects in community and improve overall performance (Anand and Ravallion, 1993; Chakraborty, 2003). The expected result of this variable could be significant and the proxy that we are using for this variable is general government final consumption expenditure.
The expected sign for this particular variable is positive. The dependent variable in the model is Economic Growth (EG) in current USD.

3.2 Econometric Model
This paper aims to study the effects of exports and public expenditure on the economic growth of Canadian economy. Study uses multiple regression model to show the relationship between these variables. The reason of using multiple regression model is that the variables in the model are linearly related and model is correctly specified because it does not change its coefficients up to significant level even if we change any variable. We expect that there is no multicollinearity among the variables and the errors variance is also constant. Due to these stated reason we are using this technique.

\[
(EG_t) = \beta_0 + \beta_1 (EP_t) + \beta_2 (PE_t) + U_t
\]  

(3.1)

In this economic model (EG) is dependent variable, economic growth. \(\beta_0\) is constant term that shows minimum level of growth even if there is no contribution from the various factors of growth, depicts where the fitted line of OLS cuts axis, whereas \(\beta_1\) is slope coefficient that explains the variations in dependent variable due to this particular independent variable. It shows that one $ change in EP leads to \(\beta_1\) times change in EG. \(\beta_2\) is another slope coefficient of public expenditure. It shows that one $ change in PE leads to \(\beta_2\) times change in dependent variable EG. \(U_t\) is the error term included in the model.

4. Empirical Findings
The empirical findings of the model are shown in a table form below with their significance level and diagnostic tests that are applied to data to check the validity of data is also presented in table to assure that data is free from all the problems that can affect the true results of any model.

</tr>
</tbody>
</table>

Diagnoctic test (Breusch Pagan) \(Prob > \text{chi2,} \quad 0.093\)

Durbin Watson Test Statistic \(1.56\)

* Significant at 1% level.

Here are the results of our model in table form. The first independent variable Exports (EP) shows a slope coefficient of 2.03. It simply means that one $ change in exports leads to 2.03 times change in dependent variable EG. The P-value shows that this variable significant at 0% that is very much highly significant level. Normally in social sciences we use 5% significance level that is considered very good confidence but in this case the 0.00 shows that the independent variable is significant at 0%. It means we can say with 100% confidence that exports matter in economic growth. Similarly in second variable public expenditure the slope coefficient is 3.47 that means one unit change in PE would lead to change 3.47 times change in EG. Second variable significant at 10% level that means it have significant effect on dependent variable of EG.

R-Square shows the explanatory power of model. It means our model explains 89% variations. The adjusted R-Square is having the value of 0.88 percent. For the purpose of detecting the heteroskedasticity we applied the Breusch Pagan test the value of BP test shows Probability of 0.093 that means our \(H_0\) of constant variance is rejected at the level of 5%. So we can say with confidence even at 95% of significance level that there is no
heteroskedasticity in the model. To detect the multicollinearity in the model we used PP-Plot. There is pattern of relationship among independent variables. To remove the multicollinearity we take the second difference of public expenditure then running again regression among the variables found these coefficients that are almost free form multicollinearity. For the purpose of detecting the correlation in the model, applied Durbin Watson test and find that there is no auto correlation exist among the errors.

5. Conclusions and Policy Implications
The aim of this paper is to examine whether exports has positive effect on economic growth of a developed country and how much it influences its economic development. The approach used in this paper is ordinary least square method to find out the relationship between exports and growth for the period of 25 years from year of 1985-2009. The findings of this paper show that exports have significant positive relationship with economic growth. Higher the exports more the prosperous economy there would be. Baldwin and Evenett (2009) also suggest that exports led growth for any country. The paper also concludes that exports play major role in development of economy of Canada. A country with high level of exports is more productive in terms of economic growth. Wagner (2007) Bhagwati and Srinivasan (1979) also share the view of more exports led economic development that is totally consistent with the findings of this study.

The government of Canada is not very much risk taker as they have limited their exports only with USA and UK. Due to limited trade partnership, the exports are more vulnerable for Canada as experienced in 2009 due credit crunch in USA. They should expand their trade partnership with other developed as well as developing nations. They should expand their services sector and banking sector which is very much conservative, so that these sectors can also contribute in economic growth. Major contribution in exports consist of natural resources which are exported in raw form to other countries if these resources will be refined and exported in the form of finished products then these can contribute more in exports income.

Canada experienced decrease in its growth due to reduction in exports for the year of 2009 it can be further area of interest. This paper incorporates the overall exports of Canada, however further consideration may be the commodity wise exports and its individual effects on economy. Another gap that can be explored is that Canada is 12th largest importer of the world but despite this fact it has sustainable growth over the long period of time. Moreover, exports of Canada with its major exports partner USA and its sole effects on the economy of Canada may also be explored.

Abstract
The purpose of this study is to investigate and describe the internationalization process of SMEs which choose strategic alliances as entry mode. Understanding the internationalization of small firms is important to enhance knowledge of how they develop their business activities in international markets. Moreover, a strategic alliance perspective gives a critical insight of firms’ strategy to challenge in global competition. The qualitative approach is chosen to carry out the research question and achieve the purpose of this study. A case study is therefore used to generate advanced knowledge and understanding. Anoto group AB, a small Swedish company is picked as a sample due to the criteria fitting. I collected both secondary and primary data through various sources. The findings reveal that internal factors and external factors strongly influence the small company’s strategy. The advantage and core values of using strategic alliances motivate the small firm to go abroad. Due to the limited resources and knowledge, the small firm could not go globally alone. Using a strategic alliance can enable the firm to gain resources, gain market power and leverage competencies. Therefore, the small company can accomplish the goal in short time and be successful in international markets through managing alliances.

Key Words: Internationalization, SMEs, Strategic alliances

Introduction
Small and medium-sized enterprises have been identified as significant components of economic activities for employment, wealth creation and innovation (Birley and Westhead, 1990; Acs et al., 1997). Moreover, improving the international contributions of the small business sector is widely examined as a priority and policy support in many countries (Organisation for Economic Co-operation and Development [OECD], 1997). Therefore, the internationalization of small and medium sized enterprises (SMEs) has increasingly received attention in the international arena (Boter and Holmquist, 1996; Gankema, Snuif and Zwart, 2000; Li, Li and Dalgic, 2004). As the development of fast changing and increasingly complex global marketplace such as changing consumer preferences,
developments in manufacturing, communication and information technologies, and changing competitive conditions, SMEs are encountering the difficulties in their international expansion due to obstacles of foreignness, newness and smallness (Lu and Beamish, 2006). These lead to disadvantages in competing with local firms, and being limited by resources and capabilities (Bell, Crick and Young, 2004). Hence, SMEs must develop and enhance their capability quickly in response to globalization. These facts are reflected in the increasingly used strategic alliances in global competition. “Strategic alliances are a logical and timely response to intense and rapid changes in economic activity, technology and globalization” (Doz and Hamel, 1998, p. xiii). There are two competitive challenges which firms must face. First, globalization has opened the race for firms to pursue opportunities and enter to markets. Second, the race for the future forces firms to seek new opportunities, new solutions and new answers to meet customers needs. The formation of strategic alliances are defined as voluntary interfirm co-operative arrangements (Das and Teng, 2001). To date, alliances play an important and strategic role in a growing company. Entering strategic alliances is to provide: access to resources, access to new markets, access to technology, access to capital, and access to international and closed markets (Rothkegel, Erakovic and Shepherd, 2006; Ireland, Hitt and Vaidyanath, 2002). Moreover, there are four strategic advantages: blocking rivals, focusing on competencies, surviving and competing against a common rival (Hoffman and Viswanathan, 1997). In addition to Doz and Hamel (1998), there are three key purposes: co-option, value creation, and learning and internalization. Alliances not only serve normal purposes, but also reduce uncertainties and accelerate learning. Consequently, many firms depend increasingly on their collective activities with other firms to acquire collaborative advantage which influence to their performance and survival.

Literature Review
Research into internationalization has mainly been inspired by the Uppsala model. This model explains a firm’s experience in international markets in stages. Then, academic research in this area has been increasing. However, the model has been criticized for failing to explain how or why firms start and the characteristics of the firm in each stage. According to the findings of Bell (1995), an established chain which proposed by the Uppsala school model does not adequately reflect the underlying factors which influence the internationalization of small firms, In addition, the Uppsala model has limited utility to analyze the internationalization process strategies of small firms due to overlooking the planning phase and ignoring firm-specific motivation (Yip, Biscarri and Monti (2000); Li, Li, and Dalgic (2004). Moreover, there are more different entry modes such as with subsidiaries, branches or joint venture that the company can involve in the market (Bell, 1995; OECD, 2008). Despite the variety of internationalization processes, none of research completely captures the internationalization of SMEs using strategic alliances as the entry mode. Nowadays changing competitive conditions have provided a favorable environment for small firms’ internationalization, strategic alliances are used to pursue many objectives in international markets. (Ireland, Hitt and Vaidyanath, 2002; Alvarez, Ireland, and Reuer, 2006). In order to fill the gap and add valued contribution to internationalization theory, there are two main perspectives, as follow; (1) the strategic alliances and (2) the internationalization process that will be used to construct a theoretical framework. Internationalization literature is important to grasp the international development of SMEs. Moreover, the strategic alliance perspective gives critical insights into why small firms enter strategic alliances as the entry market mode and how this strategy enables them to develop international activities.
Strategic alliances

Entering into alliances is one way for firms to access critical resources and increase their market power over competitors (Barringer and Harrison, 2000). SMEs therefore enter into partnerships to take advantages of complementary assets (Ireland, Hitt and Vaidyanath, 2002). For example, SMEs can exploit their financial resources and distribution channels through a partner. Moreover, the broad resource based view reveals alliances formation based on firms’ resources such as knowledge and technology (e.g. Kogut, 1988). Barringer and Harrison (2000) suggested that there are 2 motives for firms to use strategic alliances as follows.

- Obtaining resources: Firms use a local partner to seek the crucial resources such as local facilities, knowledge and connections through forming international alliances (Beamish, 1987)
- Retaining resources: Firms need to engage in alliances to maintain certain resources but lack the know-how to develop or use their resources. Firms hence prefer to secure competitive advantage for the future through holding with a partner than selling their resources (Kogut, 1988).

According to Hamel (1991), the primary objective for using international alliances is the internalization of partner skills. Companies in the alliance learned such as business knowledge, technology processes, market environments, customer needs and so forth, and have been transformed by this. There are three broad determinants of learning outcome: intent referred collaborations as an opportunity to learn; transparency, referred to as the openness of each partner; and receptivity, referred to as a partner’s capability for learning. Each stage of successful learning has become the gateway to the next step of internalization. Commingling unique skills and capabilities are enable firms to create potential powerful learning opportunities for firms which lead to learning organization (Iyer, 2002). Firms can increase their capacities and competitiveness through absorbing skills from the partner. For example, technology transformation is basically a skill which can be improved with practice. Whereas the know-how of managing a business with a partner is a learning experience which enables firms to launch further entries into non-core business (Tsang, 1999). Using alliance is a strategic choice to increase market power, increase political power, increase research, production and marketing or other functions, and provide product or service (Barringer and Harrison, 2000). Furthermore, cooperative strategy as joint venture can provide firms a better solution to the problem of markets. Moreover, pooling and sharing information and knowledge through international cooperation is able to reduce uncertainty (Beamish and Bank, 1987).

“There are numerous advantages to strategic alliances but, if not handled properly, such cooperative can result in major problem for all parties”, Lorange and Roos, 1993, p. 18. To date, a number of studies have found high failure rates of alliances (e.g. Reuer, 1999). Hence, managing alliances is crucial for firms to make strategic alliances work, and from which firms can gain competitive advantage and create value chain with a partner (Ireland, Hitt and Vaidyanath, 2002). Forming successful strategic alliances, firms need to know how to manage the different process (Lorange and Roos, 1993). According to Yoshino and Rangan (1995), there are four key activities for firms to employ strategic alliance successfully: rethinking the business, crafting an alliance strategy structuring an alliance and evaluating an alliance. However, the key risks may affect alliance success, alliances
management can be viewed as four essential stages based on key risks and firms’ management (Das and Teng, 1999).

1) selecting partner: finding a fit between firms, awareness both of resources fit and strategic fit are needed. Resource fit refers to the resource that can be effectively integrated into a value creation whereas strategic fit refers to the degree to which the partners have agreeable goals in alliances.

2) structuring the alliances: There are various structures of alliances, such as joint ventures and minority equity alliances to joint production, join marketing and so forth. It is, therefore, important for firms to have the most appropriate types of partners. One key to having an advantage is to consider the level of flexibility which affects alliance formation and success.

3) operating alliances: effective cooperation is the foundation for collaborative firms to pursue common advantage. As a result, firms restrain from their self-interested activities and exploiting their partners for their private interest. However, it is unavoidable to focus on their interest because competition is essential for firm to protect their tacit knowledge and for preventing the alliance becoming a direct competitor.

4) evaluating alliances: There is no general acceptable measure of alliance performance, but the most practical approach is to examine which alliance has served the objectives of each partner. In evaluation, alliance performance is also realized either short-term orientation or long-term orientation. Moreover, partner firms will consider overall context more than just financial outcome. Although researchers agree that alliances evolve in stages, research had failed to consider the stability area in each process. Then, Jiang, Li and Gao (2008) followed four stages of Das and Teng (1999) which focus on the factors underlying alliance stability in each stage to fill the managerial gap. Selecting a partner is a critical first step. Firms should consider three crucial criteria; resource complementarities, reputation and prior ties. Then, firms decide an appropriate governance form, alliance scope and division of labor and then are committed to an alliance. The implementation stage is important for alliance evolution and success, firm should manage unstable factors and deal with adverse conditions. This lastly translates to performance outcome which is assessed as the extent to which the partners’ set objectives are met.

Internationalization process

The internationalization process is the patterns of international operations which is the basis of interaction between attitudes and actual behavior (Johanson and Widershiem, 1975). The most important obstacles to internationalization are the lack of knowledge and resources, which can be reduced through incremental decision making and learning about the foreign market and operations. Due to lack of knowledge and resources and to avoid uncertainty, firms start exporting to their neighbor markets through independent representatives.

A stepwise of the operation development in individual countries can be identified in four stages, as shown below:

1) no regular export activities: firms lack of information and experience to foreign market, thus has no commitment of resources to the market.

2) export via independent representatives (agents): firms have a channel to get regular information, thus start commitment the market.

3) sales subsidiary: firms prefer to control information that flows directly from markets to firms.

4) production/ manufacturing: firms make a larger resource commitment.
Then, Johanson and Vahlne (1977) clarified and developed previous research to explain the incremental characteristic of internationalization. The internationalization decisions have an incremental decision due to lack of market information between countries regarding psychic distance. The dynamic model therefore, was proposed by the state aspects and change aspects. Their model focuses on the development of the individual firm, gradual acquisition and use of knowledge about foreign markets and operations through incremental commitments. Even though the stage theory of internationalization as known as Uppsala model has gained considerable support, some researchers have raised criticism against the idea.

According to the findings of Bell (1995), the established chain, which proposed by the Uppsala school model, does not adequately reflect the underlying factors which influence the internationalization of small firms. On the other hand, the decision of operation in foreign markets is dependent on foreign customer followership, the targeting of niche markets and industry-specific consideration. Moreover, there are the little supports how firms move form exporting to other market entry modes. The evidence also shows the limitation of explanation in complex, dynamic and non-linear behavior. In addition to the findings of small software firms, network relationships influence firms’ activities during the internationalization process for market selection and mode of entry (Coviello and Munro, 1997). Yip, Biscarri and Monti (2000) claimed that the Uppsala model overlooks the planning phase and ignore firm-specific motivation. Motivation of small firms to go abroad is to leverage their strength, obtain economic returns and acquire competitive advantage. When small firms are systematic, they seem to achieve better performance due to the thoroughness of planning at each stage of the internationalization process.

According to Li, and Dalgic (2004), the Uppsala Model has limited utility to analyze internationalization process strategies of small firms. The finding suggests small firms should examine their motivation and their competence carefully as a first step. Then, they have to find the right strategy to go abroad. Due to the large scope for international development, the incremental export development route may not be the mode of international development for small, high technology firms. Firms’ decisions are related to the nature of the firms’ businesses, resource needs and the development opportunities (Jones, 1999). Owing to the high level of competition in the world, the Uppsala model is invalid in the situation of highly internationalized firms and industries. Firms are likely to leapfrog the stages in the established chain and move forward more directly to some kinds of foreign investment. There are more different entry modes such as with subsidiaries, branches or joint venture that the company can involve market (Bell, 1995; OECD, 2008).

Furthermore, Firms today can hire people who have experiences and knowledge about doing business abroad, so it is no longer necessary to build up knowledge in a slow and gradual way. (Hollensen, 2007). The international operation of business companies has been growing. The developing approach was taken with a number of studies of the business operations abroad (Welch and Luostarinen, 1988). Hence, the term “internationalization” needs clarification. An increasing commitment as greater operation is not related only to greater experience, skill and knowledge of foreign markets, but also to the exposure to opportunities or the success of one method of operation. For example, success in exporting via an agent can finally lead to production subsidiary. As a consequence, the internationalization could be broadened by the concept of increasing international involvement as outward sign of the linkage between outward and inward movement. As discussed above, some small firms’ findings support the view of the stage model but other
small firms do not. Due to the complexity of internationalization, lack of knowledge is not only main factor influencing firms’ choice of foreign market and entry mode. Internal factors, external factors and the motivation of firms also strongly affect firms’ decision. Moreover, when experiencing competitive challenges, firms may not initiate internationalization via the export mode, but instead choose the right strategy for market choice and entry mode to go internationally.

Theoretical Framework
The theoretical framework of this study as shown in figure 2.3 is developed on the basis of a number of relevant theories which are discussed in the literature review. In this study, I proposed that using strategic alliances to develop the international business of SMEs consists of five major phrases: initiation, planning, commitment, managing and performance. I use arrows to show the dynamic loop of the linkage between inward and outward movement in the process of SMEs’ internationalization.

Phase1: Initiation
According to the distinction between small firms and large firms, SMEs usually have limited resources to acquire for information and knowledge in foreign markets (Yip, Biscarri and Monti, 2000; Li, Li, and Dalgic, 2004). SMEs are inexperienced in international markets compared to large companies (Yip, Biscarri and Monti, 2000; Li, Li, and Dalgic, 2004). Today, SMEs confront more different global environments to start international expansion than those which large firms which faced two or three decades ago. Differences in legal system, cultures and languages present higher risks for smaller firms than for larger firms to international expansion (Acs, Morck, Shaver and Yeung, 1997).

It is important for firms to understand internal factors and external factors which influence their strategic decisions. Considering the strategy carefully will provide an insight into both advantages and disadvantages before they make a commitment to participate. As Boter and Holmquist (1996) found, their research indicates that the history and the internal situation of the company strongly influence the internationalization in a small firm. Furthermore, the environment in which the firms are operating heavily affect small firms. The analysis in internationalization therefore must be based on these main factors. Given the challenges in globalization most SMEs face, they hopefully expect all the benefits from their partners. International alliances are especially crucial for small and medium enterprises in their internationalization process. Forming international alliance is therefore a potential way to overcome the difficulty of three obstacles in their international expansion. An entrepreneurial firm can expand into international markets with the support of their partners and thus increase sales growth (Leiblein and Reuer, 2004). Moreover, to make opportunities in global markets, SMEs require a partner to do what they can not do alone. In a research of Doz and Hamel (1998), the value creation for the alliances is represented as opportunities for winning the race. The fundamental incentives that drive firms to go abroad with alliances is the need to gain competitive capabilities, leverage resources and to gain competence through internalized learning.

Phase2: Planning
The first stage in building an alliance is the key to creating successful alliances. There are many different criteria for selecting a good partner. Firms should find a fit between resource and strategy (Yip, Biscarri and Monti, 2000; Li, Li, and Dalgic, 2004). Resource fit is important because the resources and capabilities of alliances eventually influence firms’ performance. Complementary resources are needed for firms to pursue market
opportunities and achieve desired objectives (Das and Teng, 1999; Ireland, Hitt and Vaidyanath, 2002; Jiang, Li and Gao, 2008). Supplementary resources are needed for firms to achieve competitive advantage (Das and Teng, 1999). In addition, Jiang, Li and Gao (2008) mentioned a partner’s reputation which is the source of mutual trust and prior ties and which is a critical factor for the dynamic. In order to select a right partner, firms need to acquire more knowledge and planning to decide. General and market knowledge seems to be a key of this phase. Firms then collect important data and information for the overall comparison of alliances. When firms initiate learning from their partners, and reevaluate the potential of the alliance to create value, the expected balance between each other and the ability to adapt to the existing conditions of the alliances, the cycle of success and growth initiates as well (Doz and Hamel, 1998).

**Phase 3: Commitment**

The commitment is made when the resources are committed to the market. This commitment influences several aspects of the company: human resources, organizational structure, marketing strategies and so on (Yip, Biscarri and Monti, 2000). The decision of the level involvement is strongly dependent on firms’ specific competencies. For instance, firms with limited knowledge and experience are supposed to involve at the low risk and low-level commitment. There are various structural forms to set up an alliance: joint ventures, minor equity alliances, joint product, joint marketing and R&D, and licensing (Das and Teng, 1999). Jiang, Li and Gao (2008) considered alliance governance forms as having two primary form: equity and non-equity alliances. According to Das and Teng (1999), flexibility is denoted as a key advantage of alliances in a highly competitive environment; however, rigidity to consolidate the relationship is necessary as well. Jiang, Li and Gao (2008) argued that looser inter-connection and fewer commitments tend possibly to lead to instability and failure. In contrast, equity alliances seem to be appropriate for greater risk of opportunism and behavior uncertainty. As discussed, making a commitment is an important decision because the chosen form impacts on the future alliance development and performance (Jiang, Li and Gao, 2008). Furthermore, determining alliance scope is one critical involvement in alliances. Firms have to decide the ownership and application of both tangible and intangible assets (Ireland, Hitt and Vaidyanath, 2002; Jiang, Li and Gao, 2008).

**Phase 4: Managing**

The primary objective of SMEs in making a commitment in an international market is to develop their competences that finally lead to a better overall performance. Firms can acquire, from this commitment not only a number of sales, but also competitive advantage and knowledge which generates success through internationalization (Yip, Biscarri and Monti, 2000). Managing an alliance is a foundation for a successful alliance. Jiang, Li and Gao (2008) suggested that firms must take a variety of action to manage unstable factors and handle adverse conditions over time. Relationship management and control are key approaches to reduce risk within alliances (Ibid). Furthermore, firms should not overlook either cooperation or competition in an alliance which can harm the company (Das and Teng, 1999), since, without sufficient cooperation; firms can not be operated smoothly. Without attention to competition, firms may lose their competitive advantage. In successful alliances, firms need to continue improving their learning in five key areas: the environment, the tasks, the process of collaboration, partners’ skills and goals (Doz and Hamel, 1998).
Phase 5: Evaluating

According to Welch and Luostarinen (1988), the internationalization process which focuses only on outward movement is too narrow in dynamic changes, examining inward movement will broaden the concept. Hence, the evaluating stage is conducted to explain the firm’s performance as the result of previous operation stages. The simplest way to evaluate is to measure foreign sales relative to total sales. The performance can be linked with the internationalization process by competitive advantage acquired in international operations (Yip, Biscarri and Monti (2000). Thus, the process of internationalization may enhance firms’ competencies and improve their performance. The measurement of alliance success is complicated due to different criteria. For instance, firms often have different objectives in alliance, so the alliance’s performance may vary among them (Das and Teng, 2001). However, alliance performance can be strongly influenced by financial or market-based indicators (Gulati, 1998; Das and Teng, 1999) and its network position in the industry (Gulati, 1998). Furthermore, the achievement of alliance objectives is one measure underlying a number of factors such as government regulation, political risks, rivals and competencies (Jiang, Li and Gao, 2008) and the cost that firms incur should also be considered. As a result, performance evaluation reflects the collaborative relationship. If evaluated performance is better than expected, a firm will try to maintain and invest more resources to benefit more from the relationship (Doz and Hamel, 1998; Jiang, Li and Gao, 2008). Similarly, higher level of learning and higher expectation firms is willing to make deeper commitments and improve the efficiency of the further relationship. If evaluated performance is worse than expected, a firm may switch the strategic objectives or restructure the alliance forms (see the arrow that turn back to outward movement) or modify the behavior to correct the outcome or sell its stakes or finally cease trading (Jiang, Li and Gao, 2008).

METHODOLOGY

Choice of Research Strategies

To conduct research, it is crucial to connect theory with empirical data. Theoretical considerations in whether a deductive or an inductive approach is useful to guide and influence the collection and analysis of data (Schutt, 2006; Bryman and Bell, 2007). The process of a deductive approach starts with a theory and then test some of its implications with the data. On the other hand, the process of an inductive approach starts collecting data first and then developing a theory which explains pattern in data (Ibid). Due to an increasing number of findings in SMEs internationalization process, existing research has limited application. In this study, an inductive approach is needed because the characteristic of the inductive approach is strongly regarded as the generation of theories out of data (Bryman and Bell, 2007). In other words, particular instances from observations are moved to general principles. The inductive strategy of linking data and theory is also associated with a qualitative research approach, which is most useful for hypothesis building and explanation (Ghauri and Gronhaug, 2005).

Qualitative or Quantitative Strategy

Qualitative research studies things in their natural setting and attempt to make sense of various phenomena as interpretive research (Thomas, 2003). It involves the collection of a variety of empirical material. In other words, the qualitative strategy is constructed to put emphasis on words and understanding, and on the generation of theories (Bryman and Bell, 2007). It also focuses on respondent’s and information’s perspectives, which are transformed into a critical theme by a researcher (Ghauri and Gronhaug, 2005; Hesse-Biber and Leavy, P2005). By contrast, quantitative strategy tends to be based on the numerical measurement of specific aspects of phenomena (Thomas, 2003). It is used to seek general
descriptions or to test causal hypotheses. Similarly, the quantitative is constructed to emphasize the quantification in the collection data and analysis of data, and is placed on testing theories (Ghauri and Gronhaug, 2005; Bryman and Bell, 2007). According to the research problem and objective in this study, qualitative research is more appropriate to reveal SMEs’ behavior and to provide details and understanding in its internationalization process by entering strategic alliances (Ghauri and Gronhaug, 2005).

Choice of Research Design

Research design is related to data collection and analysis of data. Although there are different methods: historical review and analysis, surveys, field experiment and case studies, different designs are suitable for different types of studies (Ghauri and Gronhaug, 2005). In fact, a case study design often favors qualitative methods because it is helpful in the generation of the intensive and detailed examination of a case. In addition, the case study is likely to advance the knowledge and understanding of a given topic. It also helps to identify the criteria for selecting and screening potential to be studied and suggests the relevant variables of interest (Yin, 2003). Despite the small number of samples on the relevant issue, several aspects of the research problem can be analyzed sufficiently in this case (Ghauri and Gronhaug, 2005). Moreover, the case study has considered the abilities for generating the answers to questions “What, Why and How” (Saunders, Lewis and Thornhill, 2007). The case study often involves data collection through multiple sources such as personal interviews and observation as primary data. It also involves data collection through sources such as financial report and operating statement (Ghauri and Gronhaug, 2005). To consider the case study issues, it is appropriate to use this method in this study. A single case is, therefore, chosen because of two main features: it is a particular case and a unique case. The single case is appropriate when it meets all the objectives necessary to confirm, challenge and extend the theory. Another feature is to provide useful insight (Yin, 1994).

Case Selection

In a research method, it is important to decide where to conduct it, and who to include in it because it is impossible to study everyone everywhere. The type of sampling is known as convenience, the selection of sample is dependent on who is available and is willing to supply the information needed for the research (Hesse-Biber and Leavy, P2005). This implies accessibility of events, activities or individuals who are significant in the selection procedures. Moreover, the number of cases selected, and the particular case selected are affected by the amount of time and money available (De Vaus, 2001). As the result, a Swedish company was chosen as a case study. The purposeful sampling is also considered to select a representative of Swedish company (Patton, 2002). The selection criteria are based on the purpose of study and the possibility of identifying participants who will have the knowledge to answer the research questions. According to the purpose of this study, an internationalized small and medium-sized company which uses a strategic alliance is chosen as the sample. The selected Swedish company in this study is Anoto Group AB. This company has approximately 110 employees and has used strategic alliance for entering the international market. Anoto Group AB matches my criteria for this study.

Data collection

Secondary Data

The common uses and functions of secondary data are to provide the necessary background, to understand the problem situation, to provide information that is useful to
gather primary data, to serve as a check for the evaluation of primary data and to provide
an insight into the sample selection (Stevens, Wrenn, Sherwood and Ruddick, 2005).
Another important, the secondary data should be gathered first because it is generally
quicker and cheaper, before moving on to a primary data gathering. The sources of
secondary data which are used in this study are mainly found through the university’s
library and website. Halmstad’s library provides such books, articles and relevant
literatures. The university website also provides articles through journal collections. The
chosen company website presents information about the company, its history, its goals, its
conception and vision, its strategy, its organization, its finance and its annual report and so
forth.

Primary Data
Primary data are data generated in a research project for a specific purpose or collected
from a specific population sample (Stevens, Wrenn, Sherwood and Ruddick, 2005). The
primary methods of collecting primary data are communication and observation.
Communication includes various direct approaches of asking questions to respondents. In
this study, an interview is chosen in order to collect data because this method is useful for a
researcher to focus on particular topic and gain information from individuals (Hesse-Biber
and Leavy, 2005). It is a kind of conversation between an interviewer and interviewee in
which the degree of division and hierarchy is regularly low. Semi-structured interviews
were employed because they are useful for asking a set of questions to guide the
conversation. Moreover, semi-structured interviews allow interviewees freedom to talk
about what is of interest or importance to them (Hesse-Biber and Leavy, 2005). This can
lead to a new and unexpected direction for researcher to develop and explore new topics.

Conducting interviews
As the company which fitted the criteria was selected, I asked the company to agree to
participate in this research via email. After the company had accepted, the time and the
place of the interview were discussed via email as well. The interview was arranged with
the key respondent who has a specific knowledge of the international process and strategic
alliances, or other information or experiences that I wanted to know about (Hesse-Biber
and Leavy, 2005). Finally, I went to Anoto Group AB in Lund to interview with Ebba Asly
Fahraeus, VP Sales and Marketing at Anoto Group AB. She has been working there since
2000, and now she plays an important role in group management. I spent around one hour
interview with her. During the conversation, I took notes and recorded by MP4. After that,
I sent the finished data to her for checking.

Criteria of Evaluating Research
It is necessary to establish and assess the quality of research. Reliability and validity are the
appropriate criteria for qualitative research (Bryman and Bell, 2007). Reliability refers to
the extent of data collection procedure and analysis generating similar interpretations and
findings however, and whenever, it is carried out (Franklin and Ballan, 2001). It is related
to testing the credibility of results with the various sources. Validity is an important key to
effective research which gives the correct answer through observing, identifying, and
measuring. this study, I was concerned with increasing the reliability and validity of the
data collected and its subsequent analysis. There are different ways to enhance the
reliability of data and interpretation. For instance, the quality of recording and documenting
data has become a central for assessing. A field note for collecting data is used. A
confirmation check between interviewer and interviewee also occurred to increase the
reliability in results. Moreover, the findings and interpretations are concerned with testing
credibility from various sources (Ibid). To increase validity, I used triangulation for the purpose of achieving confirmation of constructs by multiple methods. In this study, multiple theories and perspective is interpreted as a single set of data. Multiple data such as secondary and primary data are used. Moreover, I had to demonstrate that data collection was conducted to identify and describe the subject accurately (Ibid).

EMPIRICAL FINDINGS
In order to investigate how SMEs use strategic alliances in their internationalization process, findings were presented which were obtained from both primary data and secondary data. Primary data was collected from the interviews with Ebba Asly Fahraeus, VP Sales and Marketing at Anoto Group AB. Secondary data was collected from annual data and relevant information through the company’s website.

Anoto Group AB in brief
Anoto Group was founded as C-technologies in 1996 because of a technological idea of its founder, Christer Fahraeus. The following year, after several key mergers and a partnership had been formed, the Anoto Group was established. To date, Anoto Group AB is a world leading technology company in the area of digital pen and paper, which enables the fast and reliable transmission of handwritten text into a digital format. The company operates through global partners which focus on user-friendly forms solutions within different business segments such as healthcare, bank and finance, transport and so forth. The Anoto Group AB has its head office in Lund, Sweden as well as offices in Boston (USA) and Tokyo (Japan). The group employs approximately 110 people, and most of them are in Lund. The Anoto share has been listed since 2000 and trades on NASDAQ OMX Nordic Small Cap list [2].

Anoto Group AB using strategic alliances in internationalization process
In 1999, after Anoto initiated the establishment of a global de facto standard for paper-based digital communication, the company started working with more partners. In order to achieve its goal, Anoto required collaboration with world-leading companies. At the same time, the company has developed a strong technology platform and commercializes it through partner companies. During 2006, Anoto adopted a new strategy to focus strongly on forms solutions with local and new partners. In this section, I will focus on the process of Anoto Group AB, and how it uses strategic alliances to achieve its internationalization.

Initiation
Internal factors
According to Ebba, Anoto’s competences are the unique technology and human resources. The core technology is advanced image processing in real time which can enable development of products and services. Anoto continuously develops its competence for the integration of electronic hardware and software by using digital camera technology. Hence, the products; pen and paper are superior to the digital writing tool to share emotion, ideas and thoughts. Handwritten text, sketches and drawings can transferred directly from paper to computer, mobile phone or PDA anywhere in the world. The employees are highly skilled: 90 percent hold university graduates and almost 10 percent hold doctoral degrees. They are professionally competent in their areas. Due to the size of the company, there is no in-house production, because it is too expensive and the volume is not high enough to run the factory, according to Ebba. The company prefers to use outsourcing through suppliers and sub-contractors for production, because it is beyond the company’s competence.
External factors
Digital pens industry, Anoto has three main competitors; Smartquil, Vpen and Crosspad. However, there is a fundamental difference between Anoto and its competitors. Anoto is the only company having developed a technology enabling the use of paper and pen. Due to the challenges in the IT and telecom sectors, Anoto has managed to establish a significantly stronger foundation for further growth. Moreover, the speedy increase in the number of e-mails and SMS signaled a rapidly expanding market for Anoto in the early years. “When the market is changed, the idea of what the company wants to sell also changed” Ebba said. It influences the company’s business strategy.

Motivations
“No another way to do it for us, it is impossible to compete alone in the world when you are a small company in Sweden. We need a strong partner; we need market knowledge; we need strong brand-name and we need distribution channels. They are very important.”: Ebba said. Anoto has used strategic alliances with players in industries such as consumer electronics, mobile telephones and services, operator services and system integration to establish a new technology platform in the global market and commercialize it. Anoto has never sold anything directly but uses partnerships instead. As Ebba told me, the partners have abilities that Anoto does not have. Partners also facilitate the distribution of products and services enabling Anoto functionality. In addition to Ebba, the company has no specific knowledge of what customers want and does not have knowledge of all markets in the world. The only way that the company can go international is by entering into partnership. It is about making the first move. Furthermore, license fees and profit sharing from partners who offer products, applications and services based on Anoto functionality, they generates the firm, and this is an important part of the company’s revenue.

Planning
In the beginning, Anoto’s statement is to create a global de facto standard for paper-based digital communication. “The company early identified Japan as an interesting market. Due to Anoto’s digital pen and paper technology catching handwriting, it is of course has more value when you have more than a thousand signs that you need to capture than with twenty-eight letters”, Ebba said. The markets selected were Japan, China, United States and Europe respectively. Then, the company went to Kokuyo in Japan, Esselte in Sweden, Mead in US, and to France and UK at the same time, because the company wanted to own the note-taking market. Without partnership no one could enter that market, as Ebba said. The first business ideal of Anoto was to sell the product to customer. The original idea was note-taking and the company approached all the major note-taking companies in the world as well as the note-taking leaders in each market. Then, the company started to that this ideal should be changed due to the changing in services of products and So, Anoto has turned the focus on business-to–business, rather business to customers “At that point we first wanted to connect to the important paper players in the world. We did not want to produce the pen by ourselves because we realized that this would mean a lot of investment. So we soon established partnerships with Sony Ericsson, Nokia, Logitech and Maxell”, Ebba said. They have both the necessary and complementary resources for bringing a product to the market. According to Ebba, the pen has no value without paper, so the paper is very important. Also, for mobility, the mobile phone and Bluetooth connection are required so that documents can be sent. This is how the company picked the partner in the first phase. In the second phase, Ebba told me: “there are a lot of forms in the world into which people are filling information, so we need application developers to develop specific
application in different markets and vertical markets that want to use forms. The strategy of significant agreements can be presented as follows:

Before 2001, Anoto signed an agreement with major companies such as Sony Ericsson and Vodafone. In 2001, Anoto collaborated with Hitachi to develop a strong technology platform and commercialize it. In 2002, Anoto signed an agreement with leading companies in the telecom and PC industries such as Microsoft, Logitech, Nokia and Hitachi Maxwell. One year later, Anoto widened its venture in the Japanese market by the establishment of the Anoto de facto standard and platform for the market introduced through high-value partners. Anoto has reached this goal to establish a commercial agreement with HP in 2004, Anoto continued signing significant agreements with world-leading companies, including Dai Nippon Printing in Japan and Leapfrog. At the end of 2004, the number of partners was continuously growing to 250 companies. In 2005, Anoto’s business concept still focused on the establishment with new partner to develop powerful commercial applications based on its technology. Moreover, the company was also moving forward to sign significant partnership agreements with world-leading companies.

In 2006, Anoto adopted a new strategy to facilitate and shorten the sale processes for the partners. Furthermore, the company used a partner as driven business model. The partners were in a wide range of sectors such as health care, transport, sales and services, education and logistic partner. The requirements of commitment level are In 2007, Anoto signed an agreement with a new U.S. pen partner in Oakland, California and Livescribe in U.S. At the end of the year, Anoto had approximately 300 partners, especially in Europe, the United States and Japan. Despite an increasing number of partners, the company was still looking further partners, especially in banking, finance and insurance. During 2008, Anoto made significant partnership agreements to focus on delivering complete products that meet customer needs. Moreover, the company is looking for new partners, which are market-leading companies, and are able to identify new applications for Anoto technology such as in the game and entertainment product area.

Managing

According to the different levels of partnership, Anoto has made an effort to work closely with deep relationship partners to create a global standard for paper-based digital communication. Also, Anoto has focused on further development of the company’s technology platform to facilitate its partners making solutions easier to use and less expensive. As Ebba said; “When we work with large leading companies, we always invest a lot of time that is mostly in technological development projects and we use many resources in this even though we do not have a large engineering staff. In contrast, small companies use little resources because we already develop platform for them. So, we can do a limited number of large projects that we employ our resources in and that we believe have a saleable product”. Anoto aims to offer support that will make both kinds of partners have stronger standard and maintain a good relationship. To achieve the growth and satisfy a range of customers through partners, Anoto provides a comprehensive tool and programs enabling partners to rapidly develop, market, sell and support solutions based on Anoto’s technology as represented in the figure 4.2. Anoto’s partner program shows a lot of communications between the company and its partners. This is a way that Anoto controls and maintains the relationship as Ebba had said. The company provides a partner newsletter every three weeks, supports event markets, and arranges conferences every year. The partners come from all over the world to attend, in which Anoto will talk about strategy, roadmaps and the partners also bring customers to show the successful case and
training techniques. Having a lot of meetings is useful for the companies to work together; therefore, knowledge and skill are transferred to each other.

**Performance**

After Anoto had initiated collaboration with world’s leading companies, in 2002, Sony Ericsson introduced the first digital pen enabling Anoto functionality, connected to mobile in Sweden, Denmark, UK and Italy. As well as Logitech, the first digital pen for PC was introduced in United States, Germany, Sweden and Austria. Revenue was primarily generated through license fee and partnership development projects and sharing profits from services. Significant revenue came from Hitachi, Logitech, Sony Ericsson and Vodafone. In 2003, Nokia and Hitachi Maxell launched the digital pen enabling Anoto functionality. Hitachi provided a service solution to other companies. A major part of the income was related to product development from partners. Anoto saw an increasing number of commercial customers from partners’ marketing and sales effort in 2004.

Partners like Logitach, Nokia, DNP and Hitachi have implemented major installations at their customers. Moreover, the company’s products and services are marketed and sold by a broad network of partners. In 2005, Leapfrog launched the FLY Pentop Computer enabling Anoto functionality. Furthermore, Anoto got the valuable order from Dai Nippon around SEK 36.5 million. Anoto’s income was still increasing in 2006, 2007 and 2008 because partners could generate greater sales. Anoto got many license fees and royalties from products through both local and world’s leading partners.

![Figure 4.3: Anoto’s net sales between 2001 to 2008](image)

A commercial launch of Anoto functionality in international markets is the key to a potentially significant source of the company revenue. The company income is primarily generated by the sale of shares in royalty and license from partners, as presented in figure 4.3. According to Ebba, there are differences between large leading companies and small or local companies. The local companies typically sell custom-made forms processing application to, for example, the police, doctors and home care. The products are very specific and integrated as customized products which have less volume. On the other hand, the large leading companies sell packaged products as standardized products with larger volume than some mentioned above. However, strategy objective and market sales are important for Anoto to evaluate the level of commitment. As Ebba said; “how they communicate, how they cooperate in marketing projects with us. When they give us the
correct credit and mentioning in their market communication, this is an important part of our willingness to invest resources and marketing support in them”. In addition, the level of commitment can increase when the partner moves up and improves its sales. They can become bronze, gold and platinum partners. When they commit more, they get much more support.

Analysis
Empirical finding will be analyzed through theoretical framework in order to investigate using strategic alliances of SMEs in the internalization process of the selected company. The process will be examined and analyzed step-by-step of all five phrases.

Case analysis
To investigate how Small and Medium-sized enterprise (SME) using strategic alliances for the internationalization process, Anoto Group AB as a case study will be analyzed throughout the analytical model presented in theoretical framework. The model consists of five phrases: initiation, planning, commitment, managing and performance. The critical analysis will be examined in each phase.

Anoto Group AB using strategic alliances to internationalization process
Initiation
Anoto’s core competence is advanced image processing in real time. This technology platform enables the development of products and services. Moreover, Anoto has highly skilled employees, many holding university degrees and doctor degrees, and are professional in every area. Moreover, the opportunity in the market is such that there was a rapid increase in number of services in e-mails and SMS during 2000. The advantage of working with alliances has motivated the company expanding abroad by using strategic alliances as a global strategy (figure5.1). Due to the size of the company, Anoto has limited resources and does not have a marketing knowledge of every market. It is difficult for the company to do it alone, even though the company has a core technology. Yoshino and Rangan (1995) and Ireland, Hitt and Vaidyanath (2002) suggested that when the companies can not work alone, they have to think in term of working with others.

Anoto has decided to create a global de facto standard for digital paper through partners. Using strategic alliances Anoto can do what the company thinks is impossible. First, the company seeks the crucial resource from its partners and leverages its technical resources for the establishment a global de facto standard (Beamish, 1987; Kogut, 1988; Barringer and Harrison, 2000). Second, the company pursues expansion abroad by strategic alliances, which increases the market power and provides market solutions to the company (Beamish and Bank, 1987; Barringer and Harrison, 2000). Strategic alliances can help Anoto with potentially adverse selection and moral hazard problems when attempting to adapt technological capability for market access (Leiblein and Reuer, 2004). As discussed, internal factors and external factors influence strongly to Anoto’s decision and strategy for going internationally (Boter and Holmquist, 1996). Entering into strategic alliances is important for Anoto to gain competitive advantages. The resources are integrated between the company and its partners. Then, the company increases its capabilities through absorbing skill and knowledge from partners. This refers to value creation from strategic alliances. These advantages affect the company’s performance in terms of sales growth and revenue, thanks to the establishment of commercial cooperation with partners for successful market penetration.
Planning

The partner selection is an important step that has implication for skills and resources, the operations and procedures. Hence, Anoto has tried to find alliances that have resources and strategies that fit to each other (Das and Teng, 1999). So, Anoto acquired more knowledge and information by considering the right partner. The company vision is to create a global standard. Hence, in the beginning of Anoto’s internationalization, the company went to the large leader companies related to pen and paper industries in selected markets such as Japan, US and Europe. Geography is one criterion for Anoto in selecting alliances in order to access markets as well as priority strategy (Underhill, 1996). Anoto recognized that the business concept should be changed from business-to-customer to business-to-business. The company, therefore, uses partners to produce and commercialize instead, due to less marketing knowledge. Moreover, the company does not want to produce the pen by itself (i.e. own the production facilities). As a result, Anoto has established the global standard through a wide range of industries like telecommunication, IT and operators. The main reason is their reputation is that it is reliable, accountable and trustworthy (Glaister, Husan and Buckley, 2004). Standardized product can be produced through the world’s leading companies. By contrast, using small and local companies, commercialized products can penetrate to various customers. Business strategy strongly affects partner selection. Consideration of resource complementarities is so critical for Anoto to initiate its mission that the company can not do it alone (Glaister, Husan and Buckley, 2004; Jiang, Li and Gao, 2008). Hence, the company pools its resources and capabilities with alliances in order to increase the benefit of co-operation. For example, Anoto recognized that complementarities resources between Sony Ericson and its company would be high in term of transmission of hand written texts or sending email through mobile.

As analyzed, the critical criteria for Anoto to select partners are business strategy and resources, as some examples show in table 5.1

5.2.3 Commitment

Due to Anoto’s rule, Anoto has formed usual alliances with its partnership agreements. The majority agreement provides the rights of collaboration scope for partners. The partner scope is important for task and functional interaction between companies (Jiang, Li, and Gao, 2008). The contract arrangement refers to the type of non-equity such as joint product or service enabling Anoto functionality, joint marketing and joint manufacturing. Forming Anoto’s partners in term of non-equity made the company flexible enough to involve with partners in various ways, depending on its objectives (Das and Teng, 1999). However, this structure is loose. For example, in the case of Sony Ericsson and Vodafone, it was terminated easily when the objectives and interests were different. Although Anoto usually sets up partnerships formed with majority agreement, the company divides the level of commitment into four levels; bronze, silver, gold and platinum commitment. Partners can move forward to higher involvement after fulfilling the requirements.

On the other hand, there was one exception to the rule. Anoto has entered into a joint venture with Maxell in order to control sales in Japan markets and have ownership. This type of relationship makes more trust and confidence (Jiang, Li, and Gao, 2008). However, it leads to higher costs for the company to operate. According to the strategic alliances in inter-firm link of Yoshino and Rangan (1995), Anoto structuring form with alliances can be divided as presented in table 5.2. The major scope of commitment with world-leading companies is marketing, production and technology, respectively. In only one exceptional, Anoto has used a joint venture with Hitachi Maxell.

Note: * still committed
Source: Analysis by the author.

The most structural form between partners is a contractual agreement, because Anoto is flexible enough to enter with partners in different ways, based on its objectives. By contrast, commitment in terms of equity is only one partner. The company could be closer to the market, but the operating cost is high (figure 5.1).
Managing

Although Anoto has different level of partners’ relationship, the company continuously maintains and increases this relationship through developing technology platforms and providing a better benefit for partners. Technology platforms provide a better solution to partners, whereas Anoto’s partners benefits can decrease the adverse conditions and risk between the company and alliances (Das and Teng, 1999; Jiang, Li and Gao, 2008). Anoto’s partner program seems to be a mechanism of the company to manage and control partners. The program shows the linkage of communications in various styles between the company and partners. Technical support, product, marketing and sales information is provided to partners. Especially, participation activities open the chance for the company and partners to learn and discuss. Communication and working together are the bases of learning process. Feedback from partners in the meeting, conference, case study and so forth are important for the learning processes in the company. When Anoto improves learning in the environment, the tasks, collaboration, skills and goals, the company enhances its competence through value creation (Doz and Hamek, 1998). In addition to meetings, the company can implement strategic objectives and information, as well as a business plan to its partners, in order to clarify cooperation in functions and activities. Moreover, Anoto’s partner program presents the level of relationship. When the partners make more commitment, it leads to mutual trust between the companies. Anoto can feel more confidence, lower conflict and higher satisfaction (Jiang, Li and Gao, 2008). The company, therefore, provides more benefits to tie the relationship. As a consequence, managing partners is crucial for Anoto to enhance its competence and accomplish it goals through collaboration with partners. This is the foundation of success in terms of partnership and the performance of the firm’s internationalization (Jiang, Li and Gao, 2008), (see the arrow continue from outward movement to inward movement in figure 5.1).

Performance

To cooperate with world’s leading companies, the company is expected to create a global de facto standard for digital paper and to commercialize it. By contrast, Anoto uses small and local companies to penetrate markets around the world because they know and understand customers’ need. They can integrate vertical suppliers and reach many kinds of customer. The company has expected the high volume sales for these companies without increasing cost. One measure for evaluation the company’s performance is the objectives that are met between the company and a partner (Das and Teng, 2001; Jiang, Li and Gao, 2008). Despite of the different objectives, all partners generate sales to Anoto. The level of commitment will be considered by commercial success, experience and expertise. The foundation requirement is the amount of sales. Then, the partners who fulfill the requirement set can move forward to another level. This implies Anoto’s performance can be evaluated by financial indicators (Gulati, 1998; Das and Teng, 1999) and the collaboration area. The evaluation of Anoto’s performance in term of revenue, collaboration and objective influences the level of commitment with partners (see the arrow that turn back to outward movement in figure 5.1) as Welch and Luostarinen (1988) suggested the internationalization process is not only outward movement, but also link to inward movement. When a partner fulfills Anoto’s requirements, the company will make a tighter commitment and provide more benefits (Doz and Hamel, 1998; Jiang, Li and Gao, 2008).
Conclusion and Discussion

The Internationalization process has been studied widely since the conceptualization of Uppsala model. Internationalization process of small and medium-sized enterprises is one perspective that has attracted the researchers from looking at large companies. However, an increasing amount of research in Internationalization of SMEs has important limitations. Exporting may not be a suitable entry mode for a small firm. Nowadays, strategic alliances play an important role for firms to gain competitive advantage. Hence, in this study, I would like to investigate and describe how SMEs are using strategic alliances to develop the international business. This evidence suggests that internal and external factors influence significantly a small firms’ decision to go abroad. The small firm chooses strategic alliance as market entry mode because this strategy can enhance a firm’s capacities and gain for them a competitive advantage in international operation. The small firm can chose the partner and makes a commitment with that partner who can help firm spread globally. In order to be successful in international markets the small firm need to mange alliances and evaluate them in accordance with firm’s objectives.

Theoretical contributions

Due to the characteristics of small firms, my finding supports the idea that stage theory of internationalization is not appropriate to describe the internationalization process of SMEs (Bell, 1995; Li, Li and Dalgic, 2004; Hollenson, 2007. An understanding of SMEs internationalization process is necessary to consider all aspects. The evidence reveals that the company’s decision to go abroad is affected not only lack of market knowledge as Uppula model proposed, but internal factors and environmental factors are also strong factors influencing firm’s strategy. This implies that the stage model overlooks the planning phase, firm’s strategy and environment factors. However, some aspects such as knowledge and commitment are still critical factors.
Managerial implications
Despite the importance of strategic alliances, making alliances work is difficult for firms. The company which cannot handle this problem will face the major problem. Hence, managing alliances is critical for the company to successfully work with partners. Managing alliances also affect directly the result of internationalization process of SMEs. When the company decides to enter strategic alliances, the first step that the company should be aware is to select the right partner. The important criteria to choose are strategy match, supplementary resources, reputation and geographical area. Then, the company can set up the structural form with the partner. The contractual arrangement is the usual choice for a small firm. The company has more flexibility in various types of involvement. In contrast, rigidity collaboration in terms of joint venture is too big for the small firm to handle. However, the company needs to talk with the partner about the scope for working together. After the small company had committed with the partners, it must operate and deal with the risks that may occur when working with the partners. Moreover, the company must control and maintain the relationship through communications and activities. This process not only provides a better relationship, but also leads to a learning process which skills and knowledge are transferred to each other. Mature trust will increase, that can decrease conflict and generate a greater cooperation. The result of managing partners will influence to the company’s performance in term of accomplishing objectives or in terms of revenue. To be successful by using strategic alliance in the internationalization process, the company must be aware since the initiation step, and continuously manage partners in each step in order to gain a better performance. This is important for a firm to survive and move forward in globalization.

Abstract
This research paper analyses the efficiency and effectiveness of business operations that have shifted from the West to the Asian Giants. Most of the Multinational Companies have contracted most of their non core functions to service provider from developing countries because of the fact that there is low cost labor recently. This research focuses on comparing and analyzing the three important aspects (Country infrastructure, Human expertise and resources and Cultural issues) of elements that motivate MNCs for offshore BPO. In addition, an evaluation of the impact of emergence of Malaysia in BPO market on China also discussed.
Key words: China, Malaysia, Business, Performance, Efficiency

Introduction

Country Profiles Comparison and ICT Figures

According to The World fact Book: In terms of size both these countries contrast each other, China has a total population of around 1.33 billion, which was 52.6 times bigger than in Malaysia, and the total area is almost 30 times is bigger than Malaysia, but Malaysia GDP per capital is nearly 2.6 times higher than in China. China held an 11.9% annual economic growth compared to 6.3% in Malaysia, but its service industry has been growing with average 9.7% according to MITI (Malaysia Ministry of international trade and industry). Moreover, it is more reasonable to focus on the similarity of economic growth and other important resources such as country infrastructure, cultural issues and human expertise and resources they possess.
ICT as one of the most important factor that enables BPO practices take place, the following figures shall give readers a clear picture of the ICT development in both China
It was stated by Hertzell (2001) that the accession of China to the WTO has opened up several of her transportation and logistics sector to direct participation (cited by Lau, K. H, and Zhang, J. M. 2006). As result, the competition becomes intensive and challenging between Chinese companies and foreign companies. The increasing in competition and growing awareness of China service providers for BPO required improving their service quality in order to compete competitively at international level. Particular to the newly fast-emerging countries in the neighborhood, such as Malaysia, Vietnam, etc. the author chooses Malaysia for his study due to the rapid development of BPO industry impressive government policy and fast developed ICT sector in Malaysia and According to Gartner recently research, Malaysia has just ranked behind India and China as third favoring destination for BPO, moreover, with the strong government support, trends show it has potential to catch up or even overtake the dominance of India in several sectors. In consideration of competing effectively, it is needed for Chinese BPO industry players to accelerate its consolidation process and reinforce its standard to a higher level to sustain its impressive BPO growth in next decade.

The main objective of this dissertation is to compare BPO development at macro-level and in both countries. The author believes this will add to the literature in BPO development in Asia because China and Malaysia are two important countries in Asia and both countries
has been categorized into transition economies that transfer its economy from manufacturing to industrial society. Their market-oriented economy and very supportive government policies have made them highly competitive locations for BPO location. There is a number of research that has been conducted in the field of outsourcing in India, however, there is little research conducted in the emerging Southeast Asia emerging countries in this field. Perhaps, they are still in their infant stage. Therefore, this research may contribute some insights of BPO practices in these countries in this area of research. The final recommendation aims to help BPO player in China to improve their performance.

Literature Review

There are a quite number of studies about offshore outsourcing worldwide, but most of them involved in IT outsourcing rather than business process outsourcing. It’s been widely accepted that by outsourcing to a third party for some of companies’ non-core activities not only contributed to cost saving but better efficiency of companies’ resources. The practice of offshore BPO varies from companies. Which country should be the best offshore BPO destination becomes a first and key question. Many research based companies have published vast reports for MNCs to refer. Different aspects of outsourcing environment in different countries have been evaluated in different ways. The literature review of this research based on research company’s report, book, international journals, and academic research papers in the field of outsourcing. A number of researchers have identified some critical elements in offshore BPO and proposed some appropriate theoretical framework and empirical evidence around the world. Furthermore, data and relevant journals from universities both in China and UK were accessed. Recent published academic journal and reports have also been taken into consideration.

Introduction of Offshore BPO

Duening, T, N and Click R, L (2005) defined Business process outsourcing (BPO) is simply as the movement of business processes from inside the organization to an external service provider. With the global telecommunications infrastructure now well established and consistently reliable, BPO initiatives often include shifting work to international providers. They also listed out 5 international hot spots that specialized in various business processes and exporting services and have comparative advantages in the specific functions from the perspective of BPO (Duening, T, N and Click R, L (2005):

- India. Engineering and technical
- China. Manufacturing and technical
- Mexico. Manufacturing
- United States. Analysis and creative
- Philippines. Administrative

It is quite similar with definition from Brown & Wilson (2005), which defined as “The procurement of goods or services by a business or organization from a supplier -- who is often foreign -- typically to gain the benefits of lower costs for identical or similar labor costs”. More precisely, it is about transferring the responsibility for a specific business or from an employee group to a non-employee group. According to Bendor-Samual (1998), by outsourcing to outsider, companies can focus on their core activities. The terminology of BPO in MNCs often divided into three according to different location. There are
international BPO (Offshore BPO), domestic BPO (onshore BPO) and neighbors BPO (Near shore BPO). Despite of different specific objectives for different MNCs to outsourcing, Ian, B and Jill ,P (2003 ) has listed the following reasons as the potential goals of any outsourcing programme cited by Kobayashi-Hilary, M. (2004) in his book; Outsourcing to India. Focus on core competences- if any business activities are not creating an advantage over the competition, then it could be considered to get done by experts who can do better, firms could concentrate on its main business. Quality of service- a company like Daksh can handle your customer services email and telephone call better than you can do it internal. Because all they do is live, breathe and dream of customer services for several Fortune 500 companies, including Amazon.com. companies such as this have the infrastructure in place to offer a high quality service that can even be measured using global standards such as ISO. Recruiting the best- As service providers, it is in the interest of these companies to keep their employee skills up to date because clients demand experts when

Better technology- an outsourcing vendor can afford to invest in better systems, networks and other technical services because the cost will be spread across various clients Wider skills pool- when working with an outsourcing vendor, the latest skills are always guaranteed to be available .Agility- outsourcing frees the company from the capital considerations of office space and equipment. This allows a level of flexibility that is impossible to achieve with in-house services). Employee benefits- while recruiting the best is clearly in the interest of the client firm, the training is in the direct interest of the employee (Kobayashi-Hilary, M, 2004)

Series of studies on what activities should MNCs be outsourced, it varies from companies to companies. Based on vast sourced of studies, it falls into 7 different categories in terms of functions:
Business process outsourcing (BPO) has emerged as one of the leading business and economic issues of our time. A natural extension of the free-trade movement that has been a dominant force in global economics over the past two decades (Duening, T, N and Click R, L, 2005). According to Forrester Research predicts that 3.3 million service jobs will move to countries such as India, Russia, China, and the Philippines (EXHIBIT 1) that is the equivalent of 7.5% of all jobs in the United States right now. Estimates from leading research firms more than support this trend. The Gartner Group, a Stamford, Connecticut-based research firm, predicts that:

One in ten jobs at specialty information technology firms in the United States will move abroad by 2005, along with one in 20 IT jobs in general business-a loss of about 560,000 positions.

The beginnings of trend in the business process outsourcing in Europe was signaled by the contract between BP Exploration and Andersen Consulting in 1991 by 1993, input identified an exciting market of $150 million (Rothery, B & Robertson, I, 1995). In addition, the cult of core competency was reinforced by another significant management theory in the 1990s, with that trend, organizations studied in detail way of their business process to find ever more efficient ways of carrying them out. Armed with this knowledge of process and frustrated by the difficulty of generating real performance gains, many executives followed reengineering to one of its logical conclusions: outsourcing processes to external providers that could perform them more efficiently (Cohen, L, et al, 2006).

According to the China Outsourcing latest report that 95% of the World Top 1000 companies (Fortune) has made their offshore strategy. And averagely 5-10 companies are doing on-the-spot investigation in potential offshore destinations every week. Furthermore, in the rapid-growth phase at the inception of the internet-based economy, many organizations experimented with outsourcing in an effort to accelerate time to market, manage growth, and gain access to hard-to-find and expensive skills. During the downturn,
outsourcing leaped to the fore as a cost-saving quick fix when budgets came under pressure. Soon every element of a corporation’s IT and business operations was potentially up for outsourcing consideration, with the reinforcing impact of technology and communications advances, it is expected that the next result of all these factors have not just been a largely successful explosion in outsourcing, with the overall services outsourcing market reaching three-quarters of a trillion dollars in annual revenue by 2008. (Cohen, L, et al., 2006). Subsequently, the next question would be “who would grab these opportunity will very much depend on level of infrastructure, low-cost talent pool and other important factors countries possess.

Competition pressures have forced companies to look objectively and critically at business processes. Companies have been outsourcing Manufacturing operations, business services and even entire business line successfully for a long time now. Recently, contract manufacturing sector has benefited with considerable outsourcing, initiated by the electronics and pharmaceutical industries. Business processes such as information technology (IT), payroll, logistics and human resources (HR) management are among the common ones regularly outsourced. Outsourcing of core functions like engineering, research and development (R&D), manufacturing and marketing are being considered by corporations (Ghodeswar, B and Vaidyanathan, J, 2008). Furthermore, Outsourcing has become an important strategic tool in today’s competitive business environment (Zhu, Z.W., Hsu, K. and Lillie, J, 2001). Managers are searching for any strategy that can provide them with success. BPO is one of the most important strategies that can lead to greater competitiveness (Embleton and Wright, 1998). The use of BPO has been increasingly in today’s business practices more than ever. According to Nasscom Analysis (2006) India alone exported BPO services worth $6.3 billion during FY 2005-2006, and it yields 35 per cent growing worldwide (Nasscom Analysis, 2006). There is no doubt that offshore outsourcing have immensely contributed to success of many MNCs around the world. But there are worries from some experts from this field. The Linda Cohen as managing vice president in Gartner Research argued that high expectation associated with outsourcing is increasingly hard to meet. As more and functions are outsourced, integrating and managing a portfolio of service providers is becoming more difficult and I causing significant service disruptions in many organizations. According to their research outsourcing to cut costs no longer provides significant competitive advantage because all your competitors are using outsourcing as well and are reaping the same cost advantages. their research also showed that fully 50% percent of outsourcing contracts signed between 2000 and 2004 will fail to meet expectations. In their book, she suggested a new concept “Multisourcing” which defined as the disciplined provisioning and blending of business and IT services from the optimal set of internal and external providers in the pursuit of business goal (Cohen, L and Young, A, 2006)

According to a survey commissioned by info-tech service provider Unisys, it reported that Malaysia companies are more advanced in back office business process outsourcing (BPO) adoption than companies in Singapore. It also mentioned that Malaysia is already a leader in BPO market. Another finding of ACA Research survey of major Singapore and Malaysian companies involved in financial services showed that Malaysia companies were more likely to reap the benefits of outsourcing their back office operations from the rapidly growing BPO market in the next five year (Unisys)
Relevant frameworks

The figure 3 (source of country selection criteria; Terdiman and Berg, 2001) below shall provide an overview of theoretical framework possibly being employed in this research. According to Terdiman and Berg (2001), country’s factors are more important than offshore outsourcing vendor’s expertise.

![Country selection model](image)

**Figure 2.3.1: country selection model**

(Source of country selection criteria; Terdiman and Berg, 2001)

**Country Infrastructure**

The regulatory environment within the country, and whether factors such as intellectual property law and export regulations have negatively impacted on business activities. The communication infrastructure and the type of facilities available for business use, and whether the communications infrastructure is adequate for conducting business.

- Human Expertise and Resources
- The use of quality certification
- The availability of skilled labor resources
- The competence of IT graduates and their training provision
- Foreign language proficiency
- Knowledge of global business practices
- Cultural Issues
- Cultural difficulties and issues when engaged in offshore projects (Brendan D’ Cruz)

**The status of Offshore BPO industry in China and Malaysia**

According to India's National Association of Software and Services Companies (NASSCOM) report (2007), China's BPO industry is valued at $1.06 billion for 2006, while Malaysia's BPO market, is estimated to have posted $1.01 billion in total revenues last year, with industry spending estimated to reach $979 million,
According to A.T. Kearney’s 2004, China ranks second in the index, enjoying cost advantages and a large educated labor pool although it lags behind India in terms of experience and other key factors such as IT and management education, language skills, and overall country risk. Particularly it scored low in areas of intellectual property and bureaucratic red tape. The 2008 Olympics are expected to provide useful experience with the English language. But the fact is leading global companies are tapping Chinese talent. IBM, for example, opened three new BPO data centers in the summer of 2003. India’s service firms are in China as well, including Satyam, TCS, Infosys, as well as smaller players such as Igate Global Solutions and Mphasis Group. With the China’s entry into the World Trade Organization has extended a further investment. 130 R&D facilities in China have been established by Western MNCs, and the special economic zones (SEZs) AND 15 national software industries parks pushed the foreign invest a another level. Shanghai, home of Pudong Software Park, is becoming a service hub. More than half of the roughly 1,000 foreign start-ups in Shanghai in 2002 were in service industries, challenging Hong Kong’s long track record in attracting service-sector investment. In addition China is also becoming a destination for companies targeting the Japanese and Korean market. In the northeastern city of Dalian, Dell Computer and CSK Corp. are opening Japanese language call centers. South Korea’s Kookmin Bank is moving its customer service center to China, where it will employ ethnic Koreans as well as local Chinese staffers. Japan’s top IT companies plan to double their software development staffs in China. From the perspectives of Chinese government, it is serious about creating a first-class high-tech labor force. Beijing’s IT promotion center provides coding training, and cities are helping local firms cover the costs of acquiring Carnegie Mellon Capability Maturity Model (CMM) certification. Both multinational and Indian firms are also providing training in partnership with the government. At undergraduate, post-graduate and adult education levels, universities and training institutes are increasingly emphasizing training in software development and applications and other technical skills. English language proficiency is another skill gap receiving attention. For example, some Shanghai elementary school students receive math and science instruction in English. As the supply of bilingual, IT-skilled labor grows, China’s low wages will make it an increasingly formidable competitor to India. China’s vast labor pool and low costs made it Malaysia ranked third as the most attractive location for offshore business development in the A.T. Kearney’s 2004 offshore location attractiveness index as well as the A.T. Kearney Global Services Location Index 2005. On the other hand, India and China ranked first and second respectively in the 2005 global services location index. In 2003 and 2004, India and China were also ranked first and second respectively in the 2003 Six-Industry Survey and the 2004 offshore location attractiveness index by A.T. Kearney. It can be seen that Malaysia had not yet been discovered as an offshore location during 2003. It means that Malaysia only took off as an attractive location for offshore business development in 2004 (Kelly, 2005). According to IMPS’s latest report, its total share of services in Malaysia’s GDP has expanded from 48.8% in 1987 to 53.4% in 2007, furthermore, the government has been targeted its outsourced industry as the engine of growth under Malaysia’s Third Industrial Master Plan (IMP3), Apparently, both governments hold a very firm conviction for the contribution of BPO industry to its economic growth.

According to A.T. Kearney (2004, p.1), “The annual index is a tool to help companies understand and compare the factors that make countries attractive as potential locations for offshore services. It measures the viability of countries as offshore destinations based on their financial structure, people skills and availability, and business environment”. In the A.T. Kearney’s 2004 offshore location attractiveness index, India ranked first in both
As for the business environment category, Singapore ranked first among all the countries. Malaysia ranked ninth in the business environment category, tenth in the financial structure category, and twentieth in the people skills and availability category. Unfortunately, China was not in the list. In the A.T. Kearney Global Services Location Index 2005, India is no more a leader in the financial structure category and the people skills and availability category. Both the Philippines and Ghana ranked first in the financial structure category. On the other hand, the United States ranked first in the people skills and availability category. As for the business environment category, Singapore maintained as the top in the list. Malaysia ranked tenth in the business environment category, fifteenth in the financial structure category, and nineteenth in the people skills and availability category. Compared to Malaysia, China ranked in a better position, fifth in the financial structure category confirms its financial ability to support large projects. In the ranking of people skills and availability, China has same score with Singapore ranked fifth in A.T. Kearney Offshore Location Attractiveness Index 2004.

*Note: Calculated on a scale of 1 to 4.*

According to Taing (2005), the reasons why Malaysia is fast gaining as an attractive location for offshore business development include a well-developed infrastructure, low wage inflation, a stable government, attractive business environment, strong government support, and a workforce with good language skills (Kelly, 2005). The infrastructure in Malaysia is well-developed with reasonably low costs. According to the Ministry of Energy, Communications, and Multimedia Malaysia (2003), it is estimated that it costs 30 to 35 per cent less to operate contact centre operations in Malaysia than in more advanced countries in this region. In addition, “The Multimedia Super Corridor (MSC) offers a highly attractive value proposition which includes: (1) 2.5-10bps fiber optic backbones; (2) multiple local and international service providers; (3) multiple sub-sea
linkages to Asia, the Americans, and Europe; (4) an international Internet gateway; (5) globally competitive telecom tariffs; (6) performance and benefits guarantees” (Downe, 2004; Multimedia Development Corporation (MDC), 2004). Taing (2005) pointed out that “Malaysia derives much of its advantage from the MSC…is extremely well placed to become an offshoring heaven as it is located within the quadrant most desirable for outsourcing [a relatively high quality at a very competitive price with lower attrition rates]”. On the other hand, Malaysia has an attractive business environment for an emerging market because of its stable political environment as well as rational regulatory framework that offers consistency and predictability for enterprise planning (Downe, 2004; Ministry of Energy, Water, and Communications, 2004). Then again, Malaysia has strong government support for the information and communications technology (ICT) sector which makes Malaysia an attractive offshore location (A.T. Kearney, 2004). Last but not least, Malaysia has a strong global exposure workforce that can possess strong English and regional language skills (Downe, 2004). With all the industry strengths, “Malaysia is among the countries that will challenge India’s dominant position in business process outsourcing in the next five years” (A.T. Kearney, 2005, p.8).

According to A.T. Kearney (2004, p.8), “As a small country with only 22 million 34 people, Malaysia will not be able to match India’s scale advantages, and piracy will continue to be a major drawback”. In addition, “Talent deficiencies may exist with many of our university graduates, limiting their potential within the contact centre or CRM environment” (Downe, 2004). Besides, Malaysian’s English language skills may not be sufficient for some CRM requirements and there is a lack of attention to the importance of accent neutralization (Downe, 2004; COPC Asia Pacific, 2004). These are the reasons why Malaysia ranked twentieth and nineteenth in the people skills and availability category in the A.T. Kearney’s 2004 Offshore Location Attractiveness Index and the A.T. Kearney Global Services Location Index 2005 respectively. In order to further improve Malaysia as an attractive offshore location, there is a need to improve Malaysia’s workforce in terms of skills needed in the industry.

Research Design

China’s BPO industry is still just in its developing edge except in manufacturing sector, which has already become a leader in Global offshore outsourcing lied to the low cost labor and semi-skilled labor pool. According to the China outsourcing association’s report, it is believed that most of BPO projects are contracted by a small number of state-owned companies which accounts for around 70% of all revenue. Therefore, in this study, we only take those service providers with offshore experience into consideration. Malaysia’s BPO industry has bigger range compared to China due to its strong government support and well developed ICT infrastructure throughout the country. The multiple widely-spoken languages made it a competitive environment for BPO industry.

This research sources mainly based on a pre-structured questionnaire which derived from researcher Terdiman and Berg (2001)’s Country Selection Model to collect primary data. Besides it, a limited number of face to face interviews were also carried out for better understanding the survey by questionnaire. It is well believed by many MNCs that country’s macro-level business environment is more important than offshore service provider’s capability. According to Terdiman and Berg (2001), he writes: “Enterprises must consider country suitability for offshore projects before they consider individual vendors” (Terdiman and Berg 2001). Many others research bodies also suggest that MNCs
should give country selection the priority when deciding which service provider to outsource. For example, the reputable research firm Gartner’s selection motto is “country before company” (Terdiman and Berg 2001).

In order to minimize the bias of information given by respondents, the secondary data came from available journals in the field as well as reports from field associations in both countries. As the objective of this paper is to analyze the perception of the industry service providers rather than MNCs, BPO practices related government agents and 20 companies were contacted to generate empirical evidence. The information and data obtained from the questionnaire survey was analyzed using the Country selection model from researcher Terdiman and Berg (2001). It served as basis model to analyzed information from questionnaire survey. The model was chosen because it critically covers the important reasons why MNCs outsource their business processes in foreign countries. Basically, it will test out the attractive factors relatively in these two countries. The outcome of interview analyzed in line with theoretical models so bias can be minimized. Process of outsourcing model (source: Brown and Wilson, 2005) applied for interview outcome analysis to identify which part still need to improve in order to have better performance. One approach which begins deductively makes use of data categories and codes that derive from the theoretical frameworks to analyze the collected data (Saunders et al, 2003). The implications of different data give a essential insight and guide for MNCs who plan to do BPO projects in these two countries.

Method & data collection

Data collection consisted of a well-structured questionnaire considered as primary data both in China and Malaysia. In addition, a few interviews (telephone interview employed as Malaysia Company prefers it) with CEOs from a few selected companies whose opinion could possibly represent the majority voice in BPO industry while others bases on well-structured questionnaire. The reason why both quantitative and qualitative methods were applied because they are complementary to each other and better results could be produced. The secondary data for this study was drawn from wide resources according to Yin (2003)’s suggestion that information obtained from interviewees are often subjective, therefore, secondary data is necessary to be gained from company’s published report and others. As author fortunately have some contacts with people who working in this field. It made it possible to have chance for face to face interview with some of relevant persons. Therefore, The research data for this study will be also draw based on qualitative data that can generally be defined as “non-numerical data or data that have not been quantified” (Saunders et al, 2003). The character of this data is mostly primary data which is defined as “material that you have gathered yourself” (Jankowicz, 2005). It is always useful to gain information face to face to add bonus to primary data that conducted based on well-structured questionnaire.

For the data collection in Malaysia, the author had chance to visit Malaysia on Sep 2008 in order to conduct a survey and Semi-structured interviews with a few relevant people in Malaysia. Firstly, the questionnaire was mailed to 20 randomly selected companies who had offshore experience and 14 responses were received after one and half week. For the other six, we have made follow-up telephone calls, various reasons were given, such reasons like, people in charge were not available at moment, and bosses were on the trip for business negotiation. Fortunately, in each responded company, the majority of the response
was the senior managers who are responsible for external affairs, particular directly dealing BPO with MNCs. The author believes the information given should be valuable. Compared to questionnaire survey, interview with a few relevant personnel were rather a success. First person interviewed was the CEO of MDC (Multimedia Development Corporation). It was selected because The MDC (Multimedia Development Corporation) was primarily selected which acts as government agent to promote Malaysia is the world’s best environment to harness the full potential of ICT and multimedia technology (Multimedia Super Corridor). Another company was IDRO (M) SDN BHD which had offshore BPO experience in Malaysia. The duration for each interview was 45 minutes on average.

For the data collection in China, the questionnaire was mailed to randomly 20 selected offshore BPO service providers. Telephone follow-up was also done to have more response, it was quite a success, and 16 responses were received with help of one of China Sourcing association. But the majority of response was notified that are division executives rather than senior managers. The reason could perhaps attribute to the Chinese cultural that middle management people taken care of this kind of survey. Two interviews were carried out as author was back to China for holiday. Company ZT was primarily selected as it is one of the first Chinese telecoms equipment provider and authors’ inside contact made it possible to interview its senior manager. Content of interview was not only related to questionnaire, but additional information was gained as well. Interview topic ranged from number of failure rate of BPO projects to determine the major obstacles faced by the company the future perspective of BPO in China. Second company interviewed was one of new company, TS group. It is small, but it had several offshore BPO experiences. TS group see BPO as a very important strategic movement for new and fast growing company. The CEO of TS group was interviewed.

It is estimated that the result of this survey should be better off than a pure questionnaire or interview. With author’s effort for face to face interview, a comprehensive understanding of BPO practices in China and Malaysia gained and it will be helpful for latter quantitative analysis.

Sampling methods

Qualitative enquiry is very often about depth, nuance and complexity, and understanding how these work. Therefore, the act of concussing through sampling is likely to be as strategic as it is practical (Mason.J, 2002). In order to obtain relevant information for the study, 20 companies with offshore BPO experience have only been carefully selected for a questionnaire survey even though it was random selected based on author’s knowledge. Besides that, several face to face interviews were also conducted to gain an insight in BPO industry. The overall response rate for the questionnaire was 70% in Malaysia and 80% in China. It is considerably very high might due to the help with relevant government body. With author’s limited resources, one company and one government body were approached in Malaysia and two companies were approached in China.

Limitations

Three important limitations of this study need to be highlighted. Firstly, this study generalizes and compares results for the whole China and Malaysia with no concern of regional differences. Due to the differences of infrastructure level and culture in southern china and northern china, the primary data obtained from questionnaire survey could only
give MNCs a general guide. The sample size apparently is second limitation. With a small number of sample selected discredit the accuracy, reliability of the information obtained. Further studies with larger samples are considered in the future. Especially, the perspective of MNCs needed to study in order to make effective improvement for service providers both in China and Malaysia. The last limitation is regarded to the secondary data that most of resources in this field were engaged in offshore information technology (IT) outsourcing rather than business process outsourcing.

Findings and Discussion

Respondents’ profile

The range of the firms that have taken part in this research differs from one another, but one thing is same that they all have had offshore experience with clients from U.S, Europe and other developed companies. Surprisingly, even some of them had experience with developing nations like India. The only drawback is that some of them just had offshore IT projects experience in stead of business process outsourcing projects. The overall respondents’ profile consider highly relevant to the aim of this study. The response rate is 70 percent in Malaysia and higher in China, which is 80 percent.

Market orientation

Responding companies targeted their market differently even though they all involved in both international market and domestic market. But the reality is always not matched with their early expectation; therefore, changes are always expected according to the market value proportion.

“Still remember the initial targeted market for our company a few years ago was international market because many Chinese companies did not recognize the importance of contracting their non-core activities to a third party. But now, with the financial crisis, and government’s economic stimulate plan, and the awareness of benefits of Chinese companies pushed the domestic market a further large, therefore, we have shifted out concentration from international market to domestic market. I believe today’s business environment is an ever changing environment, companies whoever want to survive need to be flexible according the changing environment”. (Mr. Tang, the senior executive of one of the emerging companies in China)

Figure 4 shows that all surveyed companies have different degree of offshore business as well as domestic business.
The percentage breakdown graphically shows the market orientation of companies, which participated in the survey. Different results generated between China and Malaysia. As the figure shows that 11 firms are mostly oriented on international market and only 3 firms are positioned on domestic market. It is very different from the results of firms in China, which has only 8 firms out of 16 firms are mostly oriented on international market and the other 8 goes to domestic market. Reasons may vary, but this can be explained as a current trend of the industry in both countries.

**Size of companies in terms of employee’s number**

Sized of companies usually should be measured companies’ annual revenue and the “general size” (No of employees), in order to avoid any unpleasant emotions (cultural difference), the size only measured by employee number. The more employees a firm has assumed to be big company.
The figure 5 presents Number of staff employed in surveyed firms ‘ranges from 10- 500, it divided into 3 categories: 1) 1-50 employees 2) 50-100 and 3) 100-500. The results show that there are 10 Malaysia companies fall into group 1, 2 fall into group 2 and 2 into group 2. It is also very different from the results of Chinese firms, where there are 8 firms fall into group 2, 6 fall into group 3 and only 2 into group 1. This figure indicates that firms who are participated in the survey are quite diversified.

Conclusion

This research has attempted to study and compare the current status china and Malaysia BPO leading service providers. Several important characteristics have emerged as research goes on.

Firstly, there are two main sources of BPO providers: new (small companies that specialized in specific BPO projects) and transitional firms (big companies), the new firms are often creative and very much depended on its advanced information system (ICT) while transitional firms are quite traditional operated very much reply on its experience and strategic alliance strategy. With china’s entry into WTO, Chinese BPO providers are forced to improve its effectiveness of communication with clients outside and timely co-ordination due to the greater completion and higher customer requirements. Less advanced infrastructure also restricted its expansion of service variety. More customized service needed to synergized with MNCs for providing value-added services. Meanwhile, the government’s role to make China a best destination for offshore BPO business becomes ever critical, many researches have been done in this field found out the country business environment and its related factors is the major concern for MNCs making offshore outsourcing. Therefore, the overall macro-level environment evaluation is the most important aspect for any offshore outsourcing.

This study examined the important elements based on practical model “Country selection model” (Terdiman and Berg, 2001). Three components; infrastructure, resources and culture are three aspects have been evaluated from the perspective of offshore service providers both from China and Malaysia. The main conclusion can be drawn from the findings, based on the combination of questionnaire survey and interview is, Malaysia is a rising star in global BPO industry. Its strong government support in ICT and the active promotion government agency MSC very much contributed to the success. Stable political status and rational economic business environment made Malaysia a new leader in BPO industry. Despite its only 22 million people and some drawback such as piracy and cultural issues, it will certainly challenge India and China domination of global BPO market due to its strong global exposure workforce that can possess strong English and regional language skills. Well-developed infrastructure, low wage inflation, a stable government, attractive business environment, strong government support, and a workforce with good language skills (Kelly, 2005) are all favorable factors that pull MNCs consideration to outsource. An interesting answer from the manager at the Multimedia Development Corporation (MDC) Flagship Strategy and Planning Unit, Rob Cayzer: Question: With rapid and constant growth of China and India in BPO market, how does Malaysia position herself in that context? Answer: “Malaysia will serve them”

It may sound surprise, but the fact is that many reputable India outsourcing provider such as Infoys ,Wipos already planning to open new branches in Malaysia due to the rise of
salary in BPO industry in India. Despite the disadvantage of English skills and business and management skills of Chinese graduates, China’s leading role in BPO industry will continue expand from low valued manufacturing outsourcing to value-added process services in about 5 to 10 years time as many MNCs believes the potentials of Chinese market will continue make them profitable. China No 1 outsourcing association research showed that many of Chinese companies are looking forward to building partnership with developed countries such as US and experienced country like India to improve its service quality. Most of them are quite optimistic for the rapid growth in next five and ten year’s time. Most of them are planning to expand their business into more value-added business process. The immense success of hosting 2008 Olympics games confirmed China is stills the most favorable location for offshore BPO. Malaysia may only challenge China for customer service (contact center) due to its better English language proficiency. ICT sector related process may also pose a threat to China in particular business process due to its full government support in ICT.

Infrastructure

From the findings and analysis of BPO industry infrastructure, a general conclusion can be drawn that Chinese companies have less support from government compared to Malaysia, where government consider its industry as strategic to its country development. A industry is unlikely develop fast and constant without the support of favorable government policies. The situation in China is that small and medium size companies (SMEs) urgently in the need of government’s full support in R&D investment in order to provide value-added services. Better taxation will also add another incentive to SMEs because there is high percentage of firms feel the big effect of high tax that they have less capital investment in R&D. One point can be learnt from Malaysia is to establish a government agency like MSC to promote industry to a global area. The study also showed that association in China is less responsive. A strong and effective association likes NASSCOM in India to provide support from various aspects to all firms in China.

Resources

Human resources is the most fundamental and essential to any BPO industry development. Compared to Malaysia, China’s large talent pool out of 1.3 population is definitely a advantage, it provider the necessary element for BPO industry development. But the results finding is unexpected that the major concern from Service providers in China goes to the graduate’s competency level. They finds difficult to recruit qualified staffs to satisfy the rapid growth demand and expansion of their business. Two conflicts rise in China is that firms face a shortage of qualified talent and graduates facing difficulty of getting a job. With this doubt, the question was raised to one of interviewer, he said: “It is true that currently the BPO growth in china is more than 30% every year,there is more and more graduates graduate from university every year as well. We offer quite considerable salary which higher than many of job in similar industry, the main issues is that many graduates’ skills don’t match our requirement. It could trace back to our education system and human capital strategy in china. ”

When author asked the detailed explanations, he said: “In my opinion, students from university in China are lack of practical skills such as effective communication and technical skills, but they are often rich in elementary knowledge and theories, in another word, our education system is less market orientated, and talents equipped with better
practical skills needed in today’s growth BPO industry” Its explanations matched with the results revealed from the survey that value-added services are needed in order to sustain its leading position in the global BPO industry. It was also found in this study that firms suffer from a lack of business and management knowledge. The most favorable solution to address that is to hire specialist with oversea working experience from western or even from India.

Culture
This study does show many of offshore BPO projects failure attributed to the lack of understanding of difference between cultures. Particular, high percentage of firms believes the success of negotiation process has big proportion depend on the understanding of culture difference. Different work style and ineffective verbal communication are still the obstacles to drag away potential customers.

Abstract
ZTBL replaces its Annual Confidential Report system by Performance Management System. Employees are however placed in novel and uncertain. Their perception and reaction to the new system is essential for the success for new system. The study encompasses how each evaluation system is ranked by employees. How employees differentiate them and how can it help in the performance measurement framework. These are imperative for increasing productivity, motivation, performance augment and job satisfaction.

JEL: M 12, 51, 54

Key Words: Annual Confidential Report, Performance Management System, Job satisfaction and Performance measurement.

1. Introduction
Performance management system is a continuous process of identifying, measuring and developing the performance of individuals and teams and aligning performance with the strategic goals of the organization. The purpose is to measure employees’ performance which leads to better job performance. There are different performance measurement systems and each has its own implication. Zarai Tarakiati Bank Limited (ZTBL), a pioneer and only bank in agricultural credit in Pakistan, shifts from Annual Confidential Report system (ACR) to Performance Management System (PMS). The question arises as to the success of the latter. This success heavily depends on employees’ perception and satisfaction with the system. The study considers employees perception as the key to the success and easy transaction of the PMS.

The study is first of its kind on the two systems in Pakistan. The study gets an insight about two evaluation systems which are PMS and ACR. The study will be helpful in exploring an
effective and efficient performance evaluation system to motivate employees to higher grounds. Another important rationale of study is it covers a public sector organization and this sector is considered backbone of Pakistani system. The study is divided into four sections. Section one is introduction while section two is pertaining to literature review. Third section is methodology and results. The last section is conclusion with recommendations.

2. Introduction to Performance Management and Literature Review

Performance management is a tool to ensure that managers manage effectively; that they ensure the people or teams they manage, know and understand what is expected of them, they have the skills and ability to deliver on these expectations, are supported by the organization to develop the capacity to meet these expectations are given feedback on their performance, have the opportunity to discuss and contribute to individual and team aims and objectives. It is also about ensuring that managers themselves are aware of the impact of their own behavior on the people they manage and are encouraged to identify and exhibit positive behaviors. Normally, in Pakistan, ACR system is most prevalent and replacing it fast in private sector is PMS. However, in public sector ACR is still the dominating figure.

ACR system is based on confidential reports which are filled by employee’s supervisors. It is most common approach used in public sector organizations to evaluate employees but they are considered inefficient, corrupt and manipulating. Replacing it is PMS which is more comprehensive based on employee’s performance appraisal parameters. PMS follows the following guidelines; Feedback, Training and Development, Coaching, Career Management and Development and Management by Objectives. The following review covers the importance of these components which are necessary for PMS and sufficient for ACR system.

Feedback and of course its clarity plays determinative role in development of employees’ perception about their work. Employees actively seek feedback regarding their performance from their supervisor, co-workers and work itself. It’s because employees seek to minimize uncertainty about their performance at work. (Bandura and Hackman, 1977). Normally feedback occurs through informally daily communication, but it may occur through formal evaluations. (Samuel J. Yeager, 1985). Unfortunately, the importance of timely feedback is often overlooked and the practice of giving feedback is taken for granted by many supervisors and co-workers in public sector organizations (Jack Rabin, 1985). Feedback and goal setting have become integral management tools because they are thought to serve both informational motivational functions that enhance an individual’s work performance (Kopelman, 1986). Thomas D. mistakes. In contrast when job performance was good, it was not readily recognized.

Most organizations use 360 degree feedback. 360 degree feedback involves feedback from four sources namely; downward from target’s supervisor, Upward from subordinates, Laterally from peers and co-workers and Inwardly from target him/herself. It has been implemented in a number of public sector organizations to enhance employee performance and to improve organizational culture. Providing feedback to managers about how they are viewed by direct subordinates, peers, co-workers should prompt a behavior change. But many managers have not received as much honest feedback as is necessary for adequate self perception. 360 degree feedback is extremely beneficial for organizational
development but if the employees are not taken into confidence ahead of introducing a new feedback method, it can be a devastating experience.

Linkage of goal setting with feedback is an important factor to enhance employee’s performance. Because both these factors (goal setting and feedback) can be complementary to each other in enhancing performance. Steers and Porter (1974) argue that task goal attributes such as goal specific and feedback increase employee’s knowledge of what is expected of him/her and reduce the employee’s unnecessary for job relevant behavior in a work setting. Similarly performance feedback not only can serve as a cueing function, but also can facilitate a goal setting and goal clarity function.

Training and development also improves performance of individuals and groups in organizational settings. Employee training is one of the most key aspects of a successful organization,(Claire Bellios, 1997). Moreover, training focuses on fixing a specific issue (Thomas Raney (1989)). Successful development can create a stimulating environment and positive forward focused culture. In order to effectively prepare for development one thing is certain, it takes time. Most of the time employees are not happy with training in public sector organizations because they want their skills, knowledge and attitude to improve through training but in most public sector organizations training is just a mere formality and no serious attention is given towards the purpose of training program.

Career management is a process by which individuals collect information about values, interests and skill strengths and weaknesses, identify a career goal, and engage in career strategies that increase the probability that career goals will be achieved (Greenhaus (1987)). Many HR professionals have advocated the use of career management and development systems for improving employee’s career motivation and commitment because of the close linkage between career management, performance development behavior and participation in development activities (Hall and Associates (1986), London and Mone (1987)).

Career management mainly consists of three steps namely; Career Exploration, Development of Career Goals and Strategies to obtain career goals. Exploration is expected to occur for those who wish to successfully progress in their careers (Philips, 1982). It results in increased knowledge of career opportunities and a greater awareness of what skills and behaviors need to be developed for career success. Career goal that an employee desires to attain is promotion, salary increase or skill acquisition. Career goal focus likely positive related to job performance. High levels of job performance are prerequisite for achieving many career goals. The more definite an employee’s goal, the more likely they are to maximize their performance in their current position.

Career management not just deals with development of career goals but also with their implementation as well. A career strategy is an activity such as participating in a mentoring relation, which increases the likelihood of career goal attainment (Gould and Pemly (1984). Employees whose current position is closer to the career goal demonstrates more career exploration than employees whose position is farther away from their career goal (Neo and Steffy (1987)). The closer employee’s current position is to their career goal, the more interested and involved they will be in development activities.

Use interpersonal and intrapersonal career strategies results in managers giving employees more favorable performance evaluations because these strategies cause managers to develop positive affect towards employees. Use of career strategies also stimulates
developmental behavior in employees; these strategies help employees to maintain and expand their knowledge and skills and develop contacts in organization. Coaching is a collaborative, ongoing process in which the manager interacts with his/her employees and takes an active role and interest in their performance. Most common categories related with employee’s behavior are; Directing, Motivating and Rewarding.

It is very important that relationship between coach and employee is collaborative and trusting because the collective trust of all stakeholders is necessary in a process (Farr and Jacobs, 2006). Coaches in public sector organizations need to try to walk in the employee’s shoes and view the job from his/her perspective.

The main purpose of coaching is to change employee’s behavior and set a direction for what the employee will do definitely in future (Peterson (2006)). This change will not happen if employee is not in the driver’s seat. Coach will have to facilitate employee’s goals and agenda. If the coach creates the whole and rich picture of employee and understands that every employee is unique and different it will certainly be beneficial for the employee and as a whole for the organization. The main activity for a coach is to facilitate the employee and a coach can do this (especially in a public sector organization) by giving advice, providing support and by giving confidence to employees. “A leader becomes complete only after giving something back” (Laurence (2003)).

Management by Objectives (MBO) is a process of agreeing upon objectives within an organization so that management and employees agree to the objectives and understand what they are in the organization (Peter Drucker, 1954). The main theme of MBO is participative goal setting, choosing course of actions and decision making. An important part of the MBO is the measurement and the comparison of the employee’s actual performance with the standards set. Ideally, when employees themselves have been involved with the goal setting and choosing the course of action to be followed by them, they are more likely to fulfill their responsibilities.

(Douglas McGregor, 2005) stresses the value of MBO, especially the aspect of performance appraisal. This approach suggests that we look at two sets of assumptions about individuals and their reaction to work. One approach assumes that people work to survive and need therefore a strict, authoritarian approach to dealing with subordinates. The other approach assumes people do not dislike work, and derive satisfaction from it.

An effective MBO program needs full support throughout the organization as well as time and effort. In public sector organizations it can be a highly motivating exercise as it enables both managers and subordinates to see their role more clearly and participation of employees will lead to greater employee acceptance of performance goals and management decisions and improvements in communication and understanding, among both managers and their subordinates.

3. Research Methodology:
Effective and efficient performance appraisal system is pivotal for employees’ motivation. ZTBL transcends from ACR to PMS approach. The question is whether the change gives job satisfaction and performance enhancement to the employees of ZTBL?
3.i. Hypothesis Development:
The study examines the difference between ACR and PMS as perceived by the employees of ZTBL leading effectiveness and efficiency of its employees. On basis of above knowledge, we derive following two hypotheses for our research,

**H₀:** Annual Confidential Report is equal to Performance Management System in terms of its effectiveness on performance and job satisfaction.

**H₁:** Annual Confidential Report is not equal to Performance Management system in terms of its effectiveness on Performance and job satisfaction.

3.ii. Sampling:
Target segment in study is officers of ZTBL-Islamabad. ZTBL is pioneer and only bank in agricultural credit. Data is collected to assess their perception of ACR and PMS employee evaluation systems. Sample selected in research study is random sampling in order to make sample unbiased. Sample size is of 60 supervisors/officers belonging to different ranks of Zarai Tarakiati Bank Limited.

3.iii. Questionnaire Design:
Data is primary and is collected using questionnaire method. Respondents are asked to give ranking to the characteristics of the particular evaluation/appraisal system mentioned in questionnaire. A scale is defined which has the options of 1-5 and respondents are asked to rate on basis of given scale from 1 being Strongly disagree and 5 being Strongly Agree. To analyze questionnaire t-test and Anova F-statistic is used.

3.iv. Procedure:
Questionnaires are distributed to sample in ZTBL-Islamabad. After two days they are collected. Every supervisor has to fill two questionnaires; one for ACR and other one for PMS. Later on statistical tests are applied on obtained data using t-test and Anova F-statistic. Additionally, two main tests are also applied namely; Correlation between ACR and PMS and Mean Equality test.

3.v. Results and analysis:
Questionnaire is appraised using t-test and Anova F-statistic. Analysis of data is done by applying Correlation and Mean equality test. Results compiled on the basis of these tests for each question of the questionnaire are given below:

Q#1: The selected system has a significant impact on career development and career growth?

<table>
<thead>
<tr>
<th>Test for Equality of Means Between Series</th>
<th>Q1</th>
</tr>
</thead>
<tbody>
<tr>
<td>Method</td>
<td></td>
</tr>
<tr>
<td>t-test</td>

</tr>
<tr>
<td>Anova F-statistic</td>
<td></td>
</tr>
<tr>
<td>(1, 58)</td>
<td>20.18719</td>
</tr>
</tbody>
</table>
As from table 3.1, it is clear that calculated value of t (4.49) is greater than its tabular value (2) which falls in the rejected region. Therefore, it is clear both the means are not equal and the evaluation of the data is correct.

Q#2: You were putting more effort to develop your careers in the selected system?

<table>
<thead>
<tr>
<th>Test for Equality of Means Between Series</th>
<th>Q 2</th>
</tr>
</thead>
<tbody>
<tr>
<td>Method</td>
<td>Df</td>

Correlation tells us about the strength of two variables association. In the correlation we have explored the relationship of two variables A is for ACR and P is for PMS. Positive and negative signs show direction. Negative value shows that the two variables are inversely related (if one increases other decreases) to each other and positive sign shows that they are directly proportional. In table 3.13., most values are negative which shows an inverse relationship. Overall data shows that there is very weak relationship between ACR and PMS because most values are negative and the values which are positive, they are very nominal.

4. Conclusion and Recommendations:

Pakistan is country with dominance of public companies. These use ACR performance appraisal system to evaluate, develop and motivate their employees. Among these companies is ZTBL — pioneer and only agricultural credit bank in Pakistan. ZTBL has moved from ACR to PMS employee appraisal methodology. Success of latter depends on perception of employees regarding the two pivotal systems.

The study encompasses perception of employees for ZTBL. Results indicate that PMS system provides with more career development and growth opportunities as compared to ACR. Employees put less effort in their jobs when ACR was in place. PMS employees achieve better results by achieving goals due to effective coaching and guidance by the supervisors. Employees get recognition for their outstanding performance and fair and equitable pay structure due to performance appraisal. Finally, results reveal that employees are more satisfied and confident with PMS because it has improved their performance due to increased motivation and at the end of the appraisal period the goals and tasks are revised which were not achievable.

Every research is not conclusive and so is this study. The study differentiates between ACR and PMS from employees’ point of view. However, pays, fringe benefits, job design and characteristics of employees’ contract cannot be ignored. If further studies are conducted taking additional factors and building a model on multi-variate analysis, deep insight to the two performance appraisal systems can be developed laying foundation for future change in public sector for Pakistan and eventually the world.

APPENDIX:

QUESTIONNAIRE

Name: ------------------ Age: ---------

Gender: ---------- Designation: ----------

☐ PMS or ☐ ACR

INSTRUCTIONS:
➢ Kindly fill out this questionnaire keeping in mind the better output of the statement under any of the below mentioned evaluation systems.
➢ You are also requested to fill the form either for PMS or ACR
The rating scale is given below,
➢ 1 → Strongly disagree 2 → Agree 3 → Neutral 4 → Agree 5 → Strongly Agree

Note: PMS means “Performance Management System”
ACR means “Annual Credential Report”

Islamic Azad University, Iran

Abstract
This research mainly attempts at evaluating the efficiency of Accounting Educational Departments at Isfahan's State and Azad Universities by using mathematical model of Data Envelop Analysis. Today, in order to evaluate efficiency and productivity of academic systems, mathematical models of operational research are used. These models consider a collection of education, research and service activities as input and output indices and with regard to the extent of importance and effectiveness of every index in performance collection, the proportion of harmonic sum of outputs to harmonic sum of inputs is calculated as the extent of decision-making units' efficiency. For carrying out mathematical model of Data Envelop Analysis, required quantitative education, research and service data was collected from 20 Accounting Departments of State and Azad Universities of Isfahan. After performing this model in four different indices, in addition to calculating expected extent of efficiency of all units, efficient collections i.e. units that have proportionate output regarding their input resources were determined as well. Also, efficient units were ranked with usage of numerical method and in terms of both inputs and outputs oriented. The results show against general image, payame_noor universities placed in better ranks.

Keywords: Efficiency, Department of Accounting, State Universities, Azad Universities, Data Envelopment Analysis

1- Literature review
Productivity is a comprehensive concept and includes efficiency that its enhancement has always been considered by economy and management authorities in order to improve living level, welfare, convenience and peacefulness of human beings. High productivity and efficient utilization of the current possibilities go beyond a selection at current conditions practically and are converted to a necessity. Efficiency is obtained from the proportion of output to input. During recent years various models have been devised to measure efficiency that we can divide them in to two general groups of hard models relying on quantitative and objective data (models of operational research, multi-indices decision-making models, data envelopment analysis, numeral taxonomy) and soft models relying on mental and qualitative data (Delphi hierarchical analysis method and nominal groups). Capabilities of Data Envelopment Analysis method have been resulted in applying of it in most economic sectors as an appropriate tool for evaluating of efficiency. Subject of efficiency and evaluation of it in universities (governmental services sector) is a relative new subject, because measurement of efficiency and productivity has already been studied more in the private sector, industries and factories. Because of diversification of activities and objectives of universities evaluation of efficiency and measurement of their productivity have special complexity. Studies reveal that the existing methods of
performance evaluation are more traditional and experimental so that they have more control aspect and can’t practically illustrate efficiency and productivity of educational activities. Thus it is necessary to establish an efficiency evaluation and effectiveness system for educational activities. Evaluation of educational activities' performance and enhancement of their efficiency has become more important since one of the major indexes of countries' development at present is the portion of a society in knowledge production.

It is important to evaluate education efficiency. This is true for all developed, developing or underdeveloped countries. Representing of possible solutions for the issue of efficiency must be considered as a priority for institutions and the clear-sighted. It is essential to remove those obstacles that the efficient system of education is faced with in order to educate people with a more appropriate method. The first step for removing of problems is to determine the elements of the educational system. Some elements of accounting educational system include accounting environment, mutual impact of profession and education, lesson program, professors and teachers, students, lesson resources and other educational possibilities and educational aid tools (Celik and Ecer, 2008). Considerable changes are being occurred inside of active environment of companies. These changes are totally resulted from the global competition and conditions of the world market. It is possible to classify elements of change in to three classes:

- Technical or technological knowledge
- Globalization
- Institutional investors

Impact of such elements on the operational environment of companies is resulted in

1- Lower cost of information than the past
2- Considerable increasing of competition among the companies

Capabilities of all resources including corporations' labor force will be exposed to change by increasing of competition. Considering the commercial environment, value of the labor force is increased and at the same time these changes create the pressure for improvement of labor force quality. Quality of labor force depends generally on the performance of educational institutions, academic programs and etc. Improving of the quality of accounting profession is possible through increasing of accounting education quality in educational institutions. It is in a way that accounting education should be represented efficiently by efficient application of resources with a high quality and purposefully. Thus many researches have been performed through total quality management (TQM) approach. It is believed that it is possible to apply statistical techniques of quality control in educational management and learning and teaching process successfully (Celik and Ecer, 2008).

2. Objectives of Research

Given to the research objective that is evaluation of efficiency of accounting departments, objectives that are followed in this survey are

1- Evaluation of efficiency of accounting departments in State and Azad universities of Isfahan province.
2- Ranking of accounting departments in State and Azad universities of Isfahan province in terms of efficiency.
3. Background and History of Research

3.1. History of Accounting Training in the World

Field of accounting has been created in response to economic and social needs like other sciences and has been transformed given to rapid changes and increasing growth of communities. Now it is considered as one of the main educational fields that is encountered with a growing demand. Its antiquity refers to about six thousand years ago, at that time various documents were kept for recording of information. Date of the first discovered documents is referred to about 3600 years B.C. Extending of business in the fifteenth century was leaded to innovate a mutual system for recording of financial information by Luchia Pachioly in a response to modern needs. The primary education of book keeping was done by teaching of written issues of this Italian priest at Proja, Bizza and other universities (Hendricksen, 1992).

3.2. History of Accounting Education in Iran

Accounting has a long history in Iran and perhaps returns to different civilizations created in this country. Obtained accounting documents with 25 centuries of antiquity are an evidence for this claim. Lands' audit in Sassanid dynasty and evolution of style accounting for keeping of the government's income and expenses in Seljuqi period are the prominent and advanced examples of that period. Beginning of formal education of accounting in Iran is dated back to year 1912 in Dar-Alfonun School that the late Ali Akbar Dehkhoda was its manager. In 1937 a group consisted of twelve Iranian accountants were dispatched to England by Iran Melli Bank for the expert accountants' course education given to the necessity of improving of administrative organizations and urgent need to professional accountants in financial and administrative fields. After that National Oil Company and ministry of finance and economic affairs took action towards sending of groups to the foreign countries that in general about one-hundred fifty (150) persons were included in this educational period. Higher institute of Iran National Oil Company was founded to satisfy needs of this company to skilled accountants after nationalization of the oil industry at the beginning of 1952. Institute of administrative and business sciences related to the law, political and economic sciences faculty in Tehran University was established in January 1954 by cooperation of administrative sciences faculty of South California University. Article of association of administrative and business sciences institute was approved in the council of Tehran University in July 1960 and this institute was converted to administrative sciences and business management department. Accounting field was gradually founded in other departments and higher schools like higher school of accounting and Isfahan Ghazali higher school (Alimadad and Malekaraee, 1994).

3.3. Previous Research

Econometric methods that are used to measure efficiency and performance comparison have been transformed from a simple state of per capita costs to states of professional models of simultaneous equations system in which attention is focused on convergence of multi-input and multi-product systems. Verry and Leyard have used education cost functions and researches in their survey and have performed efficiency testing in higher education by aide of input explanatory variables. They weighted high level scores (A) in tests and used them as input and utilized class rank as product in order to create an independent variable in the cost function (Verry and leyard, 1975).

Data envelopment analysis (DEA) has been applied in most performed researches about comparing of performance of higher education sectors during the two recent decades. Previously this method was used to study performance and measure efficiency at the level
of departments and educational groups and not at general level of universities. Although Wilkinson's basis of activity was on efficiency of departments but he studied effectiveness (product efficiency) in higher education process through modified data. More emphasis has been put on efficiency of researches' product (Wilkinson, 1993). Beasley (1995) has studied give-and-take relation of applied resources in departments between education product and researches product through data envelopment analysis (DEA).

Among the other researches that have studied technical efficiency of universities at a general level by data envelopment analysis (DEA) is research of Athanassapoulos and Shale. In this research performance of universities in England is compared with each other by means of represented statistics of higher education in this country. Forty five (45) samples were selected among fifty two (52) universities in the Great Britain, since other universities had a different structure with others or had no full time students. Two general models were used in this research: studying of cost efficiency (input orientation) and product efficiency (product orientation). Estimation was performed in both models with two assumptions of constant return towards scale (CRS) and variable return towards scale (VRS) (Athanassapoulos and Shale, 1997).

Among the recent works we can refer to Celik and Ecer (2008) research too that have evaluated efficiency of accounting education in forty five (45) State Universities from seventy seven (77) reliable universities in Turkey both at the group and department level. Obtained results reveal that efficiency of universities has problems at these at two levels that the most important of all is spending of resources more than the permissible limit. But accounting education is generally effective in programs of B.A course in Turkey.

In Iran Etemadi and Nikkhahazad (1999) have grouped factors and obstacles of accounting education growth based on elements of higher educational system of the country, i.e. professors and members of scientific boards of universities, students, educational program and other factors in a research entitled "recognizing of factors and obstacles of accounting education growth in Iran and representing of an efficient and effective program". At last he mentions lack of specialist professors, inattention to their welfare affairs, low level of students' foreign language knowledge and deemphasizing of theoretical principles as the most important factors and obstacles of accounting education growth in Iran.

Rezvani and Sameti (2001) have studied efficiency of thirty six (36) big universities of Iran in a research entitled "studying of efficiency of big universities in Iran by means of data envelopment analysis method". According to the results fourteen (14) universities are efficient with the assumption of constant return towards scale (CRS) and sixteen (16) universities are efficient with the assumption of variable return towards scale (VRS).

Torkashvand and Azar (2006) have evaluated educational and research efficiency of educational groups of human arts faculty in Tarbiat Moddaress University in a research entitled "evaluation of educational and research efficiency through data envelopment analysis: educational groups of human arts faculty in Tarbiat Moddaress University" and has offered strategies like changing of amount of inputs and outputs in order to improve efficiency of educational groups.

Heidarynejad, Mozafari and et al (2007) have evaluated efficiency of physical exercise educational groups of State universities in three different situations with output nature in a research entitled "evaluation of efficiency of physical exercise educational groups of State
universities by mathematical model of data envelopment analysis. He has represented the final results in the form of universities' ranking table and has offered strategies in order to improve efficiency of inefficient educational groups.

3.4. Measurement of Efficiency by Means of Data Envelopment Analysis (DEA) method

First attempts for measuring of efficiency were done by Debreu (1951) and Koopmans (1954) that their activity was just related to issues of technical efficiency. According to Koopmans (1954) definition a possible input-output vector is efficient if it is not possible to increase production of a product technologically (reduction of an input) without simultaneous reduction of minimum production of another product (simultaneous increasing of at least another input). He was able to obtain the essential and sufficient condition for a vector's product being efficient through this definition. Although Koopmans (1954) offered definition and characteristic of technical efficiency but it was Debreu (1951) who represented an index for measurement of technical efficiency for the first time. Farell (1957) had done the most basic and prominent work in this regard. He divided the total efficiency of the producer for the first time in to two elements of technical efficiency and allocation (of cost) efficiency. Also he represented indexes for technical efficiency, allocation efficiency and total efficiency. His first index was a direct perceiving of Debreu's coefficient of resources utilization. Farell (1957) considered a production function that the assumption of constant return with regard to the scale was dominant throughout it.

Assume that producers in a special organization produce product Y by means of two inputs of X1 and X2. We can consider the boundary production function as \( Y = f(X_1, X_2) \). Given to the assumption of constant return with regard to the scale we can write \( f(X_1, X_2) \) = 1. So it is possible to show the boundary function with similar production curve in the following diagram.

![Diagram 1. Farell's efficiency measurement (1957)](image)

Line pp' in this diagram implies similar cost curve. Point c shows producer in the desired organization that is active in that point. Farell knows the efficiency size of this producer equal to the proportion \( \frac{OB}{OC} \). This proportion is equal to one if the producer is on the efficient boundary (point B) and otherwise is lower than one. The allocation (cost) efficiency size of this producer is equal to \( \frac{OA}{OB} \) that it is...
equal to one when the producer is on the similar cost curve (point A) and otherwise this proportion would be lower than one (Farell, 1957).

It is obvious that a producer has total efficiency when is at point D, i.e. both his technical and allocation efficiency are equal to one. Farrell considers the size of total efficiency equal to \( \frac{C}{A} \) in general state that in fact is equal to product of technical efficiency size in allocation efficiency size.

Therefore in order to measure efficiency it is necessary to measure radial distance (the line that is connected to point c from the origin) of producer to the efficiency boundary in addition to recognition and establishing of boundary function (efficiency boundary) to obtain technical efficiency. So we can obtain radial distance of efficiency boundary and similar cost curve to gain allocation efficiency too and after that it is possible to measure total efficiency. Farell used line programming technique to obtain efficiency boundary and measure technical and cost efficiency for a space in which a product is obtained by n inputs with the assumption that return is constant in proportion to the scale and final return of all inputs is positive. But his method was not welcomed well because of existence of limiting assumptions. Major limitations of this method were removed by extensive attempts of famous scholars like Farell (1957), Grosskopf (1986), Lovell (1993), Charnes (1978), Cooper and Charnes (1995), Rhodes (1974) and Banker (1989). Nowadays this method has found a very high place in economic efficiency literature and is called data analysis method or DEA.

4. Research hypotheses

Hypothesis of this research is: “Accounting departments in State and Azad universities in Isfahan province are different from each other in terms of efficiency”.

5. Research Methodology

In terms of purpose this research is of applied type and based on the manner of collecting of the desired data it is of descriptive and appraisal type. The statistical population includes accounting departments of State and Azad universities in Isfahan province. Sampling is done through systematic deletion method (purposeful method) and the statistical population of research consists of data related to accounting departments of universities in Isfahan province that have been studied from October 2009 until the end of August 2010 (i.e. academic year 2009-2010).

Data collection methods could be generally divided in to two classes of historical study and field study. Historical study was used in this survey to collect data related to research literature. Field study method was applied to gather data related to confirmation or rejection of research hypotheses. First a list of all universities of Isfahan province was exploited from Sanjesh organization website. For more confidence results were examined by some other references (like Isfahan province portal, Azad university website, Payam Nour university website and etc) too. In the next step universities with accounting field at B.A level in continuous form were exploited through websites of universities or telephone contact. Then letters were sent to the exploited universities that were finally pursued by individuals' presence and through telephone contact. Time horizon of this survey was cross-sectional, academic year 2009-2010.

Given that the existent data includes twenty (20) accounting departments from twenty (20) universities and educational institutions of Isfahan province, data envelopment analysis has been executed on this amount of data as final sample. The above data has been saved in a database in Excel software that fields and records of this database will be explained in the following. As it was mentioned earlier in order to constitute the total table of studying data, data number 2 and input number 2 must be harmonized according to table (1). The manner
of calculation of these items' final number is shown in tables (2) and (3). Total framework of database is in the form of table (4).

### Table 1. Titles of inputs and outputs

<table>
<thead>
<tr>
<th>Type of variable</th>
<th>Variable</th>
<th>Variable name</th>

</tbody>
</table>

Harmonious number of scientific board members: this variable includes full time and partial time professors. In other words, this variable is considered as a major data of accounting departments. It is based on person and adopts an amount equal to zero or greater than it and is a discontinuous variable. The manner of weighting to scientific board members is as table (2).

### Table 2. The manner of weighting to scientific board members

Number of students: one of the significant inputs of accounting departments is number of students. This variable includes all of the existing students in the educational system in the academic year 2009-2010. It is in terms of person, adopts an amount greater than zero and is discontinuous.

Educational space: this variable states area of educational environment of accounting departments that includes total area of classes of the group. It is in terms of square meter and is a continuous variable that adopts an amount greater than zero.

Number of graduates: one of the outputs of university units is number of students, thus number of students that have been graduated at B.A level is one of the outputs of accounting departments. It is in terms of person and is discontinuous that adopts an amount greater than zero.

Average score of specialized major lessons: students' average could be one of the criteria to evaluate efficiency of university units. This variable in this survey is obtained by dividing sum of score of students in major specialized lessons during the academic year 2009-2010 by the number of students of that year. To put it differently, it shows mean of total average of students. This quantitative variable is of continuous type and is in the range 0-20.

Harmonious number of research plans, professors' books and articles: professors do research while teaching, write and translate books, publish articles and participate in conferences that is the result of their research activity. This variable includes sum of research plans. Research task of accounting departments is considered with this variable. It has no specific unit, adopts an amount equal to zero or greater than it and is a discontinuous variable. The manner of weighting to members of the scientific board is as table (3).

**Data standardization**

Given that change range of the applied variables (inputs and outputs) in the present research has fluctuations they are standardized hourly in order to create homogeneity and comparability. It means that the existent variables in each column are divided by the largest number in that column and so all variables are settled in the limit (0-1). Table (5) shows standardization form of data.

6. Implementation of Data Envelopment Analysis (DEA) Method

Data envelopment analysis method has been implemented on data of twenty (20) educational groups through EMS specialized software in this research in four states of constant return towards scale (CRS), variable return towards scale (VRS), reduced return towards scale and increased return towards scale with two input oriented and output oriented approaches that totally include eight states.

If data envelopment analysis model is solved with input oriented approach, improvement suggestion will be appeared in the form of reduction in inputs amount without change of outputs amount. If output oriented state is solved, improvement suggestion will be appeared in the form of increasing of outputs amount without change of inputs amount. Efficient units have score of 100% in input oriented state and score of inefficient units is lower than 100%. The noteworthy point about output oriented state is that input oriented state is used to measure units' efficiency in most issues of data envelopment analysis. However, efficiency of educational departments has been studied in output oriented state too in this research. Units with score 100% in output oriented state are considered as
efficient units but conversely in the input oriented state units with score of more than 100% are considered as inefficient units. Efficient units of the model (reference) for each of inefficient units are shown in Benchmark column in each of the executed states of the model. Inserted numbers for efficient units in this column show their number of presence as model unit that will be used in next steps for ranking of efficient units. Tables (6) and (7) are represented as an instance here that are related to execution of model in input oriented state and by assuming that return is constant:

Given to table (6) it is observed that average amount of efficiency is equal to 89.67%. In other words, totally the studying universities apply about 10.33% inputs more than the desired amount. If universities act efficiently (are on the boundary function), they can offer the same level of outputs by decreasing of their inputs about 10.33%.

As it is observed six universities from twenty (20) existent universities (equal to 30% of the studying universities) are at efficiency boundary and are declared as completely efficient universities. Hence universities F1, F4, F11, F16, F19 and F20 are the most efficient universities according to input oriented state and under constant return towards scale, while F14 has the lowest efficiency (72.79%). It means that the above university could use its inputs lower and continues to produce the same amount of outputs if it becomes efficient (27.21%).

7. Research Findings
7.1. Conclusion
1- Efficiency size of educational groups was calculated in input oriented and output oriented states.
2- Some of the studying educational groups were inefficient either in input oriented or in output oriented state.
3- Amount of resources waste/inputs was calculated in input oriented state.
4- Amount of production shortage/outputs was calculated in output oriented state.
5- Educational groups were ranked in terms of efficiency in two states of input oriented and output oriented by means of counting method.

7.2. Recommendations
1- Inefficiency causes of educational groups should be found.
2- Outputs of inefficient educational groups should be increased as the amount of their inefficiency.
3- Inputs of inefficient educational groups should be decreased as the amount of their inefficiency.
4- Authorities responsible in the education field including Research Deputy Chief of Ministry of Sciences and Institute of Research and Higher education programming represent distinct definitions and appropriate indexes for inputs and outputs and resources of universities through specialists' ideas and gather the information and statistics related to them each year.
5- Studying and selecting of some criteria (different from criteria of this survey) and re-execution of data envelopment analysis (DEA) models are recommended.
6- Modeling of hierarchical data envelopment analysis of goal programming, in order to build this model the researcher can divide accounting departments into several sections and then calculates efficiency score at three levels of year, section and group by analysis-oriented efficiency model. Designing of hierarchical profiling model in this regard is a desirable innovation that is combination of two profile and hierarchical models that has not still been done in Iran.

Abstract
Fast Food is now becoming the most favorite food around the world due to trend shifting; quick home delivery and people are kept busy in their extensive work. Many companies trying to maximize their market & profit share after launching new product in the era of competition, therefore scanning of market environment now centre of focus to get competitive advantage via new product development. Despite the facts, the rationale right behind for investigate the Impact of Macro Environment on New Product Development of Fast Foods Companies (FFC’s) is to uncover the level of macro environment Scanning by FFC’s operating in Pakistan. The Renewal Associates (2003) PEST sheet used & descriptive statistics analysis were used to estimate the intensity of Macro Environment on New Product Development. The result shows that FFC’s were not scan Macro Environment too much & consider different factors of Macro Environment for new product development.

Key Words:

INTRODUCTION:
As per Bender and Bender (1995), Fast foods are broad term used for a restricted menu of foods that lend themselves to production-line techniques; suppliers tend to specialize in products such as hamburgers, pizzas, chicken, or sandwiches”. Smith et al. (2001) undoubtedly demonstrated the production-line approach with specific allusion to sandwich production. The fast food industry in World has grown significantly during the last decade and now fast food outlets providing a diverse range of food products according to consumer’s choices. As Fieldhouse. (1996), found that the steep size of the fast food enterprises assured that it has a substantial influence in contemporarily world on the eating habits of big segments of the population. At present in contemporary world a novel consumer standard of living has emerged about dining of fast food due to the global village, trend shifting & busy life of people. The stipulate for fast food has been mounting radically across the globe. Jennifer L. Harris et. all. (2010), and the trend of fast food is also on the rise in Pakistan from last decade. Therefore need for the new Product development greater than before to get sustainable competitive advantage.

Product Development needs to scan Business Environment, which comprising of Internal & External Environment, Further External environment divided into Micro & Macro Environment (Vignali, C., Vrontis, D, 2003). Macro Environment always plays a vital role in New Product Development as per Vrontis, D., Kogetsidis, H., Stavrou, A. (2006). In this context, to find the impact of Political, Economical, Socio-Cultural and Technological
Factors on marketing activities of Fast Food Industry in Pakistan, the research has been carried out.

In rejoinder to a cutthroat business environment, NPD has been playing a vital role in the accomplishment of many Organizations (McCarthy, Tsinopoulos, Allen, & Rose-Anderssen, 2006).

The aim of this research is to find the impact of PEST Factors on New Product Development in Fast Food industry. PEST is a word comprising of four External Factors, i.e. Political, Economic, Socio-cultural & Technology (Goodnow, J.D. and Hansz, J.E. 1972), New product development (NPD) is an inter-linked sequence of information dispensation tasks, where final product design translated from knowledge of customer needs & wants (Meybodi, 2003). Clark and Wheelwright (1995) mentioned, it is one of the most influential, but tricky activities in business. Today’s Business managers and marketing academics identical that new product development is an essential building block of an organization’s enduring survival is success (Henry et al., 1989). These studies have proved that Scanning of Environment is crucial to determine the success of new product development process.

Additionally, it is broadly recognized that strategic orientation is imperative as one of determinant to boost company performance. Several studies strenuous on the features finding the success and failure of a new product, therefore scanning of environment needed (Cooper, 1979; Maidique and Zirger, 1984; Song and Parry, 1997). While Kwaku and Satyendra (1998) research on the link between strategic orientation and business performance. Ramaseshan et al. (2002) also contribute towards marketing orientation and company performance. However very little study mull over strategic orientation as contributing factors in improving new product development process.

Involvement of External Environment in NPD process in developing countries remains unclear. Numerous marketing activities including internal environment influences on NPD process in Fast Food industry, which is still not been investigated expansively especially in developing countries like Pakistan mainly the conduct of it insinuation in determining NPD success.

Moreover, the use of Research & Development is recognized as one of imperative department that must be institute within organization to make sure the innovation continuity. As Kohli and Jaworski (1990) has talk about on the importance of market scanning / information in business decision processes. Accordingly, the role of market scanning activities is supporting the success of NPD process among Pakistani Fast Food companies, but it is still unclear and need to be investigated. Almost, no research work has been carried out regarding PEST analysis in Fast Food industry of Pakistan.

Thus, this paper aims to investigate the impact of PEST on new product development among Fast Food Companies in Pakistan. The paper also considers the relationships between New Product Development and Sustainable Competitive Advantage.

LITERATURE REVIEW

Due to intense competition in Fast Food Industry, Companies now paying special attention towards New Product Development to attracts more customers & maintain market share. Therefore, now for sustainable competitive advantage not only New Product development needed, but also importance of formulation of strategies for New Product Development considered necessary. New Product Development (NPD) process starts with the situation analysis, where Company carefully exposed the Micro & Macro Environment for new opportunities for NPD. Literature has a lot to say about this subject but few major research results are being passage here.

As per Kotler and Armstrong (2005), A new product is a good, service, or idea that is professed by potential customers as new. New product can be passing on as original products,
product modifications, some improvements in product and totally new brands that the firm builds up all the way through its own research and development & marketing effort. New products and services may be categorized according to (1) newness to the targeted market and (2) in respect of level of customer value created, resultant in the subsequent types of new products as per David and Nigel (2001). They further illustrated three types of new products that are:-

- **Transformational Innovation**: those products that are totally new and the value created are significant.
- **Substantial Innovation**: Those products that are significantly new and also may create imperative value for customers.
- **Incremental Innovations**: Those improved products, which create higher performance or better perceived value may at lower cost as comparing to previous ones. An example is a new Coca-Cola flavor.

Booz, Allen and Hamilton (1982) in their research study of new product introduction success according to the degree of newness in target market & for firm too, mentioned 6 types of new products (division according to parentage) expresses in table.

**A. The Relationship between PEST & New Product Development**

Copper (1979) suggested that for successive new product, market knowledge and marketing proficiency play the critical role. He further added that those projects which based on market-oriented activities including market assessment, market studies & test market etc, were undertake proficiently.

Cooper and Kleinschmidt (1987) narrated that collection of related market information firstly including evaluation of internal & external environment will outcome in form of success of new product development, if they also plan development strategies of these new products that match firm goals. Actuality, most new product development teams used market information for development and design process of these products in form of survey for market trends, focus group testing etc (Ramaseshan et al., 2002). So, these studies means that firms should gather as much market information in form of input to better know the market / customers needs and wants for better output in shape of new products. Therefore, it is worth mentioning that market research activities influence new product development & its allied processes.

Environmental factors affect the independent variables; few studies have shown different views on different circumstance (Smith and Grimm, 1987 and Azaze et al., 2005). While study by Smith and Grimm (1987) focused that how environment changed & impact on strategic shift and firm performance. They concluded that there is important relationship between environmental variation and strategies of firms, so majority firms change their
strategies according to the environment & those which failed to do so outperform. Azaze et al., (2005) comprised in his study that some environmental factors have moderate affect between product and promotion adaptation, delivery chain strategy, and new product design strategy and on target market.

**Situation Analysis [Environmental Scanning]**

Situation analysis is the key to find the strategic fit in between environment & company goals & also first and important stage in marketing planning, because effective strategies can’t be formulated & implemented without examining the environment in which the firm operates (Vignali et al., 2003, p. 15). Vignali and Vrontis (2004) suggested that for strategic formulation, environmental scanning including external and internal environments is essential. Important factors that should be analyzed in an internal and external inspection are mentioned in Figure 1 & 2.

**External analysis**

The external environment is comprise of macro-environment and the micro-environment, which are basically forces over which a firm has almost no control, if any, then it’s very limited. The micro-environment is the stake holders of the firms on which they have control including supplier, customers, retailers and competitors, while the macro-environment consists of forces including political, economic, social and technological (PEST) (Vignali et al., 2003).

The environment for companies operating in the Fast Food industry is constantly changing. Therefore, it becomes critically important to identify opportunities and threats when formulating strategy for the purpose of gaining competitive advantage.

**Macro-Environment (PEST)**

PEST includes all factors that can influence an organization in, but firm has not direct control on these factors. Generally, a firm does not influence by any laws. Macro Environment is oftenly changing and company cope this through flexible approach. The wider environment is
also continuously changing and the firm needs to compensate for changes in Socio-culture, economics politics, and technology. (Goodnow, J.D. and Hansz, J.E., 1972)

Some important factors listed below as per Renewal Associates (2003) recommended for scanning of PEST.

B. The Relationship between New Product Development & Sustainable Competitive Advantage

New products are vital to the survival in competitive market and also important for long-term growth of any firm. To get successive in new product development Firm have to pay attention that how they redirect their organization’s goals towards their product target market (Ramaseshan et al., 2002),

Yew (2002) suggested that a firm should develop and sustain competitive advantage, if they want to archive superior business performance. He further added that business environment analysis is vital for the success of the NPD and thus this could help firms to achieve higher performance for the new product development including overall business performance, Customer Satisfaction and then it will lead to competitive advantage.

Due to culture, demographics, geographic of a region, religion, and or any other attributes, there is almost no consensus in the literature regarding PEST factors affect uniformly on firms among researchers. It can be vary form one region to another. However, Renewal Associates (2003) urbanized PEST factor sheet/ instrument to find out the degree of the dimensions of PEST, It consists of more than 40 items that are coupled into four different dimensions namely 1-Political, 2-Economical, 3-Socio-Cultural; and 4-Technological.

This instrument is based on the differences between the perceptions and expectations of Marketing Manager regarding the dimensions of PEST. The difference between the
perceptions and expectations indicates the existence of a gap. The instrument has been adapted depending on the industry in which the research has been conducted.

The model in this study mentioned below to find the affect of Macro Environment (PEST Factors) on New Product Development. How fast Food Companies using PEST Factors sheet to scan the environment for New Product Development & how PEST factors guides the companies for that product, which is as per requirement of Customers.

Second, this study also focuses to analyze the link behind the Sustainable Competitive Advantage via New Product Development. Are Companies being paid in form sustainable Competitive Advantage, If companies doing PEST analysis for New Product Development in Pakistan?

**METHODOLOGY**

The purpose behind this study is to investigate the link in between Macro Environment (PEST Factors) & New Product Development for Sustainable Competitive Advantage in Fast Food Industry of Pakistan. All Fast Food industry Pakistan is the population of this study. A sample of 7 Fast Food Companies is selected through online sample size calculator including 03 International (Named Co. A, B & C) & 04-National (Named Co. W, X, Y & Z), while having confidence level is 99% (SurveySystem.com 13-05-2011 1100AM).

A convenience sampling, which is also known non-probability sampling design method, was used because of its consideration as more appropriate to collect the Data. In convenience sampling customer accessibility, data collection is easy as compare to other methods, required less time and in addition data can be gather from the respondent of the sample that are near to the researcher. As *Food and Nutrition Technical Assistance Project* (FANTA 1997) narrated that non-probability samples are uncomplicated and inexpensive than others probability sample’s. To collect the required information from Fast Food Companies operated in Pakistan, A-personal contact approach’ is also used; so more the researcher illuminates the queries of respondent raised by if any.

A survey is a way to gather information regarding particular population as sampling some of its members through a specific way, usually a structure of standardized questions. Surveys can be conducted by different ways including mail to the respondent, telephone, Internet or even through personal interview, which can be manage either to individuals or groups as a unit. The basic purpose of a survey is to elicit data which, after evaluation/process, results in
a profile or statistical characterization of the specific population sampled. Questions might be related to particular behaviors, activities, beliefs, attitudes, opinion, and/or attribute of those who are being surveyed.

The methodology used for Survey is Questionnaire. Questionnaires structure included closed ended Question to draw out the relevant information, which required a set of option used for collecting of required information.

The Questionnaire was divided into three sections:-

1. Demographic of the Respondent included Position of Employee, Experience in Fast Food Company, Gender, and Age, while Company & Employee name are being kept confidential due to certain approval issues & privacy due to ethics.

2. The second section relates to the New Product Development, which comprises 05-close-ended questions adapted from Dr. Ray O. Waddoups R&D Improvement Diagnostic Tools (2011) as reported below:-
   i. Do you regularly beat your competitors to market with new products? Yes or No
   ii. What type of new products your company developed? Is it Transformational innovation or Substantial Innovation or Incremental Innovations?
   iii. How long do you allow your projects to schedule development? If New iteration of existing products or if totally new products? (Time period 06moths less to onward more than 02 years).
   iv. Are you scanning external environment (pest factors) roadmaps used for NPD? Yes or no or Sometimes
   v. If yes to Q4, is NPD process leading to your company towards sustainable competitive advantage? Yes or no or Sometimes

The last section dealt with the response of marketer towards PEST:-. The questionnaire designed for this part was based on the widely accepted Renewal Associates (2003) PEST Factor sheets. Some parts of questionnaire reconstructed according to need of study while focusing of cultural & economic situations of country, where Fast Food Companies operating. The questionnaire is more scientific rather straightforward. Therefore Researcher provide full assistance while data collection & explain the nature of PEST factor. Firstly, Respondent asked by Researcher that was this factor affected your company new product development process or not? If the answer of respondent was yes then further its relative Importance of Implication of that factor asked according to the Time, type, Dynamics & relative importance for the firms, which scale mentioned in Table-A adapted from Renewal Associates (2003). A total of 22 attributes were categorized under four dimensions in respect of Pakistinis culture as follows.

<table>
<thead>
<tr>
<th>S. #</th>
<th>Attributes</th>
<th># of Questions</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Political</td>
<td>5</td>

</table>

**RELATIVE IMPORTANCE OF IMPLICATIONS OF EXTERNAL FACTORS**

**CRITICAL**
Factors that threaten the continuing existence of the organisation or seriously compromise or require review of its mission or core values.

**VERY IMPORTANT**
Factors that are likely to promote significant changes in the scope of an organisation's activities, operational structure, external relationships and its establishment (staff, premises, legal status etc) without compromising its mission or core values.

**IMPORTANT**
Factors that are likely to promote limited changes in any or all of the scope of its activities, its operational structure, its external relationships and its establishment (staff, premises, legal status etc) without compromising its mission or core values.

**SIGNIFICANT**
Factors that bear on an organisation's operation without seriously affecting the scope of its activities, its operational structure, its external relationships and its establishment (staff, premises, legal status etc) without compromising its mission or core values.

**UNIMPORTANT**
Factors that do not affect an organisation in any significant manner.

*Source:* Renewal Associates (*2003*)
FINDINGS & DISCUSSION

07-questionnaires were distributed among sample to collect data. All collected back & were usable for data analysis among them. Response rate is 100% because of personal contact approach.

The gender-composition consist of was 6 male (85.7%) and only 1 female (14.3%) respectively. The cause behind less numbers of female’s respondent was that males are held responsible for earning in Pakistani cultural. Obbe (1980) told that Men executes the necessities or accountable for outside the home, while females tend to perform domestic-duties inside the residence.

As per consideration of age of Customers, 3 persons lies in age group b/w 23-28 & remaining 4 lies in b/w 29-35. While 4 are the middle level managers & 3 are line managers to whom data were gathered. 2 managers were working with company from last 3 years, 4 were from last 3 – 6 years & 1 was loyal from last more than 6 years.

Cronbach’s alpha for Renewal instrument’ (22 items) was 0.807 was found to be within limits for further analysis as greater then Rule of Thumb (0.7).

While company’s level of New Product Development, 5 Companies (2 International & 3 National) were regularly introduced new products, while 2 (1 International & 1 National) sometimes developed new products. As per type of New Products, 1 National Company did transformational innovation & 1 national Company did substantial innovation, while all 3 International & 2 National did incremental innovation. 1 International company allow iteration in old products project to schedule development for 6 months to 1 year period, other 2 International allow 6 months or less in case of totally new & 6 months to 1 year for iteration in existing products respectively. While National companies are focused to scheduled time on new product development as 2 companies provided 6 months or less time & 1 provided 1 to 2 years for new products development, while one company out of four focused on alteration in existing products after giving 6 months to 1 year for development of products.

As per question asked regarding scanning of PEST factors for NPD, all 3 international companies did PEST analysis some times, while 2 National FFC (Fast Food Companies) doing PEST analysis regularly & 2 did some times. 1 International Company always got sustainable competitive advantage after NPD, while 2 got sometimes, on the other hand same situation was with National Companies with ration 1:3.

PEST factors affects on NPD mentioned in table-B, considering Political factors, Govt. policies, Tax rates affects most than others factors, FFC’s are least concerned with Labour Laws & Trade restrictions, while tariff didn’t affected the NPD. In Economical factors Economic growth of the country, Interest rates, Exchange rates & GDP not so much bothered by FFC’s, while inflation always impact on NPD. In Socio-Cultural, FFC’s always care health-consciousness during development of products, & didn’t care about age-distribution, & also concerned with Major events, Career attitudes of peoples, Ethnic/Religious factors for development of products, but not concerned with population growth rate. During development of products, FFC’s gives more weight to rate of technology change, while also much concerned with Technological shifts, Innovation, R&D activities & least concerned with Research funding. Table-B showing mean & standard derivates of all factors.

CO. WISE PEST ANALYSIS ACCORDING TO TIME, TYPE, DYNAMICS & RELATIVE IMPORTANCE

Factor wise PEST analyses (Table-C) narrated below for understanding of these factors according to the time, Type, dynamics & relative importance according to the scale adapted. Numbers showing, who many companies considered that factors important for NPD, then further bifurcation that what numbers of companies gives rating according to the time, type, dynamics & relative importance, i.e. in Political factor all seven companies considered that Govt. policies affects the NPD, in those 7, one company considered that Govt. Policies Impact when NPD starts & then reduce / stop inside 6-12 months, 04 Fast Food Company considered that its Impact when NPD starts & in the future beyond 6-12 months, while other one considered it’s No Impact when NPD starts but at some time in future 6-12 months & last one believed that Govt. Policies Impact intermittent over time on NPD. Whereas 06 companies out of 7 judged Govt. Policies has negative Impact on NPD, while only one considered that its impact positively on NPD. All seven companies agreed on one point that Govt. Policies have Impact of Increasing Significance, & its relative importance is critical according to 2 companies, very important for others 2 & remaining considered it’s as important for the Fast Food NPD process.

Limitations and Future Research

The critical limitation is that this study is conducted in a single geographical Region and the data collected from respondent not represent the entire business World, although it might be eradicate in imminent or future research studies regarding Macro Environment. Research study may conduct in 3 to 4 geographical area for a better generalization for the PEST Factors, because Macro Environment issues always fond of with the sphere of FFC’s or any Customer Services providing firms.

Conclusion and Implication

This study examines the FFC’s that for New Product Development, is FFC’s scanning Macro Environment (PEST Factors) & what factors considered important according to the time of that factor, dynamics & relative importance. Environment scanning are always considered very imperative whether it relates to any industry, but in Fast Food Sectors, Customers association is sky-scraping due to the trend shifting, so a better product for their Fast food Customers is the answer for any FFC to get maximum profit & share in competitive market.

In Pakistan, FFC’s doing PEST analysis for New Product development at very low level & considering Micro Environments important as compare to the PEST. Companies gaining competitive advantage after NPD, but this advantage not sustainable due to the intense competition in market. Fast Food business is increasing day by day, but Companies’ shouldn’t be pleased as this study characteristic had negatives feature & rating from different companies. FFC’s should concerned of this & be supposed to work to get better & try to fulfilled these spaces. These gaps will widen in future, if FFC’s not taken so seriously & can create serious problems for delivery of services or products.

In the age of rivalry Fast Food Companies Management should work for quality push of their products & should scan the rapidly changing that Environment for effective New Product Development, so FFC’s be able to find consumers response to become a internationally competent as customers response leads to perception then satisfaction. These procedures / actions and scanning may be costly in terms of marketing employees time, firm resources and effort, but FFC’s needs to find those ways to conquer these types of obstacles, otherwise Companies can lost their position, existing market share because of rising competition from National / international FFC’s.

Abstract
Air pollution is rapidly growing environmental problems of Pakistan. A study was conducted to analyze the ambient air quality of Hayatabad Township, Peshawar. The objectives were to investigate baseline data on ambient air quality of Hayatabad, identify the highly polluted points of the study area and to give a guideline for managing better air quality of the study area. The selected parameters CO, NO, SO₂ and noise level were studied and then compared with the permissible limits of WHO standard. The data were collected from overall Hayatabad at seven different sampling points for each sampling day. Three readings were noted in different periods of time i.e. morning (8:00 to 10:00 am), noon (11:00 to 1:00 pm) and after noon (2:00 to 4:00 pm). The study indicated that the average concentration of CO measured along with climatic condition at seven sampling points was not found to be higher than that of permissible limit of WHO standards. So from CO point of view the air quality around the Hayatabad is suitable for breathing. The concentration of nitrous oxide (NO) is ranges from 0.42ppm to 2.4ppm that is above the permissible limit of WHO standards (0.053) and thus may harmful for health. The concentration of SO₂ has been founded below detection limit (BDL), Therefore the air quality near the industrial estate is suitable for breathing and is not harmful for health. Also, the level of noise detected out side industries is within the limit and have no adverse impact on the people working out the industries. So noise level will not affect the people. It was observed that the concentration of selected parameters increases from morning to noon and afternoon. The level was low at morning because there is no more traffic at night in the study area. The emitted pollution at day diluted in the atmosphere at night and also due to dew factor which trap the pollutants and settle it down. So the atmosphere became clean from late night till morning. An increase in pollution were found as the vehicles and traffic starts moving again. It may be concluded that the selected parameters (CO, NO, SO₂ and noise level) studied were with in the permissible limits of WHO standard except NO and the ambient air quality of study area (Hayatabad) is satisfactory.

Key Words: Air Pollution, Noise Level, Carbon Monoxide, Sulphur Dioxide, Nitrogen Oxide

Introduction
Air pollution is an abnormal component of the natural environment and the environmental problems have acquired new dimensions now-a-days, resulting in the loss of biodiversity, threat of climatic change, rise in sea level, and depletion of stratospheric ozone layer. Population explosion has resulted in more and more industries, which is causing uncontrolled pollution in the form of air, water, noise and waste generation problem (Chhatwal, 1989). The under going study is concerned to the Air Pollution. Miller, (2002), defined air pollution “The presence of one or more chemicals in the atmosphere in sufficient quantities and duration to cause harm to human, other form of life, and materials”. The major sources of air pollution are the generation and ever increasing requirement, of energy in diverse sectors of economy, which has its local, regional and global environmental impacts.
The present worldwide consumption of commercial energy is about 8.3 billion tons of oil equivalents, out of which 86% is produced by burning of fossil fuels *i.e.* coal, oil, and gas. The combustion of these fossil fuels result in the emission of particulate matter, organic compounds and CO, CO$_2$, SO$_2$, and NO$_x$, for example see, Rauf and Sana (2005), Khawaja, (2005), Dara, S. S., (1993), EPA, (1997), Khan, (1997), Sohail, (1992) etc. Ever growing concentration of air pollutants in the atmosphere not only damages the materials and agriculture, but also contributes to a variety of adverse effects on human health, ranging from respiratory diseases to change in the blood chemistry of living beings.

Industrialization plays a vital role in the socio-economic development of a country. This fact was felt in the 20th century when rapid industrialization took place. The process led to enormous job opportunity in industrial sector production of goods and services that fulfill the needs of the people and ultimately increased the GNP of a country with rapid industrialization. It was not until the late half of the century, the human being or man started to realize the harmful impacts of the production process apart from the beneficial impacts. The industries produce the wastes that pollute the soil, water and air along with the workplace hazards causing harm to human health.

Air pollution is a rapidly growing environmental concern. Highly inefficient energy use, accelerated growth in vehicle population increasing industrial activity with out adequate air emission treatment or control and use of Ozone Depletion Substances (ODS) are some of the major causes of deterioration of ambient air quality (Chhatwal, 1989).

Air pollution is an old problem and has been around for centuries. In its broad context air pollution exists in these categories.

- **Personal Air Pollution**
  This type of pollution is the result of personal habits such as cigarette smoking, pipe smoking etc. Nowadays, many authorities are giving serious consideration to control this type of pollution.

- **Occupational Air Pollution**
  It represents that type of pollution, which results from aerosol, vapors of organic compounds in the working environment for the workers. Usually this type of pollution is the result of modern technological development.

- **Community Air Pollution**
  It represents the most complex three varieties since it involves a varied assortment of pollution sources and contaminants meteorological factor and the diversity of adverse social, economic and health effects, it not only affects many more individuals because of the atmosphere, but it can also exert significant impact on man’s total environment. It is most difficult variety of air pollution to control and inhale (Chhatwal, 1989).

Ambient air is the mixture of gases that envelops the earth and forms the atmosphere. Most of the atmosphere is held close to the earth by the pull of gravity, so it gets thinner in increasing the distance from the earth. Almost all (99.99%) of its total mass remain with in 80Km of the earth surface (Mushtaq and Asfaq, 2004).

**Materials and Methods**

We studied the ambient air quality status of Hayatabad. The data was collected from seven points selected randomly all around the Hayatabad, based on the concentration and density of traffic. The study is limited to three parameters of air pollutants and noise pollution. The air pollutants include oxide of carbon (CO), Nitrogen (NO) and Sulphur (SO$_2$). Although it is a field of vast study and to get a meaningful result need an extensive study but because of limiting time and resources the study was conducted in a limiting area. Looking to this aspect of the study, this will provide a guide for the future study.
The Ambient Air Quality in the study area has been monitored by the following instruments;

i. **Toxic Gas Monitor**

The data for carbon monoxide, nitrogen oxide and Sulphur oxide have been measured with the instrument named OLDHAM MX21 (Ref: D813615. Code: 98 NU MX21 GB01, France made). This instrument is a multi gas detector, which is automatically calibrated before the start of reading. It can simultaneously detect the presence of three gases by means of special sensors for each type of gas to be detected. These gases may be explosive (methane, propane, butane etc.), toxic gases like Sulphur dioxide (SO₂), carbon monoxide (CO) and nitrogen oxide (NO).

ii. **Noise Meter**

Sound Level Meter (Model TES -1350A, made by Taiwan) is used for noise level in industrial estate. The calibration standard of the Sound Level meter is 94.4dB. The noise meter was calibrated before each visit.

The primary data is collected by using portable digital instrument (model OLDHAM, made in France and noise meter level.). The instruments were provided by the EPA Peshawar. (Environmental Protection Agency Peshawar) The data is collected from 7 purposively selected points throughout the Hayatabad. On each sampling day three readings were taken from every point in different period of time. The entire secondary data is collected from literature review, which includes thesis reports, research papers, reports, and Internet information.

A sampling plan was prepared before the study. It was tested and adjusted after feedback from the field before starting the practical work. The data have been collected from overall Hayatabad at seven different sampling points for each sampling day. Three readings were noted in different periods of time i.e. morning (8:00 to 10:00 am), noon (11:00 to 1:00 pm) and after noon (2:00 to 4:00 pm). The sampling points were selected after a detail survey of the Hayatabad.

The seven points selected in Hayatabad for collection of data based on the traffic density are:

i. Phase III Chowk,
ii. Bagh-e-Naran Chowk,
iii. Ring Road Chowk
iv. Phase VII
v. Phase I
vi. Hayatabad Medical Complex
vii. Turn II

All these points were discussed with a few environmental experts. The objective was to have representative points from the Hayatabad. For each reading a specific table was designed and the data were recorded at three times a day in these tables.

The primary and secondary data is compiled and it is checked for accuracy through Statistical package SPSS and then fed to specially design program for analysis and evaluation. In the light of analysis and evaluation, a report with recommendation is prepared.

**Results and Discussion**

The quality of ambient air depends upon the condition of the area. Therefore measuring and monitoring the climatic conditions are pre-requisite for any sort of the study. In the present study the temperatures (wet and dry) are recorded by thermometers in centigrade scale (°C). The relative humidity is calculated for each period of time and then average has been taken for each sampling day. The data about wind speed, wind direction and rainfall has obtained from the Pakistan
Metrological Department Peshawar. The climatic condition for each period (morning, noon and after noon) of each sampling day is given in Tables 1.

The average concentration of CO measured along with climatic condition at seven sampling points has been given in Tables 2.

- On Saturday (Table 2) at evening (2:00pm to 4:00pm) CO was below detection limit at all the sampling point. The minimum average concentration was 0.28ppm in the morning (8:00am to 10:00 am) and maximum was recorded 2.0ppm. The average concentration at morning and noon has been recorded 0.35ppm and 1.5ppm respectively, which is very low from the permissible limit of WHO as given in Tables 2.

- On Sunday the average CO level at measuring sampling points in Hayatabad is presented in Table 2. The concentration was minimum in the morning and maximum at noon that was 0.28ppm and 2.14ppm respectively. The average concentration in morning, noon and after noon was found to be 0.28ppm, 2.57ppm and 1.9ppm respectively.

- At each of the sampling point the CO level on Monday; (Table 2) was below detection limit (DBL) in the morning, 1ppm in noon and a maximum of 4.0ppm at afternoon. The average concentration at noon and afternoon was 1.0ppm and 3.5ppm respectively, which is below the permissible limit.

- On Tuesday, (Table 2) in all the three visits at each measuring point the CO level was found below detection limit (DBL).

- The CO concentration measured on Wednesday is given in (Table 2). It is an average of 0.36ppm in morning and 2.0ppm in noon and afternoon. The average level for the day was 1.45ppm.

- On Thursday, (Table 2) in the morning no CO has been detected at any of the sampling point. The average level recorded at noon and afternoon is 0.21ppm and 0.49ppm respectively.

- Table 2 also present the CO level measured at Friday. In morning and noon the average concentration has founded 0.35ppm and 2.5ppm respectively and was below detection limit at after noon.

- On all the sampling points in the Hayatabad the CO level was not found to be higher than that of permissible limit of WHO standards, which is 9ppm for carbon monoxide. So from CO point of view the air quality around the Hayatabad is suitable for breathing.

- The concentration of nitrous oxide NO recorded on the sampling points for one week has been given in the same tables described earlier for CO.

- On Saturday, (Table 2) the minimum concentration in morning was 0.35ppm and maximum was 1.0ppm at after noon. The average concentration of NO at morning, noon and afternoon was recorded 0.71ppm, 0.85ppm and 1.0ppm respectively.

- Table 2 presented the Sunday data. It shows minimum concentration 0.57ppm, 1.0ppm,
and 1.14ppm at morning, noon and afternoon. The minimum and maximum average level was found in morning 0.57ppm and after noon 1.17ppm.

- The NO concentration has been measured on Monday (Table 2) was found to be 1.0ppm for each of the visit at morning, noon and afternoon.

- The concentration noted on Tuesday given in Table 2 is a little bit same to that of Table 3. The average concentration at morning, noon and afternoon has been founded as 0.57ppm, 0.85ppm and 1.35ppm respectively.

- The average NO concentration measured on Wednesday at all sampling points is given in Table 2. The minimum level at morning was 0.57ppm and maximum recorded at noon was 1.88ppm. The average level for the day was 0.57ppm, 0.58ppm and 1.58ppm at morning, noon and afternoon respectively.

- The average concentration of nitrous oxide recorded on Thursday in study area at seven sampling points has been given (Table 2). The minimum level was 0.71ppm in morning and maximum was 1.71ppm at noon. The average concentrations at all the selected measuring points were 0.71ppm, 1.56ppm and 1.49ppm at morning, noon and afternoon respectively. There is an increase in concentration from morning to noon but afternoon the concentration again become low and reached to 1.49ppm.

- The Friday reading (Table 2) shows the maximum concentration of nitrous oxide (NO) in comparison to other days. The minimum level was 0.71ppm at morning and maximum was 2.4ppm at after noon. The average concentration was measured 0.71ppm, 1.50ppm and 1.70ppm at morning, noon and afternoon respectively.

- The noise level has been also monitored at each of the sampling point all around the Hayatabad for a week (Table 2) along with other parameters of ambient air. The noise level ranges from 52.2dB on Thursday at noon (Table 2) to 84.6dB on Monday morning (Table 2). The permissible limit of Pakistan Environmental Protection Agency (PEPA) is 85dB for eight (8) working hours. The above level of noise detected out side industries is within the limit and have no adverse impact on the people working out the industries. So noise level will not affect the people.

- From the analysis of the Tables 2, it is clear that there is a direct relation between temperature and pollution level in the industrial estate. With the increase in temperature the pollution level also rises. In Table 3 the morning temperature was 18.8°C and the CO and NO level were 0.35ppm and 0.71ppm respectively. As temperature rises to 24.2°C at noon, the concentration of both reaches to 1.5ppm and 0.85ppm respectively. There is an
increase of 5.4°C in temperature the level of both parameters rise 1.15ppm and 0.14ppm respectively. Similarly on Sunday (Table 2) 5°C rise in temperature from morning to noon, as a result the concentration of CO and NO raises from 0.28 to 2.57ppm and 0.57 to 1ppm respectively.

- Table 2 shows that the temperature rise from 23.6 (noon) to 27.8°C (afternoon) and the CO level rises from 1ppm to 3.5ppm and there is no effect on NO concentration.
- The Tuesday, Table 2 shows that even with increase in temperature the CO level was below detection limit and NO level rises 0.28ppm for an increase of 5.2°C temperature at noon. At afternoon at 16.7°C the NO reached to 1.35ppm.
- Similarly Table 2 shows that with 5.1°C increase in temperature at noon, the concentration of CO increases 1.64ppm. NO increases 1ppm at afternoon with an increase of 1.3°C temperature. The CO level did not change, while NO level increased 1.0ppm at afternoon.
- On Thursday Table 2, the morning temperature was 14.8°C, CO level was below detection limit and NO was 0.71ppm. As the temperature rose to 26.3°C the concentrations reached to 1.56ppm. At afternoon at 17.8°C, the level of both CO and NO rise up to 0.49ppm and 1.49ppm respectively.
- Friday Table 2, it is clear that as the temperature rise 5.3°C (from 13.2 morning to 18.5°C noon), NO level increases 0.79ppm. At afternoon the temperature reached to 21.3°C with a rise of 2.8°C and has no effect on CO but NO level increased 0.20ppm as compare to noon.

The study also shows that there is an indirect relation between relative humidity and pollution level at Hayatabad. As the humidity decrease the pollution level increases. This relation is clear from Tables 2.

- On Saturday (Table 2), the humidity decrease 4.9% at noon, the CO, NO, level increase 1.15ppm and 0.14ppm. At afternoon there is again decrease in humidity but the CO, level was below detection limits and NO increase 0.15ppm with 4% decrease in humanity.
- On Sunday Table 2, 7.9% decrease at noon 2.29ppm in CO and 0.43ppm increase has been noted in NO.
- On Monday Table 2, the humidity decreased from 48% to 44.7% (3.3 % decrease) at noon, the CO level has been increase 1ppm and have no impact on NO concentration similarly at afternoon there is 3.9% decrease occurred which resulted an increase of 2.5% CO concentration, but have no impact on NO concentration.
- On Tuesday Table 2, shows that at noon no effect have been noted on CO level due to humidity but there is 0.28ppm and 0.78ppm increase in NO level at noon and afternoon as the humidity becomes low from 51.1% to 48.1%.
- The reading of Wednesday Table 2 and Thursday Table 2 also shows a similar relation. On Friday Table 7 humidity decreases about 2% at noon, the CO and NO level increase 2.15ppm and 0.79ppm respectively. At afternoon it decreases from 54.2% to 51.2 % (3% decreases) the concentration of CO was below detection limits in NO increase 0.20ppm.

It is clear from the above discussion that the temperature reacts directly with pollution level but this relation in the all the concerned tables for each sampling day is not uniform and have been found a lot of non-uniformity (non-consistency) in relation and same as for the humidity indirect relation. The main reasons for that are following;

1. Pollution level in the ambient air depends on the vehicles flow, higher the flow of vehicles higher will be the level of CO and NO
ii. The pollution level in the area also depends upon other climatic conditions like wind speed, wind direction, and rainfall etc. Due to the limitation of study, the data for these parameters were obtained from Metrological Department Peshawar which was for the whole Peshawar and not only for Hayatabad. Therefore the non-consistency/non-uniformity may exist in the relation of both temperature and humidity with pollution level.

iii. The CO concentration is low, below the permissible limit of NEQS. The reason is that during burning the temperature is very high and more oxygen is available for burning of natural gas, so all the organic carbon of gas is converted to carbon dioxide instead of carbon monoxide due to complete combustion.

iv. The oxides of nitrogen are produced in more/high quantity, above the permissible limit of NEQS. The reason is that air contain more nitrogen (about 78%), during burning process that nitrogen reacts with oxygen, as a result produce nitrogen oxides especially NO.

v. Approximately, in the Hayatabad, at all the seven sampling points the SO₂ level was below detection limit. The simple reason is that most of the vehicles use natural gas as a fuel for burning, which has no or very less Sulphur contents, therefore SO₂ level in Hayatabad was not detected (BDL). Sulphur is mostly present in diesel (oils), that’s why more SO₂ is present in vehicles which use diesel Oil.

vi. The noise level/pollution in Hayatabad are less/low from the permissible limit (85dB for eight hours).

vii. The concentration of selected parameters increases from morning to noon and afternoon as clear from the Tables 2. The level is low at morning because due to there is no more traffic at night in the study area. The emitted pollution at day diluted in the atmosphere at night) and also due to dew factor, which trap the pollutants and settle it down. So the atmosphere becomes clean from late night till morning. And increase in pollution occurs as the vehicles and traffic starts moving again.

Conclusion
It may be concluded that from this study that the ambient air quality of study area (Hayatabad) is satisfactory. The result of record parameters i.e. CO and SO2 and were with in the limit of WHO standard. However the concentration of NO (1.35ppm) was higher that of permissible limit. The noise pollution in the township of Hayatabad was found to be varied among locations. The average minimum noise level was recorded as 52.2 dB and maximum average noise level was 84.6dB which were below the WHO standard.

Recommendations
The rapidly expanding population of Hayatabad Township, directly or indirectly contributes towards air pollution, therefore in order to keep the air free from pollutants the tree plantation should be given top priority. Also the industrial units responsible for harmful emissions of gases in the densely populated township should be established away from this area to minimize health hazards and enhance the quality of life.

Abstract

In this research work an attempt was made to investigate the “effect of specious view of teachers on academic performance of the students at elementary level”. A sample consisting of 8th class of male and female elementary school student was taken and was divided into two equal groups, control group and experimental group. Results of this research work indicated that a specious view affects the academic performance of students at elementary level.

Keywords: Specious View ; Teachers ; Effect ; Academic Performance ; Students ; Elementary Level

Introduction

Baron (1992) some teachers provide opportunities to their students in enhancing and developing the necessary skills and performance to deal with their effort and to face any kind of situation and problem successfully. It means that these teachers put the students in the way of psychomotor domain. These teachers want to set their student according to realistic standards. Encourage them to have full confidence to act independently and responsibly in each and every place of the society. But some teachers have specious view and leave student with negative feelings about themselves and their abilities. The attitude and behavior of these teachers is not fair in teaching, learning, dealing and each and every activity related to the students. Self awareness plays a crucial role in academic performance of the students. When teachers behave unequally with their students and also leave students with negative feelings about themselves and their abilities, this can reduce the performance of the students. Strong negative feelings reduced interest and lead the students toward high level of anxiety and frustration which is harmful for all kind of performance.

Specious view means bogus response or underestimation. Teacher’s interest, statements, behavior and attitude affect the student’s performances. Consistent positive or negative feedback has an effect on a student’s awareness and their academic performance, positive response of teachers leads the students towards high performance and negative response of the teachers lead the students towards low/poor performance.

Many teachers felt that it was important for a student to receive positive feedback. Positive feedback is very important because a student gets success. This gives the student motivation to continue with his or her development. However, negative feedback is not useful, because in this way we can decrease the performance of students. A teacher can never get away having prospects for his or her students. However, it is the way in which these prospects are conveyed to these students that is important. One teacher summed it all up by saying, "students are very sensitive and they pick up on everything." This research work shows that teacher prospects affect student performance. In their opinions, it is impossible to enter a classroom without having certain prospects. However, we believe, from our experience, that there are so many important things that we can do to aid our student’s academic performance.
STATEMENT OF THE PROBLEM
The problem under study was to investigate the “specious view of teachers and its effect on the academic performance of students at elementary level”.

OBJECTIVE OF THE STUDY
- To investigate the specious view of teachers and its effect on the academic performance of students at elementary level.

SIGNIFICANCE OF THE STUDY
Following are the significances of the study:
- This research work will be useful for those teachers who often underestimate their students and behave roughly in different occasions.
- This research work will enable the teacher to know that how to deal with their students in different educational activities.

HYPOTHESIS
H₀: There is no significant effect of specious view on the academic performance of students at elementary level.
H₁: There is significant effect of specious view on the academic performance of students at elementary level.

REVIEW OF RELATED LITERATURE
Baron et al (1992) false statements about performance has put the students in dangerous condition as a result they lose their actual performance. Some time unconsciously the teacher’s passes some rough statements on the students, due to which the authenticity of the students is affected as a result they show poor performance.
Baumeiste (1990) on the bases of specious view students are less competent and adverse, this of course generates strong negative effect and enter the students in a state of cognitive deconstruction, student think in less stylish way, focusing on present rather then the future issues along with this go reduced interest in searching for higher level meaning. When this practice is repeated it becomes too difficult for such students to do away with disturbing thoughts and negative feelings, so students make mistake
Borg (2006) self-assessment is an effective way in improving students’ performance. Self-assessment helps students to give more accurate and true responses, especially when they feel that they will not be judged exclusively by marks. Some specious views of teachers affect the efforts of the students partially.

Davis (1998) explained that self-assessment is an effective method in improving students’ educational performance. Due to self-assessment students can remove so many difficulties and can improve their educational performance. Self-assessment encourages students to participate in the different educational activities more openly, and help students to give more accurate and honest responses, especially when they feel that they will not be judged exclusively by marks. Self-assessment also helps students to direct their own learning efforts more effectively, because in this way ambiguities and problems are highlighted and removed. Teachers and parents should avoid specious view because clear feedback helps students to involved and motivated in the learning process.
Gabler (1980) views are too much essential in shaping the personality, behavior and attitude of the students. If views are positive and true then it will lead to the success similarly if views are false then obviously it will lead to the failure.
Hayman (1981) teachers convey their expectations on their students, positive and correct conveying leads to the better performance and negative and false conveying leads to the poor performance of the students. If a student consistently receives a certain message from the teacher then student begins to internalize these messages. It is very obvious that in a classroom situation, a student may begin to accept the teacher's signals and show the reflection on the bases of that signals.

Helton (1999) explain that bogus statements decrease the performance of the individuals, in this regard he conducted a research work in which thirty-three college swimmers completed the attribution style questionnaire and then they were asked to swim their best event. After swimming their coach told them that their swim time was slower than it actually was, it was a false statement. After some time rest, all the swimmers were asked to swim the same event again. Now the swimming time was poorer than those on the initial swim for pessimistic, but not for optimistic swimmers.

Kapoor G (2007) specious views affect the personality of the individuals in wrong direction and also effect on intelligence, because the individuals aware about them so we can say that self awareness play a very important role in the performance of the individuals. Specious view decreases the performance of the individual in teaching learning process.

Merton (1957) self-assessment insight plays a crucial role in the performance and shaping the behavior in positive way. Self-assessment prediction is relevant to many social areas, including education, learning and knowledge.

Rosenthal and Jacobson (1968) explain that one person’s expectations for another’s behavior serves as a self-assessment prediction. Standardized tests about intelligence are one of the factors that play a vital role in teachers’ expectations about their students’ academic performance. Researchers believe that some time we don’t take any care in conveying the messages as a result we decrease the performances of the individuals. Teacher's assumptions influence potential ability of the students.

Rosenthal and Jacobson (1968) when teachers regularly use a language and behavior to underpin what they think to be a students’ prospective then automatically students behave accordingly what the teacher wants. Many researches show that teachers convey their expectations and feelings through their behaviors, so in this prospective the teacher should take too much care. Positive behavior of teacher’s toward their students with the use of different types of communications may increase the learning, self-concept, self-expectations, self-assessment and motivation of the students.

Singh K (2009) specious views not only affect the academic performance of the individuals, it also affects the attitude, behavior, intelligence and personality of the individuals, as a result the individual makes error and their achievement is very low.

Swann (1987) performance of individuals can be increased when some authentic views are passed on them similarly performance of individuals can be decreased when some specious view are passed on them. Self awareness plays a very important role in shaping the personality of the individuals in the right or wrong way so teachers should take too much care in passing bogus statements on the students.

METHODOLOGY OF THE STUDY
POPULATION
The population of the study consisted of all students of 8th class in District Dera Ismail Khan, Khyber Pakhtoon Khwa, Pakistan.
SAMPLE
Six male and six female elementary schools were selected randomly, and from each elementary school five students of class 8\textsuperscript{th} were randomly selected. So thirty female and thirty male students were randomly selected as a sample.

PROCEDURE
Researcher personally visited the male and female schools and collected the data. In male and female schools those students from class 8\textsuperscript{th} who were never failed in the examination were divided into two equal groups i.e. control and experimental group. Both the groups were administered a test. There was no significance difference in scores of both the groups in male and female schools. Few days later both the groups were again tested, but just before the test, members of experimental group were given slips of paper indicating that they had failed in the previous test, the score of control and experimental group were then compared.

STATISTICAL ANALYSIS
Alam (2000), “Consistency or stability in the variables is used as terms opposite to variation or dispersion. A data is considered more stable if it has less variation and likewise it is less stable if variation is more”.

Chaudhary (1996) in actual practice the population variance ($\delta^2$) is usually not known and is estimated from the sample data the t-test can be used. “Testing hypotheses about differences of means of two normal populations but unknown”.

Chaudhary (1996), “The co-efficient of variation was also used to compare the performance of two candidates”.

The applied formulae of test were as under:

\[ t = \frac{\bar{x}_1 - \bar{x}_2}{s_p \sqrt{\frac{1}{n_1} + \frac{1}{n_2}}} \quad \text{With} \quad v = n_1 + n_2 - 2 \ \text{d.f} \]

Where \( \bar{x}_1 = \frac{\sum f_1 x_1}{\sum f_1} \quad \bar{x}_2 = \frac{\sum f_2 x_2}{\sum f_2} \)

Pooled Estimation \( S^2_p = \frac{(n_1 - 1)S^2_1 + (n_2 - 1)S^2_2}{n_1 + n_2 - 2} \)

Where \( S^2_1 = \frac{1}{n_1 - 1} \sum (X_{1i} - \bar{X}_1)^2 \quad \text{And} \quad S^2_2 = \frac{1}{n_2 - 1} \sum (X_{2i} - \bar{X}_2)^2 \)

Co-efficient of Variation \( C.V = \frac{S}{\bar{X}} \times 100 \)

Where \( S = \text{standard deviation} \quad \text{and} \quad \bar{X} = \text{Mean} \)

The analysis and interpretation of data is presented in tabular form and given below.

RESULTS
For Male School Students
Table no: 1 indicates that the mean of both the groups (controlled and experimental) were 37.15 and 21.10 respectively, S.D in the scores of two samples i.e. controlled and experimental was 17.69 and 12.54 respectively. The t-calculated value 2.93 is greater than the t-tabulated 1.701 at 0.05 level of significance (α) so we reject H₀ and accept H₁ and concludes that there is significant effect of specious view on the academic performance of students. The difference was in the favor of controlled group. The co-efficient of variation (C.V) of controlled and experimental group is 47.61 and 59.40 respectively. Since C.V of controlled group is less than the experimental group so there is consistency in the performance of controlled group.

For Male School Students
Table no: 2 indicates that the mean of both the groups (controlled and experimental) were 39.01 and 22.11 respectively, S.D in the scores of two samples i.e. controlled and experimental was 15.97 and 13.43 respectively. The t-calculated value 3.14 is greater than the t-tabulated 1.701 at 0.05 level of significance (α) so we reject H₀ and accept H₁ and concludes that there is significant effect of specious view on the academic performance of students. The difference was in the favor of controlled group. The co-efficient of variation (C.V) of controlled and experimental group is 40.93 and 60.74 respectively. Since C.V of controlled group is less than the experimental group so there is consistency in the performance of controlled group.

CONCLUSION
It was concluded that specious view of teachers put the students in aggressive conditions and as a result the students loose their performance. This research further revealed that specious view of teacher’s decreases the self concept and damage later performance of the students at elementary level.

RECOMMENDATIONS
➤ Teachers may provide real, true and perfect evaluation for student success.
➤ Student may be invited to see themselves in positive ways and to reach beyond their present performance then students are more likely to have clear picture of their potential as human being and to realize what they can achieve.
➤ Individual attention and real feedback may be given to the students in a school.

Abstract
This study was undertaken to look into role of the qualification of teachers in academic achievements of the students. Study was conducted in Dera Ismail Khan, a southern district of Khyber Pakhtoonkhwa Province in Pakistan. At the primary levels of elementary education, multiple subject system persists where a class teacher, formerly referred as the ‘Form Master’ deals with the entire set of subjects offered, hence grade five of the Primary leg of elementary level of education was focused for determining the effects of the teachers’ qualification in raising the achievements of students. It was found that at grade five of the elementary level of education there has been no significant effect of the qualification of teachers on the achievements of students, notwithstanding, it was perceived that a blend of experience, effective teaching methodology and qualification can improve the achievements of students to a greater extent.

Keywords: Role ; Male Teachers’ ; Qualification ; Academic Achievements ; Students at Grade Five (Multiple Subjects) Level

Introduction
Evaluation of the performance of teachers is exacted in almost all the societies and in this respect there is a general inclination concerning evaluation of the performance and quality of teachers’ on basis of the academic achievements and outcomes of the students. It is generally agreed that teachers differ in terms of caliber and quality and the students’ educational success and achievement much depends upon the quality of the teachers. Prescriptive approach, bonding to the ethical values of the society, social believes, psychological status, method of teaching and qualification are the most pertinent determinants for valuation of the quality of teachers. In this particular study the researchers took the qualification, for determining the quality of teachers in terms of the academic achievements of students. In this context, Teachers’ effectiveness in view of their qualification and its causal relationship with students’ academic achievements need appropriate exploration and investigation. Teachers are by and large believed to play an agentive role in creation of innovative and in this context adequate qualification is quite essential for purposeful innovative drives. In many parts of the world teachers qualification is considered as of quite significance and that’s why due emphasis is being given on education reforms.

Because of psychometric difficulties in assessing teachers by their normative attributes i.e. the logical, the psychological, and (especially) the ethical, which are defined differently across cultures (Alexander & fuller, 2004) the tendency to evaluate teacher qualities on the basis of student performance is given even greater emphasis. With the increased demands for accountability in line with performance standards and with the growing demand for evidence-based policymaking, student achievement is considered an accurate measure of teacher effectiveness and has become a basis for value-added teacher assessment systems (Braun, 2005).
Dera Ismail Khan, one of the southern districts of Khyber Pakhtoonkhwa Province of Pakistan consists of four Tehsils i.e. Paharpur, Paroa, Kulachi and Dera Ismail Khan. There are numbers of Elementary Schools where hundreds of teachers are imparting education on the students. Prescribed minimum qualification for appointment of a teacher in the primary section of the elementary level of education was earlier Secondary School Certificate (SSC) which has now been enhanced to FA/FSc, with Primary Teaching Certificate (PTC), whereas numerous teachers in many of the primary sections of elementary education Institutions have much higher qualification i.e. a Degree of MA/MSc with BEd or Even MEd.

STATEMENT OF THE PROBLEM
Implications of the Elementary Education for being cornerstone of Education in the life of a child are quite obvious and in this respect role of the teacher can not be underestimated as the teachers at that very level of Education is supposed to deal with more than one subjects as there a single class teacher for a section of grade five who deals with all the subject taught to the students. This study was initiated to investigate the effects and association of Elementary teachers’ qualification on the achievements and academic success of the Elementary level students.

Objective of the Study
Cardinal object of the study was to determine the association and ultimate effects of elementary teachers’ qualification on achievements of students of grade five at elementary level of education.

SIGNIFICANCE OF THE STUDY
No one can deny the importance of elementary education in life of a child which is the inception of the process of education that helps nourish the potentials of a child and guides him through to the track of success. At elementary level the teachers are supposed to deal with multiple subjects and take their pupils through successfully to the next phase of education i.e. junior secondary or middle school level of education. Elementary education being the foundation for future journey of education requires lot of attention, care and appropriate instructional guidance to attract the students towards purposeful education. Teachers’ academic qualification, knowledge base, apprehension and understanding of the ways and means of effective teaching play quite important role in this respect.

HYPOTHESES
Following were the hypotheses of the study:
\( H_0 \): There is no significant effect of teachers’ qualification on the achievement of elementary level students
\( H_0 \): There is no association among teachers’ qualification and the academic success of elementary level students
\( H_1 \): There is a significant effect of teachers’ qualification on the achievement of elementary level students
\( H_1 \): There is significant association among teachers’ qualification and the academic success of elementary level students

LIMITATIONS
The study mere considered the qualification of the respective teachers whereas their experience and methods of teaching were not taken into account while determining the achievements and educational successes of the elementary level students. Further, only male teachers were considered whereas female teachers were not included in the study.
In addition to all the desirable attributes considered essential for a teacher and adherence to the established “norms and standards” believed to be associated with the profession of teaching, a teachers’ success and his/her potency as a ‘quality teachers’ yet largely depends on the academic achievements of students (Braun, 2005; McCaffrey et al, 2004). It is a matter of fact that the quality of education and attainments of the students are directly proportional to the quality of teaching that comes about in the classroom. In this respect the qualification of teacher matters a lot as it adds to his knowledge base and gives him a better understanding and grip of the subject matter offered in the classroom, and enhances his professional competence and delivery in the classroom, which ultimately results in better attainments on part of the students.

National Education Policy (NEP 1998-2010) advocated by the government of Pakistan emphasizes on the adequate qualification of teacher for proper academic promotion and development of the students. In many of the countries round the globe, the education reforms also focus the qualifications of teachers in perspectives of the academic achievements of students which are predominately considered as intimately associated. Consequent upon many research studies, it is believed that the Teachers’ quality is directly associated with learning outcomes of his/her students and the teachers’ literally producing such impressions on students are regarded as “effective” (Berliner, 1987, 2005) and “successful” (Fenstermacher & Richardson, 2005) teachers

According to Henke, et al. (2000) many research studies indicate a positive relationship between teachers qualification and the students achievements, in this perspective, referring the research studies done during the last “15 years” Henke, et al. (2000) say that a linkage among teachers qualification and students educational attainments has been evidenced.

Contrary to the findings mentioned above, Eric (1990), while conducting a macro analysis of 113 research studies conducted on the subject problem, found no effect of teachers’ qualification on the achievements of students. His findings revealed that out of the aforementioned, 85% of the studies did not prove any “positive correlation” between qualification of the teachers and academic achievement of students, instead, five percent out of the mentioned studies referred to a “negative correlation” whereas only 07% of the research studies evidenced a significant effect of teachers qualification on the educational performance and achievement of students. Similar were the findings of studies conducted by Hazard & Freeman (1977) and Howsam & Corrigan (1976) which revealed “no significant” effect of the teachers qualification on the classroom performance of the students and their academic attainments.

On the other hand, Betts at el. (2003) found a positive relationship between the teachers’ qualification and educational attainment of the students. Similarly Darling (2000) referring many advocates of the effectiveness and role of teachers’ qualification in academic attainments of the students maintains that better qualification of the teachers is significantly linked up with better understanding and academic “gains” by the students. Likewise, Ehrenberg and Brewer (1994) found that teachers with a higher qualification produced better results and their students performed and achieved much better in many subject areas.

Ferguson (1991) ascertained that the number of teachers with master’s degrees in Texas was positively associated with student achievement gains at the district level. Alternatively, using Texas data as well, Rivkin, Hanushek, and Kain (2002) stated that master’s degrees are not related to teacher effectiveness. However, the authors only examined the scores at the elementary grades. Yadved & Singh (1988) say that enhancement in the quality of teaching and ultimately of the education much depends on the appropriate training and qualification of the teachers, hence, due process of teaching can only prove to be effective if the respective teachers are appositely equipped with adequate qualification for the purpose of teaching. According to
Ruhela and Singh (1990) success of the school and by and large of the students largely depends on the quality and professional qualification of the teachers.

**METHODOLOGY OF THE STUDY**

Following procedure was adopted for reaching at findings and drawing the conclusions concerning association and effects of the teachers’ academic qualification on the achievements of elementary level students.

**Population**

Population of the study comprised of the teachers engaged with grade five, Heads of the Elementary Schools and the students enrolled in grade five of the Primary sections in the Elementary Education Institutions of Dera Ismail Khan District.

Record concerning with qualifications of the Teachers and students’ academic achievements were also considered as part of the required information for the purpose of reaching at findings and conclusions.

**Sample**

A total of 30 elementary Schools situated in different Tehsil, Town and Union Councils of the study area were randomly classified to select the sample population for the data collection.

300 students i.e. 10 each from every classified School were randomly selected as subject samples. Whereas, all the 30 respective teachers and all the 30 Heads of sampled Elementary Schools formed the sampled population for the study.

**Data Collection Instrument**

A 20 items structured questionnaire constructed on the pattern of three point Likert scale was distributed among the teachers and HoD’s for the collection of needed information. The responses were valued as (1) for agree, (2) for Undecided and (3) for disagree. Record of the qualifications of teachers working in the respective elementary Schools was acquired from the district education office which was tallied with the record available in the offices of respective elementary Schools. Results of the students for the measurement of their achievements were acquired from the respective office of the concerned School.

**Statistical analysis**

SPSS version .12 was used for the analysis of collected data while Independent sample t-test and Pearson correlation coefficient were calculated for the purpose finding out the conclusions.

**RESULTS AND DISCUSSIONS**

Out of the sampled population of teachers 63.33% had a comparatively higher qualification than the prescribed for appointment as Elementary teachers, whereas 36.66% teachers had minimum required qualification, yet 54.54% amongst them were improving their academic qualification and were found enrolled in different higher Degree programmes either with AIOU, Distance Education Programme of Gomal University, DEC’s of Sarhad University and with other Institution where non-formal or evening programmes were offered a detailed account of the teachers qualification has been given in table #1 below.

**Table #1 showing qualification of the Teachers**

</tbody>
</table>

Most of the sampled elementary teachers, irrespective of their qualification were quite satisfied with their ‘in the class’ performance and the results they did produce in perspective of the achievements of their students. HoD’s i.e. the Headmasters and Incharge teachers of the primary...
sections of respective Elementary Institutions were avowedly of the views that teachers with a higher qualification can prove to be more effective teachers but mere qualification is perhaps not the most appropriate solitary parameter for determining the effectiveness of teachers in terms of the results they produce or achievements of their students. Most of the HoD’s said that no doubt qualification plays a significant role in enhancement of the vision and knowledgebase of a teacher but the experience and teaching methodology are the literal instruments which really improve the capacity of a teacher and by and large help determine his effectuality in terms of the success and achievement of the students. Most of the HoD’s denied any significant association of the qualification of teachers with the achievements of students particularly at grade five level of education, contrary to the findings of Henke, et al. (2000) which do not correspond with the findings of this study and manifest a significant association of teachers qualification with the achievement of students nonetheless the findings of a macro study conducted by Eric (1990) affirms the stance of HoD’s and describes no significant relationship of the qualification of teachers with the achievements of students a summary of the responses of HoD’s has been given in the table# 2 hereunder. Similarly the results of the Pearson correlation coefficient negate any significant correlation between qualification of the teachers and the achievements of students showing a significance of .103 at 0.01 levels (2-tailed).

</tr>
</tbody>
</table>

The results concerning academic achievement of the students did not show any significant difference of achievements among the students instructed by better qualified teachers in comparison to the teachers with prescribed qualification for appointment in the primary legs of elementary schools. In some case, nonetheless, a bit of difference was noticed but that was not of a high significance. There were 63.33% teachers in the classified primary sections of the elementary schools with a better than the required qualification but the students of mere 13.66% did show any visible difference of achievement whereas the overall results of the remaining students were found as almost comparable to the students instructed by the teachers with prescribed qualification for becoming a primary teacher.

**CONCLUSION**

It was concluded that there is no significant effect of the qualification of teachers on the achievements of students at grade five of the primary leg of elementary level of education. A meager difference of achievements however exists but that might be a resultant of such other factors in addition to the qualification of the teachers. The HoD’s specifically were found of the view that the teachers with a better qualified than the required or prescribed can produce better results as far as achievement of the students is concerned but in this respect the experience and the teaching methodology of the teachers must also be taken into consideration while determining their effectuality in terms of the achievements of the students.

Abstract  
This paper presents the framework for customer retention in microfinance banks. The paper integrates the two relatively new disciplines; microfinance and relationship marketing. Today, microfinance which is often viewed as the tool to fight against poverty, is facing the numerous problems, Customer dropouts is one of them. This problem is of such severe in nature, that it threatens the very existence of microfinance. To provide solution, a theoretical framework that helps microfinance banks to retain its most profitable customers is developed. Phenomenological philosophy and strategy of case study was adopted. Both open and closed end questionnaires were developed and administered from the various categories of respondents. In addition to quantitative analysis, a qualitative, issue-based analysis of different issues; such as customer selection and screening process, needs of customers and financial products, group lending, employee turnover and marketing in microfinance banks. Finally on the basis of results, a conceptual customer retention model for microfinance banks was developed.

Keywords Microfinance Banks, Customer Dropouts, Customer Retention Framework.

1. Introduction  
The microfinance sector in Pakistan has mushroomed during the last decade. Today, number of microfinance organizations is operating in country. The sector has shown mixed growth and performance results. Though, generally successful but almost entire microfinance sector plagued with customer dropouts particularly early customer dropouts. For example, one of the leading microfinance institutes is also facing the same problem. According to Asian Development Bank reports the customer retention rate during 2005, 2006 and 2007 for the said institute was around 27%, 52% and 65% respectively. (Figure 1) The bank officials argue that a low customer retention rate does not affect its organization much since it unable to generate customer deposits.
Regardless what bank officials argue, the truth is customer dropouts are disadvantageous for microfinance banks, mainly because with early dropouts first microfinance will not be able to alleviate poverty which they claim and second is microfinance banks will not be able to achieve both operational and financial self-sufficiency which could ultimately lead to long-term survival of these banks. Considering the severity of problem microfinance sector face today, the idea of the study is to address relationship aspect in microfinance and develop framework that help these institutes to retain their existing customers and achieve their objectives.

2. Research Methodology
Following research methodology was adopted for this research purpose.

2.1 Research Philosophy
Phenomenology approach has been adopted for this study. This philosophy provides an excellent opportunity to have a comprehensible picture of complex world and as well as the reality that work behind the fact. By adopting phenomenological philosophy both open and closed end questionnaire have been developed and administered from the respondents.

2.2 Research Approach
As this study involved in depth analysis, diagnosis and solution of customer dropouts in microfinance institutes therefore induction approach was adopted. In this study induction approach has helped in discovering and uncovering the facts, also this approach was consistent with the Phenomenology philosophy. In addition to all, induction approach has allowed more flexibility in determining research emphasis as the research progressed.

2.3 Research Strategy
To obtain complete as well as reliable and valid data combination of Case Study, Survey and Action Research has been adopted.

2.4 Sample Designing
Sample selection is of paramount importance for the success of any research study. Keeping this fact in view, convenience and Judgmental sampling techniques of non-probabilistic sampling approach were adopted for this study purpose. In this study non-probabilistic sampling approach has enabled to obtain best information from a relatively small sample, and also provided more freedom in accessing the data and information.
2.5 Data Collection

The data for the purpose of this study both primary and secondary data has been collected.

2.5.1 Primary Data: For the collecting primary data multiple tools and techniques were employed such as Customer dropout survey, Focus group interviews, Individual interviews, and Observations. Overall 356 survey questionnaires were conducted and 317 were considered for analysis. Observation technique was also applied during interviews with employees and customers. To understand the dynamics of relationship among the field staff and customers I personally traveled in the field and observed various phenomena related with studies.

2.5.2 Secondary Data: In addition to the primary, secondary data was also of prime importance for this study Sources of data inside the organization included: policy documents, annual reports and news letters which were published periodically. Sources of data outside the organization included: various reports on microfinance institutes published by Pakistan Microfinance Network (PMN), Consultative Group to Assist the Poor (CGAP) and Microsave. Apart from this, secondary data was also collected from different websites of microfinance institutes and articles published by various sources.

2.6 Data Analysis and Interpretation

The data collected for this study was both qualitative and quantitative in nature therefore mixed methodology of data analysis was adopted. While analyzing the quantitative data SPSS software 10 and 17 editions were used. Statistical techniques ranging from simple frequencies to more advanced descriptive techniques such as cross tabulations, and sample statistical tests were applied. In addition, following qualitative techniques were also adopted for data analysis in this research study.

2.6.1 Content Analysis: According to Mostyn (1985), this technique has been systematically used to convert text into numerical data for quantitative analysis. In this study content analysis was used to analyze written documents. With the help of content analysis large set of data was classified and reduced to reach the conclusions.

2.6.2 Process of Analysis – Morse’s Framework: In processing of data and information, Morse’s framework was also adopted. According to Morse there are four steps in analyzing the data and information, including comprehending, Synthesizing, Theorizing and Re-contextualizing Morse (1994). Shown in Figure 2.
2.6.3 Data Analysis and Interpretation – Quasi-Judicial Method: Bromley (1986) suggests a Quasi-Judicial method which uses a logical inductive method for evaluating data. The procedure is involved in applying rationale argument to interpret empirical evidence. All issues, factors, and events have been scrutinized and assessed in the light of following questions shown in figure 3.

What is at issue?

What other relevant evidence might there be?

How else might one make sense of the data?

How were the data obtained?

Figure 3: Quasi-Judicial Method Four Questions

In the light of above guiding queries the qualitative data was obtained, and compiled into separate cases. Finally the data analysis was carried out and findings were reported accordingly.

3. Analysis and Interpretation

In this research, considering the nature of data collected both qualitative and quantitative techniques of data analysis were used. Figure 4 summarizes the results of survey carried out from dropout customers. The results of qualitative analysis are discussed below.

Figure 4: Causes of Customer Dropouts in Microfinance Banks
3.1 Qualitative Analysis

The painstaking qualitative study has discovered that, financial products, group lending, and contact employees as whole are imperative for customer satisfaction and retention in microfinance banks. Following qualitative analysis is based on the issues which play critical role in the customer dropout and its flip side customer retention in microfinance banks.

1. Customer Selection and Screening Process
2. Needs of Customers and Financial Products
3. Group Lending
4. Employee Turnover
5. Marketing

1) Right Customers

In depth interviews with Bank officials and follow-up interviews with dropout customers revealed that, the reasons of low customer retention in microfinance banks at first instance are due to not acquiring right potential customers. Serious lapses during customer selection and screening process cost dearly to microfinance banks in the shape of early customer dropouts. Investigations have revealed that, top management, and field staff of microfinance banks is equally responsible for not acquiring right customers. In practice it was observed that the focal point of bank officials was on increasing the customer outreach, in order to take advantage of huge untapped market. This shift in focus on acquiring new customers has resulted in recruitment of new customers who are not even falling under the category of microfinance customers. Some times the objectives of management influence the field staff and at other times inefficiency of field staff results in lapses during customer selection and screening process. One such example was found in one microfinance bank under investigation, where, micro loans should be extended to micro entrepreneurs, after verifying the existence of their businesses however in practice it has been revealed that field officers, partly due to their negligence and partly under the influence of management to increase outreach, did not verify the existence of potential customers’ business. As result some unwanted customers enter into the loan program. While talking with branch manager of bank on this issue, he acknowledged that: “In initial years of banks operations the emphasis of top management was on increasing customer outreach therefore in order to achieve this objective, field officers did not verified the existing businesses of potential customers as a result many customers availed our loans who were not micro entrepreneurs and eventually there was increase in non performing loan and dropouts”.

Majority of times customers also falsify their financial information and self-select themselves into the loan program. In addition it was also found that members of a single family self select themselves into different groups and obtain the loans, worse is that they do not utilized loans properly.

2) Needs of Customers and Financial Products

Microfinance was based on closely watching the needs of its target market, which not only include poor but all those, who are excluded as of proper Banking system. However over the time it is appeared that microfinance has become a product driven rather than market driven industry Monica Brand, (1998). The microfinance sector in Pakistan is a single product driven, the market is dominated by one financial service- credit and many microfinance providers use a methodology inspired by the Grameen model (CLEAR, CGAP Report (2007), Syed Salim Raza (2009).

This qualitative research has revealed that microfinance banks under investigation were unsuccessful in addressing the financial needs and expectations of its target market even though most recently these Microfinance Banks have started to rollout saving and insurance products but not sufficient to address the financial needs of their customer groups. The financial services offered by three microfinance institutes under study are similar with little variations. For instance
the features of microcredit products such as minimum and maximum amount of loan, interest rate, delivery mechanisms, and group lending methodology are almost similar in nature. This similarity is not prevalence but because of the guidelines issued by regulating body of microfinance banks. In one open-ended question the manager of one bank under study believed that “our product line does not effectively meet the life cycle needs of customers”. He further added that “one of major reason of customer dropouts in microfinance institutes is lack of innovation in the products we offer". During the interviews with dropout customers it was observed that size of loan is major source of dissatisfaction from program. The dropout customers believed that “amount of loan offered as credit not sufficient to finance their existing or new business”, and they also believed that “loan was not productive enough for their businesses”. In one focus group interview with field staff they acknowledged the customers point of view and added that “the size of loan our bank offers to customers has remained the same even after nine years of its operation. Where as, inflation in country has increased almost 100%, during the same period of time, rendering loan size insufficient to buy inputs for business”. In addition to size of loan, interest rates, product delivery mechanisms, and group lending methodology are also major source of customer dissatisfaction and eventually cause of dropouts.

3) Group Lending
This research has revealed that group lending has also been a major cause of customer dropouts in microfinance banks. Since the beginning of microfinance revolution in Pakistan, Grameen Bank’s group lending model has been a mainstay for the delivery of financial products and services to poor customers. In addition groups are also an important forum for empowering people and their capacity building.

All these three microfinance banks under this study has adopted group lending model with little variations to assist the poor. The groups are usually formed with three to ten members in rural and urban environment and are formally known as village organization or community organizations or functional groups. The group are formed either by the customers themselves, with facilitation from field staff, or by alliance partners and service providers. It has been found that conflict among group members started to appear on issues like timely loan repayments and group meetings which eventually results in inactivation of group, and multiples dropouts in these microfinance banks.

4) Employee Turnover
Another major problem microfinance banks are facing is high employee turnover; especially the turnover in contact employees (i.e. field staff) was on higher side. Research in service sector has shown that satisfied employees contribute in customer satisfaction and retention. Similarly in microfinance banks field staff have very critical role to play.

Speaking on the matter with the official of microfinance banks he acknowledged the field staff turnover in their microfinance bank and further added that “microfinance sector in Pakistan is on boom many new microfinance institutes are entering into market which in turn creates opportunities for every one look for other jobs and excel their career”. This fact was also confirmed in interviews with field officers of these three microfinance banks.

5) Marketing
Emergence of microfinance during 1970s was based on the financial needs of poor, as well as those who were considered as un-bankable by formal banking system. It is widely believed that microfinance by character is a customer focused and a relationship based industry. In addition financial products and services were also developed considering the needs and wants of their target market. In spite of all these facts, during the investigations it was revealed that the primary focus of these microfinance banks was still on credit operations. All the resources were devoted to credit department. The top management’s priorities were to improve market outreach, and monitor disbursements, delinquencies and credit portfolios, literally very little effort has been put
on the marketing function in these microfinance banks. In response to an open-ended question “What marketing and promotional activities your organization undertakes? The marketing manager of a leading microfinance bank replied that “the main role of marketing department in our organization is to create awareness among our customers, make them realize that financial products of our bank are means for them to escape from poverty. In addition we also encourage customer to utilize loans properly”. It has been observed that because of ineffectiveness of marketing department, the microfinance banks are experiencing problems such as increase in non-performing loans and low customer retention rates.

4. Recommendations
On the basis of the analysis and discussions, following is the framework for customer retention in microfinance banks.

Model of Customer Retention in Microfinance Banks
This research has proposed a model which is aimed at curbing the customer dropout in Microfinance Banks. The proposed model is based on the empirical results of research and recommendations of the study (Figure 5 shows the model above). The model propose that in order to retain customers in microfinance banks top managers should make customer retention as a institutional priority and undertake a major revamp in their organizations. The constituents such as commercial approach, right customers, keeping & serving customers through need based products and loyal employee plays decisive role in customer satisfaction and eventually customer retention. The model also include feed back loop which provide information whether or not goal of customer retention achieved.

5. Conclusion
From the discussions above it is concluded that customer retention is still not the priority of microfinance banks in Pakistan. The top most priority of three banks under investigation was to increase customer outreach where as, little or no care has been taken to retain existing customers. Further it is concluded that in order to retain existing customers the microfinance banks should consider putting into practice commercial approach, selection right customers, introduce need
based products, and retain its loyal field officers. By adopting these ingredients microfinance banks will be able to retain its profitable customers.

Sadaf Javaid
Mahvish Mehnaz
Riphah School of leadership (Faculty of Management Sciences)
Riphah International University, Islamabad, Pakistan

Abstract
The purpose of this study was to explore the factors that affect the New Product Development (NPD) success. Many companies launch the new products but suffered a lot due to poor product design, positioning and distribution, advertisement, chain of communication, technology and innovativeness, distribution synergy, time efficiency, cross functional team, marketing and political uncertainty etc. Along with these poor factors some products do not match the customer’s needs and eventually could not make the grade. So without determining customer needs one can not jump in to the market. Furthermore company’s success do not merely relies on the strength of one department; it is a cross-functional activity of the organization. For exploring these dimensions the researchers have made a huge assortment of past work and have put a lot of exertion in developing a model of NPD success. It is a conceptual study. Findings suggest that numerous marketing and organizational factors have a strong relationship and impact on NPD success.

Keywords: Determinants; New Product Development Success; Developing; Proposing; Conceptual Model

Introduction
The basic purpose of any business is to earn profit and to get maximum growth and market share. For this purpose the firm has to make continuous improvement in its products and services. All the firms have to compete with one another to survive. They have to introduce new and innovative products to retain their existing customers and to fetch new one. To meet this criterion the firms have to bring changes in its existing products or they have to bring a significantly new dimension in their product line. For survival and growth a firm has to launch new and innovative products with the passage of time (Axarloglou, 2003). New Product Development (NPD) is a process in which first the needs and wants of customers are determined and according to them the new products are tailored (Meybodi, 2003). This proves to be a clandestine of success for any business but it is not easy to do. For this purpose a lot of Research and Development (R&D), innovativeness, product design technology, and cross functional teams are required. The management believes that NPD success pave the way for long term survival of the business. So it is important for firms to determine various factors that affect the NPD success.

We are living in the era of globalization; frequent change in system and technology has made realization that the firm should not close its eyes after successfully launching a new product. The firms have to utilize latest apprehensions provided by NPD teams in different parts of the world and have to mold themselves accordingly (Salomo, Kien Schmidt & Brentani, 2010). New products very quickly come in to the market, and with the same pace moves towards the declining stage that makes the product obsolete. Now a days firms have to compete globally and for various segments they have to launch new and innovative products to fulfill their consumer’s distinct needs (McDonough, Kahn & Barczak, 2001).

For NPD success, organizational strengths plays major role and especially marketing section of any organization proves to be an important pillar without which success can’t be achieved. If
marketing department is not capable enough to meet the organizational needs their all efforts will go in drain. So the success of all activities right from the beginning till end depends on it. This is a common assumption that marketing is involved in whole process of developing a product from its production to selling. Along with a proper organization structure is also necessary for efficiently functioning of the firm. The important determinants of NPD success include strong distribution channel and effective chain of communication, updated technical know how and synergy, corporate management support and commitment, R&D, cross functional teams, and speedy processes. This research paper explores all these different and essential determinants which contribute to NPD success.

Problem Statement
Many companies launch a new product or a product line but could not entice the market due to inadequate marketing and organizational strengths.

Significance of Study
This study provides numerous course of action to the managers seeking to launch a new product. It offers critical insights for the identification of marketing and organizational factors that determine NPD success. No researcher has previously contributed any knowledge about determining the effects of these factors significantly affecting NPD success so this is an original contribution to the body of knowledge.

Objective of Study
The main objective of this study is to evaluate the different determinants of NPD success which includes various marketing and organizational factors. This has been area of concern for managers to explore these factors that determine NPD success. It is a qualitative study and main emphasis of this research paper is on developing and proposing a conceptual model.

Literature Review
A new product or service is a good business thought that is appeared by some potential customers as new that does not exist (Kotler & Armstrong, 2005). New products can be any complete new product, modification in product and product improvement that a firm develops through its own R & D efforts (Adis & Razli, 2009). If any organization wants to succeed then NPD is essential but it is not easy task to accomplish (Schimmoeller, 2010). It requires a lot of efforts, top management commitment and resources that are necessary for developing new product. NPD success is determined by a number of other factors as well such as reduction in time, minimizing the failure rate, increasing the profitability and degree of innovation (Ahmadi, Roemer & Wang, 2001).

The products that are low and highly innovative were more successful as compared to moderate innovative products (Kleinschmidt & Cooper, 1991). Firms are continuously converting new ideas to commercialization for attaining NPD success (Brown, 1995). For NPD success and effectiveness, product should be customer centered instead of Product centered (Rackham, 1998).If the product will be product centered then sales force instead of focusing on consumer need, will focus on its extra features which will result in product failure.

Marketing has been identified as a foundation of NPD success. From marketing prospect the major factor that contributes to NPD success is the change in traditional communication. Chain which starts with product development instead start it with problem solution, then introduce the new product to sales force and this is how the product should communicated to the customer which leads to NPD success (Rackham, 1998). This is the precise way of introducing the product to customer because customers do not purchase products, they actually purchase the benefits. For example, while making the purchase of a drill machine, a consumer is actually buying the holes. If the specific product that consumer is buying is not fulfilling its core benefit it will be useless for him.
A product that will be technically sound and processes of which will be complex for other competitors, eventually will lead towards improved product performance and success (Tatikonda & Montoya-Weiss 2001). New product is necessary for the firm to be develop, because when a product reaches at maturity stage firm has to modify the existing product as well as has to introduce entirely a new product (Calantone, Garcia & Droge, 2003). Design of the product should be such that it should be easy to use for the consumer but technically it is stiff for competitors to imitate in short period of time and product can not be bandit in the market so that the firm can get the fruit of its innovation before the competitors jumps in.

For efficient performance of NPD teams, sustainability at corporate level as well as proper utilization of organizational resources is necessary. Corporate management plays a vital role in leading and coordinating the global NPD efforts and success (Salomo, Kienschmidt & Brentani, 2010). Therefore without corporate level involvement new product can not be introduced successfully in to the market. Launching of a new product demands a huge commitment of time and of resources as well. Swift NPD process will enable the product to make a significant place in the market. In this way product can be introduced speedily and same resources can be utilized for launching another new product thus minimizing cost of production (Griffin, 1997). It increases the revenues of the firm and eventually results in increase in profits. Research shows that there must be a proper organizational structure that supports new product development (Hwand, 2004). There should be a Centralized and dynamic organizational structure that support the creativity and innovativeness.

Cross functional team is also an important ingredient for NPD success in which people from different departments work together. Cross functional teams who believe that they have monopoly in the market or they are empowered over their customers, chances of innovation at that place will be less (Ebrahimi & McGowan, 2006). Because if there will be stiff competition in the market, the firms will strive continuously for betterment. And then the same cause helps them to involve in R&D which leads toward NPD success. Research shows that higher the improved and better problem skills, the greater will be the chances of NPD success (Lynn & Akgun, 2003). It means that people diversity, their belongingness to different cultures, their expertise, knowledge and skills ultimately lead towards NPD success. Although team members work together in cross functional teams if they don’t share information among themselves then it will not result in NPD success (Jassawalla & Sashittal, 2000). All firms know the importance of teamwork, because for NPD success quality skills and expertise are required by team members (Cooper & Kleinschmidt, 1995).

For NPD success, team composition is of great importance, usually multifunctional teams contribute more for attaining success (Bunderson & Sutcliffe, 2002). As employees come from different geographical areas, their culture, back ground, language is different, so one critical dilemma one has to face is information sharing (Doughtery, 1992). Researches have proved that creativity and innovation results from cross-functional NPD teams because of diversity (Woodenman, Swyer & Griffin, 1993).

For NPD success advertising and promotion plays a vital role because unless a customer will be aware of new product, he will not buy it. For NPD success a lot of management commitment is required because advertising demands a huge investment (Parry & Song, 1997). NPD Success also depends on different marketing activities such as advertising and promotion (Lim, Sharkey & Heinrichs, 2004). Advertisement attracts people and promotion usefulness of distribution.

**Research Methodology**

An intensive and extensive literature review was carried out in which after critically evaluating different research work done on New Product Development success and completing scrutiny of its relationship with different factors. A conceptual model has been developed in which NPD
Determinants of New Product Development Success; developing and proposing a conceptual model

NPD SUCCESS CONCEPTUAL MODEL

(Ebrahim,i & McGowan, 2006)  (Researcher’s own processing)
Model Elaboration
This research paper is an extract of different researches in the field of new product development success to show the relationship of different factors. NPD Success model is a conceptual model. In this model NPD success has been taken as dependent variable while various marketing and organizational factors have been considered as independent variables which include R&D, effective chain of communication, distribution synergy and advertising in marketing factors while product design, cross functional teams, time efficiency and updated technical synergy in organizational factors. This model has been evolved after making a rigorous effort by the researchers.

Hypotheses
For NPD Success model the researchers hypothesize that:
H1: Product design has a strong impact on NPD success.
H2: There is a strong relationship between Cross functional team and NPD success.
H3: Technical synergy and NPD success are positively related to each other.
H4: Time efficiency has a significant impact on NPD success.
H5: R & D has a strong relationship with NPD success.
H6: Effective chain of communication has a strong impact on NPD success.
H7: There is a positive relationship between Distribution synergy and NPD success.
H8: Advertising has a strong impact on NPD success.

Conclusion
This research is a conceptual study in which previous relevant researches have been reviewed. In this model NPD success has been taken as dependent variable while other marketing and organizational factors have been treated as independent variables, such as effective chain of communication, updated technical know how, corporate management support and commitment, R&D, cross functional teams, speedy processes, advertising and chain distribution synergy, and product design.

In the above mentioned independent variables one of the factors which have prior importance is chain of communication. This means that the evolver should not recognize that what its customer feels about the product after he communicates his problem but it should be realized at very early stage of developing or introducing the product in the market. Effective communication with the customer brings a significant response about the product.

Factor which has secondary importance is technical know how and R & D. This is a common experience that a company who keeps it self up to date and strives to empower latest dimensions of the market gives a tough competition to it peers. They fight on the strengths of their product’s multi dimensional characteristics. So when their product reaches to its maturity level, either they have to introduce a new dimension or have to bring innovation to the existing product line. These apprehensions keep them up-to-date in the market. But for this purpose they need to strive
hard and have to adopt such technology which could not be pirated by their competitors so that they enjoy the benefit of the innovation.

Similar is the case with corporate management support and commitment which has utmost importance in the success of NPD process. Coordinating the global NPD efforts and efficient utilization of organizational resources can only be done through corporate level involvement. Cross functional team is the most important variable in which diversity plays a vital role in enhancing level of success of NPD. People from different cultures and with new ideas bring a significant change. Researches have proved that creativity and innovation results from cross-functional NPD teams and this dimension has a back support of diversity.

Advertising has also a significant place in marketing factors which contributes majorly in NPD success. Concluding the whole scenario it has been determined that marketing factors are important because they determine the needs and want of the customer and then accordingly leads toward the success of new product development process.

**Future Recommendations**

There is an opportunity for other researchers to determine those factors which can affect NPD success. Marketing and organizational factors are the key variables determining the NPD success which has been discussed in this study. If organizations want to further enhance the market of their product or they want to increase their profits, then they can conduct a thorough study with self effort so they can explore new dimension for the success of their business. A qualitative study has been conducted along with this to check the reliability of these different factors, a quantitative measure can also be adopted by developing questionnaires and by conducting interviews in order to test NPD success.

Empirical Analysis of Macro Indicators Determining Foreign Direct Investment in Pakistan

Muhammad Khyzer Bin Dost
Muhammad Waqas Younas
Hafiz Muhammad Arslan
M. Sarfraz Khan
Sidra Izzat

Hailey College of Commerce, University of the Punjab, Lahore, Pakistan.

Abstract
Foreign direct investment inflows have remained low in the whole economic history of Pakistan as compared to other developing countries. However a sharp increasing trend is seen by economist in the first decade of 21st century in Pakistan. The present study has examined the variation in FDI inflows and effects of some macro indicators on FDI inflows in Pakistan. Two models of multiple and simple regression analysis are employed on secondary time series data of some macro indicators of Pakistani economy from 1985 to 2009 for analysis of impact of these macro indicators on FDI inflows in Pakistan with the help of statistical analysis software SPSS 17.0 version. Results of the 1st model show that high trade volume and better infrastructure have positive impact on FDI inflows where as high inflation and high variations in exchange rate have negative impact on FDI inflows. Results of 2nd simple regression model show that a developed stock market with high market capitalization value is a great attraction for FDI inflows in Pakistan.

Keywords: FDI, Developing countries, Macro indicators, Infrastructure, Inflation, Exchange rate, trade volume, Market capitalization

1. Introduction

World is becoming global village. Multinationals are investing all over the world and where there is a little bit feasibility of investment MNCs are investing there. Before investing in any country MNCs have to see some indicators because in real world there is only cost benefit analysis in those indicators there come some social factors, political factors and economic factors.

According to a study FDI inflows in US reached to $ 1.3 trillion in 2000 where as it was only $200 billion in 1993. There happens a huge transfer of wealth from country to country and region to region. In 21st century the wealth is transferring from developed nations to developing nations whose economic growth is very high. FDI inflows in developing countries were $132.9 billions in 1980 where as within a decade it has reached to $ 1438.48 bullions.

Pakistan a developing nation with high economic growth attracted huge amount of FDI in different sectors. In previous decade the sector which has attracted huge amount of FDI in Pakistan is telecom sector. FDI in telecom sector was $ 6.1 million in 2001 and reached to $ 1824.3 million in 2005-06 a growth of 285.33%. The overall share of FDI reached to $5124.9 million in 2005-06 where as it was $484.7 million in 2001-02 a growth of 131.03%.
Developing nations are now relaxing the FDI relevant restrictions, as Pakistan does in the same way. The most important step is allowing 100% equity on repatriation bases due to which foreign investors can send back full profit to their homeland without any restrictions.

In this research basically the researcher focuses on the factors to which FDI is dependent in Pakistan. The research plan is in such a way that first we have define the factors due to which investment in Pakistan becomes attractive, then we have use some statistical tools to explain the validity and relationships between dependent and independent variables and at the end there will be a conclusion about findings.

2. Literature Review

Investor’s perceptions about investment have changed now. In start of 20th century there was a great attraction towards agriculture and minerals but scenario has changed now. Today although these factors matters but now indicators of FDI have changed because of globalization and industrialization. Now FDI moves where there is cheap and skilled labor, country risk is low and a good efficient stock market present. As in the same way Dirk (2004) stated that developing countries have attracted huge amount of FDI after liberalization of their economies, but it does not mean that after liberalization, the inflow of FDI will continue. Governments have to focus on technology and development of skills in labor by overcoming information barriers. Agiomigianak (2006) also stated that Trade openness, GDP and highly educated and skill labor force plays important role in attracting FDI in OECD countries. Rabin (2006) sees the determinants of FDI inflows to South Asia from two angles. The demand side determinants and supply side determinants. In demand side he has taken market size, population, FTA’s (Free Trade Agreements) as determinants of FDI. Where as in supply side more skilled labor, literacy rate, increased entrepreneurial culture and mature capital and money market are the attractive determinants for FDI. Due to less restrictions in South Asian countries as compare to other service sector has attracted a huge amount of FDI for these countries. Governments have to focus on basic education then widen the scope to engineering skills and then creation of research and development centers, so that environment becomes feasible and research and development centers can interact with TNC’s as a result innovation and human capital formation becomes possible. Improvements in business conditions, infrastructure development, general education and technological advancements plays important role in attracting FDI from TNC’s to all over the world.

According to a model given by Vernon (1966) innovations decrease the demand of labor. The countries who mostly innovates are mostly capital intensive. The innovated product is then produced in low capital intensive countries and then in developing countries as time passes. And in the same way richer countries start improving already innovated products, and the circle repeats again and again. Capital intensive countries earn from selling innovated technologies to low capital intensive countries or earn by manufacturing their products by their partners in low capital intensive countries, low capital intensive countries earn by selling manufactured products to the countries where cost of production is high.

Kravia and Lipsey (1982) have focused on the relationship between FDI and higher wage rate. They stated that higher wage rate affects FDI only in industries those are highly labor intensive. However Moody and Wheeler (1990), Lucas (1993), swain and Wang (1995). and Pain and Barrell (1996) finds higher wage rate as an insignificant factor for FDI. The reason found behind
that high productivity is the outcome of higher wage rate so, high tech and research oriented fields demand highly skilled and expensive labor.

Lenj and Franklin (2004) focused on institutional environment and macroeconomic indicators are basically the stimulators of FDI movements from MNE’s. Where there is less institutional environment gap in the host country, MNE’s invest in those countries. In the same way governments make policies for the improvement in institutional environment for attracting FDI inflows. In regulatory framework work bad governance, repatriation policy, restriction on foreign ownership, critical regulatory environment, and corruption effects negatively to FDI. In emerging countries infrastructure plays an important role in attracting FDI (Zhang, 2006).

Nonadozie and Osli (2004) found that GDP was main factor of FDI inflows from USA to Africa. According to Yih Yun (2000) found trade openness as important indicator of FDI inflow to Australia. Khair-uz-zaman (2006) found that inflation plays important role in attracting FDI to Pakistan. After that there come some political factors. Li (2008) found that there is an inverse relationship between military conflicts and FDI. In Africa political stability plays significant role to attract FDI according to Dupasquier (2006). Garibaldi stated that exchange rate variation, Inflation, market size, trade openness, and fiscal deficit are important indicators for FDI inflow of any country.

According to Ohlin (1977) FDI moves toward those countries where there is high profitability and low cost of capital. Some other points those Ohlin point out for FDI were low trade barriers and availability of raw material.

Government of Pakistan has given many incentives to investors for attracting FDI. 100 percent hold of equity is allowed with 100 percent repatriation of profits where as in past only 60 percent profits were allowed to repatriate, 40 percents of profit must transfer to domestic investors. Some other relaxation has given in duties and taxes and in the field of financing. Anjum and Nishat (1998) stated that from 1980’s government of Pakistan start liberalizing its economy by giving tax relaxations; tariff reductions, credit easiness and control of foreign exchange to 1988. After that in 1990’s government take further steps such as opening the sectors of telecommunication, agriculture, insurance and energy for foreigners. But due to political instability and abrupt change in government four times within a decade loosen the foreign investor’s confidence. Interest rate, exchange rate, tariff rate and percapita GDP are the important determinants for attracting FDI in Pakistan. It is seen that some times higher tariffs plays important role in attracting horizontal FDI in the countries where production cost is very low. MNE’s start producing with the affiliates in the host country at lower cost, and then enjoy huge market of host country without tariffs. In vertical FDI, MNE’s try to attach with the affiliates who are technologically advanced. Manufacture basic components from different affiliates in different countries according to specialization and then assemble those parts with the affiliates in the country having cheaper labor and low tariffs due to which sometimes imports of the last country in the chain enhanced as in the case of Pakistan due to trade liberalization imports have increased (khan, 1999).

Khair-uz-zaman (2006) in a research paper on determinants of FDI in Pakistan has given the following model:
Regression results of this model shows that there is a positive relationship of FDI with inflation, market size and trade balance. A negative significant relationship exists between FDI inflows and unit labor cost. Unit labor cost shows high negative significance with FDI which shows its importance in attracting FDI. There is insignificant negative relationship exists between service sector and FDI inflows. The researcher explains the reason of this result in such a way that study is from 1970-71 to 2002-03. there was no trade liberalization and sufficient infrastructure in past in Pakistan due to which FDI inflows in service sector was very low, but in recent years scenario has changed.

Shumaila et al (2010) discussed the determinants of FDI in Pakistan as after 2000 due to increase in domestic and foreign trade the demand for telecom sector increased which attracted huge amount of FDI in telecom sector. Further they discussed that literacy rate, market size, population and per capita income plays very important role in attracting FDI in Pakistan. Shumaila in another research discussed the importance of telecom infrastructure in the economic development of Pakistan. She saw a positive relationship of GDP growth with investment in telecom sector and teledensity. According to results researcher conclude that due to increase in investment in telecom sector and high teledensity GDP grows positively.

Shumaila and Zaman (2010) studied the role of investment in the growth of trade both foreign and domestic in Pakistan. They found empirically a positive relationship between investment and trade over the period of 58 years. They also derived a relation that foreign investment has improved foreign trade significantly than domestic trade. With the increase in foreign investment local business transactions are executed efficiently and cost on foreign trades are minimized.

3. Data and Methodology

The portion of the study describes the methodological approach used in this study to find out what numbers say about the relationship between dependent and independent variables and whether the relationship is in accordance with the theories or not? Data sources, sample size and variables will also be discussed.

3.1. Data source and sample size

Secondary data of 25 years has been employed for finding the relationship between FDI and its determinants. In national sources of data economic surveys and state bank of Pakistan website are important sources of macro indicators where as in international sources World Bank website is a good database for macro indicators.
3.2. **Variable description**

One multiple and one simple regression model is used in the study for analysis. In multiple regression model one dependent and five independent variables are used for analysis. Dependent variable is FDI which is calculated as foreign direct investment inflows in Pakistan. Independent variables are GDP growth rate, physical infrastructure, inflation, average annual exchange rate of rupee and total trade. The proxy of infrastructure used in the study is length of low type and high type road network in Pakistan, total trade is calculated as addition of imports plus exports and other variables are named by their proxies. In simple regression model one dependent and one independent variable are present. FDI is regressed on stock market capitalization to find out the relationship present between these two variables.

3.3. **Model one:**

\[
\text{FDIt} = \alpha + \beta_1 \text{GDPGR} + \beta_2 \text{PI} + \beta_3 \text{INF} + \beta_4 \text{EX} + \beta_5 \text{TT} + \text{Ut}
\]

FDI= Foreign Direct investment
GDPGR= GDP growth rate
PI= Physical infrastructure
INF= Inflation
EX= Average annual exchange rate as rupee/$
TT= Total trade
Ut= Error term capturing left over effects

3.4. **Model Two:**

\[
\text{FDIt} = \alpha + \beta_1 \text{MCAP} + \text{Ut}
\]

Where
MCAP= market capitalization

Table 6.1.3 presents the regression results for the independent variables of GDP growth rate, inflation, total trade, exchange rate and physical infrastructure for the dependent variable of FDI inflows in Pakistan. Variables of total trade and exchange rate are significant at 0% level of significance having a coefficient value of 1.561 and -1.507 respectively indicating a positive and negative association in the same order. Physical infrastructure shows a positive and significant relationship with FDI inflows in Pakistan with a coefficient value of .856. The last significant variable in the model is inflation which predicts a negative change of .209 in dependent variable due to increase of independent variable. The GDP growth rate however was found to be insignificant for FDI inflows, in context of Pakistani economy. ANOVA results indicate that our model is good fit at 0% level of significance and the value of adjusted R² implies that this model explains 94.3% of the total variations in the FDI inflows in Pakistan.

a. Predictors: (Constant), Market Capitalization
Tables 6.2.1, 6.2.2 and 6.2.3 provide the results for the single independent variable model and market capitalization is found to be an important predictor of the FDI inflows in Pakistan causing the change of 96.8% of dependent variable with its total change in the same direction. This model is also a good fit and explains 93.4% of variations in dependent variable i.e. FDI inflows in Pakistan.

Our findings suggest that total foreign trade infrastructural facilities, inflation, exchange rate and market capitalization have a statistically significant influence on FDI inflows in Pakistan. GDP growth rate has negative and statistically insignificant relation with FDI inflows. Pakistan has faced fluctuating growth over the period under study and most of the foreign investment in Pakistan was towards army and social aids which has nothing to do with growth of economy.
There is a strong association between total trade and FDI (Aizenman & Noy 2006). Multinational Corporations tend to enter new markets for economies of scale and to explore new horizons of emerging economies.

5. Conclusion
In today’s changing world economic conditions, FDI is one of the most important factors to fuel the development of under developed countries. There are many theoretical and empirical research evidences about the underlying factors that cause inflows of FDI. This study empirically finds out the relationship between different macro economic variables and FDI inflows with in the context of Pakistan’s economy. For the purpose of analysis annual time series data has been used (1985-2009). The focal point of the paper was to study how different economic variables attract FDI. We have considered GDP Growth rate, Inflation, Total Foreign Trade, Exchange Rate, Physical Infrastructure and market Capitalization as if they impact FDI inflows in Pakistan. Regression results show that all variables are statistically significant except GDP Growth Rate. This paper clearly brings out the importance of these variables in attracting FDI in Pakistan. Hence, it is inferred that all those variables which were used in this study have strong impact on FDI inflows in Pakistan. Pakistan faces the intimidating challenges of broadening and upgrading the economy base, reducing the debt burden, controlling the population growth, improving the human capital, alleviating the mass poverty and skewed distribution of wealth and strength the institutional mechanism. With all these cumbersome problems the government/policy makers must focus on increasing trade with foreign countries, devise monetary policy to ensure that inflation remains in single digit for overall growth of economy, provide good infrastructural facilities. Also to attract large amount of foreign investment an attractive investment environment with positive policies and measures is quite essential.

Abstract

In recent years the world of costing systems have shown major developments in costing techniques, specifically a major contribution of activity-based costing (ABC) in manufacturing and services organizations. This study aims to identify the reasons why activity-based costing is preferred to traditional costing tools in modern manufacturing environment; why managers are showing their interests in the adoption of ABC to improve their financial performance, managerial and production efficiency; how ABC helps managers to eliminate production inefficiencies; how ABC facilitates adaptive and generative learning in organizations and the usefulness of ABC in vendor selection, service sector and SME’s. Traditional measurement methods of cost accounting proved insufficient on these issues, which leads to the invention of activity-based costing.

Keywords: Activity-based Costing, Activity-based Management, Modern Manufacturing Environment, Sport Organizations, Cost Accounting, Management Accounting.

1. Introduction

Traditional method of costing has the essence of dealing with overheads by splitting them into variable overheads and fixed overheads. If we are using absorption costing, we will first decide the suitable basis for absorption, then we will absorb all the overheads on that basis. The traditional costing methods were designed around 1870-1920. It changed rapidly from 1960’s – particularly 1980’s due to the problem of increased lack of relevance of traditional cost accounting methods. Activity – Based Costing (ABC) is based on the insight that activities create costs, while products consume activities. ABC is a costing technique that first identifies the major activities that give rise to overhead costs, then groups activities having same cost drivers into cost pools and finally assigns total overhead costs to each product or service by calculating absorption rate for each cost pool.

Traditional systems often rely on unpredictable allocations of indirect costs; particularly they rely extensively on volume-based allocations. Volume based activities are those which have high correlation with number of units produced. It will lead to over costing of high volume products and under costing of low volume products, which will further provide misleading information. So if you want to control your costs, you have to first control the activities that cause the costs to be incurred. ABC may help to identify value added activities and non-value added activities, which will help managers to control their costs by eliminating non-value added activities or at least reducing number of cost drivers of non-value added activities. There are two phases of activity accounting. First phase is called Activity-Based Accounting (ABC) where it
tells us how we can improve our competitiveness by managing our resources more efficiently. It does not only provide accurate costs but it is a mechanism for managing costs. Second phase is called Activity-Based Management (ABM) which is an important tool for achieving continuous improvement. Managers generally achieve improvements by managing activities in four ways:

- Activity reduction – by reducing the time required to perform activity.
- Activity elimination – by eliminating the entire activity.
- Activity selection – by selecting the low-cost activity from set of activity alternatives.
- Activity sharing – here managers make such changes that allow them to share activities with other products to achieve economies of scale.

This study aims to present that ABC is preferred to traditional absorption costing in the modern manufacturing environment because now indirect costs constitute a greater proportion of total product costs due to product’s complex specifications, widespread use of computer control and automation and increased use of just-in-time (JIT) production methods which will ultimately improve the financial performance of organizations. When you implement ABC in your organization a change in the management structure should occur, managers can adapt ABM by using the information provided by ABC to achieve required profits. Application of ABC is a teamwork and requires a lot of manpower training.

2. Literature Review

Some authors reported that there is an association between use of activity-based costing and improvement in financial performance of organization and results show that there is indeed a positive association between ABC and improvement in financial performance when we use ABC with other strategic initiatives such as total quality management (TQM) approach, just-in-time (JIT) manufacturing methods, business process reengineering (BPR) and flexible manufacturing systems (FMS), these strategic methods will help to reduce non-value adding activities when we use ABC in specific conditions such as in complex and diverse firms, where managers give importance to costs in decision making process, where there is limited number of intra company transactions and unused capacities and where there is huge competition.

Whereas if company is having sophisticated technology, cost of data collection and processing will be reduced, this will make the use of ABC more beneficial. It shows that usefulness of ABC is having positive relationship with sophistication of technology. If you do not have enough technological resources first update your resources otherwise you will have to bear huge costs (Sohal & W.C. Chung, 1998). It is ABC’s beauty that it deals with non-volume related costs and provides true and accurate costs of products (Sohal & W.C. Chung, 1998 – p, 137). You can achieve better results by allocating indirect costs to total product cost (Snyder and Davenport, 1997) and in this way management will have better control over decision making process. We can also combine the benefits of ABC with the benefits of cash flow based accounting with the help of logistics management accounting framework to support logistics management decisions (van Damme and van der Zon, 1999).

People should understand the difference between value-added and non-value added activities by understanding the reasons why an activity is called as value or non-value added (Miller 1996). ABM helps managers to eliminate inefficiencies by redirecting resources towards value adding activities (Needles & Crosson 2002). Horngren (1977), Miller & Vollman (1985) and Johnson & Kaplan (1987) argued that if you want to increase managerial and production efficiency, you have to deal with some hidden factors very carefully that influence the general industrial and manufacturing expenses. Because of the deficiency of traditional costing technique in improving global competitiveness, organizations hesitate to use it (Johnson, H. T., 1990).
ABC is a tool that helps managers to think about organizations more effectively and about how value is created (Cooper et al. 1992). In ABC and EVA system, rate of consumption of resources and capital demand is included in cost of activities. This increased competition and technology has led manufacturing companies to adopt new manufacturing techniques and methods such as TQM, JIT and FMS (p. 286). This model suggests us that if you want to implement ABC in your organization, you have to first consider conditions and factors that favor and are against the application of ABC (p. 289). In this way you can achieve your profit objectives with the help of ABC and ABM (p. 292). ABC is a guide that gives management actions a direction towards high profits (Cooper and Kaplan 1991). Application of ABC requires total commitment from top to bottom; management should clearly understand the benefits offer by ABC by communicating achievable objectives to everyone in the organization. It is management’s duty to educate and train everyone in the organization about the system which is going to be implemented so that everyone understands the complexity of project and its impact on the performance of organization (Sohal & W.C. Chung, 1998 – p. 144). ABC facilitates adaptive and generative learning by supporting continuous improvement at individual and organizational level and management of existing knowledge (Argyris 1977; March 1991; Appelbaum and Goransson 1997) as well as development of a learning culture to let organizations become more empowered and team-oriented (Cooper et al. 1992; Michelman et al. 1999). Try to keep implementation process as simple as you can otherwise employees will get irritated. You must have enough resources and time to get ABC success. ABC/M success relates with top management support, training of staff, availability of resources required to implement this system, performance evaluation and compensation systems (Mitchell, p. 66; Shields 1995; young 1989).

Determination of selection criteria depends on the needs of the firm and level of success of selection criteria to fulfill these needs (Swift Owens 1995; Brown 1998). By using ABC for vendor selection process, purchasing company will be able to predict and see internal production costs caused by the vendor, can design different situations by reducing different costs drivers, this system will help vendors to review their strategy by the indication of customer’s satisfaction and offers improvement in vendor purchaser relationship (Roodhooft and Konings 1996). Because of the usefulness of ABC/M, it is not even adopting by manufacturing companies to get competitive advantage but many services organizations (Innes & Mitchell 1995; Drury & Tayles 2000) and SME’s are taking advantage from these management accounting systems. The implementation of ABC in SME’s can help them in improving their financial and non-financial performance. It will help to reduce direct labor components, continuous skill development, reengineering and developing positive attitude of workers that contributes toward successful implementation of operations (Sage and Fox 1989). Chan, Keung and Chung (2000) conducted a study to invoke an empirical approach with the help of which we can design an ABC template to use it as a tool for easy assimilation in an SME environment. No doubt ABC was first designed to fulfill the cost management needs of manufacturing and industrial organizations but researches soon realized that they can also apply this system in services sector. Kaplan (1994) documents that since 1980’s many firms working in services sector. If organizations with diverse products and services use single cost driver to absorb high overheads, may distorts its cost estimates (Cooper and Kaplan, 1988).

Initially ABC was used only by manufacturing companies and industries and many researchers discusses it’s usefulness in marketing decisions. Stevenson et al., (1993) introduces ABC as a powerful toll for industrial marketing decision makers with emphases on the impact of ABC on...
profitability measures. John C. Lere (2000) states the importance of manufacturing costs in considering price negotiations. Feature of ABC is its recognition that cost does not only vary with volume but it can also vary with some other activities i.e. unit-level activities, Batch-level activities and Product-level activities (Cooper, 1990). Steve R. Letza and Ken Gadd (1994) examines the use of ABM with TQM in total quality organizations to identify their common features and compatibility as management tools. They stated that by using the accounting information generated by ABC, TQM can evaluate costs effectively. Charles Praker (2000) comments on the use of ABC and balanced scorecard as the more modern approaches to performance measurement as it helps a lot in making judgments and decisions. We use ABC data as input to measure performances.

3. Methodology

This study is based on documentary analysis. Extensive literature has been reviewed to arrive at the conclusion with regard to the significance and application of ABC in different organizational settings. Findings of 33 researchers published through various research channels in different countries has been quoted to arrive at general research outlook on the topic on the basis of these researches. The common findings are generalized henceforth.

4. Findings

- Horngren (1977) argued that there are some hidden factors that influence the industrial and manufacturing expenses, if u wants to increase managerial and production efficiency you have to deal with those factors very carefully. Activity-Based costing is a technique which helps us in finding the way to reveal those factors. Miller & Vollman (1985), Johnson & Kaplan (1987) and Johnson, H. T. (1990) supported this argument.

- Because of the usefulness of activity-based costing, many services organizations such as hospitals, universities, libraries, sport organizations, banks, logistic companies etc. and SME’s are adopting this new costing technique to improve their financial and non-financial performance by reducing direct labour components, continuous skill development and reengineering. Kaplan (1994), King et. Al (1994), Antikainen, Roivainen, Hyvärinen, Toivonen, Kärr (2005), Granof, E. Platt, Vaysman (2000), Snyder and Davenport (1997), Ellis-Newman (2003), Sage and Fox (1989) support this fact.

- Usefulness of ABC in marketing decisions, importance of manufacturing costs information provided by ABC in considering price negotiations, use of ABC and balanced scorecard as the more modern approaches to performance measurement, use of ABM with TQM in total quality organizations as management tool and usefulness of ABC in firms having diverse products, services and processes let managers think that activity-based costing is the most appropriate costing technique in modern manufacturing and services environment than traditional costing techniques. Stevenson et al. (1993), John C. Lere (2000), Charles Praker (2000), Steve R. Letza and Ken Gadd (1994) and Cooper and Kaplan (1988) support this fact.

So all the authors irrespective of culture are of one view that activity-based costing is from pain to joy.

5. Conclusion

From all of the above discussion and findings on the basis of thorough research review it is concluded that there are many issues (discussed above) which cannot be dealt Traditional
measurement methods of cost accounting proved insufficient on these issues, which leads to the invention of activity-based costing.

Acknowledgement

Authors are highly thankful to Prof. Dr Mujahid Kamran (Vice chancellor Punjab University) and Prof. Dr Liaqat Ali (Principal Hailey College Of Commerce, Punjab University) for moral and financial support in lieu of presentencing this paper at conferences. Authors are also thankful to Mr. Muhammad Adnan Khan (student Hailey College of Commerce) for his valuable services.

Abstract
Considerable growth has been takes place in the field of marketing strategies adopted by Banks. The main objective of this research paper is to identify the customer perception and preference towards the marketing strategies adopted by the Banks. Here the Various dimensions of functional strategies and Infrastructure strategies are analysed using Factor analysis to identify the factors that influence the selection of the banks. The data was collected from 200 customers of public and private sector banks using the structured interview schedules. The result showed that there exist the relationship among the variables of Functional and Infrastructure Strategies. Thus the bank must give importance to these variables in order to be effective.

1. Introduction
A banker should treat every customer who visits the bank as though he/she were the most important customer. To attain success, customer-centric functional business strategies are essential for any bank. Many banks have a Customer Banking Terminal near the entrance in the banking hall. The primary focus of marketing strategy is to effectively allocate and coordinate marketing resources and activities to accomplish the firm’s objectives within a specific product-market.

The customer can use the terminal for some of the facilities listed below:
- Balance enquiry
- Statement of accounts.
- Daily inward cheques enquiry
- Outstanding outward cheques deposited/purchased inquiry.
- Outstation cheques deposited/purchased inquiry.
- Account summary.
- Password change.

How to go about rendering good customer service:
- Be courteous, polite.
- Welcome smile and good body language.
- Listen and respond.
- Empathize.
- Be open, honest and positive.
- Admit mistakes and shortcomings.
- Introduce tech-savvy products.

Without the aid of technology, no bank can prosper or improve the customer base. Earlier, the depositor used to ask “Do you have cheque book facility?” But today’s prospective customer
asks, “Do you have an ATM? Whether the bank has Core Banking Solutions (CBS) and credit card facility?”

CHANGING PERCEPTION OF THE CUSTOMER

- 1950s to 1960s: Serving the customer.
- 1960s to 1980s: Satisfying the customer.
- 1980s to 1990s: Pleasing the Customer.
- 1990s to 2000: Delighting the customer.
- 2000 to 2005: Retaining the customer.
- Beyond 2005: Reaching out to new and young customers with tech-savvy products.

Functional services rendered by banks

The primary operations of banks include:

- Keeping money safe while also allowing withdrawals when needed.
- Issuance of checkbooks so that bills can be paid and other kinds of payments can be delivered by post.
- Provide personal loans, commercial loans, and mortgage loans (typically loans to purchase a home, property or business).
- Issuance of credit cards and processing of credit card transactions and billing.
- Issuance of debit cards for use as a substitute for checks.
- Allow financial transactions at branches or by using Automatic Teller Machines (ATMs).
- Provide wire transfers of funds and Electronic fund transfers between banks.
- Facilitation of standing orders and direct debits, so payments for bills can be made automatically.
- Provide overdraft agreements for the temporary advancement of the Bank's own money to meet monthly spending commitments of a customer in their current account.
- Provide Charge card advances of the Bank's own money for customers wishing to settle credit advances monthly.
- Provide a check guaranteed by the Bank itself and prepaid by the customer, such as a cashier's check or certified check.
- Notary service for financial and other documents.

2. Review of Literature:

Aish et al., (2003) compared the bank selection decisions of the small business market across UK and Egypt and the results advocated various similarities and provides evidence to suggest that brand place major role in the bank selection decisions of the small businesses at both UK and Egypt. The study reinforces the opinion that technical quality (quality of services itself) is more important than functional quality (quality of the service provider) in the bank selection decisions more specifically both Egyptians and UK small business customers consider financial items (fees, interest rates and credit availability) as the most important factors in bank selection decision.

Devlin and Gerrard (2005) studied the relative importance of various choice criteria for main and secondary banks. Results showed that relatively rudimentary factors such as locations, recommendation and relationships were important choice criteria when choosing a right bank though the same criteria were found to be strongly influential in choosing the secondary bank, offering an incentive was also significantly more important in prompting the choice of secondary bank service exception was found to be significantly more important for main bank as were low fees and over draft charges.
Indian financial market is very diverse and the preferences of services change across demographic factors like education, age, sex, salary/earnings level etc., Aydin et al., (2005) noted that perceived switching cost had a moderate effect on the relationship between the customer satisfaction and loyalty, and trust and loyalty. The effect of customer satisfaction on loyalty in customers is less, when the switching cost is perceived to be high rather than low.

Koutouvalas and Siomkos (2006) examined the following issues relating to customer satisfaction in Greek banks:
1. The factor shaping Greek banks customers perceptions of service quality
2. Direct influence of perceptions on customer loyalty’ customer perceptions and switching intentions among public and private bank customers

A sample of 200 customers was taken for primary survey. The results of regression analysis showed that, there was a direct and positive correlation between perceive service quality and customer loyalty in the case of both private and the public sectors banks, significant relationship was recorded between demographic characteristic and perceived quality of both types of banks. Customers of both the banks were willing to express their complaints to banks employees. Thus, bank employees were the bank agents and were acting as the connecting link between banks and customers. Customer loyalty was related only to educational level since a higher educational level was related to an increased tendency for information search regarding competitive product/services/providers. Bank’s promotional efforts, aimed at providing relevant information to the public might increase loyalty level. In such promotional efforts, the service quality and the reputation were the main areas to be emphasized.

Rahman (2006) also used SERVQUAL model for measuring the service quality at cellular retail outlets in the Indian environment. In some studies on cellular services, service quality has been measured by call quality, pricing, structure, mobile devices, value-added services, convenience in procedures and customer support (e.g., Kim, 2000; Gerpott et al., 2001;Lee et al., 2001; and Kim et al., 2004). For the present study, service quality has been measured using SERVQUAL scale and additional dimensions adopted from various researches carried

Roig et al., (2006) analyzed the dimensionally of the concept of customer’s perceived value in the banking sector of Spain. A total of 200 customers were selected for survey. The result of confirmatory factor analysis and linear regression analysis indicated that customers perceived value in banking sector composed of six dimensions; functional value of the establishment. Functional value of the personnel, functional value of the service, functional value of price, emotional value and social value.

Manrai and Manarai (2007) investigated the overall dimensions of customer satisfaction with bank services in the US. The sample comprised of 578 respondents and for measurement of customer’s satisfaction factor analysis technique was used. The study identified four overall dimensions of customer satisfaction. These were personnel related considerations financial considerations and convenience related considerations (ATM and hours). The findings suggested that bank marketers should pay much more attention towards promoting factors like personnel, atmospherics, and convenience than what was done in the past. This would help the banks in differentiating their offerings in customers’ perceptions and thus attracting they form the competitors.

3. RESEARCH METHODOLOGY
Research is the process of a carefully planned scientific way of inquiry for solution of a problem, through an organized method. Research methodology is the description, explanation, and justification of various methods in the research process. The why and how of various aspects encountered in the research process is answered in the research methodology. A good research
design provides a clear description about the statement of problem, hypotheses, design, variables, tools used, sample dealings, method of data collection and analysis.
Respondents were asked to give opinion on different aspects of customer perception towards the marketing strategies adopted by banks on a five-point scale ranging from ‘Strongly agree’ to ‘Strongly disagree’. The analysis was conducted through SPSS version 17 Statistical package.

OBJECTIVES OF THE STUDY

- To know the factor that influence the level of customer satisfaction towards the functional and Infrastructure Strategies.
- To find out customer preference towards various banking facilities.

SCOPE OF THE STUDY

- The survey is confined to opinion survey about the various facilities provided by the Bank’ at Trichy.
- The study also involves in identifying and analyzing the purpose of Marketing Strategies and its various features.

LIMITATIONS OF THE STUDY

- The survey has been conducted only on 200 respondents.
- Unwillingness of some respondents to provide information is another limitation.
- Findings of the study may be influenced by personal bias of the respondents.

RESEARCH METHODOLOGY

Problem Statement:
The bank has been offering various Marketing Strategies like Functional, CRM, Infrastructure and Promotional strategies by the banks and in this study the level of customer perception towards the Functional and Infrastructure Strategies were analysed.

Sample technique and Size:
Sampling is a technique or a method of selection of samples. Convenient sampling method is used. The researchers have taken 200 samples.

Sampling Area:
This study was undertaken in Trichy city.

Method of Data Collection:
Data collection for this study consists of Primary sources of data collected through structured questionnaire by way of personal interview.
Secondary sources of data collected through magazines, journals and website

Tools Used

- Factor Analysis
- Correlation

4. DATA ANALYSIS AND INTERPRETATION

The data has been collected with the help of questionnaire. And it has been analyzed and interpreted with the help of tables along with relevant descriptions. Appropriate treatment has been done to the raw data and logical conclusions are drawn based on the findings.

</table>

Based on this survey, the usage percentage is identified as ICICI 16%, Indian Bank 16%, SBI 42%, IOB 8%, HDFC 6%, Dena Bank 2%, Canara Bank 2%, Punjab National Bank 4% and Karur vysya Bank 4%.
With the view to identify the reason for selecting the most frequented bank can be inferred from table 3. From the above it is clear that 52% of the respondent prefers for location convenience, 16% prefers for Bank customization, 14% is for Infrastructure Facilities, 8% is because of Bank Image, 4% is for Online Banking and Friendly staff and only 2% is for greater speed for ATM.

Requesting principal component analysis and specifying the interpretation obtain output of factor analysis. There are two stages in factor analysis. Stage 1 being the factor extraction process, wherein objective is to identify how many factors are to be extracted from the data. The most popular method this is called principal component analysis. There is also a rule of thumb based on the computation in Eigen value, to determine how many factors to extract. The higher the Eigen value of a factor, the higher is the amount of variance explained by the factor. The six factors were extracted as 53.608 percent of the variance.

To find out the factors influencing the personality level of the customers, the responses were obtained on a five-point scale ranging from 1-5. Strongly disagree to strongly agree. If the Questions were started from negative perspective, they were reversly coded, (streiner and Norman, 1995). These items worded negatively to reduce the bias due to tendency of respondents to reply in affirmative during data collection. In total, 27 variables were used to identify the major factors influencing functional strategies adopted by the Indian Banks. (Table 5.2). The item scale was subject to factor analysis using principal component method with Varimax with Kaizer normalization rotation. The principal component Analysis was conducted using SPSS version 17 statistical package. It is evident from Table 4 (looking at the cumulative
% column), we find that the six factors acted together accounted for 53.608 of the total variance (information contained in the original table). Hence we have reduced the variables from 27 to 6 underlying factors.

Looking at Table 4.2 we see that the variables Explanation of details, Same service at all times, Staff provides service without bias, Staff are clear, Staff posses required skill and knowledge, Staff use technology quickly have loadings of .516, .564, .618, .708, .676 and .517 on factor 1 indicating that it is a combination of these six variables. The variables like Bank account is safe and secured, Service charges, Interest rates, Adequate explanation on service charges, Bank rate for Senior citizens and Favourable minimum reserve like have loadings of .057, .713, .615, .630, .635 and .576 on factor 2 indicating that factor 2 is a combination of these six variables. Next for factor 3 (as seen in table 2), it is evident that Helping and Training, Bank Educating the Customer, Bank specification and Regular Statement have loadings of .565, .730, .475 and .629 on factor 3, indicates that factor 3 is a combination of these three variables. Factor 4 consists of variables like Sanctioning of loan, Error free bank statement and Correct services have the loadings like .401, .633 and .542 on factor 4, indicating that factor 4 is the combination of 3 variables. The variables like Bank sells products, Buying and Selling securities, Foreign exchange transaction and Bank promote export trade have loadings of .711, .638, .537 and .549 on factor 5 indicating that factor 5 is a combination of these four variables.

And finally factor six consists of Bank provides overdraft facility, Variety of features & services offered and Wire transfers have loadings like .614, .529 and .679 on factor 6 and it is the combination of three variables.

Output of factor analysis is obtained by requesting principal component analysis and specifying the interpretation. There are two stages in factor analysis. Stage 1 being the factor extraction process, wherein objective is to identify how many factors are to be extracted from the data. The most popular method is called principal component analysis. There is also a rule of thumb based on the computation in Eigen value, to determine how many factors to extract. The higher the Eigen value of a factor, the higher is the amount of variance explained by the factor. The three factors were extracted as 57.053 percent of the variance.

To find out the factors influencing the personal of the customers, the responses were obtained on a five-point scale ranging from 1-5. Strongly disagree to strongly agree. If the Questions were started from negative perspective, they were reversly coded, (streiner and Norman, 1995). These items worded negatively to reduce the bias due to tendency of respondents to reply in affirmative during data collection. In total, 11 variables were used to identify the major factors influencing personality level of the customers of the Indian Banks. (Table 5.2). The item scale was subject to factor analysis using principal component method with Varimax with Kaizer normalization rotation. The principal component Analysis was conducted using SPSS version 17 statistical package. It is evident from Table 5 (looking at the cumulative % column), we find that the three factors acted together accounted for 57.053 of the total variance (information contained in the original table). Hence we have reduced the number of variables from 11 to 3 underlying factors.

Looking at Table 5.2 we see that the variables Core Banking Facilities, Flexi Counter facilities, self Informative Instruction, Locational Convenience and ATM in same branch have loadings of .695, .746, .738 .512 and .529 on factor 1 indicating that it is a combination of these five variables. The variables like Bank account Centralised Air Conditioners, Seating arrangements and pure water facility have loadings of .751, .811 and .742 on factor 2, indicating that factor 2 is a combination of these three variables. Next for factor 3 (as seen in table 2), it is evident that Coffee/Tea vending machine, Special machine for withdrawals and deposits have loadings of .727 and .768 on factor 3, indicates that factor 3 is a combination of these two variables.
In this study, Marketing Strategy is treated as the independent or Predictor variable and Functional Strategies & Infrastructure strategies are treated as the dependent or Criterion variable. In order to examine the relationship between variables, Correlation is calculated. The results showed that there is a positive relationship between the Functional Oriented Strategy factors (Reliability, Awareness, Secondary services, Facilities, Bank Charges and Interest Rates and Staff Competencies) and Infrastructure factors (Tangibles, Ambience and proximity) respectively. The result does not show any negative relationship between the variables. Multi co linearity among the variables were found as no variables are highly correlated. (> 0.80). This shows that all the variables are independent though related with each other.

Conclusion:

The study examined the factors that influence the customer’s preferences in selecting the best bank. It also explains how far functional Oriented Strategies and Infrastructure strategies play a vital role in the marketing strategies of banks. It also explains the various dimensions that affect the customer satisfaction and the relevant importance of each factor. The dimensions of Functional Oriented Strategy like Reliability, Awareness, Secondary services, Facilities, Bank Charges and Interest Rates and Staff Competencies and of Infrastructure’s like Tangibles, Ambience and proximity are positively correlated and each factor must be given due concentration by both the public and private sector banks in order to compete with the Foreign Banks.

** Correlation is significant at the 0.01 level (2-tailed).
* Correlation is significant at the 0.05 level (2-tailed).

Abstract

The number of road traffic casualties is still very lofty and the trend shows a boost with each passing day. The road traffic accidents involve fatalities due to which economic resources are damaged and the productivity of the economy is correspondingly impaired. Costs resulting from traffic accidents represent the largest single part of the overall cost of traffic to the economy. Knowledge about the harm of these traffic accidents to the economy is essential if measures to reduce road traffic accidents are to be identified and initiated. Once an economic assessment of road safety measures has been made, work on improving safety in accordance with economic criteria can be organized as efficiently as possible. Towards this end, it is necessary to opt for measures that are likely to be successful in a given situation. Current research is regarding the evaluation of road traffic safety measures in Pakistan and its economical effects based on available data. The research reveals that road accidents have key influence on the economic statistics of the country. The study presents a valuable tool for policy formulation on the road safety regulations in the country.

Keywords: Economic, Evaluation, Traffic, Safety, Accidents, Statistical Analysis.

1. Introduction

The transport of persons and goods by road is an essential element of modern society. At the same time such transport carries highest risks of accidents causing damage to human and resources. Safety is therefore a very important aspect of planning for road transport. Safety is of prime importance, not only to the users but also to engineers, planners and decision makers associated with operation, improvement and development of transportation system (Davis, 1993). Planning road safety measures is a complex exercise, since results and estimates varies in large way. In recent years, technical innovations have led to a steady increase in road safety measures (Hakim, 1991). Recent research has even stepped into behavioural theories and concluded that safety can be increased by improvements in human behaviour (Ghee, 1997). Education and training programmes for those using the roads can help reduce individual traffic problems. Economic dimension of road safety measure is also significant since road traffic crashes are a huge burden on the economy of countries, particularly those in low and middle-income groups (ADB, 1997). The economic cost of road crashes and injuries is estimated to be consuming roughly about 2% of the Pakistan’s GDP (NHA, 2006). In this research, statistical analysis of data pertaining to efficacy of road safety measures has been evaluated to draw meaningful conclusions. The data used in this paper is related to Pakistan and may not be applicable exactly to the other regions of the world.

2. Research Methodology

A comprehensive research methodology was used to carry out this study. The research approach was consisting of following steps:-

- Step 1: Appraisal of the efficacy of existing evaluation methods and selection of evaluation method for this research
Step 2: Identification of the nature of cost involved in the context of Pakistan.

Step 2: Field survey for collective of data about accidents and to ascertain trends and patterns.

Step 3: Economic evaluation of road safety measures.

Step 4: Conclusions.

3. Efficacy of the Current Evaluation Methods

Controversy exists over the choice of the correct way of evaluating road safety measures as different evaluation procedures produce different opinions and estimates (Tengs, 1995). Moreover, a generally accepted view on the economic cost of accidents has not emerged so far (Ghee, 1997). Estimates of the costs of accidents display considerable diversity. Presently following methods are available to assess the economic impacts of road safety measures:-

- Economic evaluation using cost-benefit analysis is based on the costs incurred as a result of road accidents. Avoiding such costs, through effective road safety measures, represents the economic benefit of road safety measures. A measure is macro-economically profitable, if the difference between benefits and costs is $\geq 0$ or the ratio of benefits to costs is $\geq 1$. This method is the most reliable, therefore, has been used in the current research.

- The “cost of damage” method determines costs through direct assessment of the damage caused by accidents. By determining the actual damage caused, this approach attempts to make an objective evaluation of the costs, based on various factors involved. This method has been used hitherto to calculate the cost of accidents around the globe (Choueiri, 1995). However, it is argued that the method can lead to ethical problems as injury may be assessed differently, depending on the individual injured and his/her contribution to production (Fouracre, 1977).

- Accidents costs can be assessed on the basis of “willingness to pay approach“, which is a more accurate indication of losses to the national economy resulting from road accidents (Ghee, 1997). This approach determines financial outlay a person is prepared to accept to refrain from harmful practice or the amount a person suffering the effects of such practice is prepared to pay to prevent it. The approach establishes the payments that must be made to induce a person responsible for harmful practice to stop or an injured party to tolerate such practice (Hakim, 1991).

4. Identification of the Nature of Cost

In economic analyses of road safety measures, it is important to assess costs arising from accidents. The nature of cost is different for different areas. Calculation of the economic costs of road accidents takes account of all the consequences of an accident that lead to a loss of net product (Ghee, 1997). After detailed survey, a matrix of component elements was developed which was named after the author as Gul’s matrix which is shown in Figure 1. Various related aspects are as under:-

4.1 Restoration Costs

These are incurred where a situation is restored through recourse of medical, legal, administrative and other measures. Direct restoration costs arise from the medical and professional rehabilitation of the accident victim. Professional rehabilitation consists of measures that enable the accident victim to resume his professional activity. Indirect restoration costs arise
from the attempt to settle legal matters (police costs, legal costs, insurance claims etc). In Pakistan, this type of cost takes the major share of total accident costs (NHA, 2006).

4.2 Costs Arising from Loss of Resources

This cost covers the reduction in economic net product resulting from the fact that persons injured or killed in an accident are no longer able to take part in the production process (Choueiri, 1995). Moreover, vehicles, property and materials are damaged or destroyed in road accidents which represent real capital.

4.3 Human Consequences

An accident is an experience that can have harmful psychological effects on those involved and their families. This may limit their capacity to endure stress as to make them unfit for work, and this entails an economic loss. Many accident victims have to change their way of life as a result of their experience (Cooper, 1998). This leads to a reduction in productivity. This also includes costs associated with the higher probability of future illness (Wilde, 1994).

![Gul’s Chart for Nature of Cost for Economic Evaluation Process](image)

5. Field Survey

An extensive field survey was carried out in which the data of accidents was collected from the traffic police offices at all the provincial headquarters and the capital of Pakistan. This data was then sequentially tabulated and analyzed. The results are discussed below.

5.1 Statistical Analysis of the Data

Data of accidents and fatalities from 2001 to 2009 obtained from the survey was tabulated and with the help of state of the art latest software Stat Assist 5.3 descriptive statistics were found which reveal interesting facts and trends. Figure 2 shows a relationship between time, accidents
and victims. The descriptive statistics of accidents and victims are shown in Table 1 and 2 respectively. Few important aspects from the statistical analysis of the data are as under:-

- Roughly there are about 17000 accidents of all kinds each year in Pakistan since 2001. The graph shows increasing trend of accidents with time, probably due to more number of vehicles coming in use of the citizen since 2001. The standard deviation for the accidents is high which reflects that accidents have never been less than 10000 per year.

- Roughly over 114000 people become the victim of accidents in Pakistan every year which means roughly about 300 people suffer each day. The victims include all types deaths, severe and minor injured.

- Total economic cost of accidents is estimated to be about a billion US $ every year (NHA, 2006).

- Material and property costs exceed US $200 Million per year which is neglected in most of the analysis.

- In next 12 years time, the number of accidents is likely to grow double; and the accident costs from US $ 1 billion to US $ 2.5 billion. Similarly the number of victims will be tripled making about 1000 people suffering from the accidents per day.

5.2 Identifying the causes of accidents

Analysis of the data reflected that road safety is affected by three main factors: man, vehicle and infrastructure. Table 3 shows the most common causes of accidents in Pakistan. It clearly emerges that in Pakistan human error is a far more frequent cause than technical failure or the condition of the infrastructure.
Table 3. Percentage Share of Causes of Accidents

<tr>
<td>Total</td>
<td>100.0</td>
</tr>
</tbody>
</table>

The above table shows that man in the role of driver is the major cause of accidents. The accumulative share of the man (driver and pedestrian) is 88.6%. This clearly indicates the need for training and monitoring of drivers and awareness of traffic rules in the common masses. This aspect has been neglected over the years. Moreover, lack of latest state of the art technological innovations and gadgets (shown as 2.1% in Table 1) is also emerging as a cause of accidents.

5.3 Results of Accident Cost Data Analysis

Tables 4 shows the results of accident cost analysis for Pakistan, established annually from the data obtained through field survey. By linking costs arising from accidents, with the frequency with which they occur in a year, the cost to economy due to road accidents has been worked out. Fatalities due to road accidents in a year accounted for the highest cost: more than 40 million dollars, followed by the sever injuries and the cost of damage to property and material. Overall the cost is more than a billion dollars per year.

Table 4. Results of Accident Cost Data Analysis

<table>
<thead>

<tr>
<td>Damage to property and material</td>
<td>23.22</td>
</tr>
<tr>
<td>Total</td>
<td>119.97</td>
</tr>
</tbody>
</table>
Personal injuries accounted for 80.65% of the total costs per year and damage to property and material for 19.35%. So, just as human is the man cause of accidents, human itself is the main sufferer. The cost provided in table 4, is the expenditure incurred on restoration, loss of resources and human psychological incapacitation. Its categorization is shown in Table 5.

Table 5. Categorization of the Cost Impact of Accidents

</tr>
</tbody>
</table>

As shown in Figure 3, restoration cost takes 61% share of the total cost per year. Restoration includes both rehabilitative and legal aspects. This is followed by cost arising from the loss of resources which comes to 30% whereas a small share of 9% is taken by the human incapacitation due to psychological reasons. In Pakistan, there is a constant increase with time in the cost arising from restoration and loss of resources. This is because of consistent increase in the cost of component elements which makes restoration and rehabilitation. The human capital is badly depleted due to accidents. It is believed that efficiency of the human being is averagely reduced by 5 – 15% even after the minor accidents for considerable period of time. From economics point of view, accident is a phenomenon which has only cost out flows and no revenue in flow.

Figure 3. Percentage Share of Cost Categories

6. Economic Evaluations of Road Safety Measures

The above discussion clearly indicates that accident is a heavy burden on the national economy. To reduce the harm to manageable proportion, possible ways of reducing accidents, are
implemented by each state around the globe (Hakim, 1991). The economic evaluation of these measures is essential to assess their efficacy in reduction of accidents, and hence, contribution to the economy. Table 6 shows the potential of current road safety measures for reducing the accidents in Pakistan, based on the field survey and opinion of the masses taken on selected sites. The analysis of the current measures shows that these measures are sufficiently insufficient to control the situation. The traffic police control and speed surveillance are the two measures which are marginally effective, but overall a very weak trend can be seen in the table. The accumulative effect of these measures is not more than 60%, which indicates the huge space for improvement required in the field of traffic safety measures. Current inadequacy can be sited as the most significant reason for increase in the accidents with time instead of decrease (Figure 2). The reductions shown should be understood as potential reductions based on empirical data and not the factual.

Now let us evaluate some of the road safety measures using cost-benefit analysis (CBA). As has been stated earlier, CBA is the most reliable and effective method for economic evaluation of the road safety measures since it takes the practical and tangible facets and quantifies the intangible as well (Ghee, 1997). It is in use for evaluation of roads and communication infrastructure since 1950s and it has been used extensively for development of highways and motorways investments in the USA and UK (Hakim, 1991). CBA is simple in application as it relies on the addition of positive factors and the subtraction of negative ones to determine a net result. The accuracy of the outcome of CBA depends on how accurately costs and benefits have been estimated. Table 6 shows the CBA of all the road safety measures in terms of cost – benefit ratio (CBR) which is the ratio of benefits to costs for a particular safety measure and has to be $\geq 1$ for a measure to be economically beneficial and viable.

Except for few minor safety measures, most of the measures are not viable and effective. Currently the cost on these measures is more than the benefit they are rendering in terms of reduction in the accidents. The average CBR for all measures considered in this analysis comes to be less than one, which economically undesirable. A comparison of CBR value and accident reduction percentage for each road safety measure is shown in Figure 4.

</table>
Figure 4 indicates that although traffic control measures are effective in reduction of accidents but these are not economically viable. Similarly, small measures such as wearing of safety belt, using crash helmets and traffic awareness are economical and effective as they reduce accidents costs.

7. Conclusions

Based on the data available, this study has provided an economic evaluation of the current road safety measures. It has also, shown the weaknesses of the existing measures and the need to put system worthy and beneficial. The following points show possible limitations and areas of emphasis for future in the context of Pakistan:-

- Studies of costs arising from road accidents reveal considerable differences in scope and composition. For example, damage to property is often not taken into account in the calculation of accident costs, although they account for a considerable proportion – over 19% of overall accidents costs.

- Differences in accident cost levels also result from the fact that the cost components and evaluation procedures used in the calculations are not always the same. The origin of data is not always clear which makes comparison and judgment difficult. The information available for assessing the measures is sometimes incomplete. The functional connections between traffic parameters (for example kilometer performance, speed) and the frequency and seriousness of accidents are not always apparent.
Priority needs to be given to the collection of road accident data. This information can then be used to assess the relative importance of the problem from both an economic and social viewpoint. For this purpose a computerized accident database centre may be established.

Assessment of accident cost should be reviewed each year and accordingly suitable measures may be taken to reduce these costs. The economic costs of road crashes are, in general, not well understood as much of the cost is hidden and incurred in small-scale crashes rather than in large incidents.

The current study shows that the implementation of certain road safety measures could develop the potential for safety even further. This potential is associated with technological and legal measures, as well as those that address behaviour:

- Traffic awareness has shown one of the best cost-benefit results. This area needs to be exploited.
- As regards legal measures, the requirement to wear seat belts and helmets is proving to have a significant effect on road safety while also being more cost-effective.
- A further tightening on licensing, driver’s health and vehicle fitness is also regarded by many experts as an effective way of improving road safety.
- If the accident reduction target alone is considered, we might expect speed restrictions to have a significant effect on road safety. Unfortunately, the available data on the cost effectiveness of speed restrictions is not very encouraging. Investigations carried out suggest that such a measure would lead to higher costs, resulting mainly from loss of time.
- Technological innovations also promise further improvements in road safety. This involves measures taken both inside and outside the vehicle. The critical point is that technological improvements are often associated with significant costs, which mean unsatisfactory cost benefit ratios.
- The traffic rules and regulations need to be enforced in true letter and spirits. This has the maximum accident reduction potential in the developing societies.

The Standard Theory of Economic Behavior Towards Risk:
Large Risks versus Small Risks

Ai-Yee Ooi, Mohd Fahmi Ghazali
Labuan School of International Business and Finance,
Universiti Malaysia Sabah,
P.O.Box 80594, 87015 Labuan F.T, Malaysia.

Abstract
This paper focuses on some of the major theories of economic behavior towards risks and its efficiency in explaining risk attitudes towards large risks and small risks alike. Risk attitude measures the willingness of a decision maker to undertake risks in return for perceived rewards, ranging from risk aversion, risk neutrality, to risk preference. Due to earlier research exposing the limitations of the expected utility theorem in plausibly explaining risk aversion over relatively smaller stakes, this paper has empirically explored the possibilities that may cause similar ambiguous explanations in such modest-scale risk aversion. The empirical examination of the expected utility theory generally lends further supportive evidence that only large risks are capable of explaining risk aversion, with small to moderate risks being incapable of explaining risk-aversive behavior. Many other risk theories remain to be explored, and it is hoped that variants of these risk models might eventually lead to a more comprehensive coverage of risk behavior over the spectrum of large to small risks.

Keywords: Expected utility theorem, risk aversion, larger risks, small risks

1. Introduction
A central objective in developing an empirical science is coherence in the application of theory to data from different sources. Thus, Rabin (2000), and Rabin and Thaler (2001) address an important question concerning coherence of the application of concave expected utility theory to explain risk-averse behavior for both small stakes gambles used in laboratory experiments and large-stakes gambles observed in everyday life.

A decision maker’s risk attitude characterizes his willingness to engage in risky prospects. Focusing on risky prospects with monetary outcomes, a decision maker displays risk aversion if and only if he strictly prefers a certain consequence to any risky prospect whose mathematical expectation of consequences equals that certain amount. Equivalently, a decision maker is said to be risk averse if and only if he strictly refuses to participate in fair games (i.e. games with an expected net outcome of zero). He is said to be a risk preferrer if and only if he strictly prefers the above mentioned risky prospect to its certain consequence. He displays risk neutrality if and only if he is indifferent between the risky prospect and the certain consequence.

The most common theory that has been used wisely by economists to explain people behavior towards risks is expected utility theorem. This theorem implies that the utility function over wealth is concave. This diminishing marginal utility of wealth theory of risk aversion is psychologically intuitive and helps in explaining our behavior towards large-scale risk (Rabin, 2000).

---

[20] The explanation of risk attitude is taken from web: www.sfb504.uni-mannheim.de/glossary/riskatt.htm
However, the explanation for risk especially risk aversion towards small-scale risk is implausible in most cases where economists and researchers invoke it.

Many early researches have noted the inability of expected utility theory to provide a plausible account of risk aversion over moderate stakes (Pratt, 1964; Arrow, 1971; Machina, 1987), but the questions still arise and remain unresolved: why the standard theory of economic behavior towards risk can explain behavior towards large risks but not towards small risks? How well risk aversion does in explaining behavior towards small risks in relation to other theories? Thus, the objective of this paper is to discuss empirically results that have been done by early and recent researchers, aiming to shed light on the unanswered questions.

The following section of this paper is to discuss empirically that the standard theory of economic behavior towards risk in fact can well explain behavior towards large risks but not towards small risks. In section three, we will evaluate how well risk aversion does in explaining small risk in relation to other theories (quantitative and qualitative). Finally, a brief conclusion is drawn in the last section.

2. Literature Review

The empirical examination of research of ‘the standard theory of economic behavior towards risk can explain towards large risk but not small risks’ has attracted the interest of many researchers dwell on it while economists attempt to explore more detail to establish the statement.

In the following section, we will present several researches that had been conducted, either by simply taking general risks, to large risks, and even to laboratory risks. However, these studies had neglected size of risk in all of their tests. In other words, they have not taken into account the economic behavior towards small risk. Thus, later on this paper, we will present and discuss the research study conducted on this area of economic behavior towards small risk.

Arrow (1971) shows that an expected utility maximizers with a differentiable utility function will always want to take a sufficiently small stake in any positive expected-value bet. That is, expected utility maximizers are (almost everywhere) arbitrarily close to risk neutral when stakes are arbitrarily small. Certainly, this circumstance will arise when the stakes are negligible or substantially small and the loss or gain will not affect the gambler economically. Eventually, invoking the expected utility theory to explain substantial risk aversion over these stakes will bring biased results as the theory actually predicts virtual risk neutrality.

Rabin (2000) provides a theorem that shows the risk-neutrality implication of expected utility is not restricted to particular contexts, particular functional forms, or negligible stakes. Assuming nothing about the utility function except that it is increasing and concave, the theorem allow us to make statements of the form: “If an expected utility maximizer always turns down modest-stakes Gamble A, she will always turn down large-stakes Gamble B.

The intuition for the theorem itself is that within the expected-utility framework, turning down a modest-stakes means that the marginal utility of money must diminish very quickly for a small change in wealth. Indeed, the theorem is merely an algebraic articulation of how implausible it is that the consumption value of dollar changes significantly as a function no matter how much is the wealth that we hold. In other word, we should conclude that aversion to modest-stakes risk has nothing to do with the diminishing marginal utility. This contradiction
with assumption of expected utility theory again enhance that the theory can be very misleading in analyzing risk attitudes towards modest stakes.

Rabin and Thaler (2001) make the above assumption to establish the implausibility of expected utility theory by showing that absurd large-stakes risk aversion (rejecting Gamble B) follow inherently from non-negligible modest-scale risk aversion (rejecting Gamble A). The logic behind this result is that within the expected utility framework turning down a moderate stakes gamble means that the marginal utility of money must diminish very quickly.

Rabin (2000) also demonstrates a simple gamble to enhance this assumption. Suppose that you have initial wealth of $W$, and you reject a 50 - 50 lose $10/gain $11 gamble because of diminishing marginal utility of wealth. Then it must be that:

$$U(W + 11) - U(W) \leq U(W) - U(W - 10)$$

Hence, on average you value each of the dollars between $W$ and $W + 11$ at most 10/11 as much as you, on average, value each of the dollars between $W - 10$ and $W$. By concavity, this implies that you value the dollar $W + 11$ at most 10/11 as much as you value the dollar $W - 10$. Iterating this observation, if you have value dollar $W + 21 - 10 = W + 11$, which means you value dollar $W + 32$ by at most 10/11 x 10/11 = 5/6 as much as dollar $W - 10$. You will value the $W + 210^{th}$ dollar by at most 40% as much as dollar $W - 10$, and the $W + 199^{th}$ dollar by at most 2% as much as dollar $W - 10$. Rejecting the 50 - 50 lose $10/gain $11 gamble implies a 10% decline in marginal utility for each $21 in additional lifetime wealth, meaning that the marginal utility plummets for substantial change in lifetime wealth.

The theorem in Rabin (2000) shows that any attempt to explain attitudes about modest risk in terms of the utility of lifetime wealth would imply a paralyzing aversion to risks that everyone finds extremely attractive. Rabin’s Theory also demonstrates that people will not be averse to risks involving monetary gains and losses that do not alter lifetime wealth enough to affect significantly the marginal utility one derives from that lifetime wealth. He concludes that risk aversion pertains to large stakes and not small stakes merely an artifact of the structure of expected utility theory.

Another observation made by Samuelson (1963) showed that expected utility theory’s presumption that attitudes towards moderate-scale and large-scale risks derive from the same utility-of-wealth function relates to a widely discussed implication of the theory: that people have approximately the same risk attitude towards an aggregation of independent, identical gambles as towards each of the independent gambles. This was inconsistent with expected utility theory, which implies that if (for some range of wealth level) a person turns down a particular gamble, then the person should also turn down an offer to play many of those gambles.

Samuelson (1963) enhanced his statement by offered his colleague a bet in which he could flip a coin and either gain $200 or lose $100. His colleague declined the bet but willing to accept 100 such bets together. The aggregated gamble of 100 50-50 lose $100/gain $200 bets has as expected return of $5,000, with only a 1/ 2,300 chance of losing any money and merely a 1/ 63,000 chance of losing more than $1,000. No matter what his colleague expected utility, since the degree of risk aversion he exhibited proved he was not an expected utility maximizer. In fact, under the same assumptions by Samuelson, Rabin implies that a risk-averse expected utility maximizer who turns down a 50-50 lose $100/gain $200 gamble will turn down lose $200/gain
$20,000 gamble. This has an expected return of $9900 with exactly zero chance of losing more than $200.

3. Discussion
Expected utility theory may well be a useful model of the taste for very large scale stakes or insurance but not for small scale stakes. Besides its usefulness, however, there are reasons why it is important for economists to recognize how miscalibrated expected utility theory is as an explanation of modest-scale risk aversion. For example, some research methods economists recently employ should be abandoned because they rely significantly on the expected utility interpretation of modest-scale risk aversion.

3.1 Quantitative
3.1.1 Expected utility theory is not sufficient to explain neutralizing risk aversion
Recent years, there has been laboratory research in economics in which subjects interact to generate outcomes with payoffs on the order of $10 to $20. Researchers are often interested in inferring subjects’ beliefs from their behavior. Doing so often requires knowing the relative value subjects hold for different money prizes. If a person chooses $5 in event A over $10 in event B, we know that she believes A is at least twice as likely as B only if we can assume the person likes $10 exactly twice as much as $5. Experimentalists (Davis and Holt, 1993, 472 -476) have developed a clever scheme to avoid this problem: Instead of prizes of $10 and $5, subjects are given prizes such as 10% chance of winning $100 vs. 5% chance of winning $100. Expected utility theory tells us that irrespective of the utility function, a subject values the 10% chance of a prize exactly twice as much as the 5% chance of winning the same prize.

Rabin (2000) found that this laboratory procedure is known to be sufficient only when we maintain the expected utility hypothesis. If the statement of expected utility ‘people will be virtually risk neutral in decision on the scale of laboratory stakes’ is right, then the above procedures are at best redundant and harmful. Conversely, if the subjects are risk averse, then they are not expected utility maximizers. Hence, the assumptions that preferences are linear in probabilities and that risk attitudes come only from the curvature of the utility of wealth function, has little presumptive value in “neutralizing” risk aversion. This observation proves that expected utility theory is not sufficient to explain neutralizing risk aversion.

3.1.2 Problem in the scale of comprising data
Rabin (2000) also demonstrates another problematic of research methods is expected-utility theory makes wrong predictions about the relationship between risk aversion over modest stakes and risk aversion over large stakes. Hence, when measuring risk attitudes maintaining the expected-utility hypothesis, differences in estimates of risk attitudes may come from differences in the scale of risk comprising data sets, rather than from differences in risk attitudes of the people being studied. Data sets dominated by modest-risk investment opportunities are likely to yield much higher estimates of risk aversion than data sets dominated by larger-scale investment opportunities. So not only are standard measures of risk aversion somewhat hard to interpret given that people are not expected-utility maximizers, but even attempts to compare risk attitudes so as to compare across groups will be misleading unless economists pay due attention to the theory’s calibrational problems.

3.1.3 Amalgamation bet
The problems with assuming that risk attitudes over modest and large stakes derive from the same utility of wealth function relate to a long-standing debate in economics. Expected-utility theory makes a powerful prediction that economic actors don’t see an amalgamation of
independent gambles as significant insurance against the risk of those gambles; they are either barely less willing or barely more willing to accept risks when clumped together than when apart. This observation was introduced in a famous article by Samuelson (1963), who showed that expected-utility theory implies that if (for some sufficiently wide range of initial wealth levels) a person turns down a particular gamble, then she should also turn down an offer to play n > 1 of those gambles. Hence, in his example, if Samuelson’s colleague is unwilling to accept a 50-50 lose $100/gain $200 stake, then he should be unwilling to accept 100 of those gambles take together. Though Samuelson’s theorem is “weaker” than Rabin’s Theorem, it makes manifest the fact that expected-utility theory predicts that adding together a lot of independent risks should not appreciably alter attitudes towards those risks.

Obviously everyone would find the aggregated gamble of 100 50-50 lose $100/gain $200 bets attractive. It has an expected yield of $5,000, with negligible risk: There is only a (1/700) chance of losing any money and merely a (1/25,000) chance of losing more than $1,000. While nobody would turn down this gamble, many people might reject the single bet. Thus, using expected-utility theory to make inferences about the risk attitudes towards the amalgamated bet from the reaction to the one bet – or vice versa – would be misleading.

What is empirically the most firmly established feature of risk preferences, loss aversion, is a departure from expected-utility theory that provides a direct explanation for modest-scale risk aversion. Loss aversion says that people are significantly more averse to losses relative to the status quo than they are attracted by gains and more generally that people’s utilities are determined by changes in wealth rather than absolute levels. Preferences incorporating loss aversion can reconcile significant small-scale risk aversion with reasonable degrees of large-scale risk aversion. A loss-averse person will, for instance, be likely to run down the one 50/50 lose $100/gain $200 gamble Samuelson’s colleague turned down, but will surely accept one hundred such gambles pooled together. Variants of this or other models of risk attitudes can provide useful alternatives to expected-utility theory that can reconcile plausible risk attitudes over large stakes with nontrivial risk aversion over modest stakes.

3.1.4 Measurement of Risk Aversion

The aversion to risk implied by a utility function u seems to be a form of concavity, and one might set out to measure concavity as representing aversion to risk. For this purpose,

\[ r(x) = -u''(x)/u'(x) \]

can be considered a measure of the concavity of u at the point of w. A case might perhaps be made for using instead some one–to-one function of r(x), but it should be noted that u"(x) or -u"(x) is not in itself a meaningful measure of concavity in utility theory no is the curvature. Multiplying u by a positive constant, for instance, does not alter behavior but does alter u"(x) and the curvature.

A more striking and instructive example is provided by the function \( u(x) = -e^{-x} \). As x increase, this function approaches the asymptote u = 0 and looks graphically less and less concave and more and more like a horizontal straight line, in accordance with the fact that \( u'(x) = e^{-x} \) and \( u''(x) = -e^{-x} \) both approach 0. As utility function, however, it does not change at all with the level of assets x, that is, the behavior implied by u(x) is the same for all x. All this is duly reflected in r(x), which is constant: (Pratt, 1964)

\[ r(x) = -u''(x)/u'(x) = -e^{-x} / e^{-x} = 1, \quad \text{for all } x \]

(2)
Therefore, economists have to take into account that it is important to obtain the precise value of aversion before further investigating one’s behavior towards risk. Otherwise, the outcome of any theory in explaining one’s attitudes towards risk is meaningless.

3.1.5 Myopic Loss Aversion in Risk Aversion

The myopic loss aversion explanation rests on two behavioral principles: loss aversion and mental accounting. Loss aversion refers to the fact that people tend to be more sensitive to decreases in their wealth than to increases. This reflected in the prospect theory value function that has a kink at the origin. Empirical estimates find that losses are weighted about twice as strongly as gains. Mental accounting is the set of (implicit or explicit) cognitive activities that individuals and households engage in to serve the same function that regular accounting serves in as organization. In the context of financial transactions, the key mental accounting issues concern aggregation: how transactions are grouped both cross-sectionally (e.g., are securities evaluated one at a time or as portfolios) and intertemporally (how often are portfolios evaluated). A financial investor can be modeled as making a series of decisions about the allocation of his assets.

Loss aversion and mental accounting are well illustrated by a famous example due to Samuelson (1963). Using the same observation in section 2.4, Samuelson proved a theorem showing that this pair of choices is irrational. That is, someone should not be willing to play a bet many times if he is not willing to play just once. Samuelson’s friend was evidently loss averse, but not myopic. A myopic decision maker will first determine whether he likes the prospect of the initial gamble in the series, will conclude that he does not, and consequently reject the entire series.

The argument developed by Thaler et al. (1997) is that the price of financial assets reflects the preferences of investors who are both loss averse and myopic. Their subjects were so myopic that they simply did not distinguish the tasks of deciding on an allocation for 400 trials and for a single trial. This result also shows that the subjects do not realize that they suffer from myopic loss aversion – they are unsophisticated about their malady. If they were sophisticated but unable to control themselves, then, when offered the opportunity to commit themselves for 400 trials with no interim feedback, they would take the opportunity to accept more risk or vice versa. Through experience, the investors who vary in myopia will learn to gravitate to a lower level of risk and earn less money. Investors will turn their intention from high risk trials to lower risk trials. This condition is inconsistent with the expected utility theory that once you reject a single bet, you will reject the entire bets.

3.1.6 Degree of Relative Risk Aversion

Rabin and Thaler (2001) concluded that in the case of a risk-averse expected utility maximizer who turns down a 50-50 chance of losing $10 and winning $11 for any initial wealth level due to the diminishing marginal utility, then this individual would also turn down all bets involving a 50-50 chance of losing $10 and winning even an infinite amount of money. Watt (2002) commented on their statement that since the large-stakes bets should obviously be taken, then it may be incorrect that the moderate-stakes bets should be turned down in the first place. To illustrate the counterargument, Watt (2002) demonstrates a quantitative test by using a simple utility function: \( U(x) = \ln(x) \), where \( x \) is income. An individual turns down the 50-50 chance of losing $10 and winning $11 at an initial wealth level of \( w \), which implies that \( \ln(w-10) + \ln(w+11) < 2\ln(w) \). Let individual wealth, \( w = 109 \), a 50-50 chance of losing $100 and
winning $Y$ will be accepted if $\ln(99) + \ln(109 + Y) \geq 2\ln(109)$ if $Y \geq 1,211.11$. Thus for the utility function and with a starting wealth level of $109$, the individual will turn down the 50-50 chance of losing $10$ and winning $11$, but will accept a bet of losing $100$ and winning any amount $Y$ in excess of $1,211.11$.

Watt (2002) explained that for someone with a very high initial level of wealth, this bet poses very little risk, and so turning it down requires an extraordinarily high level of risk aversion. But if the person has an extraordinarily high level of risk aversion in turning down the bet for even moderate stakes, then the person will also have an extraordinarily high level of risk aversion in turning down bets for large stakes. Using Pratt’s approximation, Watt showed that absolute risk aversion at wealth $w$ is approximately equal to $\frac{2(w+E(L) - C(L, w))}{V(L)}$ where $L$ denotes a lottery with expected value $E(L)$, variance $V(L)$ and certainty equivalent at wealth $w$ of $C(L, w)$. The rejection of the 50-50 bet of gaining $105$ and losing $100$, with the initial wealth $350,000$ implies that relative risk aversion would have to be greater than 166.57. Watt concluded that for a person with a high level of wealth to turn down a bet for even moderate stakes that has a positive expected value would require either an unreasonably high level of risk aversion, or some other unusual peculiarity in the utility function. Otherwise, the individual will not reject both large-scale bets and moderate-scale bets. Therefore, the Expected utility theory certainly faces its share of problems in explaining certain kinds of empirical evidence, as do other competing theories.

### 3.2 Qualitative

#### 3.2.1 Reference Level

How psychological findings suggest modifying the utility function that economists employ through years. Researchers have identified a pervasive feature of reference dependence. In a wide variety of domains, people are significantly more averse to losses than they are attracted to same-sized gains (Kahneman et al., 1990). One realm where such loss aversion plays out is in preferences over wealth levels. Tversky and Kahneman (1992) suggest that in the domain of money (and in others where the size of losses and gains can be measured), people value modest losses roughly twice as much as equal-sized gains. That the displeasure from a monetary loss is greater than the pleasure from same-sized gain is also implied by a concave utility function, which typically use as the explanation for risk aversion. But loss aversion says that the value function abruptly changes slope at the reference level, so that people prefer their status quo to a 50/50 bet of losing $10$ or gaining $11$. The standard concave-utility-function explanation for risk aversion is simply not a plausible explanation of such risk attitude.

Mehra and Prescott (1985) and Epstein and Zin (1990) have, for instance, observed that the utility-function framework cannot simultaneously explain both small-scale and large-scale risk attitudes implied by macro data. Rabin (2000) also supported this claim by providing a “calibration theorem” that indeed show that no concave utility function can simultaneously explain plausible small-scale and large-scale risk attitudes.

### 4. Conclusion

We have focused on some of the major theories of economic behavior towards risks and its efficiency of explanation toward large risks and small risks. Due to the inability of the expected utility theory to provide a plausible account of risk aversion over modest stakes, we also discuss the possibilities that may cause an ambiguous explanation of modest-scale risk aversion. This is crucial especially for the research methods that rely extensively on the expected utility interpretation.
This paper lends further support to the contention that an expected utility preference representation with a single utility function is unable to describe behavior towards both small, moderate stakes risk and large stakes risks. We show that the coefficients of constant relative risk aversion compatible with wage fatality risk premium data are smaller than the coefficients compatible with portfolio choice data, suggesting that utility functions used to evaluate large-stakes risk are less risk averse than those used to evaluate small or moderate-stakes risks. This result is compatible with the theoretical analysis presented by Rabin (2000).

Besides expected utility theory and the above-mentioned theories, there are plenty of other theories used by researchers in explaining risk behavior towards risk. However, it is hardly worthwhile trying to conclude which theory could possibly best replace another. Also, given the fact that recent years have not seen the influx of new literature related to the expected utility theorem in explaining risk averse behavior; therefore, it is hoped that this paper would help to stimulate the development of new variants of the models of risk attitudes, that could offer useful alternatives to the standard theory that could possibly resolve both plausible risk attitudes over large risks with nontrivial risk aversion over small risks.

Impact of Culture on Employees' Trust in Management: Evidence from Pakistani Banking Sector

Tariq Hussain Khan,
MBA (HRM), MS Scholar, Riphah International University, Islamabad, Pakistan

Muhammad Maalik
MBA, MS Scholar, Riphah International University, Islamabad Pakistan

Abstract

The main purpose of this paper was to examine and analyze the impact of cultural dimension of Power Distance, given by Hofstede, on factors which manipulate the employees’ insight regarding the trust-worthiness of management. This research is estimated to validate the hypotheses related to probable moderating influence of High Power Distance on the relationship between employees’ participation, autonomy, feedback and goal clarity (independent variables) and trust in management (dependent variable). Culture plays an important role in employees’ trust in the management and the most important cultural dimension of Power Distance, is analyzed in this paper. Pakistani culture has been defined by Hofstede as High Power Distance (HPD). A sample of 120 employees of private sector banks located in Rawalpindi and Islamabad was studied. The results indicated that HPD had negative effect on relationships of independent and dependent variables. The employees’ participation, goal clarity and autonomy are significantly influenced by HPD in Pakistani culture, whereas employees’ feedback is not influenced by HPD.

Key Words: Power Distance, Trust in Management, Employees’ Participation, Autonomy, Goal Clarity, Feedback.

INTRODUCTION

The function of Trust in Organizations’ Performance has gained considerable importance in the recent past as organizations shift away from monitored style of control and supervision, to greater employee empowerment, autonomy, and introduction of changed organizational structures such as “self-directed and self-managed teams” (Connell & Mannion, 2006). HR managers can have a positive impact on employees by inculcating trust and confidence in the organization and the management (Tzafrir et al, 2003). Organizational Environments where employee's participations are always welcomed and positively considered, lead to a greater trust in management. Building trust between employees and management is considered essential for success of organizations in all countries and cultures. However, the degree of trust varies in cultures. As identified by Seal (1998) and Coleman & Mannion (2006), culture affects the trust of employees in management because trust is enhanced by interactions of individuals and the trust most importantly depends upon the organization and the social structure and culture of the country. Hofstede had studied culture over many years and gave five important dimensions which could be found common in all regions, cultures and countries (Hofstede, 1984). One of the most important dimensions of culture is power distance which refers to the extent to which a society tolerates power differences as well as accepts status privileges (Carl, Gupta, & Javidan, 2004). Employees’ trust in the supervisor/ manager may differ depending on the kind of cultural support given to the power distance. Pakistan is considered to be high power distance (HPD) country as indicated by Hofstede cultural dimensions (Hofstede Cultural Dimensions of Pakistan available at http://www.geert-hofstede.com/hofstede_pakistan.shtml).
The ever changing world economy, pressures from competitors, and changing customer preferences have placed organizations including banking sector right on the threshold of constant change. These factors coupled with environmental ambiguity in Pakistan have put many organizations in a vicious competition of gaining more and more of the market share. Trust in management is becoming significant to motivate the employees and to retain the talent. Some of the variables that contribute to trust in management are employees’ participation, feedback, goal clarity and autonomy. Yoon et al. (2001) had emphasized on managers’ concern and support for staff work to create climate of trust, support and cooperation. Sharkies’ research (2005) on employees’ perception of trust is also very important. These research findings indicate that organizations have to develop clear and open communication means to enhance Goal Clarity, Employee Participation and eventually the Trust in Management. These findings also strengthen Coleman’s view of “Social organization of trust” (1984). An environment of support, trust, and cooperation from the senior management gives employees greater control over their work efforts in order to achieve their job goals (Brown & Leigh, 1996).

This paper is an exploratory examination that considers the cultural impacts on Employees’ Trust in Management. For this purpose we have chosen an important dimension of Pakistani culture i.e. HPD (High Power Distance) and its’ impact on employees’ trust in management. The other dimensions of culture i.e. Uncertainty Avoidance, Short term Vs Long term Orientations, Masculinity Vs Femininity and Individualism Vs Collectivism, have not been purposely studied so as to have a focused approach to study only one important dimension effecting management. The research was done by using the survey method. The respondents were 120 employees of different private sector banks i.e. Askari Bank, Bank Alfalah, United Mank Limited, Habib Bank Limited, Muslim Commercial Bank and Standard Charted Bank from Rawalpindi and Islamabad. The statistical analysis has revealed that HPD has significant moderating effect on the relationship of independent and dependent variables thus the HPD has negative influence on the positive relationship of Employee Participation, Goal Clarity and Autonomy with an inherently immeasurable concept such as Employee’s Trust in Management in the private Banking Sector of Pakistan. Influence of HPD on relationship of Feedback and Trust was found to be slightly positive instead of negative effect. On the whole, this research supports the divergence theory that employees trust is culture-bound.

This research paper may add new dimensions which may hold value for the HR practices in the leading banks / firms. This paper is expected to help HR managers to devise plans and strategies to foster employee’s trust in management in a complex and volatile industry and culture of high power distance.

Culture and Power Distance in Pakistani Culture

Culture has a complex definition, however most of the researchers commonly agree on the definition given by Kroeber and Kluckhohn (1952) as “Human-made part of the environment”. Hofstede defined culture as “Collective programming of minds” (1994). Culture is influenced by society’s shared values, norms, beliefs, customs, and religion; and above all by individual attitudes and personality (Kluckhohn & H.A. Murray, 1953; Triandis, 1996). Culture is consequent of the social, economic, legal, political, religious norms, values and traditions of the society. Hofstede had indicated that culture shapes the individual behaviour to act differently in various situations in all spheres of life (Hofsted, 1984). Cotgrove (1978) had stated that culture is the shared values, norms and traditions of a social system which are considered the most important aspect of any society.

National culture and organizational culture are frequently mixed with each other. It is therefore imperative to differentiate national culture from organizational culture. An organizational culture differentiates the same kind of organizations within the same country, whereas the national culture distinguishes alike type of people, organizations and countries.
around the world. All organizations continue living in specific socio-cultural environment which affects the individual behaviour and the organizations to a great extent. The research remained mostly focused on organizational culture and its different effects on organizational behaviour. Therefore, modest work was done to analyze the effects of national culture on individuals and organizational behaviours. This research paper fulfills this gap by analyzing the effects of national culture on employees’ trust in management in the context of Pakistan.

Pakistan's national culture is having high degree of power distance; this can be also viewed through the prevalent variety of social classes in Pakistani society. The wealth in Pakistan is very much unequally distributed among various segments of the society. Different classes of the society enjoy different types of lifestyles, education, medical and residential facilities. INSEAD, Europe's newly published recent edition of its Global Innovation Index 2008-2009, which benchmarks the world's most innovative economies, states that Pakistan is ranked at 93 out of 130 countries of the world. (INSEAD Global Innovation Index 2008-2009).

Power Distance Index

Power Distance Index (PDI) can be aptly defined as the degree to which the less authoritative individuals of institutions, organizations and the family groups admit and anticipate that power is distributed disproportionately (Hofstede & Bond, 1984; Hofstede & McCrae, 2004). This represents discrimination (more versus less), but distinctive from below, not from above. It advocates that a society's level of disparity is allowed and accepted by the followers as much as by the leaders. Power and inequality are fundamental and accepted facts of any society and anyone who has some international will be aware that 'all societies are unequal, but some are more unequal than others', this is where discrimination exists.

The Impact of High Power Distance Index (HPDI)

The impact of High Power Distance Index (HPDI) creates societies which are highly rule-receptive and abide by laws, rules, regulations, and controls, while inequality of power and wealth have been accepted and are allowed to prosper within the society. These cultures mostly follow a caste system that negates considerable upward mobility of its citizens (Hofstede, 1984). This type of culture creates a situation where leaders have virtually decisive power and authority and moreover, the rules, laws and regulations are developed by those in power basically reinforce their own leadership and control. It is not abnormal for the new leadership to come up from armed uprising - the ultimate power, rather than from democratic or diplomatic change (Hofstede, 1984). The high degree of power distance index (HPDI) suggests that Pakistani culture and society is highly rule-receptive with laws, rules, regulations, and controls, whereas the imbalances created by power and wealth have been supported to flourish within the society. Pakistani culture is expected to follow a caste system which does not allow upward movement of its citizens and the gap between leader and the followers remains significant.

Trust and Trust in Management (Dependent Variable)

The definition of Trust in the Oxford English Dictionary is given as, “Confidence in or reliance on some quality or attribute of a person or thing, or the truth of the statement”. Robbins (2003) defined trust as, “A positive expectation that another will not act opportunistically”, Mayer et al. (1995) modified the definition as “A positive expectation that another will act benevolently towards others”. Rousseau et al. (1998) defined trust as, “a psychosomatic state comprising the objective to recognize susceptibility based upon positive expectations of the intentions or behaviour of another”. Robert Bruce Shaw (1997) defined trust to mean: Belief that those on whom we depend will meet our expectations of them.

Trust is considered as a critical intangible resource in modern organizations without which they cannot achieve excellence and severe negative consequences of organizational competitiveness may result (Greenberg & Cropanzano, 1990: cited in Tzafrir et al., 2003, p. 630). It is crucial for the organizational success to build a trusting relationship between the employees and the management. Substantial research findings of Dolan & Garcia (2002),
Gambetta (1988), McKnight et al., (1998), suggest that organizations consider ‘trust’ as a desirable attribute. Seal (1998) advocated that the person (or a company or firm) trust may be evaluated by analyzing the characteristics of the company or firm and may be developed by personal interaction between staff, particularly the key-decision makers. The existence of a culture of trust guarantees that the promises are honored by the senior management which would reduce ambiguity to a great extent (Connell & Mannion, 2006). To grow a culture of trust between management and employees is a time intensive process with a display of trust-worthy attitude from the employee’s and management creates reciprocating element of trust. This investment in trust building processes can be lost easily whereas it is difficult to form and establish. Blois, (1999) concluded that in case if the promisor does not honour the promise, he subjects himself to the penalty of never being trusted again” by those who know the incident.

Researchers like Sable (1992); Ghoshal & Moran, (1996) accentuate that unremitting organizational progress and culture might amplify manifold in a high-trust relationship based surroundings. Employees encompassing trust in their supervision might feel equivalence with decision-making values (Martin, 1998). The information sharing related to strategy, financial performance, and operational measures suggests to the organization’s people that they are trusted (Pfeffer & Veiga, 1999).

**Trust in Management and Impact of HPD**

“Trust in Management’ is the only dependent level variable considered in this study. Coleman identified trust as a societal occurrence and not an individual experience. He advocates that trust mostly depends upon the organization and the social and cultural structure of the country. He noted that individuals trust one another perfectly, who in turn trust others, resulting in a, “Social organization of trust” (Coleman, 1984).

As stated earlier, power distance indicates the extent to which organizational members and society accept unequal power sharing (Carl et al., 2004). High power distance (HPD) cultures’ individuals tend to be limited by distinct role expectations that will not let them deviate (Tyler, Lind, & Huo, 1995). It is expected that role of these employees will be more discriminatory by their level of trust in the management. On the other hand, persons from a low power distance (LPD) culture tend to be less controlled by role expectations, permitting them more freedom to deviate behaviorally across situations, depending on trust levels. Reduction of trust in HPD had also been reported by Williams, Whyte & Green (1966) who assert that Peruvians in HPD culture were less trusting of others. Their satisfaction with their supervisor is based less on the socio-emotional qualities of the leader and more on the leader's technical know-how.

As the above literature findings suggest, organizations need to develop clear and open communication means to enhance Goal Clarity, Employee Participation and eventually their Trust in Management. The high scores of Pakistani cultural dimension of power distance suggest reduction of employees’ trust in the management specially the banking sector which otherwise demands strict following the authority and rules/ regulations. This leads us to the first hypothesis of the study.

**H 1: Higher power distance dimension of culture reduces the Trust in Management.**

Four independent level variables have been considered in this study, namely Employee Participation, Feedback, Goal Clarity and Autonomy. Cultural dimension of High Power Distance (HPD) has moderating effect on the relationship of independent variables on dependent variable (Trust in Management).
Employee Participation - Trust in Management and Power Distance

White & Ruh (1973) had defined employee participation as, “The degree to which employees believe that they can make decisions about how they do their work”. It must be noted that employee participation in turn depends upon the support it gets from the organization. The organizational structures and process need to support the employee participation process thus, leading to organizational participation. Strauss, (1998) had defined organizational participation as, “A process which permits employee to exert some influence over his/her work in the organizational environment”.

In this paper we have focused on the employee participation in the context of their “say in the decision making” in the organization. Issues like whom to involve, when to involve; and how to involve, hold significant importance in determining the employee participation. In all, this suggests that regardless of how the participation in decision making is applied, the role and level of participation needs to be made very clear (Ladd & Marshall, 2004). Rausch (1996) had suggested that best results of employee participation are obtained if top management leads the ways by example and encourages others.

As per research evidence a positive relationship exists between employees’ believe that they have the ability to participate in decision making. This supports that there will be positive impact on the work environment (Lawler, 1994; Sullivan, 1992). According to Rausch (1996), the extent to which employees have access to the information, required to participate in decision making serves as a limiting factor. He argues that not every employee shall exercise employee participation but only the ones who are capable to handle increased responsibilities, non routine tasks and possess work - maturity. Maher & Pier sol (1970) had discovered that the direct involvement and participation of employee with his manager in the goal-setting process results in two-fold benefit- firstly, the participation process leads to a greater clarity of what to do and how to evaluate the outcomes, secondly, increased mutual commitment was witnessed upon the agreed upon results.

The high value of power distance in Pakistani culture will not permit employees participation in any decision making. Thus the trust of employees in management will be adversely affected. Since Pakistan is rated higher on the power distance, which should have an impact on the employee participation process in two ways. First, managers may be reluctant to involve employees in goal setting and decision making activities because they may perceive this as "giving up" their own power and authority. In a high power distance culture, this perception of empowerment may cause the concept to be rejected. Second, employees may not accept a more empowered role because they expect the manager to be the person "in control." The above literature review leads to the development of second Hypothesis;

**H 2: The positive relationship of Employee Participation with Trust in Management is reduced due to higher power distance dimension of culture.**

Feedback -Trust in Management and Impact of Culture

Robbins (2003) defined feedback c as the, “extent to which carrying out the work activities as per job requirements results in the individual obtaining direct and clear information about the effectiveness of his or her performance”. Stanley & Standen (2001) had reviewed the work of Rozzell & Gardner (1995) and they have suggested on condition that positive feedback to skeptical workforce, whenever possible, will result in avoiding personal and global attributions for employee failure. Randolph (1995) has concluded that sharing of performance related information with employees will keep them informed about their impacts on organizational outcomes and will raise the employee’s trust in management Ardalan et al. (1994) research results support the assumption that permitting employee’s discretion in decision making process and providing them with outcome feedback will result in to higher quality decisions. These
results substantiate the conviction that by allowing employees’ discretion and providing feedback improves the confidence of fellow workers in each other. The relationship of trust shall encourage exchange of knowledge, mostly during informal exchanges (Dirks, 1999; Dirks & Ferrin, 2001). Kramer & Cook (2004) have concluded that the trust can also endorse sharing of timely and accurate information because trusting associates are extra motivated to be open and visible in their actions and business relationships.

The high power distance (HPD) culture is expected to influence managers' self-ratings. Hofstede had argued that a society's level of inequality is endorsed by the followers as much as by the leaders (Hofstede 1980a; Hofstede, 2001). On contrary, a low power distance (LPD) indicates a more broad-based power distribution in the society, with people's participation at various levels and adequate self-governance. This approach strengthens a cooperative interaction across different power levels and creates a more stable cultural environment (Hofstede, 2001). The power asymmetry in a vertical relationship in a High Power Distance (HPD) environment results in subordinates praising their supervisors at every level. Each person in the chain of command perceives himself to be substandard in comparison with the boss but superior to his subordinates. For this rationale, self-assessments by managers in HPD cultures will tend to reflect their perception and acceptance of their position in the power chain. In Low Power Distance (LPD) cultures on the other hand, the tendencies towards self-promotion and non-acceptance of power asymmetry in the vertical relationship will lead managers boosting their self-evaluations. Research of Bond, Wan, Leung and Giacalone (1985) envisaged that Chinese having culture of high power distance index (HPDI) were keen to accept negative feedback from a senior; such HPD orientations serve to authenticate the authenticity of unequal power distributions among various members.

James (1993) recommends that individuals with low power distance (LPD) orientation will exhibit less respect to authority and will react poorly to feedback that indicates areas needing improvement. Buckley & Ghauri (1999) concluded that in HPD orientation, learning involves receiving knowledge from teacher or mentor (i.e., guru) whose methods are not questioned; leaders are rigid in style and juniors or subordinates are expected to perform based on these instructions. Hofstede (1984) asserts that, in a LPD context, people with formal authority are “not supposed to look powerful”; in other words, they are professed more as colleagues on a virtually equal footing as the subordinate/junior.

One may feel safe to assume that people have a preference for positive feedback; whereas certain people might have a higher tolerance for negative feedback. A HPD context accepts the unequal distribution of authority within an organization, and as such members recognize that negative feedback from a superior is virtually unavoidable (Bond et al., 1985; Hofstede, 1980b). The superior/senior functions as a mentor that conveys wise guidance (Buckley & Ghauri, 1999); as a result, subordinates/juniors receive any feedback – positive or negative – as helpful and unquestionably productive. Managers with HPD culture favour routine working and prefer to avoid suspicions in their decision making. They prefer having clear rules, regulations and guidance. Moreover, they are also motivated by having legitimate procedures and protocols and are supporters of human resource-related issues such as training, development and empowerment.

The analysis of above literature suggests that impact of high power distance adversely affects the employees trust in management, especially once the feedback is not based on fairness. This leads to the third hypothesis of the study,

**H 3: The positive relationship of Employee Feedback with Trust in Management is reduced due to higher power distance dimension of culture.**
Goal Clarity - Trust in Management and Impact of HPD

Maher & Piersol (1970) concluded that lack of transparency on the part of an employee concerning his or her own job or the overall assignment of his / her position will result in major negative consequences. Maher & Piersol (1970) also concluded in their study that the “…….sources of frustration- lack of professed clarity about person and group work goals / objectives and to relate the results to the organizational communication process”. The findings of Maher & Piersol had confirmed that the more role clarity will result in a comparatively high measure of cohesiveness, teamwork and cooperation within his/ her working entity or unit and between his/ her unit and other working units at the location.” Maher & Piersol (1970) have also claimed that the employee-involvement approach increases goals / objectives clarity and thus decreasing significant amount of frustration from the work situation. Increased goal clarity leads to job satisfactions which in turn involve a critical need for meticulous understanding of communication media as well as ability in oral and written communication skills in order for an administrator to be successful (Maher & Piersol, 1970). Stanley & Standen (2001) quoted Gollwitzer & Moskowitz, “Because ……. there is often a long way from goal-setting to goal attainment’ (1996, p. 368), ways should also be found to support key workers who are faced with unexpected failures of goal planning.”

Improper or ineffective communication and clarity regarding the job increases ambiguity and decreases employee’s perceptions of management trustworthiness (Schweiger & DeNisi, 1991). Apparently, training key workers to improve the technical quality of their goal setting is an important prerequisite (Cardillo & Choate, 1994). Stanley & Standen (2001) had reviewed the work of Harris & Rosenthal (1985) who reported that positive expectations about others were found to be associated with more admire, support, feedback, input and acceptance than for those for whom expectations were negative. Erez & Earley (1987) had examined the impact of cultural differences on goal reception; one of the cultural variables was power distance. People with a HPD orientation accepted the unequal power distribution and believed that it was acceptable for superiors/ seniors to have a great degree of power over subordinates/ juniors (Hofstede, 1980b). On the contrary, employees with LPD orientations have a tendency to develop a strong, personal connection with their seniors/ superiors (Tyler, Lind & Huo, 1995). This type of relationship may distort the lines of authority because the junior / subordinate might be somewhat dependent on goal clarity and positive feedback which enhances the relationship.

The analysis of above literature suggests that impact of high power distance negatively affect the employees trust in management, especially once the goal clarity is not there. This leads to the fourth hypothesis of the study.

H 4: The positive relationship of Goal Clarity with Trust in Management is decreased due to higher power distance dimension of culture.

Autonomy - Trust in Management and Impact of Culture

Metaal (1992) defined autonomy as; “Individuals make their own choices independent of others.” Robbins (2003) defined autonomy as, “The degree to which the job provides considerable freedom and discretion to the individual to schedule his/ her work and in determining the procedures to be used in carrying it out”. Melhem (2003) defined autonomy as “An employee’s perception that he or she uses his/ her capability of discretion and freedom when dealing with customers/ clients. It replicates the amount of confidence among employees.” In this competitive era, the organizations have to look beyond the traditional directive styles of management. Now the employees are involved and they feel autonomous. Pfeffer (1994, p. 41 cited in Melhem, 2003) stated sharing information as: It is an important feature found in many successful work systems that decentralization of decision making and more worker participation
and empowerment in controlling his/ her own work process. Organizations those who empower lower levels of employees in order to enhance organizational performance might be at risk and it might create ambiguity in association with employee’s reaction to such initiatives (Tzafrir et al., 2003).

Kirkman & Shapiro (1997) state “Employees from HPD cultures expect managers to lead, and they become uncomfortable with both the delegation of discretionary decisions and the role ambiguity that may result from taking on new tasks … management approaches granting employees more autonomy and responsibility may not be suitable for employees from HPD cultures.” In HPD culture, the companies that have no employee involvement have no or very limited market orientation and success. In HPD culture managers are afraid of giving autonomy to the employees. They fear that employees might involve themselves in unwarranted activities and might not follow the rules and regulations of safe practices. The analysis of above literature suggests that impact of HPD adversely affect the employees trust in management, especially once employees are not given autonomy. This leads us to the fifth hypothesis of the study.

**H 5:** The positive relationship of Autonomy with Trust in Management is decreased due to higher power distance dimension of culture.

**THEORETICAL FRAME WORK**

![Diagram of theoretical framework](image)

Source: Researchers’ own processing.

**Methods**
The details regarding population, sample size, sampling procedure and data collection measures are given below.

*Population:* Banking Sector at Rawalpindi & Islamabad.

*Sample Size:* 120

*Sampling Procedure*
Convenient sampling technique was used and questionnaires were distributed to the employees of Askari Bank, Askari Bank, Bank Alfalah, UBL, HBL, MCB & Standard Charted Bank from Rawalpindi and Islamabad. A covering letter was attached with questionnaire which...
explained the purpose and scope of the study and respondents were assured about confidentiality of information provided by them. Out of 150 questionnaires issued 120 filled surveys were received back making the response rate of 80%.

**Measures**

Questionnaire was used as secondary method to collect data from respondents. The question items were taken from the sources identified in Table 1. The same have already been deployed by Weber & Weber (2001) and Yoo, 1996). Questionnaire is attached as Annex-A.

Table 1: Sources of Questionnaire Items adapted from Weber & Weber (2001) and Yoo, 1996).

Four Independent and One Dependent Variables and culture (HPD) as Moderator were employed in the Study. The scale used was a seven point Likert-Scale. Reliability of each scale was measured through SPSS Version 16, which is between 70.4 to 83.6% (Table1). This is considered ideal scales for conducting social sciences research.

**Trust in Management**

This was the only Dependent level variable. Four items were places in the questionnaire. The items included like, “Do you trust your supervisor?” and “Does management treat you with respect?” The Seven Item Likert scale used 1 as Never and 7 as Always.

**Employee Participation**

It was the first independent level variable. Four items were places in the questionnaire. The items included were like, “Can you influence your supervisor’s decisions?” & “Does your supervisor accept your ideas and suggestions?” The Seven Item Likert scale used 1 as Never and 7 as Always.

**Feedback**

It was the second independent level variable. Five items were placed to assess feedback. The items included were like, “The feedback from my supervisor, on how well I am doing?” & “The opportunity to find out, how well I am doing on my job?” The Seven Item Likert scale used 1 as Very Little and 7 as Very Much.

**Goal Clarity**

It was the third independent level variable. Six items assesses goal clarity. The items included like, “Are the organization’s goals clear to you?” The Seven Item Likert scale used 1 as Never and 7 as Always.

**Autonomy**

It was the last independent level variable. Six items were places in the questionnaire. The items included like, “How much are you left on your own to do your own work?” & “The freedom to do pretty much what i wants on my job?” The Seven Item Likert scale used 1 as Very Little and 7 as Very much.

**Power Distance**

It was the only moderating variable used in this study. Seven items assesses power distance. The items included like, “People in higher positions should make most decisions without consulting people in lower position.” The Seven Item Likert scale used 1 as Very Little and 7 as Very Much.
Statistical Tools
Statistical tools of software such as SPSS version 16 was used to calculate the Correlation between independent variables and dependent variables. As a further step of the analysis, Linear Regression was used to find out combined effect of all the independent variables on dependent variable and Moderated Regression was used to find out moderation of cultural dimension of Power Distance. Higher scores represent the higher reported levels of variables.

Results
Results were obtained through SPSS Version 16, which included demographic details, correlation analysis, regression analysis and moderating regression analysis.

Demographics
Demographic details of the sample, though not used in this paper, included Employee Designation, Gender, Age, Education, Religion, Marital Status, Type of Employment (contractual or regular), Work Experience, Overtime Paid and Extra Work Required in the Job (Refer to Table 2). In this study, these control variables were ascertained directly through the questionnaire. Table 3 provides the Means, Standard Deviations and Correlations among the study variables. The mean for employees trust in management was 4.9229 and S.D=1.09275 on scale of 1 to 7, which was above 70%.

**, Correlation is significant at the 0.01 level (2-tailed).
*, Correlation is significant at the 0.05 level (2-tailed).

Table 3 above indicates correlation analysis of all the variables i.e. Trust in Management (Dependent Variable), Power Distance (Moderating Variable) and Employee Participation, Goal Clarity, Autonomy and Feedback (Independent Variables). The table shows that Trust has positive and significant relationship with Employee Participation (Correlation .315 at p< .000) and Goal Clarity (Correlation .493 at p< .000). It has positive but insignificant relation with Autonomy (Correlation .055 at p< .552) and Feedback (Correlation .090 at p< .327), whereas it has negative and significant relationship with moderating variable Power Distance (Correlation -.190 at p< .038).

* a. Dependent Variable: Trust

**Table 4. Results of Regression Analysis of the study.**

Regression analysis of the study indicates that all the independent variables have a combined affect of 32.2 % (R square .322) on the trust in the management whereas other factors also contribute in enhancing trust in management.

**Moderated Regression and Hypotheses Testing**

Moderated regression analysis was conducted through SPSS version 16 in three steps. In step-1 the demographics were controlled, in step-2 mean of each independent variable and mean value of Power Distance (moderating variable) was fed in. In step-3 interaction term (IV*MV) of respective independent variable was put in to compute moderated regression. Results of moderated regression of each independent variable were found as given below.

Table 5b. Results of Moderated Regression indicating effects of Power Distance on the relationship of Employee Participation & Trust.

H1 posits that High Power Distance would reduce Trust in Management. Table 3 indicates significant negative relationship of High Power Distance and Trust (Correlation -.190 at p< .038). This validates H1 that High Power Distance will reduce the Trust of employees in the management.

H2 posits that the positive relationship of Employee Participation with Trust in Management is reduced due to higher power distance dimension of culture. Correlation Analysis at Table 3 indicates that Employee Participation has significant positive relationship with Trust in Management (Correlation .315 at p< .000). Regression Analysis at Table 4 indicates that Employee Participation contributes significantly in building trust in management (b= .256, t= 3.556 at p< .001). Whereas Moderated Regression Analysis Table 5b indicates that interaction of Employee Participation (b=.253, t= 2.936 at p< .004) with cultural dimension of High Power Distance has reduced the relationship of Employee Participation with Trust (b= -.419, t= -1.568 at p< .120). This substantiate H2 that High Power Distance effects negatively the relationship between Employee Participation and Trust in Management.

H3 posits that the positive relationship of Employee Feedback with Trust in Management is reduced due to higher Power Distance dimension of culture. Correlation Analysis at Table 3 indicates that Employee Feedback has insignificant positive relationship with Trust in Management (Correlation .090 at p< .327). Regression Analysis at Table 4 indicates that Employee Feedback contributes in building trust in management though not significantly (b= .011, t=.132 at p< .895). Whereas Moderated Regression Analysis Table 6b indicates that interaction of Employee Feedback (b=.139, t= 1.575 at p< .118) with cultural dimension of High Power Distance has slightly enhanced the relationship of Employee Feedback with Trust (b= .196, t=.458 at p< .648). This negates H3 that High Power Distance effects negatively the relationship between Employee Participation and Trust in Management. Thus H3 has not been proved.

Table 7b. Results of Moderated Regression indicating effects of Power Distance on the relationship of Goal Clarity & Trust.

H4 posits that the positive relationship of Goal clarity with Trust in Management is reduced due to higher Power Distance dimension of culture. Correlation Analysis at Table 3 indicates that Goal Clarity has significant positive relationship with Trust in Management (Correlation .493 at p< .000). Regression Analysis at Table 4 indicates that Goal Clarity contributes much in building trust in management significantly (b= .526, t=6.077 at p< .000). Whereas Moderated Regression Analysis Table 8b indicates that interaction of Goal Clarity (b= .473, t= 6.063 at p< .000) with cultural dimension of High Power Distance has reduced the relationship of Goal Clarity with Trust (b= -.161, t= -1.325 at p< .188). This proves H4 that High Power Distance effects negatively the relationship between Goal Clarity & Trust in Management.

Table 8b. Results of Moderated Regression indicating effects of Power Distance on the relationship of Autonomy & Trust.

H5 posits that the positive relationship of Autonomy with Trust in Management is reduced due to higher Power Distance dimension of culture. Correlation Analysis at Table 3 indicates that Autonomy has positive relationship with Trust in Management though not significant (Correlation .055 at p< .527). Regression Analysis at Table 4 indicates that Autonomy does not contribute much in building trust in management significantly (b= -.067, t= -.802 at p< .424). Whereas Moderated Regression Analysis Table 8b indicates that interaction of Autonomy (b= .087, t= .962 at p< .338) with cultural dimension of High Power Distance has reduced the relationship of Autonomy with Trust (b= -.597, t= -1.520 at p< .132). This proves H5 that High Power Distance effects negatively the relationship between Autonomy and Trust in Management.

DISCUSSION

The results of this study are mostly in accordance with expectations. As hypothesized, Cultural dimension of High Power Distance had a significant effect on the relationship of independent variables (Employee Participation, Feedback, and Goal Clarity & Autonomy) and dependent variable Trust in Management. However, High Power Distance did not significantly affect relationship of Employee Feedback with Trust in Management for the High Power Distance society of Pakistan. The lack of association for Employee Feedback in the Pakistan is contrary to provide a strong empirical support for the proposed model. However, the effect is negligible. Thus H3 of the study is not substantiated whereas remaining four hypotheses of the study have been proved. The fact that power distance did not show a strong moderating effect is perhaps due
to the weak correlation of Employee Feedback and Trust which is .090 at p< .327. Moreover, due to better educated sample of the study and improper feedback of employees’ performance by the managers could also contribute to a weaker relationship Employee Feedback and Trust and thus insignificant moderating effect of power distance. The power distance scores may simply not enough to capture a strong moderating effect, especially given the small sample size of 120 employees. Nonetheless, there is still sufficient evidence for the moderating role of power distance on other independent variables.

Employee Feedback from managers in High Power Distance may not be the true reflection of their performance moreover employees from HPD culture would tend to accept negative feedback from their managers and seniors due to the authoritative positions of the management. This had been found in Chinese HPD culture in which employees were keen to accept negative feedback from a senior; such HPD orientations proves the authenticity of unequal power distributions among various members (Bond, Wan, Leung & Giacalone, 1985). This could also support the unexpected results of Employee Feedback found in this study.

Pakistani culture with high degree of power distance index (HPDI) demands that and society is highly rule receptive and laws, rules, regulations etc. are followed which is more pronounced in most of the government departments and banking sector. People of high power distance (HPD) cultures would want to have a situation of high separation of those who do and who do not hold power.

It has been amply supported by research that people with HPD culture accept the unequal distribution of power and wealth and it is acceptable for superiors/ seniors to have a great degree of power over subordinates/ juniors (Hofstede, 1980b). Whereas the employees with LPD culture tend to grow a strong personal association with their seniors, managers and superiors (Tyler, Lind & Huo, 1995). This type of relationship would tend to distort the lines of authority because the junior / subordinate might be somewhat dependent on goal clarity and positive feedback which enhances the relationship. HPD culture suggests learning by receiving knowledge from teacher or mentor (i.e., guru) whose methods are not questioned (Buckly & Ghauri, 1999). The leaders are found rigid in their style and subordinates are expected follow the instructions of their seniors / leaders.

The negative impact of High Power Distance culture would reduce the goal clarity of the employees specially of banking sector because employees in HPD tend to agree that the goal setting process is an exercise of the manager's power and so the manager is still the authority figure in deciding their goals and employees have very less say, which could be expected in MBO (Management by Objectives) scenario of banking sector.

The HPD in Pakistani culture would not allow employees participation in any decision making process. Thus the trust of employees in management will be adversely affected. Since Pakistan culture is rated higher on the power distance, this would have an impact on the employee participation process. Firstly, the managers might be reluctant to involve employees in goal setting and decision making activities due to their perception of "giving up their own power and authority". Secondly, the employees may be reluctant to accept a more empowered role because they expect the manager to be the person "in control." Thus HPD would reduce goal clarity, employees’ participation and autonomy as found in this research study.

In HPD culture the managers and seniors have to adopt certain measures to create atmosphere of trust, support and cooperation (Yoon et al., 2001). The research findings suggest
that organizations have to develop clear and open communication means to enhance Goal Clarity, Employee Participation and ultimately the Trust in Management. It may be noted that an environment of support, trust, and cooperation from the senior management gives employees greater control over their work efforts in order to achieve their job goals (Brown & Leigh, 1996). Therefore, organizations, specially banks, need to develop clear and open communication means to enhance Goal Clarity, Employee Participation and finally their Trust in Management. The high scores of Pakistani cultural dimension of power distance suggest reduction of employees’ trust in the management specially the banking sector which otherwise demands strict following the authority and rules/ regulations.

Greater autonomy to the bank employees, empowering them to independently take actions so as to devise the means to better satisfy customer needs, is considered essential. Conger & Kanungo (1988) had suggested that empowerment is not only delegating / sharing of power with workers, but the empowerment could include sharing of resources. This envisages empowerment as a process by which a leader / manager share his/her power with subordinates by sharing control over organizational/ firm resources. Conger & Kanungo had grouped techniques such as Management by Objectives (MBO), Goal Setting & Quality Circles, and together as a category of tools which facilitate the sharing of resources. A goal setting structure can be used to evade this power distance obstacle. As a preliminary point, managers have to revolutionize the way they think about power and control. This may be more relevant to banking sector where goals are set for each individual to achieve. Conger & Kanungo also describe empowerment as a motivational construct where workers are motivated through enhancing their own self-efficacy. That is, employees are motivated to accomplish tasks and goals because they are given the authority to do so. Thomas & Velthouse (1990) have further expanded upon the work of Conger and Kanungo. They see empowerment as a type of motivation which emphasizes the "pull of the task rather than the push of management" (1990).

The manager ought to comprehend that for empowerment and participation to occur, the subordinates' jobs will have to vary and so must the manager's job. The managers must be qualified and have expertise to administer the new jobs of subordinates. Managers must understand that while their base of power doesn't change, they should exercise their power differently. Underneath this coordination the manager maintains his/her command by establishing goals, guiding employees in the growth and use of strategies for the accomplishment of demanding goals, providing feedback about goal achievement and allocation of resources based on goal achievement. In the course of this system of activities, the manager continues to direct employee actions.

CONCLUSION

This study was aimed at enhancing our understanding of the impact of culture on employees' trust in management in Pakistani environment by proposing a model which gives relationship of determinants of trust i.e. Employees’ Participation, Employees Feedback, Goal Clarity and Autonomy. The proposed model incorporates Hofstede’s (2001) one of cultural dimensions (power distance) as key moderators of the effect of independent variables on dependent variable. An empirical study was conducted in Pakistani HPD culture. The outcomes of this study may help employers redefine their organizational strategies keeping the Trust of the employees as the focal point. It is assumed that this trust can be the only ever-lasting association if, employees and employers enjoy as mutual beneficiaries in the form of high profitability, market share and development of both the employees and the organizations. We have studied only dimension of
Pakistan culture future research may be found useful to study the impact of other dimensions of culture on trust in management.

Questionnaire Moderating Impact of Power Distance on Trust Annex-A

Dear Sir/Madam

Your contribution in helping me analyze employees’ perceptions of trust in management and the factors associated in this process is valued highly. I am also studying the impact of Pakistani culture on employees’ trust in management. Completion of this information is voluntary and confidentially is assured. No individual data will be reported.

Thank You!

Impact of Organizational Context on Key Determinant of Customer Satisfaction
In Baking Sector of Pakistan
Muhammad Maalik
MS Scholar, RIPHAH University
Tariq Hussain Khan
MS Scholar, RIPHAH University.

Abstract
Customer satisfaction has become a corporate goal in today’s economy driven world. Hence, understanding its determinants as well as outcome is of critical importance for managers. Most of the shades of opinion emerging out of previous research agree that service quality has a major impact on customer satisfaction. However, there has been some conflicting empirical evidence in the past regarding direction of causal linkage between service quality and customer satisfaction. The literature survey also reveals a gap in the body of knowledge as to what an extent a specific organizational context affects the outcome as well as direction of causal linkage of this inter-relationship. This paper infers its findings from a survey conducted to determine impact of service quality on customers’ satisfaction in different organizational context related to baking sector of Pakistan. A sample of 155 respondents participated in the research process. Findings reflect that both core and relational aspects of service quality have a varying degree of impact, the variance caused by the context impact, on customers post –purchase judgment. The researcher has the discussed results and have also made the suggestions for managers as well as directions for future studies.

Key Words: Service Quality, customer satisfaction, Banking sector, organizational context and Pakistan.

1. Introduction
In spite of non-appearance on balance sheet, customers are deemed to be an economic asset (Kanji and Wallace, 2000). That is why customer-driven quality of service/product is viewed as a success striving factor (Deming, 1986; Oakland & Porter 1994, Spring, Mcquater, Swift, Dalc & Booker 1998; Oakland, 2000; Winser and Corney, 2001 and Nakata, 2002). Most of the scholars engaged in consumer related research have viewed customer satisfaction as a theoretical as well as practical issue (Dabholkar, Thrope and Rentz, and Fournier and Mick, 1999); It is so because customer retention is directly related to customer satisfaction (Kohli and Jaworski, 1980). Resultantly, customer satisfaction has become a “corporate goal” as different companies across the market divide endeavour to gain quality in their products and services (Bittner and Hubbert, 1994). Customer Satisfaction is the most critical factor influencing market share of any business venture. Whatever business strategy it might develop, the end objective remains customer satisfaction (Naeem and Saif, 2010).

Banks serve as an intermediary for funds channeling from money lenders to money borrowers (Luckett, 1994, P.36). Banking service deals with simultaneous convergence and divergence of funds. Because banks deal with “undifferentiated Products” service quality assumes critical importance to gain competitive edge in the market. To this end, banks follow an approach which seeks continuous improvement in services and processes (Pearce and Robinson, 2005), which is determined by satisfaction level of the customers. To measure this level different indexes i.e. Swedish Customer satisfaction Barometer (SCSB)(Fornell, Johnson, Anderson, Cher and Bryant, 1989); and American Customer Satisfaction Index (Fornell et al; 1996); were developed during last decade of last century and current decade of current century.

During first half of the last decade (2000 -2006) Pakistani banks achieved phenomenal growth in consumer banking (Hussain, Hussain, Hussain, Shahid & Sajid 2009)”. Despite “global recession, financial disaster, cash crouch and bankruptcy across globe” Pakistani banks...
produced highest returns (Hussain, et al; 2009). In the lead were the newly privatized banks like UBL, HBL and MCB which have embarked upon consumer financing and extended their network outside major cities (Hussain et al; 2009). This development led to a tough competition which compelled bankers to meaningfully enhance their service quality (determinant of customer satisfaction) to attract and retain new clientele (Naeem and Saif, 2010). Hence, a need was felt to investigate the nature of correlation between service quality and customer satisfaction as applicable to Pakistani Banks with different organizational culture. In the backdrop of above described situation, the researcher intends to study the contextual impact of service quality on customer satisfaction in banking sector of Pakistan.

1.1 Objectives of the Study

- To confirm direction of causal linkage between service quality and customer satisfaction in banking sector of Pakistan.
- To study impact of service quality on customer satisfaction or vice-a-versa.
- To contextualize the interaction between service quality and customer satisfaction in banking sector of Pakistan.

1.2 Significance of the Study

The study contextualizes the impact of service quality on customer satisfaction in banking sector of Pakistan by comparing two independent sets of data. Moreover it makes recommendations for researchers as well as managers.

2. Literature Review

2.1 Dimensions of National Culture

Till late sixties the Convergence approach remained as a widely accepted belief (Hofstede, 2008). The scholars could not find any linkage between national culture and management which was taken as a universal practice. However, with the advent of seventies this notion faded away and most of the organizations including multi-nationals identified it to be the most crucial problem for management in the corporate sector. As of now, the concept of “flat world” (Friedman, 2005) or a “global village” (Ger, 1999) is having a telling effect on business concerns (Dunphy, 1987). However, each nation still maintains the integrity of its respective culture (Aristotle, 330 B.C; Ibne Khnldum, 1380 A.D; Frederic, 1850; Wundt, 1910). The impact of this distinctive element of different cultures can be measured with five dimensions of national cultures (Hofstede, 1983).

2.2 Organizational Context

With the fading away of standardization, the importance of context specific localization has increased manifolds (Hofstede, 1980). Therefore, organizational psychology needs to develop a through understanding of context related implication of culture. It will reveal the nature of their interdependence. The cross cultural organizational psychology should, therefore, incorporate contextual factor (s) into the research design to find their moderating affect (Koztowski and Klicn, 2000). In this backdrop, the organizational context can affect the interrelationship of independent and dependent variables as under:-

- **Amplification Effect**
  It this case organizational context will accelerate and strengthen the variations caused by direct relationship (Tett and Burnett, 2003). For example sense of accountability makes the collectivists more cooperative and individualists more competitive (Gelfand and Realo, 1999).

- **Suppression Effect**
In this case the organizational context weakens the outcome of the interrelationship of independent and dependent variables (Michele, Lisa and Ryan, 2008). It deactivated the salience of norms and values (Tett and Burnett, 2003).

c. **Reversion Effect.**

Here, the organizational context may reverse the causal linkage of culture-outcome relationship. For example if sense of accountability is waived-off, individualists may cooperate and collectivists may compete (Yamagishi, 1988).

### 2.3 Customer Satisfaction

Customer satisfaction has been defined as complete fulfillment of some body’s expectations (Oliver, 1983). Schiff man and kanuf (2005) define customers satisfaction as perception about some product/service in accordance with some ones pre-conceived expectations. Yet another definition reads that feeling or impressions formed after using a product or service (Jamal & Nasir, 2002). Customer’s satisfaction is a post exposure judgment made by customers towards a product or service after it has been used. Hence, it makes a major influence on the consumer buying behavior (Jamal and Nasir 2002). For example a satisfied customer is likely to be engaged in repeat purchase of a particular offering, he/she is satisfied with (East, 1997). Thus, it influences a customer’s future purchase priorities (Taylor and Baker 1994). Satisfied customers were also expected to utter a “positive world of mouth” which serves as advertising (Jamal and Naser, 2002). On the contrary, dissatisfied customer would not only switch loyalties but would also resort to “negative word of mouth advertising” (Richens, 1983). This phenomenon has direct bearing on profitability of a firm (Dabholkar et al; 1996).

### 2.4 Key Determinants of Customer Satisfaction

Satisfaction judgments are global in nature (Taylor and Baker, 1994). Thus potentially there may be a number of antecedents of customer satisfaction (Rust and Oliver, 1994). However, most of the research conducted on this subject has relied upon disconfirmation paradigm, which takes into account two variables: Purchase expectations and disconfirmation(Peter and Olson, 1996; Churchill and Supprenant, 1982). According to Peter and Olson (1996), disconfirmation is difference between Pre-purchase expectations and post purchase perceptions. Hence, if perceived performance is higher than expectations (Positive disconfirmation), the customer gets satisfied and vice-a-versa. Some researchers also believe that satisfaction is caused by expectations which requires cognitive effort by the customers (Cadotte et al, 1987; Bearden and Teel, 1983). Later research also argued that besides cognitive components (expectation and disconfirmation), customer satisfaction also relies upon effective components like equity (Mano and Oliver, 1993). However, almost all the researchers have linked customer satisfaction with the service quality (Abderson and Sullivan, 1993; Cronin and Taylor, 1992; Bittner and Mubbert, 1994; Levesque and McDongall, 1996). That is the reason that this research focuses on impact of service quality on customer satisfaction.

### 2.5 Service Quality

Service quality has been defined as customer’s overall impression of the relative inferiority/superiority of the organization and its services (Bittner and Hubbert, 1994).

### 2.6 Facets of Service Quality

Service quality has two main facts i.e Core aspects and relational aspects (Levesque and McDongall, 1996). Core aspects cater for reliability of the service while the relational aspects deal with responsiveness, tangibles, assurance and empathy (Parasuraman, Zeithaml & Berry,
The reliability refers to outcome of the service, while relational aspects are related to delivery processes. Based on this opinion, it is being suggested that both aspects, core as well as relational, contribute towards achievement of customer satisfaction.

2.7 Criticality of Tangible Dimensions

A service differs from a product on account of being intangible. That makes it difficult for a customer to understand it explicitly (Legg and Baker 1996). In this backdrop a customer tends to draw inference about the service on the basis of tangibles i.e building and physical layout etc (Bitner, 1990). Physical features of the service environments do have substantial impact on satisfaction judgment of the customer (Wakefield and Blodgett, 1999). In the context of banking service, convenient location of the bank constitutes a tangible feature (Levesque and McDougall, 1996). Accessibility is yet another related factor affecting customer behavior (Jamal and Naser, 2002). Substantial return on Investment and reduced transactional cost are the fiscal tangibles having pronounced effect on customer satisfaction (Hussain et al; 2002). And last but not the least are the bank employees themselves, who happen to be the most effective tangibles directly contributing towards customer satisfaction (Naeem and Sajid, 2010). It is in this context that the organizational context matters the most.

2.8 Causal Linkage Between Service Quality and Customer Satisfaction

A number of researchers have considered customer satisfaction judgments as causal determinants of service quality judgments (Bitner, 1990; Parasuraman et al; 1988) Yet many other scholars believe that it is the service quality which happens to be the causal determinant of customer satisfaction (Taler and Baker, 1994; Anderson and Sullivan, 1993; Cronin and Taylor, 1992). Hence, there is contradictory empirical evidence with regard to the direction of causal linkage between these two variables. This anomaly, unless resolved, can have different managerial implications (Jamal and Naser, 2002). However, there has been a dominating view that “service quality generally results into higher level of customer satisfaction” (Naeem & Saif, 2010). It is this causal direction which outlines theoretical frame work and generates Hypothesis of this study.

3. Theoretical Framework
4. Hypotheses

4.1 Hypotheses-1
Service quality has a positive impact on customer satisfaction in Banking sector of Pakistan.

4.2 Hypothesis-2
Organizational context affects the outcome resulting from interaction of service quality and customer satisfaction in banking sector of Pakistan.

5. Methodology

Participants
To leading banks operating in Pakistan with country-wide network were chosen as universe for the current study. One of these is a foreign bank while the other one is a recently privatized local bank. Both of these banks are doing profitable business. This purposeful selection of the universe is meant to bring out the difference in outcome resulting from interaction of predictors and the dependent variable based on the data collected from local and the foreign bank, while national culture of the bank staff and the customers being common in each case (a derivative function of Hofstede’s approach to infer cultural dimensions). With due permission of the banks management, their selected branches were visited during first weeks of the calendar months when maximum customers visit the banks in connection with financial transactions. The individual customers were taken as unit of analysis and were administered with the questionnaire. They were requested to fill and return it before leaving the bank premises.

Sampling Procedure
To gain access to sufficient number of the units of analysis, convenience sampling procedure was followed. Around hundred customers from each bank were contacted in person. In case of foreign bank, 80% customers responded while others declined. Response in case of local bank proved to be 75%. Thus the research has benefitted from a high response rate.

Tool for Data Collection
A six item tool was used to measure the customer satisfaction of above described banks from detailed questionnaire developed by Tailor and Baker (1994). Tangibles were measured with seven items whole Reliability, responsiveness and satisfactions were measured with five items each while empathy and assurance with four items each. A five point likert scale was commonly applied to record the results.

Reliability of Instruments
As the tool with well established reliability values was followed, it showed strong internal consistency during pre-testing.

a. Dependent Variable: Satisfaction
7. Result Analysis

Adjusted R Square in case of local bank proved to be 0.75. Being co-efficient of determination, it showed that 75% of variation in dependent variable (customer satisfaction) is predicted by the independent variables considered in this study i.e. Assurance, Responsiveness, Tangibility, Reliability and Empathy. The two-tailed strong co-relation of the variables being considered speaks of the relevance of the Questions asked and their comprehension by the respondents. The value of F is 45.425 and is significant at .000.

\textsuperscript{a} Dependent Variable: Satisfaction
8. Result Analysis

As expected, the results in case of foreign bank were at some what variance with results of the local bank. The adjusted R Square in this case came to be 0.559 which shows 60% contribution of the predictors towards determination of the dependent variation. The variation has basically been caused by the organizational context which has moderated the overall contribution of the predictors by causing a suppression effect to reduce it by nineteen percent i.e from 75% in case of local bank to 56% in case of the foreign bank. F ratio in this case is 21.063 and is significant at .000.

9. Discussion

The study benefits from two sets of data drawn from two different bank net-works i.e a foreign and a local bank. The clientage of both the banks happens to be the host country nationals. Same is the case with the bank staff. Hence, it makes a logical sense to assume that any variation in the result is caused by the organizational culture. The major difference has been noted in the value of adjusted R square. It is .75 in case of local bank, while it comes to .559 in case of the foreign bank. The nineteen percent suppression has been caused by the organizational culture. The contextual factors which might have played their part could have been:-

i. Convergence approach followed by the foreign bank disregarding norms of the local culture. This standardization approach has suppressed the salience of national culture, rendering some of the predictor variables ineffective.

ii. Relative lack of relevance of some of the items of the questionnaire in the given organizational context, especially so when the organizational culture is at variance with the national culture to which the bank staff as well as the customers belong.

iii. Ethnocentric management style followed by the foreign bank which affects the bank employee’s attitude towards job. They might be facing a dilemma while endeavouring to render quality service to the clients who do not readily get aligned with the bank practices.

iv. The organizational context might have been creating a different perception of the standards followed by the bank in minds of the customers. Thus organizational context inculcates a sense of some what alienship between customers and the bank staff, though both share the same national culture.

v. There is an element of cultural diversity between similar organizations working in the same country. Due to this factor the internal work culture does affect HRM practices differently in different organizations. It affects the employees and the outcome of their interaction with the customers. In this manner, the cultural diversity amongst organizations causes variance in the outcome of the interaction between predictors and dependant variables.

In case of foreign bank, tangibility, Reliability, Empathy and Assurance are significant at .005, .011, .06 and .003 respectively. However, Responsiveness is not significant with t-ratio .015 and significance level of .998. The probable reasons contributing towards this non-significance could be:-

i. Fresh graduates employed at front desk are not properly conditioned to interact with an average local customer.
ii. A tendency in the local customer to get out-of-turn service not entertained by a foreign bank.

iii. A lack of awareness amongst the average customers about modern banking practices.

iv. Reduced inter-action between customer and bank staff due to ATM etc, creating a sort of communication gap between bank staff and customers.

v. Partial convergence approach followed by the foreign bank with a negative impact on interrelation of independent and dependent variables (supression effect).

In case of local bank the T Ratio is ideal at .000 in case of Tangibility and Responsiveness. It is significant in case of assurance and is insignificant in case of reliability and empathy. It could be attributed due to following reasons:-

i. Indifferent attitude of the bank staff towards customer.

ii. A national cultural of non-caring attitude for others.

iii. Stressful nature of the job.

iv. Over-worked bank staff because of prolonged banking hours and shortage of staff.

v. Insufficient vocational training of the staff in the field of customer handling.

10. Conclusion

Following conclusions have been inferred from the study:-

10.1 Both, core as well as relational aspects of service quality have a positive correlation with the customer satisfaction. Hence, Hypotheses-1 is substantiated.

10.2 The diversity of organizational culture affects variance caused by independent variables in the resultant value of dependent variable, thus supporting Hypothesis-2.

10.3 Bank staff’s interaction with customers has been problematic in case of both the banks to a varying degree.

11. Recommendations

11.1 Recommendation for Managers

In light of the above concluded study, it is recommended that managers of both the banks need to arrange training for their front desk staff in the field of customer handling. It is more so in the case of local bank. The foreign bank needs to fill the communication gap between bank staff and customers by adapting local culture.

11.2 Recommendation for Researchers

The future research should focus on other predictors contributing towards determination of customer satisfaction in banking sector of Pakistan, especially foreign banks operating in Pakistan. A confirmatory study encompassing a bigger sample is also recommended. The researchers should also determine the moderating effect of organizational culture derived through comparison of data in respect of similar organizations working in the same country.

12 Limitation

The data could have been analyzed on more up-to-date software.

Abstract

CAPM with all its controversies is still valid, popular and most used asset pricing model in the world. Three major perspectives run among the researchers. The first rejects CAPM completely and the rest two advocates changes but differently. A scrupulous analysis yields that investors care more for downside risk rather than variance. Overwhelming evidence especially in emerging markets is present world-wide. Stochastic Dominance is a powerful tool to measure downside risk. Lower Partial Moment is developed proxy for Stochastic Dominance. Lower Partial Moment working comes under scrutiny. In last, its algorithm and relation of lower partial moment to downside-beta is discussed.

Key Words: CAPM, Downside risk, Lower partial moment.

I. Introduction

This paper discusses the primary issues of CAPM and finds controversies world-wide around CAPM. The major among them are investor’s preference for downside risk and non-normality in asset returns. This paper, being its own kind, brings the world of CAPM and downside risk together with lower partial moment as a bridge between them. Lower partial moment is a proxy for downside risk. The paper theme lower partial moment and for the first time brings together all the relevant material related to it with discussing in detail. Lower partial moment algorithms are discussed and loopholes are also identified making it very easier to be adopted. In the end, the relationship between lower partial moment and CAPM, and downside beta is established. The paper also claims to strike the balance by addressing the theoretical issues of lower partial moment, making it simpler to comprehend for beginners in financial econometrics and advance

---

21 The investigation in CAPM have lead so far to three working papers and This paper is a direct extension of the first paper, which are written while working for PhD dissertation at COMSATS Institute of Information Technology, Islamabad.
The paper is divided into four sections. The first section gives an introduction while second section presents a brief introduction of CAPM. The third section discusses the problems with CAPM and the evidence in favor of downside beta. Lower partial moment is discussed theoretically. Initially, lower partial moment is ascertained as a proxy of downside risk and then its usage in research is discussed in detail. The last section is conclusion with recommendations.

2. Introduction to CAPM
Capital Asset pricing Model (CAPM) has mystified the researchers in the field of finance and economics for the last half a century. Despite the theoretical and empirical onslaught on it, it has survived and on the contrary has gained more popularity and acceptability both among researchers as well as players in stock markets. It is simple, cost-effective and even a beginner in the field of finance easily comprehends it.

Markowitz and Tobin’s contributions to the field of asset pricing have made CAPM its birth-child. With almost all the conditions of CAPM having roots in MV-framework and 2-fund separation theorem, CAPM cannot be independently analyzed. The pillars of CAPM are Capital Market Line (CML) and Security Market Line (SML). CML portrays a linear relationship of risk and return among different portfolios. And its test ground is SML where the performers of financial econometrics show their metal.

With evidence against CAPM from developed markets and mix evidence from emerging markets, it seems that theoretical and empirical framework of CAPM is to be reconsidered, rethought and regenerated. Researchers have paid attention to this and have come up with a solution. They contest that investors do really care about negative returns, do not give equal weights to upside and downside risk and are safety-conscious towards a below target return and they call it the “downside risk”. In life, we do not find what we dream but we tend to come as closer to it. In finance we call it proxy. Lower partial moment based on stochastic dominance, is considered a proxy of downside risk. Though developed in seventies and did not gain due attention until recently when researchers retraced their footsteps back in time to correct the assumptions of investor’s preference of risk and the condition of ‘normality” for CAPM.

3. The Background
During seventies, earlier tests for CAPM indicate that favorability but later on it seems that research on CAPM and controversies around it are highly correlated. These controversies revolve around three major viewpoints. Roll (1977) and Ross (1977) are the forerunners in the first perspective which completely rejects CAPM theoretically as well as empirically. Shanken (1982, 1987), Kandel and Stambaugh (1987), Reisman (1992) and Nawalkha (1997, CAPM is independently developed by Sharpe (1964), Lintner (1965), Mossin (1966) & Treynor(1962). 73.5% of U.S. CFOs (Graham & Harvey (2001)) and 45% in Europe use CAPM (Brounen, Abe de Jong and Koedijk (2004)). Mean-Variance (MV) Approach (Markowitz (1952)). Two-Fund Separation theorem under the conditions of market equilibrium (Tobin (1958)). See Beaver, Kettler and Scholes (1970), Galai and Masulis (1976), Black, Jensen and Scholes (1972), Fama and MacBeth (1973) and Blume and Friend (1973). Ross (1976) applies Arbitrage Pricing Theory (APT) to capital asset pricing and contests that APT substitutes CAPM.
2004) do try to defend CAPM but eventually settle down for modified-CAPM as multi-factor CAPM.

The third perspective is kind of solution provider. In it, the theoretical shortcomings of CAPM are addressed and transformed into modified versions of CAPM. Fischer Black (1972) provides solution to the problem without risk-free borrowing or lending in CAPM and is supported by Stambaugh (1982). Beta’s instability over time is disentangled by Bollerslev (1986, 1988, 1994) and French, Schwert, and Stambaugh (1987) and Jagannathan and Wang (1996) and held up by Lettau and Ludvigson (2001), Zhang (2003) and Petkova and Zhang (2003).

The million dollar question arises as to discard CAPM or not! A meticulous analysis offers a solution. If we go back in time to the very basics as to how an investor defines and assigns value to risk perhaps we can find a solution. CAPM basics imply that an investor care for risk in Markowitz’s (1952) Mean-Variance (MV) framework. However there are two major problems associated to it. Firsty investors care more for downside risk as compared to upside risk. And secondly, to validate CAPM “normality” is assumed which is very much questionable. The irony is that you propose something and belief something works better. This is what happened to Markowitz himself. Initially, he is convinced that downside risk as semivariance is more appropriate as compared to variance as a measure of investor’s risk. However he stays with the variance but does recognize the importance of semivariance (Markowitz (1959)).

3.1 Are Downside Risk and Normality Really Fundamental

Challenging the theoretical MV-framework of CAPM is altogether not simple. The first major premise is that investors are safety cognizant and the second one is the empirical tests are based on condition on normal distribution. However the latter problem can be addressed by using Generalized Method of Moments (GMM) as normal distribution is a sufficient assumption which is assumed for statistical purposes and to make it empirically testable (Campbell, Lo and MacKinlay (1997), chapter 5). But still this condition does affect the empirical results and

---

29 He discards it due to lack of resources at that time. Variance is computationally simpler as semivariance optimization model requires twice the number of data inputs than the variance model and with the lack of cost-effective computer power until advent of the microcomputer in 1980s and with the fact that variance model is already mathematically very complex.

30 For detail, please see Abbas (2011)
though one can make CAPM testable but one cannot forget message it is conveying as to the investor’s preference for the downside utility function.

Downside risk is initially discarded by Markowitz (1952, 1959) and lived for three decades under the shadow of CAPM but it slowly makes its way to the arena. Roy (1952) starts the debate of downside risk and argues that investor care for disaster and safety from that disaster is the foremost goal of an investor thus entailing safety-first rule (SF-rule). Taken true means that Markowitz MV-framework and Roy’s SF-rule do not have any common ground to hold except under the condition of “normality” which is hard to find (Fama (1965a&b), Kon (1984), Affleck-Graves and McDonald (1989), Richardson and Smith (1993), Susmel (2001), Hwang and Pedersen (2002), Dufour, Khalaf and Beaulieu (2003)). In addition, Aparicio and Estrada (1997) study Scandinavian markets and assert that fat tails and high peaks is shown by distributions of daily stock returns. Bekaert and Harvey (1995, 1997), Eftekhari and Satchell (1996) and Bekaert, Erb, Harvey, and Viskanta (1998), show that emerging market display non-normality.

Researchers follow a pragmatic approach and prefer normal distribution being not a necessary condition to derive CAPM primarily assumed for statistical purposes. However under large departure from normality particularly when the distribution is severely asymmetric, MV-criterion may fail to correctly approximate the expected utility (see Chunachinda et al. (1997), Athayde and Flôres (2004) and Jondeau and Rockinger (2006)). A large body of literature is available purposing that MV-framework lacks theoretical support and stresses higher moments (skewness and kurtosis) are to be included.

Investors are indifferent to upside and downside risk is not true. They do not give equal weights to both upside and downside risk as assumed in CAPM. Markowitz (1959) himself agrees to it and Kahneman and Tversky (1979), Gul (1991) and Estrada (2000, 2002 and 2007) give reinforcement. Post and Levy (2005) emphasize that if investors show different behavior for bear and bull markets, then they are willing to pay premium for stocks giving downside protection in bear markets and upside potential in bull markets. Under this assumption one wonders how still CAPM survives the blitz directed to it all these decades with variance as the measure of risk.

31 Both Nielsen (1990) and Allingham (1991) provide sufficient conditions but these conditions are hard to interpret. Also see Berk (1997).
32 CAPM rests on MV-framework.
33 Downside risk is different from co-skewness risk. The downside risk is captured non-linearly while co-skewness does not assume it.
34 Especially for skewness and kurtosis.
35 Investors are risk averse for losses and they become seekers for gains.
Quirk and Saposnik (1962), Mao (1970), Klemkosky (1973) and Ang and Chua (1979) all demonstrate that semivariance is superior to variance. Grootveld and Hallerbach (1999) conclude that downside risk approaches tend to favor more as compared to variance. Harvey (2000) suggests the supremacy of downside risk for emerging markets for a sample based on equilibrium as well as non-equilibrium-based risk measures. Estrada (2002) uses methodology of Levy and Markowitz (1979), asserts credibility of semivariance over standard deviation-empirically. Balzer (2001) comes up with the relationship between utility and downside risk measures, and contests that semivariance framework is better than Markowitz’s M-V framework. Ang, Chen and Xing (2002, 2006) conclude that downside beta works better in predicting future than variance-based framework. Estrada (2002) affirms that over 45% of variability for a cross-sectional analysis for a joint sample of developed markets and emerging markets and 55% in emerging market are explained by DCAPM. Post and Vliet (2004) contest that DCAPM surpasses CAPM. Estrada and Serra (2005) find out global downside beta is the best risk measures among the various risk measures studied. This evidence is just the beginning, ahead lays vast frontiers of downside risk in form of its conditional and intertemporal versions. The basic premise of this debate is to establish downside risk the heir of CAPM in field of asset pricing but the question arises as to how downside risk is measured in asset returns.

3.2: Lower Partial Moment-Proxy for Downside Risk

Researchers though advocate supremacy of downside risk over variance as a measure of investors’ risk but face an uphill task of an appropriate proxy for downside risk in asset returns. Markowitz (1952, 1959) and Roy (1952) stress semivariance but the question arises how to measure downside risk! Markowitz has two suggestions for measuring downside risk: SVm- semivariance from mean return or below-mean semivariance and SVt- semivariance from a target return or below-target semivariance. Markowitz names these measures partial or semi-variances. In addition, Hogan and Warren (1974) substitute variance with semivariance but it fails to get due attention until the adoption of stochastic dominance in downside risk.

Stochastic dominance (SD) is a powerful risk analysis tool which does not rely on any certain type of distribution but, rather compares results in pairs using their cumulative distribution functions. In portfolio science, an investor exhibit three type of behavior namely; investor prefers more to less (nonsatiation), investor is risk averse and prefer more wealth but at a decreasing rate (decreasing absolute risk aversion (DARA)). Quadratic utility is assumed for variance in MV-framework using Taylor series to expand the utility function including the first two moments; mean and variance and ignoring the rest. However quadratic concave utility curve turns down after they reach the “bliss point” -certainly against the third assumption of the type of investor i.e. DARA. Under these circumstances SD seems to be the ideal tool as it does not
assumes a specific form of distribution and the different form of SD capture all the three behaviors of an investor\textsuperscript{41}.

SD uses probability distribution functions (pdf) of assets in pairs and asserts the dominance of one over the other. For the first condition SD forms First-order SD (FSD) such as first difference of a utility function is greater than zero i.e. $U'(w) > 0$. For the first two conditions SD assumes Second-order SD (SSD) as second difference be less than zero i.e. $U''(w) < 0$ and to fulfill all the three conditions SD assumes Third-order SD (TSD) as the third difference is positive i.e. $U'''(w) > 0$\textsuperscript{42}.

The procedure seems simple and can be used both in portfolio optimization as well as for downside risk in asset pricing but the problem to quantify SD remains until the breakthrough by Bawa\textsuperscript{43}.

In 1975, Bawa develops proxy for SD. He generalizes semi-variance measure of risk with the development of the Lower Partial Moment (LPM), proxy for stochastic dominance, to reflect less restrictive class of decreasing absolute risk aversion (DARA) utility function. Bawa uses n-order LPMs to cover a wide range of risk measures as:

$$LPM_n(\tau, R_i) = \int_{\tau}^{\infty} (\tau - R_i)^n dF(R_i).$$

where $\tau$ is the target return specified by the investor, $R_i$ is the return of asset $i$, $dF(R_i)$ is probability density function of asset $i$ and $n$ is the order of investor’s risk preference for ex ante. For setting LPM=0 (i.e. n=0) means that the investor is risk neutral. For n=1 means that the investor is risk averse but in a mean-variance framework. For n=2 implies that the investor is risk averse but from the point of semivariance. For n=3 and n=4, represent skewness and kurtosis. For discrete form the equation (1) takes the following form:

$$LPM_{n}(\tau, R_i) = \frac{1}{\tau} \sum_{i=1}^{\tau} [\max(0, (\tau, R_i))]^n.$$

Fishburn (1977) extends the general LPM model into unlimited view of LPM which embraces all classes of investors; risk averse, risk seeking and risk neutral. For value $n<1$ captures risk seeking behavior while setting equal to zero is risk neutral behavior and risk averse behavior is $n > 1$. The higher the n (but above one), the higher the degree of risk aversion for an investor\textsuperscript{44}.

Moreover with fractional degrees like 2.33 or 3.89 for different n in Fishburn classes, LPM simply encompasses unlimited view of risk measures (Nawrocki (1999)).

Bawa and Lindenberg (1977) generalize LPM based on co-semivariance measure into generalized or asymmetric co-LPM or GCLPM for n-degree LPM structures defined as:

$$GCLPM_{ij,n}(\tau, R_i, R_j) = \int_{-\infty}^{\tau} \int_{-\infty}^{\tau} (\tau - R_i)^{n-1}(\tau - R_j) dF(R_i, R_j).$$

where normally the covariance between security $i$ is not equal to $j$ as depicted in Markowitz’s EV-framework and $dF(R_i, R_j)$ is the joint probability density function of returns of asset $i$ and $j$. However if one wishes to equal them then it has the flexibility to do so. In this case it will not be asymmetric co-LPM but symmetric co-LPM as follows:

$$GCLPM_{ij,n}(\tau, R_i, R_j) \neq GCLPM_{n}(\tau, R_i, R_j).$$

\textsuperscript{41} Quadratic utility also assumes IARA and IRRA while evidence is in favor of CRRA (Blume and Friend (1973)) and DARA (Cohn et al. (1975)). For details, see Chavas (2004), chapter 4.

\textsuperscript{42} For details see Levy (2006).

\textsuperscript{43} For details see Elton, Gruber, Brown and Goetzmann (2003).

\textsuperscript{44} For $n \geq 0$ is FSD, $n \geq 1$ is SSD and $n \geq 2$ is TSD-efficient set. For details see Fishburn (1977) and Nawrocki (1991, 1999).
for asymmetric co-LPM,
\[ GCLPM_{ij,n}(\tau, R_i, R_j) = GCLPM_n(\tau, R_i, R_j) \].................................(5)

for symmetric co-LPM, in this the equation(5) will reduce to:
\[ GCLPM_{ij,n}(\tau, R_i, R_j) = LPM_m(\tau, R_i) \].................................(6)

when \( R_i = R_j \).

For ex post or discrete form, equation (4) takes the following form:
\[ GCLPM_{ij,n}(\tau, R_i, R_j) = \frac{1}{\tau} \sum_{i=1}^{n} [\text{Max}(0, (\tau, R_i))]^{n-1} (\tau - R_i) \]............(7)

In all of above cases, Bawa and Lindenberg (1977) propose that \( \tau \) is equal to risk-free interest rate. However later versions became more flexible and \( \tau \) can assume any value according to investor’s choice\(^{45}\).

3.3 Algorithms for Lower Partial Moment

In a Markowitz world, quadratic programming is used to optimize a portfolio with linear constraints\(^{46}\). As the risk of portfolio is defined as:
\[ \sigma_p^2 = \sum_{i=1}^{n} W_i^2 \sigma_i^2 + \sum_{i=1}^{n} \sum_{j=1}^{n} W_i W_j \sigma_{ij} \].................................(8)

where \( \sigma_p^2 \) is the variance of portfolio, \( W_i \) and \( W_j \) are weights of individual securities \( i \) and \( j \) and \( \sigma_{ij} \) is the covariance between securities \( i \) and \( j \). However it is assumed that under efficient diversification all risk is diversified but the covariance risk cannot be diversified (Sharpe (1964) and Elton, Gruber, Brown and Goetzmann (2003)) so all attention is paid to minimize the following expression:
\[ \text{Minimize } F(x) = \sum_{i=1}^{n} \sum_{j=1}^{n} x_i x_j \sigma_{ij} \].................................(9)

Subject to the following constraints:
\[ C1: R_p = \sum_{i=1}^{n} x_i (R_i - R_p) \]
\[ C2: \sum_{i=1}^{n} x_i = 1 \]
\[ C3: x_i \geq 0, \ i = 1, 2, \ldots, \ N. \]

where \( x_i \) is portion of portfolio in security \( i \), \( R_p \) is portfolio return and \( R_i \) is return of security. \( C1 \) entails that the portfolio return is equivalent to weighted returns of individual securities. \( C2 \) implies that all weights should equal to 1 and \( C3 \) says that all weights should be more that 0 for no short sales allowed. However if short sales are allowed then \( C3 \) does not stand.

For downside risk maximization, two approaches can be used; Harlow (1991) applies (9) on LPM using the same constraints as discussed above:

\(^{46}\) For details see Elton, Gruber, Brown and Goetzmann (2003).
Minimize $LPM_{in}(\tau; x) = \sum_{R_{p} < \tau} p_{p}(\tau - R_{p})^{n}$..........................(10)

where $p_{p}$ is the probability return of portfolio $P$.

Harlow (1991), however, uses $n = 1$ or 2 and assumes co-LPM of security $i$ equal to co-LPM of security $j^{47}$. As the data depicts non-normality and asymmetry, so covariance of $i$ and $j$ cannot be equal to $j$ and $i$. Nawrocki (1991) propose another solution to downside risk minimization using LPM. He uses semi-deviation ($SmD$) instead of standard deviation to calculate co-LPM as follows:

$$SmD_{ni} = \left\{ \frac{1}{t} \sum_{i=1}^{t} [Max(0, \tau - R_{ni})]^{\frac{1}{m}} \right\}$$ ........................................(11)

and co-LPM as:

$$GCLPM_{ij} = (SmD_{ni})(SmD_{nj})(\rho_{ij})$$.................................(12)

where $\rho_{ij}$ is the correlation between asset $i$ and $j$. But the problem with it is that it assumes symmetry while the evidence is counter-symmetry. Under these circumstances, to modify (9) seems to be a feasible solution into the following function:

$$Minimize F(x) = \sum_{i=1}^{n} \sum_{j=1}^{n} x_{i}x_{j}GCLPM_{ij,n}(\tau, R_{i}, R_{j})$$..........................(13)

where

$$GCLPM_{ij,n^{-1}}(\tau, R_{i}, R_{j}) = \frac{1}{t} \sum_{i=1}^{t} [Max(0, (\tau, R_{i}))]^{n-1}(\tau - R_{j})$$

### 3.4 Matrices for Lower Partial Moment

The use of matrices has become very common in finance. As more and more computation is being done, matrices have become as essential ingredient for a financial econometrics researcher$^{48}$. To solve the following function, matrices come very handy for a researcher:

$$Minimize F(x) = \sum_{i=1}^{n} \sum_{j=1}^{n} x_{i}x_{j}GCLPM_{ij,n}(\tau, R_{i}, R_{j})$$

Let $W$ be $n \times 1$ vector matrix defined as:

$$Transpose W = \{w_{1}, w_{2}, ..., w_{n}\}$$

where $w_{i}, w_{j}$ and $w_{n}$ are weights for securities $i, j$ to $n$. The co-LPM or GCLPM matrix is defined as $n \times n$ matrix defines as:

$$V = \begin{pmatrix}
GCLPM_{11} & \cdots & GCLPM_{1n} \\
\vdots & \ddots & \vdots \\
GCLPM_{n1} & \cdots & GCLPM_{nn}
\end{pmatrix}$$

To calculate variance of a portfolio, we use the following expression:

$$Minimize F(x) or \sigma_{p}^{2} = [TransposeW] \ [V] \ [W]$$..........................(14)

$^{47}$ This makes Harlow’s LPM quite similar to Markowitz’s EV-framework as both assume covariance and security $i$ and $j$ equal to covariance of $j$ and $i$.

$^{48}$ Portfolio analysis, yield curves, arbitrage with risk-free bonds, binomial option pricing, put-call parity and arbitrage pricing theory use matrices, for a detail discussion consult Teall (1999).
Excel-Solver or any other quadratic programming tool can be used to solve (14) and obtain different for each individual security to minimize the variance of a portfolio for a given portfolio return.

3.5 Lower Partial Moment Relation to Downside Beta

LPM-based risk measures are to be tested and to test it one comes back to square one i.e. CAPM. Tests of CAPM are to be applied if one has to compare results of regular-beta CAPM against downside-beta CAPM. LPM, a proxy of downside risk is not totally unrelated to other proxies of downside risk, namely the downside-beta. Harlow and Rao (1989) establish the relationship but first an understanding of regular-beta as follows is imperative:

\[ \beta = \frac{\text{cov}(R_i, R_m)}{\text{var}(R_m)} \]  (15)

where \( \text{cov}(R_i, R_m) \) is covariance of security \( i \) with market return and \( \text{var}(R_m) \) is variance of market return while downside-beta is defined as:

\[ \beta_D = \frac{\text{cov}(R_i, R_m | R_m < \tau)}{\text{var}(R_m | R_m < \tau)} \]  (16)

Harlow and Rao (1989), using \( \tau \) equal to risk-free rate define downside beta in terms of GCLPM and LPM as follows:

\[ \beta_D = \frac{GCLPM_n(\tau, R : R_m, R_i)}{LPM_n(\tau, R : R_m)} \]  (17)

However, \( \tau \) can be varied as discussed above and can be assigned any value while \( n \) is valued from 1 to 5 and the highest value used by Fishburn is 4.6 for an individual utility function (Fishburn (1977) and Nawrocki (1991)). Using (17) makes it easier to test downside-risk by applying conventional statistical test of CAPM and compare the two models\(^{49}\). Now the beta can be replaced by downside beta to test and compare the results of the two betas as follows\(^{50}\):

\[ E(R_i) = R_f + \beta_{Dk}[E(R_m) - R_f] \]  (18)

4. Conclusion

CAPM has always allured its audience right from its inception. However it is not free from controversies and the primary are that the investor places different weights to upside and downside risk-being more safety conscious and the model revolves around normality but is usually non-normal. On the other hand, CAPM popularity and high usage cannot be denied at all. A complete renovation is necessary only when needed and CAPM does not need it.

Instead of using variance as a measure of risk, downside risk is used. Evidence around the world is collected and is found to be superior to the conventional measure of risk. Next the theoretical framework is explored for downside risk with lower partial moment being a proxy to it. Lower partial moment, a proxy of stochastic dominance, is discussed with its both symmetric and asymmetric versions. Its strong points are that it accommodates investor’s preference of being safety-conscious and flexible to adopt non-normality. Lower partial moment algorithms are viewed and eventually its relation to downside beta is established.

\(^{49}\) Like Black, Jensen and Scholes (1972) and Fama and MacBeth (1973).

\(^{50}\) For details see Harlow and Rao (1989).
Research does not end here but it leads to other worlds of consumption and intertemporal models and discrete and continuous models. With high inception of statistical techniques like GMM, GARCH and Markov Switching Models into field of finance, results can be made better, and enhanced versions of downside risk and lower partial moment can be developed which can be tested with accuracy and commercialized as risk measurement techniques in the field of asset pricing.

Abstract

Capital asset pricing model is one of the most practical methods for anticipating the stock return. According to this model BETA as a systematic risk criterion, is the only variable capable to anticipating the return. Researches on the ability of this model for anticipating and its use of other variables in Iran and other countries lead to the interesting result indicated variables other than BETA which have better ability to anticipating the stock return. These variables are the firm size, stock liquidity and idiosyncratic volatility. In this research the relation between the BETA and other mentioned variables investigated in a period of five years since 2006 to 2010 in Tehran stock market. Using the Eviews software, the outcome information from the firms tested according to the multi variable regression model and under the (OLS) method, and showed that firm size and idiosyncratic volatility are of variables with the ability to anticipate the stock return in the firms accepted in Iran stock market too. And BETA variable in case of controlling the liquidity effect has the ability to explain the return. And also liquidity variable is shown to be in no significant relation with the average of return.

Key Words: BETA, firm size, liquidity, idiosyncratic volatility, stock return

Introduction

Traditional finance theory as represented by the CAPM (Sharpe 1964, Lintner, 1965) posits that an investor’s required expectation of return on a risky asset in excess of the risk-free rate is determined as the product of that risky asset’s beta (the covariance or its returns with market returns) with the expected return on the market in excess of the risk-free rate. The degree to which beta, capitalization, liquidity and idiosyncratic volatility may be a proxy for one or more of the other variables remains controversial. So also does the extent to which any one of these variables might be capturing an element of investor risk exposure (either diversifiable or non-diversifiable). In effect, no convincing theory has been advanced to explain the contribution of these variables.

The capital asset pricing model (CAPM) of Sharpe (1964), Lintner (1965a) and Black (1972) predicts that only systematic risk is priced in the stock returns. This is because investors are assumed to be able to diversify away idiosyncratic risk by holding well-diversified portfolios. However, in practice investors may fail to hold diversified portfolios for various reasons (e.g. Malkiel & Xu, 2006). This would lead in less diversified investors demanding a risk premium for bearing idiosyncratic risk. Furthermore, Barberis and Huang (2001) show that if investors are loss averse over individual stock fluctuations, expected premiums will depend on prior performance and also total risk will be positively correlated with expected returns.

The role of idiosyncratic risk on asset pricing has been under intense academic debate since an influential study by Campbell, Lettau, Malkiel, and Xu (2001). They explore the volatility of U.S. stocks at the market, industry, and firm levels over the period from 1962 to 1997. Campbell et al. (2001) find that while the market and industry level volatilities have remained quite stable, the average firm-level volatility exhibits a strong positive deterministic trend, more than doubling over the period.
Malkiel and Xu (2006) provide empirical evidence to the under-diversification hypothesis and find a positive relation between idiosyncratic risk and cross-sectional stock returns. Using exponential generalized autoregressive conditional heteroskedasticity (EGARCH) model to estimate conditional idiosyncratic volatility, Spiegel and Wang (2005) and Fu (2009) also find a significantly positive relation between idiosyncratic risk and expected returns.

On the other hand, some authors have found a puzzling negative relation between idiosyncratic risk and cross-sectional stock returns. Using daily data to estimate idiosyncratic risk, Ang et al. (2006, 2009) find that stocks with high idiosyncratic volatility have abysmally low average returns both in US and in other G7 countries. This negative cross-sectional relation contradicts the basic fundamental of finance that higher risk is compensated with higher returns. Guo and Savickas (2006) argue that idiosyncratic risk can be a proxy for dispersion in opinion among investors. Their hypothesis is that an increase in idiosyncratic risk leads the most optimistic investors to hold a particular stock, and thus we should find a negative relation between idiosyncratic risk and return.

Financial distress has also been theorized to impact stock returns. The idea is that stocks of financially distressed companies tend to move together so that their risk cannot be diversified away (Chan, 2003). Fama and French (1996) argue that financial distress is a driving factor behind the size and value effects. The covariation can exist if corporate failures are correlated with a measure not accounted in the standard CAPM, such as deteriorating investment opportunities or declines in unmeasured components of wealth such as human capital or debt securities (Ferguson & Shockley, 2003).

Several papers have studied the impact of financial distress on stock returns with contradictory results. Griffin and Lemmon (2002) find supporting evidence to Fama and French (1996) and show that the value premium is most significant among firms with high probability of financial distress. Vassalou and Xing (2004) also demonstrate that both the size and book-to-market effects are concentrated in high default risk firms.

There is an intuitive reason to believe that these two puzzles are related to each other. According to the Merton’s (1974) model, corporate debt is a risk-free bond less a put option on the value of the firm’s assets, with strike price of the face value of the debt. Thus, a firm with more volatile equity is more likely to reach the boundary condition of default. Based on this argument, Campbell and Taksler (2003) show that idiosyncratic firm-level volatility can explain an ignificant part of cross-sectional variation in corporate bond yields. This suggests a possibility that the idiosyncratic volatility-return relationship may be due to a distress-return relationship or vice versa.

Only two recent working papers explore this interaction. Following Ang et al. (2006), Song (2008) estimate idiosyncratic volatility using daily data from one month period and find that while the volatility spread is -1.68% for the most distressed stocks; it is actually positive and significant at 0.61% per month for the least distressed ones. Similarly, Chen and Chollete (2006) find that after controlling for distress risk, stocks with high idiosyncratic volatility earn significantly low returns only in the highest distress risk quintile. Both conclude that distress risk has a more fundamental asset pricing impact than idiosyncratic volatility.

However, Fu (2009) argues that due to the time varying property of idiosyncratic volatility, lagged one month volatility may not be an appropriate proxy for the expected volatility this month. In order to capture the time varying property of idiosyncratic volatility, Fu suggest the use of GARCH models. Therefore, it is of interest to study the interaction of idiosyncratic volatility and financial distress using these more sophisticated models.

The propose of this study is surveying of Investigation of the relation between the BETA, firm size, liquidity and idiosyncratic volatility with stock return in Tehran stock market since 2006 to 2010.
Methodology

In this study all the statistical information of the companies accepted in Tehran stock market to calculate the distributive variables, we use Tadbir Pardaz Company's information bank and for the information about the companies we used interned cites of Tehran Stock Market Service Company. Also we used SPSS, E-view and excel software to analyze the data's, testing hypothesis and designing the diagrams.

Methodology introducing the model

We used the following model in order to investigate the effect of independent variables (systematic risk, company size, liquidity and price variability) on dependent variable (stock return)

\[ R_{pt} = \alpha + \beta_t \beta_{pt} + \beta_2 (ME_{pt}) + \beta_3 (LIQ_{pt}) + \beta_4 (IV_{pt}) + e_t \]

\[ R_{pt} = P \text{ basket return in T period} \]

\[ \beta_{pt} = \text{Systematic risk of P basket in T period} \]

\[ LIQ_{pt} = P \text{ basket liquidity in T period} \]

\[ e_t = \text{Accidental error relating to regression equation} \]

In this research we used the descriptive statistic of main indexes (mid and average) and distributive indexes (the largest and smallest amount of dates).

For example the following diagram shows the main indexes and distribution of independent and dependent variables of baskets in one dimension sorting according to every independent variable. Company size and liquidity, are rounded according to thousand billion Rials and thousand stocks.

The relation between independent variables with average weight return and account return has determined using one dimensioned diagrams. And achieved results have been written just according to investigations and decisive and final results determined after doing regression and necessary tests.
Diagram 1. shows the relation between weight return and account return average liquidity.

In this diagram baskets are sorted according to regressive liquidity average, namely basket number 1 has the most amount of liquidity and basket number 30 has the least amount of liquidity. The most return is in basket 28 and the least return is in basket 30. There is a weak negative relation between return and liquidity, but there is no definite and decisive procedure to study them. Because of the importance that stock liquidity has for the stock holder, and they prefer the stocks with high rate of liquidity to other stocks. It cannot be recommended anything to stock holders, regarding the relation between return and liquidity in diagram 1.

Finally, we used two-dimensional diagram in this research, because two-dimensional sorting of variables provide the possibility of controlling the effect of one variable and examining the other variables effect on stock return. Using the four independent variables (beta, company size, liquidity, price variability) we investigated all six possible pairs. For each variable we formed 30 baskets reggressively. Company basket according to levels first variable categorized to three (high – mid – low) which every level contains 10 baskets. In every level, we investigated second variables 30 baskets and in every case account return average of the baskets in specified period of time was calculated. We formed the correlation matrix for discussed variables and for each of the levels correlation amount and meaningfulness of every variable was calculated. Correlation quotient is a means to determine the linear relation between two variables.

**Diagram 2. Arithmetic different levels of efficiency compared to the beta oscillation sort by Best Price**

For example the above diagram shows the relation between beta and basket price variability with the return. As you can see with decrease in basket price variability, there is a negative procedure in the return.
Table 2 shows that for large amount of beta with reliability degree of 95 percent, beta and price variability has a 78, 79 percent relation with the return and for medium and small amount if beta there is nearly 40 percent relation between price variability with the return with the same degree of reliability. It can be resulted that for large amount of beta positive linear relation between beta and basket result is approved. So there is enough reason to reject Akdeniz and et al (2000) research which say there is no meaningful relation between beta and return. Also with controlling the beta effect stock basket with high price variability shows higher returns. As Schpigel and wang (2005) concluded that price reliability has meaningful relation with stock return, also in this research the important role of price variability was identified and meaningful relation between stock price variability and return with controlling the beta effect was approved.

As the baskets were sorted according to four independent variables and average weight return and average account return were calculated for every medium set, so eight regression test was performed which one of these tests is explained as an example in Table 3.

Normality Test

Jarque- Bera: 1.7289
Probability: 0.4212

White Heteroskedasticity Test:
F-statistic: 1.0457
Probability: 0.4410

Obs* R- squared: 8.5463
Probability: 0.382

Ramsey RESET Test:
F- statistic: 4.2863
Probability: 0.262

Log likelihood ratio: 9.5036
Probability: 0.861

Breusch – Godfrey Serial Correlation LM Test:
F- statistic: 1.209
Probability: 0.4123

Obs* R- Squared: 2.8538
Probability: 0.2401

According to above diagram it is necessary to explain that:
1- The Quartile Probability Amount is (0/4212). so the distribution of the remaining sentences is normal and is not rejected.
2- The White Probability amount is (0/4410). So there is no variance heterogeneity
3- Self correlation test possibility amount in remaining sentences is (0/4123), so there is no self correlation in this model.
4- According to the analysis outputs of above diagram, the amount of the above statistics for self correlation test is near 2 which show there is no self correlation in this model.
5- The amount of possibility in F statistics is equal to (0/0462), so this is less than (0/05). This means that zero assumption is rejected in 95 percent level and the model can be accepted in 95 percent reliability level.
6- The amount of determined quotient is equal to (0/37) which shows 37 percent of return changes is expressed.
7- The amount of statistic possibility of T for liquidity beta is bigger than (0/05), so these variables are not meaningful and their relation with basket return as an independent variable are rejected. Only company size and price variability variables which their T statistic amount is less than (0/05) are meaningful and show that in 95 percent level of reliability, these variables are in relation with basket returns as a dependent variable.

Data Analysis
For examining the hypothesis of the research, the stocks of 126 companies in financial period of April 2006 to October 2010 was selected from Tehran stock market. In this research, to investigate the relation among the different data’s, firstly the stocks of selected companies ranked separately according to every variables of beta, company size, liquidity and price variability. The selected companies information was calculated separately in all months and are sorted according to one of the variables for every month regessively. In this stage we formed 30 baskets for every month and average account return, weight return, beta, company size, liquidity and price variability was calculated for every basket. After that every different month’s basket was gathered and for available same baskets the average was taken and then we calculated the averages of account and weight return, beta, company size, liquidity and price variability for every 30 new baskets. In the next stage we sorted the baskets with two-dimensional diagrams, so that all of possible pairs from these four variables were regarded. Doing so and assuming 2 of 4 compositions we gained six pairs of variables. In this stage sorting 30 of 30 of baskets is done and then for optimal resulting from them, the variable which its effect should to be controlled is leveled. So that first 10 baskets in first level (the baskets having the most amount of beta) and second and third 10 baskets in level two and three (baskets having the medium and low amount of beta) in two dimensional sorting of 3 in 30 for all 90 baskets are formed and their average weight and account return, beta, company size, liquidity and price variability calculated. Using diagrams and correlation quotient of independent variables the relation between them and account return was discussed. The Analyzing results are relating to beta, company size, liquidity and price variability with average account return.

1- Analyzing the results from controlling the systematic risk effect.
The amount of $R^2$ Quotient determination became equal to 88 percent, it means that 88 percent of changes in account return are expressed by independent variables, and because the amount of T statistics in independent variables was too little, there was linearity possibility in this model. Using matrix quotient determinant and calculating it, existing of linearity was determined and for solving this problem, beta variable with square quotient was inserted to the model.
next stage beta variable eliminated and investigating different tests, it was considered that if the beta variable effect was controlled, the company size variable became meaningful and in case of removing beta from the model, size would have negative relation with the return, which is the same as Benx and Ringanam (1981) findings.

In addition to this the effect of liquidity variable was controlled, beta and size variables became meaningful. So liquidity variable was removed from the model and we saw that when the effect of systematic risk was controlled basket price variability and account return show positive relation which approves Malkil and Jo (2006) theory which say there is positive relation between the return and price variability.

2- Analyzing the results from controlling the size:
The variable shows that in case of controlling the basket size effect, there is meaningful relation between size and price variability with account return. After investigating the results positive relation between company size and the return was appeared.

3-analyzing the results from controlling the effect of liquidity variable:
In case of controlling this effect there is meaningful relation only between beta and company size. So that company size has direct relation with the return that approves Fama and Franch (1992) theory which say there is negative relation between beta and the return.

4-analyzing the results from controlling the price variability variable:
In case of controlling this variable effect, only company size and price variability have meaningful relation with weight return regarding their quotient mark in the model, company size and return have positive relation. In this research the importance of price variability in explaining the weight return was discovered furthermore. So that basket price variability have positive relation with the return. And also it approves the theory of Malkil and Jo (2006) and Klaito and Demsey (2007).

Conclusion and suggestions
In this research we studied the relation between beta, company size, liquidity, price variability with basket return and using the results of the research it was determined that only company size and stock price variability are of those variables which can explain the stock basket return in Iran and beta variable has a little capability to explain the return. And only in case of controlling the liquidity effect, its effect appears. For liquidity variable, only in two dimensional sorting of liquidity and price variability, the positive relation between the return and liquidity was appeared with controlling its effect for little amounts.

Suggestions resulted from the research
Regarding the findings of this research and approving the meaningful relation between accounting variables with stock return the following suggestions are presented:

1- For better decision making of the investors of stock market we suggest that stock market organization establish committee for ranking the companies from the risk, size and the variables point of view for the usage of investors.

2- We suggest to the investors and financial analyzers that only systematic risk as a variable to explain the return is not enough in analyzing the factors effective to stock return in Tehran stock market. The other variables like company size, liquidity and especially stock price variability should to be noticed.

Abstract
The theory of multiple intelligences was developed in 1983 by Howard Gardner. He suggests that the traditional notion of intelligence, based on I.Q. testing, is far too limited. Instead, Dr. Gardner proposes eight different intelligences to account for a broader range of human potential in children and adults. These intelligences are linguistic intelligence, logical intelligence, spatial intelligence, bodily intelligence, musical intelligence, interpersonal intelligence, intrapersonal intelligence and Naturalist intelligence. The purpose of this research is surveying of relationship between multiple intelligences and critical thinking of Islamic Azad University managers in 13th region. The methodology of study is descriptive and analytical study. Data collection instrument was a questionnaire that its reliability was confirmed by Crohn Bach’s alpha and library studies. The results show that, there is a relationship between multiple intelligences and critical thinking of Islamic Azad University managers in 13th region.

Keywords: multiple intelligences, critical thinking, Islamic Azad University managers

Introduction
You’ve been thinking all of your life, of course, for thinking is simply the interaction of ideas. However, thinking is somewhat similar to other skills, like writing, drawing, or fixing cars. Practice and education can improve it. So even though you "know how to think" already, you can improve your thinking by learning about the tools and mental habits that produce the best thinking.

Critical thinking might be defined as an approach to ideas from the standpoint of deliberate consideration. You hold an idea at arm's length and examine it before accepting it into your mental framework. Another way of defining critical thinking might be as a habit of cautious evaluation, an analytic mindset aimed at discovering the component parts of ideas and philosophies, eager to weigh the merits of arguments and reasons in order to become a good judge of them. Analysis is the ability to break arguments or claims down into parts and to discover the relationship between the parts. The arguments can then be evaluated. Critical thinking generally refers to higher order thinking that questions assumptions. Critical thinking is "thinking about thinking." It is a way of deciding if a claim is true, false, or sometimes true and sometimes false, or partly true and partly false. The concept is somewhat contested within the field of education due to the multiple possible meanings.[1]

In one sense, critical thinking has been described as “the correct assessing of statements.”[2] It has also been described popularly as "thinking about thinking."[3] It has been described in a much more comprehensive sense as "the intellectually disciplined process of actively and skillfully conceptualizing, applying, analyzing, synthesizing, and/or evaluating information gathered from, or generated by, observation, experience, reflection, reasoning, or communication, as a guide to belief and action"[4]

1 This paper is based on the final report based on research projects sponsored by Islamic Azad University, Kaleybar Branch
More recently, critical thinking has been described as "the process of purposeful, self-regulatory judgment, which uses reasoned consideration to evidence, context, conceptualizations, methods, and criteria."[5] Within the critical social theory philosophical frame, critical thinking is commonly understood to involve commitment to the social and political practice of participatory democracy, willingness to imagine or remain open to considering alternative perspectives, willingness to integrate new or revised perspectives into our ways of thinking and acting, and willingness to foster criticality in others.[6] Within a critical Africentric philosophical frame, it has been described as a philosophical model for thinking and acting guided by traditional African philosophical assumptions for the purpose of furthering African American interests.[7] The critical thinking philosophical frame traces its roots in analytic philosophy and pragmatist constructivism, as well as the Buddhist Teaching -- kalamasutta and abhidhamma, and the Greek Socratic tradition that dates back over 2,500 years in which probing questions were used to determine whether claims to knowledge based on authority could be rationally justified with clarity and logical consistency. The one sense of the term critical means crucial or related to core criteria and derives from the ancient Greek kriterion, which means standards; a second sense derives etymologically from kriticos, which means discerning judgment.[8] While John Dewey introduced the term critical thinking to American education in the early 1900s, the critical thinking movement gained momentum in America only in the 1980s."[2] The movement represented a pragmatic response to expectations and demands for the kind of thinking required of the modern workforce.”[9] The critical theory philosophical frame has its roots to the Frankfurt School of Critical Social Theory that attempted to amend Marxist theory for applicability in 20th century Germany. Critical thinking within this philosophical frame was introduced by Jurgen Habermas in the 1970s, was brought to American adult education theory by Jack Mezirow and Stephen Brookfield in the 1980s[10]. The Africentric philosophical frame has its roots in historical, cultural and philosophical assumptions of African people. Introduction to American adult education of critical thinking within this philosophical frame is credited to Na'ilm Akbar [11].

The theory of multiple intelligences was developed in 1983 by Dr. Howard Gardner, professor of education at Harvard University. It suggests that the traditional notion of intelligence, based on I.Q. testing, is far too limited. Instead, Dr. Gardner proposes eight different intelligences to account for a broader range of human potential in children and adults. These intelligences are:

- Linguistic intelligence ("word smart")
- Logical-mathematical intelligence ("number/reasoning smart")
- Spatial intelligence ("picture smart")
- Bodily-Kinesthetic intelligence ("body smart")
- Musical intelligence ("music smart")
- Interpersonal intelligence ("people smart")
- Intrapersonal intelligence ("self smart")
- Naturalist intelligence ("nature smart")[12].

Gardner says that our schools and culture focus most of their attention on linguistic and logical-mathematical intelligence [13]. We esteem the highly articulate or logical people of our culture. However, Dr. Gardner says that we should also place equal attention on individuals who show gifts in the other intelligences: the artists, architects, musicians, naturalists, designers, dancers, therapists, entrepreneurs, and others who enrich the world in which we live. Unfortunately, many children who have these gifts don’t receive much reinforcement for them in school. Many of these kids, in fact, end up being labeled "learning disabled," "ADD (attention deficit disorder)," or simply underachievers, when their unique ways of thinking and learning aren’t addressed by a heavily linguistic or logical-mathematical classroom. The theory of multiple intelligences
proposes a major transformation in the way our schools are run. It suggests that teachers be trained to present their lessons in a wide variety of ways using music, cooperative learning, art activities, role play, multimedia, field trips, inner reflection, and much more. The good news is that the theory of multiple intelligences has grabbed the attention of many educators around the country, and hundreds of schools are currently using its philosophy to redesign the way it educates children [14]. The bad news is that there are thousands of schools still out there that teach in the same old dull way, through dry lectures, and boring worksheets and textbooks. The challenge is to get this information out to many more teachers, school administrators, and others who work with children, so that each child has the opportunity to learn in ways harmonious with their unique minds [15].

The theory of multiple intelligences also has strong implications for adult learning and development. Many adults find themselves in jobs that do not make optimal use of their most highly developed intelligences (for example, the highly bodily-kinesthetic individual who is stuck in a linguistic or logical desk-job when he or she would be much happier in a job where they could move around, such as a recreational leader, a forest ranger, or physical therapist) [16]. The theory of multiple intelligences gives adults a whole new way to look at their lives, examining potentials that they left behind in their childhood (such as a love for art or drama) but now have the opportunity to develop through courses, hobbies, or other programs of self-development[17].

METHODOLOGY
The recent research is a field work methodically and applied from the goal point of view. In this research for collecting data we used the library and field resources so that for compiling the literature of the research we used library sources, and field work resources to test the thesis of the research.

The population of this study is all of the Islamic Azad university branches and centers in 13th. We determined the amount of the sample size with the used of p.q sampling method, which obtained 33 with 95 percent confidence level. We also used cluster sampling in order to selecting samples from the statistical community. We used a questionnaire with 48 questions which its stability was equal to 0/894.

In order to analyze the data resulted from collected questionnaires deductive and descriptive statistical methods are used, and to describe the answers to questions, we used abundance chart and percentage of answers to every question. Also to display some statistical data we used column diagram and in deductive level to test the hypothesis of the research we used Pierson correlation test (r) and to determine the meaningfulness level of (r) we used t-test.
ANALYSIS AND CONCLUSION

B) Data Analysis

The results obtained from survey and testing the research hypothesis have come below.

**H1. There is a relationship between multiple intelligences and critical thinking of Islamic Azad University managers in 13th region**

This hypothesis is measured by 32 questions which is blending of 32 first questions (1-32) relating to multi-intelligence and 16 questions relating to critical thinking of IAU managers of 13th region. According to obtained $t$ from testing the main hypothesis which is bigger than the critical point of $t$-table in fault ability level $\alpha=0.01$, so with reliability level of 99 percent we can be said the main hypothesis is approved, and we can say that multiple intelligence of 13th region managers of IAU is affecting in critical thinking and according to obtained determination quotient, multiple intelligence variable of managers explains 31.1 percent of dependent variable variance of critical thinking of IAU 13th region managers. This means that 31.1 percent of variation in critical thinking of 13th region of IAU managers is dependent upon independent variable.

**H1-1. There is a relationship between musical intelligences and critical thinking of Islamic Azad University managers in 13th region**

This hypothesis is measured by four questions which is blending of four first questions (1-4) relating to musical intelligence and 16 questions relating to critical thinking of IAU managers of 13th region. According to obtained $t$ from testing the sub-hypothesis which is bigger than the critical point of $t$-table in fault ability level $\alpha=0.01$, so with reliability level of 99 percent we can be said the sub-hypothesis is approved, and we can say that musical intelligence of 13th region managers of IAU is affecting in critical thinking and according to obtained determination quotient, musical intelligence variable of managers explains 55 percent of dependent variable variance of critical thinking of IAU managers in 13th region managers. This means that 55 percent of variation in critical thinking of 13th region of IAU managers is dependent upon musical intelligence.

**H1-2. There is a relationship between bodily intelligences and critical thinking of Islamic Azad University managers in 13th region**

This hypothesis is measured by four questions which is blending of four second questions (5-8) relating to bodily intelligence and 16 questions relating to critical thinking of IAU managers of 13th region. According to obtained $t$ from testing the sub-hypothesis which is bigger than the
critical point of t-table in fault ability level $\alpha=0.01$, so with reliability level of 99 percent we can be said the sub-hypothesis is approved, and we can say that bodily intelligence of $13^{th}$ region managers of IAU is affecting in critical thinking and according to obtained determination quotient, bodily intelligence variable of managers explains 16 percent of dependent variable variance of critical thinking of IAU managers in $13^{th}$ region managers. This means that 16 percent of variation in critical thinking of $13^{th}$ region of IAU managers is dependent upon bodily intelligence.

$H1-3. There\ is\ a\ relationship\ between\ Logical\ intelligences\ and\ critical\ thinking\ of\ Islamic\ Azad\ University\ managers\ in\ 13^{th}\ region$
This hypothesis is measured by four questions which is blending of four second questions (5-8) relating to Logical intelligence and 16 questions relating to critical thinking of IAU managers of $13^{th}$ region. According to obtained $t$ from testing the sub-hypothesis which is bigger than the critical point of t-table in fault ability level $\alpha=0.01$, so with reliability level of 99 percent we can be said the sub-hypothesis is approved, and we can say that Logical intelligence of $13^{th}$ region managers of IAU is affecting in critical thinking and according to obtained determination quotient, Logical intelligence variable of managers explains 8.5 percent of dependent variable variance of critical thinking of IAU managers in $13^{th}$ region managers. This means that 8.5 percent of variation in critical thinking of $13^{th}$ region of IAU managers is dependent upon Logical intelligence.

$H1-4. There\ is\ a\ relationship\ between\ spatial\ intelligences\ and\ critical\ thinking\ of\ Islamic\ Azad\ University\ managers\ in\ 13^{th}\ region$
This hypothesis is measured by four questions which is blending of four second questions (5-8) relating to Spatial intelligence and 16 questions relating to critical thinking of IAU managers of $13^{th}$ region. According to obtained $t$ from testing the sub-hypothesis which is bigger than the critical point of t-table in fault ability level $\alpha=0.01$, so with reliability level of 99 percent we can be said the sub-hypothesis is approved, and we can say that Spatial intelligence of $13^{th}$ region managers of IAU is affecting in critical thinking and according to obtained determination quotient, Spatial intelligence variable of managers explains 10.6 percent of dependent variable variance of critical thinking of IAU managers in $13^{th}$ region managers. This means that 10.6 percent of variation in critical thinking of $13^{th}$ region of IAU managers is dependent upon Spatial intelligence.

$H1-5. There\ is\ a\ relationship\ between\ Linguistic\ intelligences\ and\ critical\ thinking\ of\ Islamic\ Azad\ University\ managers\ in\ 13^{th}\ region$
This hypothesis is measured by four questions which is blending of four second questions (5-8) relating to Linguistic intelligence and 16 questions relating to critical thinking of IAU managers of $13^{th}$ region. According to obtained $t$ from testing the sub-hypothesis which is bigger than the critical point of t-table in fault ability level $\alpha=0.01$, so with reliability level of 99 percent we can be said the sub-hypothesis is approved, and we can say that Linguistic intelligence of $13^{th}$ region managers of IAU is affecting in critical thinking and according to obtained determination quotient, Linguistic intelligence variable of managers explains 21.8 percent of dependent variable variance of critical thinking of IAU managers in $13^{th}$ region managers. This means that 21.8 percent of variation in critical thinking of $13^{th}$ region of IAU managers is dependent upon Linguistic intelligence.

$H1-6. There\ is\ a\ relationship\ between\ Interpersonal\ intelligences\ and\ critical\ thinking\ of\ Islamic\ Azad\ University\ managers\ in\ 13^{th}\ region$
This hypothesis is measured by four questions which is blending of four second questions (5-8) relating to Interpersonal intelligence and 16 questions relating to critical thinking of IAU
managers of 13th region. According to obtained \( t \) from testing the sub-hypothesis which is bigger than the critical point of t-table in fault ability level \( \alpha=0.01 \), so with reliability level of 99 percent we can be said the sub-hypothesis is approved, and we can say that Interpersonal intelligence of 13th region managers of IAU is affecting in critical thinking and according to obtained determination quotient, Interpersonal intelligence variable of managers explains 5.1 percent of dependent variable variance of critical thinking of IAU managers in 13th region managers. This means that 5.1 percent of variation in critical thinking of 13th region of IAU managers is dependent upon Interpersonal intelligence.

**H1-7. There is a relationship between Intrapersonal intelligences and critical thinking of Islamic Azad University managers in 13th region**

This hypothesis is measured by four questions which is blending of four second questions (5-8) relating to Intrapersonal intelligence and 16 questions relating to critical thinking of IAU managers of 13th region. According to obtained \( t \) from testing the sub-hypothesis which is bigger than the critical point of t-table in fault ability level \( \alpha=0.01 \), so with reliability level of 99 percent we can be said the sub-hypothesis is approved, and we can say that Intrapersonal intelligence of 13th region managers of IAU is affecting in critical thinking and according to obtained determination quotient, Intrapersonal intelligence variable of managers explains 4.1 percent of dependent variable variance of critical thinking of IAU managers in 13th region managers. This means that 4.1 percent of variation in critical thinking of 13th region of IAU managers is dependent upon Intrapersonal intelligence.

**H1-7. There is a relationship between Naturalist intelligences and critical thinking of Islamic Azad University managers in 13th region**

This hypothesis is measured by four questions which is blending of four second questions (5-8) relating to Naturalist intelligence and 16 questions relating to critical thinking of IAU managers of 13th region. According to obtained \( t \) from testing the sub-hypothesis which is bigger than the critical point of t-table in fault ability level \( \alpha=0.01 \), so with reliability level of 99 percent we can be said the sub-hypothesis is approved, and we can say that Naturalist intelligence of 13th region managers of IAU is affecting in critical thinking and according to obtained determination quotient, Naturalist intelligence variable of managers explains 6.2 percent of dependent variable variance of critical thinking of IAU managers in 13th region managers. This means that 6.2 percent of variation in critical thinking of 13th region of IAU managers is dependent upon Naturalist intelligence.

Abstract
Surveying the degree of social capitals effect and its different aspects over entrepreneurship, surveying the weak and strong points of under study society from social capital and entrepreneurship point of view and providing suggestions for increasing the social capital effect over entrepreneurship are among the most important purposes of this study. The Hypotheses were tested through Freedman and Regression tests. The research has shown a positive and meaningful relation between social capital with its aspects and entrepreneurship. Moreover in this study is shown that the social capitals quality aspect in the under study society is more important and its correlation index is higher. In entrepreneurship its risk indicator has the highest priority, too. In addition the research results show that the relationship structure indicator has the highest effect over the entrepreneurship and connection indicator has the lowest effect and creativity and independence indicators (from entrepreneurship) are affected by none of the social capitals indicators.

Keywords: Social capital, entrepreneurship, social capital quality and structural aspect.

INTRODUCTION
The entrepreneur or top-level manager develops values, strategies, and structures that fit with his/her knowledge structure of what makes the business (Martin, & Minnillo, 2009). Entrepreneurship is the mark and symbol of effort and success in business and entrepreneurs are the pioneers of successful businesses in the society. Their ability to take the opportunities, their strength in innovation and their capacity in succeeding are the standards which modern entrepreneurship is measured by (Brochaus & Horwitz, 1986). Entrepreneurs in leading, management, innovation, competency, job production, competition, efficiency and establishing new companies have an important role in economic growth. According to a kind of belief, entrepreneurship as a revolution is necessary for the societies. The importance of this revolution in current century is increasingly more than industrial revolution (Kuratko & Hodgetts, 1993 quoted by AhmadPour, 2007). Viewing the entrepreneurship in the frame work of social structures pave the way for a broad perspective for it, so that it shifts the attention toward the vague and less considered points, that is social aspect of entrepreneurship phenomenon. Recently social capital has established hypothesis which has been a foundation for other management studies. In the absence of social capital other capitals lose their efficiency and taking the path of cultural and economical development and evolution would be ragged and tough (Adler, 2002). Social capital increasingly is based on social and cultural factors and its recognition as a kind of capital in the macro management level or institutions and services management can give a new kind of
understanding about socio-economical systems and help the managers in better leading of systems. Since entrepreneurship is a socio-economical process which is based on the status and context of society in two ways this kind of capital has an important role in the activities of entrepreneurs and as a result the existence or lack of social connections and communications effects the nature of business (Bolino, 2002). This research is accomplished in answering this question that what relations are there between social capital aspects and entrepreneurship aspects? And its main purpose is to find frameworks for optimum social capital implementation in the process of entrepreneurship.

This research in purpose is developmental and in nature is descriptive-measurable and correlative. The sample volume of industrial entrepreneurs is chosen from the industrial complexes in Ardabil province.

SOCIAL CAPITAL
Social capital is a somewhat broad term that has assumed a variety of different meanings and definitions (Woolcock, 1998). Cohen and Prusak (2001) state that social capital consists of the stock of active connections amongst people: the trust, mutual understanding and shared values and behavioral aspects that bind the members of human networks and communities and make cooperative action possible. Hence, viewed broadly, social capital encompasses many aspects of a social context such as the social ties, trusting relations and value systems that facilitate the actions of individuals located within that context. Drawing on a comprehensive review of previous studies on social capital, Coleman (1988) refers to social capital as a variety of entities with two elements in common: they all consist of some aspect of a social structure and they facilitate certain actions of the actors – whether individuals or corporate actors – within that structure. Nahapiet and Ghoshal (1998) refer to these different aspects of social context as the structural, relational and cognitive dimensions of social capital. Lin (2001) proposes that social capital encompasses three intersecting aspects of structure and action: structural (embedded), opportunity (accessibility) and action oriented (use) aspects.

Robert Putnam, from the other side in his assessments suggests that social capital is a collection of concepts such as confidence, norms and networks which cause an optimum connection and contribution between the members of a society and at the end provides their mutual benefits (Putnam, 2002).

Structural aspects of social capital: This aspect in terms of management structures and processes like responsiveness of managers and leaders according to their functions, transparency in decision making considers the degree of making decision and taking action according to group work and general pattern of dominant relationship in the society. This means that this aspect takes into account the degree of relations between the people in the society (Bolino, 2002).

The quality aspect of social capital: This aspect is in terms of phenomena such as values, attitudes, commitments, partnership, and trust and includes the nature of social relations. In another words since the structural aspect focuses on this question that weather the people have any relation, the quality aspect focuses on the quality of this relation.

ENTREPRENEURSHIP
Entrepreneurial opportunity can be defined as “a situation in which new goods, services, raw materials, markets and organizing methods can be introduced through the formation of new means” (Eckhardt & Shane, 2003). This definition is maybe a bit unclear and opportunity recognition is perhaps better defined by Christensen, Madsen and Petersen. They defined opportunity recognition as ‘perceiving a possibility for new profit through (a) the founding and formation of a new venture, or (b) the significant improvement of an existing venture (Dellabarca, 2002).
Entrepreneurship is the process of benefiting from the new, individual and valuable compound of resources in a vague and indecisive environment. Entrepreneurship means the beginning of growth in a newly established company through a kind of innovative and risk taking management (Ahmadpour, 2002). In the process of entrepreneurship an entrepreneur starts a small and new business with its own capital (Drucker, 1985); and without considering the available resources for the people, they follow the opportunities. Entrepreneurship is the process of innovative destruction. (More recent products and facilities destruct the present market and create a new market). Entrepreneurship is the engine of economic development.

Types of entrepreneurship: Company entrepreneurship which is a process that a company takes in order for all its members to become encouraged in entrepreneurship and all the individual and group entrepreneurial activities are independently accomplished fast and easily in the company. Independent entrepreneurship is a process that forms the early idea of production until the presenting its product to the society takes all the entrepreneur activities with the establishment of a new independent business. Although Organizational entrepreneurship word has been accepted recently in the management vocabulary, it is a conception which is related to the entrepreneurial approach of an organization and it is rooted in the entrepreneurship literature. (Antonic & Hisrich, 2003).

THE IMPORTANCE OF SOCIAL CAPITAL

In the recent two decades the concept of social capital in its different grounds and forms, as one of the most focal concepts, has been appeared and expressed. Even though it has developed a great deal of enthusiasm and passion among the researches and authorities, it has caused different attitudes, views, and expectations. The notable increase of research in this field expresses the importance and unique status of social capital in different social context. Generally speaking the amount of social capital in each group or society represents the amount of trust that people have to each other (Phezy & Faghihi, 2007). The existence of acceptable amount of social capital facilitates the social actions, so that in critical situations, social capital can be used as the main source for solving the problems and reforming current procedures. Hence, identifying the effective factors in boosting or weakening the social capital is of utmost importance (Ranani. 2007).Some of the main elements which can be used to measure social capital are:

- Understanding public political, social affairs and the presence of motivation among people who are seeking to obtain this sort of knowledge.
- Public mutual trust
- Informal cooperative sharing in voluntary activities

In general we can say one of the main factors for social capital recognition for target society is the form and the way of people relations and the state of coexistence among the people (Adler, 2002).

Value of social capital for the personnel, specially for the knowledge personnel is drawn from this fact that social capital is the original source of power for the person and it is non transitional, that is personal social capital can not be directly transformed to some other people (Timmons, 2003). It is not possible for an individual to sell or transform his developed network of relations to some one else, for it is possible the other people reject these relations. Individuals could help in developing personal network of relations but direct transforming of personal relations is impossible. Although this kind of transition is possible for the physical, financial and knowledge capital and this means that power and success of people in knowledge and service organizations somehow are dependent on the depth, width and transitional feature of their social capital. Knowledge personnel have understood that establishing variable and expanded networks of
relations has an important role in their ability and capability to help the organization to be successful.

Social capital is developed through the establishment of personal connections which leads to a communication (Fukuyama, 1999) without any form of compulsion, so this social capital is more uncontrollable than other types of capitals. It depends on the person himself that be able to develop a kind of personal relation which would have mutual interest. An organization can not betake social capital to its personnel and in fact developing and expanding network of relations needs interpersonal skills and personal interests.

Both the social capital and human capital have a high entropic, that is for the creation and keeping and enhancing their value both of them need a significant investment. In the case of social capital if the energy is not frequently injected into the relations, it is possible that relations or even the persons themselves be forgotten (Entropy).

When the social capital grows it is difficult to keep it in place. The critical element which here plays the role of glue and cement is trust that should be developed and expanded, because when the trust is developed, communications are more expanded and stabilized. In fact people with high mutual trust need not spend a lot of time to keep their relations and their relations remains powerful for good.

The last feature of social capital is a high level of synergy. Social capital among the different types of capitals has a high level of capability in producing synergy with the other types of capitals. meeting a problem in the organization, personnel who have a higher level of social capital with the help of a large information and relation network which have already developed in the organization and enjoy it access to critical and more important information and enjoy different views and attitudes, because each one of the persons in the network see the peripheral world and issues with a distinctive view and these different views and attitudes establish a new view for the person himself. Of course here to get help from the communication instruments and technologies can enrich more the social capital (Timmons, 2003).Destructive effect of social capital: Social capital has some costs and it can be destructive in some situations. A lot of studies have been performed on the advantages of using social capital but a less attention has been paid to the risks and threats of social capital. The first objection is related to the actors who have the original and central role in social capital. Developing and keeping the social capital in an organization needs a large amount of financial investment to keep in place and maintain the relationships between the members. In some situations the advantages derived from social capital are so lower than the capital which is allocated to it. In another word the following inequality should always be kept in place (Alvany & Taghavy 2008).

The second threat derived from using social capital is related to the powerful connections in the organization. So that social capital has an inclination toward enhancing the relations between the members and stabilizing these relations but performed studies in this area has shown that the organizations and teams which have powerful connections with other units are slower than the teams which have weaker relations. In another word powerful connections and relations which is derived from social capital is less effective than weak connections and the teams which have weaker connections with other units work better and faster.

The other objection for the social capital is related to its integration advantage. This advantage in some situations could have a reverse result for its actors. Too much unity and integrity with the members of a group possibly involve the actors with relations and communications and divert the attention from the major purposes and missions of the organization and in some situations even replaces the purpose so that keeping in place the relations between the members replaces the purposes and missions of the organization. In addition to the possibility of purpose replacement, boosting the spirit of integrity results in reducing new thinking, laziness and prudery, and developing the phenomenon of when in Rome do as Romans do, in the organization (Adler, 1999 quoted by Alvani and Taghavi, 2007).
THE NECESSITY AND IMPORTANCE OF ENTREPRENEURSHIP

From the beginning of the 1980s and simultaneously with the focus on innovation for survival and competition with the entrepreneurs who increasingly appeared in the market, the inclination toward entrepreneurship and entrepreneurs results in directing entrepreneurial activities into the companies. Beside the penetration of bureaucracy in the culture of companies during 1960s and 1970s, entrepreneurship in the major organizations was taking in to the account increasingly by the senior managers so that they could also follow the process of invention and innovation and make their new products and services marketable. In terms of competition it can also be suggested that this factor with its recent years' velocity has been a challenge for all of the companies and even the companies which are working with advanced high tech are encountered with numerous competitors.

The speed of innovation and presenting the new products is so fast that with these changes the initiatives and improvement in types and quality of productions has been a normal case so the companies should be innovative, otherwise they are condemned to destruction (Daf, quoted by Parsaeyan and Eraby, 2000).

General features of entrepreneurs: In the 20th century some psychologies such as McClelland, the psychology professor of Harvard studied the role of entrepreneurs and business masters and their major differences has been discussed from philosop hic point of view and perspective. In their view for entrepreneurs who has foresight and innovative thoughts the situational factors effect their decisions in the beginning of risky activities (Collins et all, 1964). Carland and his workmates collected different features which had been studied from the outset of the case until 1984 and some of the most prominent of them are pointed out here in the following cases: Oversight and perspective, Determination, Concentration, Motivation, Time and self-sacrifice, internal control, Independence, creativity and innovation, Risk taking and ambiguity bearing.

RELATION OF SOCIAL CAPITAL WITH ENTREPRENEURSHIP

Viclen believes that in addition to the economic elements such as market and capital advantages which affect the entrepreneur, noneconomic factors such as social relation networks can also affect the phenomenon of entrepreneurship, too. Social capital as a social phenomenon can lead to creativity, ideology, and it can facilitate the innovative behaviors and risk taking that could be one of the entrepreneurship indexes (Coleman, 1998). Those with higher amount of social capital have more access to the sources and information that can affect the development and formation process of business and access to the new market. Hence, social capital is of utmost importance to the entrepreneurs and those in social groups who have more social capital more likely are placed in profitable situations inside the networks, so it is more likely that they can discern business opportunities more effectively and can use them.

To be involved in entrepreneurial activities, people should be able to monitor environmental changes and evaluate the effects of these changes over their newborn business. Failing of entrepreneur on forecasting his achievement in the business produces environmental hesitancy which in turn would stop his participation in entrepreneurial activities. Even though, social networks provide the skill and knowledge which reduces the existence of natural ambiguity in the process of entrepreneurship.

SOCIAL INTERACTIONS IMPORTANCE IN ENTREPRENEURIAL ACTIVITIES

Empirical studies show that social interactions play a major role in facilitating innovations and creativity which are among the indexes of entrepreneurship. Theorists have examined the relationship between social networks, the development of new ideas, and creativity. Also
empirical and hypothetical studies have been carried out about the relation between social interaction and risk taking which are among other aspects of entrepreneurship (Nahapiet & Ghoshal, 1996).

Social relations through identification and exploration of threats and environmental opportunities and with implementing measures for neutralizing environmental hesitancy can lead to pioneering. Social relations also results in facilitating the knowledge transference and implementation of social interaction not only benefits participants in these relations, but also people themselves with reducing the expenses and time in responding to the needs and environmental threats achieve some advantages.

Recent researches suggest a connection between the network size and innovation, self renewal and entrepreneurship. The role of networks in boosting innovation and development of new ideas has been the subject of studies in recent years and their findings supports this hypothesis (Burt, 2000).

THE EXAMINATION OF RESEARCH FINDINGS

1- FREEDMAN'S VARIANCE ANALYSIS TESTS

This test is used for the examination of meaningfulness of variables ranking and because the suggested responses are based on Richard's spectrum for examining the degree of effectiveness and the way of variable's ranking here Freedman's variance analysis is used.

According to this test, the following ranking is drawn from the factors related to the social capital:

<table>
<thead>
<tr>
<th>Priority</th>
<th>variable</th>
<th>Average rankings</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Cohesion</td>
<td>4.98</td>
</tr>
<tr>
<td>2</td>
<td>structure of relations</td>
<td>3.85</td>
</tr>
<tr>
<td>3</td>
<td>size of network</td>
<td>3.78</td>
</tr>
<tr>
<td>4</td>
<td>trust</td>
<td>3.61</td>
</tr>
<tr>
<td>5</td>
<td>relational</td>
<td>2.42</td>
</tr>
<tr>
<td>6</td>
<td>mutual relations</td>
<td>2.01</td>
</tr>
</tbody>
</table>

Table 1- Prioritizing the social capital variables in terms of average rankings

This ranking suggests that among the social capital related variables in statistical society, relational item and mutual relations are weaker than other factors and should be empowered and in another side trust and size of network should be empowered in the later stages.

2- RANKING THE ENTREPRENEURSHIP VARIABLES

TEST OF HYPOTHESIS: there is meaning difference between the states of average ranks of entrepreneurship variables.

According to this test, the following ranking is drawn from the factors related to the entrepreneurship:

<table>
<thead>
<tr>
<th>Priority</th>
<th>variable</th>
<th>Average rankings</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>risk</td>
<td>5.32</td>
</tr>
<tr>
<td>2</td>
<td>foresightedness</td>
<td>5.05</td>
</tr>
<tr>
<td>3</td>
<td>inside control</td>
<td>4.70</td>
</tr>
<tr>
<td>4</td>
<td>motivation</td>
<td>4.49</td>
</tr>
<tr>
<td>5</td>
<td>independence</td>
<td>3.34</td>
</tr>
<tr>
<td>6</td>
<td>concentration</td>
<td>2.89</td>
</tr>
<tr>
<td>7</td>
<td>determination</td>
<td>2.39</td>
</tr>
</tbody>
</table>

Table 2- Prioritizing the entrepreneurship variables in terms of average rankings

This ranking suggests that among the entrepreneurship related variables in statistical society which is target related factors of entrepreneurship, concentration and determination are weaker
than other factors and should be empowered and in another side independence and motivation should be empowered in the later stages.

TEST OF REGRESSION
For the sake of surveying the effect of social capital and its aspects on the entrepreneurship Regression test has been used so that firstly to test the hypothesis in terms of weather they are right or wrong and secondly to identify which aspects of social capital has the most effects on the entrepreneurship. For this purpose each effect of social capital as an independent variable was tested and the results of the tests suggests that from factors which are related to the social capital, relations structure index has the most effects and communication index has the less effect on the entrepreneurship and independence and creativity index from entrepreneurship are affected by non of the indexes of social capital. From the other side it can be said that nearly all aspects of entrepreneurship is affected by the social capital and only independence and creativity variables are affected by none of the aspects of social capital.

It seems that for entrepreneurship features are innate and they are not transformable and acquirable it can be said that the perimeter environment has the least effect on Entrepreneurship. Creative person is seeking opportunities, even though the environmental conditions impose different limitations on him. These environmental limitations can be weakness and shortage of social capital. As this test shows, creativity and independence variable are not affected by none of the social capital aspects, although none of the entrepreneurship aspects were affected by one of the social capital aspects.

DISCUSSION, CONCLUSION AND SUGGESTIONS
The results of present research suggest the existence of a positive and meaningful relation between social capital and its aspects with entrepreneurship. This means that with the increase and decrease of social capital, entrepreneurship will be increased and decreased. The founding of the research in the target society shows that nearly all the aspects of entrepreneurship (according to Carland et all's model) are affected by the social capital`s aspects (according to Aston model) and only the independence and creativity variables directly are not affected by social capital. Social capital in terms of entrepreneurship plays the role of leverage and we can not name it as the entrepreneurship producer, however to make the potential creativity of entrepreneur practical and results in entrepreneurship, there are so many environmental factors which affect it and one of them would be social capital.

Considering the results of data analysis the target society in terms of entrepreneurship has a favorite average, but to keep the features in place needs some efforts. In addition, when a creative person by taking advantage of entrepreneurship features runs an independent business, considering current dynamic environment, for keeping it in place and staying in the relevant industry he must have company type of entrepreneurship and avoids setting back and decline. For this purpose and for keeping entrepreneurship in a business the following suggestions are put forward:

1- Developing the unit of research and development in terms of productions or services and identifying the customers can provide environmental opportunities and flexibility. In another side, the establishers of the companies personally should involve in the activities, because in this way their commitment to the findings and their executions would be increased and the initial idea for establishing a business is the corner stone of its future position and an entrepreneur with taking advantage of entrepreneurial features has a broader perspective to the objectives and future of the company.
2- Human resources are the most valuable resources of each company and they can help the company to get to its objectives. Taking advantages of original and creative ideas even at the lowest level of the company, encouraging people to put forward their ideas and holding discussion sessions with the persons who participate directly in the process of production or delivering service can be effective in the reform and improvement processes.

3- The findings of this research show a high level of risk taking between the people of understudy society. Taking this advantage, managers could direct their strategy from defensive and passive form toward analytic and prospective ones and take steps in understanding opportunities, taking new technologies in production and entering the new markets. In another word there should be some efforts to surpass competitors by developing production and market.

4- Gaining entrepreneurship characteristics needs determination and focus on the objectives, which the understudy society is prevalent in. however in some situations social and economic circumstances dominate these features and limit the new established companies from boosting and flourishing and the company establishers with all necessary determination and conviction for following their job have to leave the industry.

The research findings showed that the related factors with social capital are at an acceptable and satisfactory state and the only factor which has not a satisfactory condition is social integrity. For empowering the social capital in the understudy society the following recommendations are suggested.

1: for empowering the aspect of relations in social capital the horizontal relations should be increased and for these purpose the following initiatives are suggested:
   - The more vesting of authority to the members.
   - Establishing working committees for improving the relations.
   - Holding frequent sessions and meetings with the personnel to get more information and exchange of ideas.

2: The aspect of trust is one the most important parts of social capital which is so sensitive that permanently is under a destructive situation and it is a factor which forms social relations and provides a ground for personnel partnership in a working group. For boosting the trust between the members of a society the following recommendations can be suggested.
   - Making teams which their members are consisted of company managers in the same industry and holding monthly meetings to exchange ideas and experiences and also developing integrity and enhancing trust between the members. These face to face meetings not only increase the familiarity between the members, but also they would obviate the vague points and misunderstandings which would possibly exist between the members. These meetings would increase the trust and stability of the relations based on it.
     - Developing group programs for boosting the spirit of group work.
     - Enhancing the professional and secular morale: the managers who take into account the moral principals form a kind of relations which initiate trust.
     - Feeling of social responsibility: in any business when the personnel believe in to be responsive to the society and they have responsibility against it, they would get to a positive understanding to their job and under the light of this space trust would replace distrust.
     - Strengthening of the guild and labor unions and being bound over their united decisions.
     - Forming guild and professional intermediate groups to decrease the tensions and develop the space of cooperation with the participation of company representatives with more working relations.
3. Forming and keeping the spirit of interrelation or intercourse among the companies. Reciprocal action is the process of interaction in social relations and this matter itself is the function of special norms which needs different relational networks. For increasing this kind of spirit the following cases can be taken into account:

- Developing the spirit of generosity as the people with social popularity, that is White Beards, in their guild or industry step forward.
- Encouraging and appreciating the pioneer individuals in such actions and promote such spirit.

4. Integrity was one of the cases, which was not in a good condition in the target society. For strengthening this important index of social capital the following cases are pointed out.

- Encouraging and forming professional and expert groups and associations among companies: this case is one of the structural ways for increasing the social capital. People in the shape of social institutions enjoy common identity and a kind of cooperative ground is developed among them. Forming these institutes with the volunteered participation of experts and professionals of the companies can encourage others and increase the social integrity. Especially in the membership of these associations or groups the differences of size and financial power of the companies are no taken into account and the right of presence and freedom of expression is being respected.
- Forming funds for financial support with membership of the original personnel of all the companies and using its capital to help the members in solving their financial needs on a regular base of justice and candid. If the companies with more financial power support such funds the integrity would be increased.
- Establishing groups in the form of expert teams for companies which are active in an industry to solve the common problems in the field of their activity, such as providing primary materials, goods transformation and gaining governmental and bank support.

Abstract

This study investigates the perceived importance of knowledge management and innovation, demographics, entrepreneurship, firm size, and turnover in SME’s. This particular paper contributes to the body of literature by analysing the different elements that directly affect the sustainable growth of SME’s in Pakistan. To achieve success in identifying the best value of their knowledge asset, the SME’s need to give equal attention towards the implementation of knowledge management strategies. Findings reflect that, the awareness of knowledge management, innovation, firm size, demographics is positively related to the sustainable growth of a firm. The small and medium size industry, which is the backbone of Pakistan’s economy, is needed to be addressed in order to have more understanding about the factors that are contributing towards its growth.

Key Words: Knowledge management, Small and medium size industries, Innovation, entrepreneurship, demographics

1. Introduction

1.1 Objectives of the research

There are many factors that affect the growth of SME’s in Pakistan. However, the objective of this paper is to find out if Knowledge management awareness, turnover, demographics, entrepreneurship, innovation and firm size has any affect towards the sustainable growth of the SME’s of Pakistan.

1.2 Problem statement / Literature gap and research questions: -

The objective of this current study is to analyze the regularity, role and nature of knowledge management activity, entrepreneurship, innovation, demographics, and firm size and turn over in the context of Small and medium sized enterprise (SME). More or less, these all factors have never adopted to investigate their impact on the performance of the small and medium size industries especially in Pakistan. The understanding of the factors that are responsible for sustainable growth in the SME sector in Pakistan is the need of the time as SME sector is one of the major sectors in the Pakistan in terms of employment and their contribution towards GDP. In Pakistan, a very limited research has been carried out in order to know which are responsible for the sustainable growth in SME’s.
2. Literature Review

2.1 SME’s of Pakistan: -
Small and medium size firms in Pakistan are contributing a significant proportion towards the GDP. There are approximately 3.3 million business enterprises operating in Pakistan. The share of SME’s in industrial employment is estimated at 78%, in value addition about 35%. The contribution in manufacturing export earnings is about 25%. The contribution of SME’s towards GDP is 30%. (economic survey, 2009) SME sector is the important sector of the Pakistan economy. These are scattered all over the Pakistan. In Pakistan SME’s are dealing with textile, leather, marble, steel, handicrafts, gems and precious stones. The strongest arguments favouring SME’s are that they provide higher resource distribution from societal point of view, because they are the open source of more employment at smaller capital cost as compared to large enterprises. According to Pakistan Ministry of Labour, there will be an addition of approximately 17 million persons in labour force at the end of 2009. To deploy these new entrants it needs Rs. 5.2 trillion in large scale sector while on the other hand only Rs. 8 billion needed in small/micro scale sector (Government of Pakistan Ministry of Industries & Production, 2010). According to the definition of SMEDA (small and medium size enterprise development authority) of Pakistan, those firms will fall under the category of SME who have up to 250 employees, or 250 million of paid up capital and or sale of 250 million rupees annually (Small and Medium Enterprise development authority, 2010).

2.2 Small and Medium size enterprises and Sustainable growth: -
The key indicator of performance for any firm is growth i.e. like in case of stock market valuation, growth is an important measure and failure to meet the growth expectation may lead to shatter market valuation. Similarly in the case of SME’s, here too the performance of the firm is judged on the basis of growth. Most importantly sustainable growth in sales is considered to a deciding and reliable success criteria (Laurence, 2001).

The sustainability in the growth of SME does finally contribute towards the prosperity of the modern society. To maintain sustainable growth for a longer duration is difficult (Goold, 1999). Therefore long term growth, sustainable growth, is considered to be the important factor of success (Gorman, 2001). For many organizations for many reasons growth is very important and essential in order to retain the knowledge workers, to enhance competitive advantage, to increase market share and finally to successfully meet the customer’s needs and demand (Daft, 1998). Therefore, here we propose that knowledge management possibly have positive effect on the growth of a company in a long run, sustainable growth.

2.3 Knowledge management awareness and sustainable growth: -
The management of capitals (intangible assets i.e. social capital, human capital, external capital, organizational capital, technological capital is known to be knowledge management. Knowledge management awareness is all about how to accomplish knowledge management (Sveiby, 1997). The awareness of knowledge management can be materialize within and across the organization by imparting a group of knowledgeable workers who have skills in knowledge management techniques and practices, which in turn establish a framework to attain knowledge management (Macintosh, 1999). Intellectual capital refers to all available resources that determine the competitiveness and value of a firm. The value of any firm comprises of both physical and financial assets and intangible assets also called as intellectual capital. The term intellectual capital means a capital which is not easily transferable in any form. On the other hand all other resources like real estate, machinery can be converted into monetary form. As far as intellectual capital is concerned, it is made up of elements which are hard to imitate like quality of
employees, reputation of brand. Intangible assets are considered as one of the vital factors for the wealth creation and for the firms it has become an important task to manage the intellectual resources (Sarrocco, 2003).

Intangible assets consists of many factors but we have selected human capital (competencies of employees, commitment, education, experience), social capital (cultural values, relations among employees, communication), external capital (relations with the customers, brand image), organizational capital (management and internal activities of the firm), technological capital (modern machinery and new processes) (Edvinsson and Malone, 1997). In Pakistan knowledge management is probably the new phenomena for the SME’s. Knowledge management is persists in SME’s but they are not aware of the term knowledge management. So in this research paper we will try to perceive the possible effect of knowledge management awareness on the sustainable growth in the context of SME’s.

2.4 Human capital: -

According to (Zakariya, 2011) human capital is all about the knowledgeable workers and that knowledge resides in the minds of the employees and in tangible form. Human capital refers to the combination of the talents of the employees, their education, experience they have, and their attitude towards the organization (Hudson, 1993). Human capital can be enhanced by training and education. There is a causal connection between knowledge resources and management of human capital. Human capital can effectively enhance the performance and growth for longer period in SME’s (Salojarvi. 2005).

Development and sustainable growth of SME’s can effectively be explained by the effective use of human capital and production processes. Human capital is the ability to manage and maintain the business resources by the managers. In this paper we will analyze the impact of human capital on knowledge management and sustainable growth.

2.5 Organizational capital: -

Organizational capital is considered to be the productive resource for any firm and it is the most important contributor to the growth and performance. This kind of a capital is hard to imitate and difficult to transfer. This particular capital also reflects the managerial decisions and activities (Baruch, 2004). Organizational capital cannot be completely codified and cannot easily transferable because tacit knowledge is hard to transfer. According to (Bruton, 2007) organizational capital is a kind of resource that is collectively held and help in interactions across the organization. Organizational capital is also responsible for the sustained growth of the SME’s (Evenson and Westphal 1995, p. 2213). In this paper we will try to analyze the possible impact of organizational capital towards knowledge management.

2.6 External capital: -

External capital here denotes relations with the customer’s ad brand image (Edvinsson & Malone, 1997). SME’s can effectively explore new ideas by making healthy relations with their customers. In UK, France and Portugal SME’s are the major drivers of innovation by working very close with their customers and meeting their needs and demands (Chanaron, 1998). It was that internal technological capital is important for the SME’s but at the same time external capital that is information from suppliers and customers are also important. SME’s in Portugal, besides internal sources also depend on the external capital for sustainable growth and innovation. External capital is also vital for the growth of SME’s in UK (Hoffman et al, 1998). Therefore in this study we will analyze the impact of external capital on the knowledge management and sustainable growth.
2.7 Social capital: -

Nahapiet and Ghoshal, 1998 defined social capital as interactive resources that are rooted in the networks of social relations. Social capital here means ‘Who you know’. It also refers to the civic relations in the organization and serves as a source of competitiveness, growth and cooperation. The SME’s are the creator and at the same time users of social capital as it enhance the flow of information and facilitates the exchange of knowledge, that is important for the SME’s (Boschma, 2005). Intellectual capital is indeed social capital. Social capital consists of relationship among the team members, trust, values and network ties. Intellectual capital is the ability of a firm to exploit its networks, social capital and connectivity for achieving sustainable growth in SME’s (Nahapiet and Ghoshal, 1998). Here we can say that knowledge is always created in the context of social capital. Therefore in this paper we will analyze the impact of social capital on the knowledge management awareness and sustainable growth in SME’s of Pakistan.

2.8 Technology capital: -

According to (Aggrwal, 2007), there is a growing need to enhance the sustainable growth and competitive advantage through capital or technological capacity building. In SME’s the technological capacity building is easy because of limited organizational structure and flexibility. SME’s in some countries have been reported to achieve sustainable growth and improved performance by adopting new technological practice. The technology facilitates to perform practices pertaining to knowledge management and helps in sustainable competence for the firms.(Jiatao Li, 2008). Technology provides infrastructure for economic development which also helps in creating new knowledge combined with innovation. The most important aspect is that it brought the world closer together by continuously improving dissemination of the knowledge and facilitates collaboration (Diem Ho, 2007). Therefore technological capital has the ability to enhance the growth of individual firm and for economy at macro level. In this paper we will analyse the importance of technological capital and its contribution towards the sustainable growth.

2.9 Turnover and sustainable growth: -

(Abassi and Hollman, 2000), has defined turnover as the rotation of workers among the firms, jobs, between the state of employment and unemployment, and around the labour market. The workforce activities can be divided into two parts: involuntary and voluntary. Involuntary turnover refers to the dismal of employees while voluntary turnover means when employees resign. Whereas function turnover means when knowledge workers are left with the firm as the bad performers leave the firm. Similarly Dysfunctional turnover refers to the situation when good knowledgeable workers leave the firm while bad performers stay in the firm. So turnover affects the productivity and growth of the firm. Turnover has an impact on the growth of the firms (Johnson et al., 2000). Therefore it is necessary to analyze the impact of turnover on the SME’s of Pakistan.

2.10 Firm Size and sustainable growth: -

Firm size refers to the number of employees that a firm has and the area of its product influence. Firm size has an impact on the growth of a firm and there is a positive association between firm size and growth and the rate of growth of the economy too (Beck, 2005). The results of the study conducted by (Cohen et al, 1987) concluded that investment in firm size has greater impact on the growth of the firm as compared to the investment in R&D. the size of the firm has an effect on the growth and survival of the firm (Renáta Kosová, 2005). Similarly it was argued by
Shumpeter (1934) that firm size is prerequisite for activities pertaining to innovation and firm size. For the above literature it is obvious that firm size has an impact on the growth of the firm. We will try to analyze the impact of firm size on the sustainable growth of the firms in the context of SME’s of Pakistan.

2.11 Innovation and sustainable growth: -

Innovation is regarded as the most important phenomena in economic and business spheres of our times for the growth of firms (G.M Peter 2010). Innovation refers to practice, ideas or any object which is perceived as new. Here it should be mentioned that the novelty does not always involve new knowledge, it may also concern with the advancement or the upgradation of the existing knowledge (Rogers, 2003). Adoring the SME’s with the innovation particularly in the knowledge economy will surely effect their working and for the overall economy. The study conducted by (Bessant, 1999) concluded that SME’s need innovation for attaining competitiveness. Studies have also emphasized on the introduction of innovation for increasing market share and growth. There is a higher rate of innovation and skill intensive in small firms. As far as innovation is concerned it provides a straight path for sustainable growth. There is positive impact of innovation on the competitiveness and sustainable growth in SME’s. According to Lee, 1998 SME need innovation in order to have technological advantage and sustainable growth. In this paper we will try to analyze whether the innovation in SME’s of Pakistan have any impact on their sustainable growth.

2.12 Entrepreneurship and sustainable growth in SME’s: -

In literature, a continuous discussion is going on over the difference between the owner manger of small firms and entrepreneur. But in the theories of Schumpeter (1934) and Knight (1921), a distinction has been made between decision making of entrepreneur and the owner of small firm. They argued that it is not always true that all the owners of small business are entrepreneur. Vecianna in 2000 defined entrepreneurship as creator of new business, identify new opportunities and it is the ability of the entrepreneur to create novel combinations of factors production. According to Ahrens 2000, firms have to bring changes within itself because it is not possible to achieve long term sustainability and it is the entrepreneurship that impelement the changes. In this paper we will analyze the impact of entrepreneurship on the sustainable growth of SME’s.

2.13 Demographics and sustainable growth: -

Demographics refer to the general characteristics of the human population. It commonly refers to the gender, income, mobility etc (Power, 2006). Here in the context of small firm’s demographics refers to the location of the firm and experience of the employees. Demographics effect the growth and sales (Boschma 2005). The location of the firm has an important affect on the productivity and growth of the firm. If the firm is located near the big cities, the firm has an easy access to the raw material and it will be easily available to the firm. If the firm is located in rural the raw material will not be timely available and hence growth rate will be retarded. Similarly experience of the worker too contributes towards the sustainable growth, innovation and competitiveness of the firm. As supported by the literature that demographics do effect the sustainable growth therefore in this paper we will analyze the impact of demographics on the sustainable growth of SME’s in Pakistan.
3. Conceptual Framework of the Research

The conceptual framework for this study is to analyze the relationship between small and medium enterprises, innovation and knowledge management. Variables that will be helpful for this study are knowledge management maturity/awareness, sustainable growth, human capital, organizational capital, external capital, technological capital, turnover, innovation, entrepreneurship, demographics and firm size. Among these variables there exists some relation according to the previous studies. Sustainable growth is the dependant variable while KM maturity/awareness, organizational capital, external capital and human capital, are independent variables. This is described with the help of a model which is given below.

### Figure 1

![Conceptual Framework Model]

#### CONCEPTUAL FRAMEWORK MODEL

- **KM awareness**
  - Human Capital
  - Org. Capital
  - External Capital
  - Social Capital
  - Tech. Capital

- **Sustainable Growth**
  - Turnover
  - Firm Size
  - Innovation
  - Entrepreneurship
  - Demographics

**Research hypotheses**

- **Ha1**: KM awareness is significantly associated with human capital.
- **Ha2**: KM awareness is significantly associated with organizational capital.
- **Ha3**: KM awareness is significantly associated with external capital.
- **Ha4**: KM awareness is significantly associated with social capital.
- **Ha5**: KM awareness is significantly associated with technological capital.
- **Ha6**: Turnover is significantly associated with KM awareness.
- **Ha7**: Sustainable growth is significantly associated with turnover.
- **Ha8**: Sustainable growth is significantly associated with KM awareness.
- **Ha9**: Sustainable growth is significantly associated with firm size.
- **Ha10**: Sustainable growth is significantly associated with entrepreneurship.
- **Ha11**: Sustainable growth is significantly associated with innovation.
- **Ha12**: Sustainable growth is significantly associated with Demographic i.e. experience and location.

Sustainable Growth =function (Knowledge Management awareness, innovation, turnover, firm size, entrepreneurship, demographics)

(1)
Sustainable Growth = $\beta_0 + \beta_1 \times \text{Knowledge Management awareness} + \beta_2 \times \text{innovation} + \beta_3 \times \text{turnover} + \beta_4 \times \text{firm size} + \beta_5 \times \text{entrepreneurship} + \beta \times \text{demographics}$.................(2)

4. Study Design and Methodology

The study is descriptive in nature based on quantitative data and previous studies.

4.1 Population

Our target population was the employees of SME, working in different departments.

4.2 Sample

The sample was taken on a convenient basis from SME’s from Pakistan. As the SME’s are scattered all over Pakistan so we have selected those SME’s that were easily accessible. The respondents were both males and females of different ages and belonging to any race, socio-economic status and background.

4.3 Data collection

As the research is quantitative in nature therefore primary data was collected with the help of self-administrated questionnaire. Total n= 350 questionnaires were floated out of which n= 250 respondents filled the questionnaire properly; the response rate was 71%. These were selected from different areas of Pakistan. SMEDA also provided laudable work and helped in data collection.

4.4 Survey Instrument

The questionnaire was designed with the help of extensive literature review. The questionnaire consisted of 9 parts, each variable consist of 5 constructs. The respondent were asked to reply on Likert scale from strongly agree to strongly disagree. The reason for using Likert scale is that because it is psychometric analysis of respondent’s behaviour (Likert, 1932). All the items were close ended because close ended questions allow the respondent to show their degree of agreement or disagreement.

4.5 Validity

The initial draft of the questionnaire was floated for the purpose of content validity, for which views were collected from the scholars as well as potential respondents. Based on their view various items were ommitted, modified and even few more questions specially in organizational culture variable were added. After the changes questionnaire was floated to different organizations for pilot testing. The sample size for pilot testing was 15 and on the basis of results generated internal consistency of data was measured. It was found that all the variables met the cut of value (0.65) (Leech, et al., 2005).

4.6 Reliability

Reliability test was used to measure the internal consistency based on computed values of Cronbach alpha ($\alpha$). Reliability of the sample was measured which shows that all the variables met the cut off value (0.65) that is acceptable for retaining the variables (Leech, et al., 2005).

4.7 Classical Linear Regression Assumptions

The data fulfill all the five classical linear regression assumptions i.e. strict exogeneity, No multicollinearity, no hetroscadesticity, no autocorrelation. So the data is good enough to test for further analysis (Leech, et al., 2005).

5.3 Factor Analysis

The purpose of using factor analysis is to investigate the large number of relationships among inter-level variables. For factor loading principle component analysis method was used. Less than 0.40 of items values were omitted and did not use for further analysis (Leech, et al., 2005). Table below shows the retained items that met the cut off values i.e. > .40

KMO stands for Kaiser-Meyer-Olkin Measure of Sampling Adequacy (small value of KMO indicates factor analysis is inappropriate and). KMO indicates sufficient items for each factor. All the values are found greater than 0.5 (SPSS user’s guide). If the value of Bartlett Test of Sphericity (to test the null hypothesis that the correlation matrix is an identity matrix which would indicate that the factor model is inappropriate) is less than .05 then it should be significant and indicates that the correlation matrix is significantly different from an identity matrix, in which correlations between variables are all zero (Leech, et al., 2005). Table 5 shows the values of KMO and Bartlett's Test of Spheric.

5. Data Analysis

5.1 Correlation

Pearson Correlation was used to check the correlation among the variables. Table 6 shows that all variables are associated with each other and have significant correlations (Leech, et al., 2005).

**Correlation is significant at the 0.01 level (2-tailed)
*Correlation is significant at the 0.05 level (2-tailed)

The above correlation table suggests us that almost a significant and positive correlation exists among the variables like human capital with organizational capital, external capital, social capital, technological capital, innovation, entrepreneurship, location and experience.

5.2 Descriptive Analysis

The entire 250 respondent have responded through emails and by visiting the respondents personally. Demographic data indicate that 77.2% were male and 22.8% were female. 46% were having Diploma/Higher Graduate diploma level qualification, 23% were having Bachelor degree, 25% were having Master degree, 4% were having M.Phil/MS, 0.8% was having PhD and
remaining 1.2% was having other degrees. The Table 5 shows the rest of the details. Data collected from private organizations. Majority of the respondents were in 20-30 age groups (40%). Then come 31-40 age groups (35.2%) and 41-50 age groups (24.8%). The least represented one is 60 above age group with 1 respondent.

5.3 Hypothesis Testing and testing the model

A structural equation modeling technique was utilized to analyze the model. We have used SEM because it is used for testing relationships using different combinations of statistical data and casual assumptions. The LISREL 8.80 program was used for this purpose (Usluel et al., 2008; Jackson et al., 2005). The observed variables used to predict the latent variables in structural equation modeling were obtained by processing the data in the instrument (Jackson et al., 2005). The variable human capital, organizational capital, external capital, social capital, technological capital, firm size, innovation, entrepreneur, location and experience predict the latent variable knowledge management awareness, sustainable growth, demographic, turnover that was calculated using the relevant items as a result of the factor analysis carried out on the items, in the data collection tool, which tend to explain the purposes of sustainable growth on knowledge management awareness, demographic, innovation, firm size and turnover. The value of chi-square is 21.93 and the degree of freedom is 14 according to Usluel et al (2008) the chi-square will be divide by degree of freedom then the results generated will be less than 3 i.e. 1.99 which shows model is significant. The value of p is also significant because it is less than 0.05. Figure 3 shows the recommended model. Fit indexes (7) which are commonly used in the literature (x²/d.f, GFI, AGFI, NNFI, CFI, RMSR, RMSEA) were employed to test model fit. According to Usluel et al., (2008) the best fit were acquired when all the seven fit indexes meet the cutoff values that were acknowledged in the literature. The commonly used measures of model fit, based on results from an analysis of the structural model, are summarized in table. In practice, Chi-square / degrees of freedom less than 3, GFI, NNFI, CFI greater than 0.9, an AGFI greater than 0.8, RMSR less than 0.1, and RMSEA less than 0.06 or 0.08 are considered indicators of good fit. As seen in table, all goodness-of-fit statistics are in the acceptable range (Usluel et al., 2008; Jackson et al., 2005).

<table>
<thead>
<tr>
<th>Fit Index</th>
<th>Recommended Value</th>
<th>Observed Value</th>
<th>Observed values</th>
</tr>
</thead>
<tbody>
<tr>
<td>Chi-square/ degrees of freedom</td>
<td>≤3.00</td>
<td>&lt; 2.72</td>
<td></td>
</tr>
<tr>
<td>GFI</td>
<td>≥0.90</td>
<td>&gt;0.96</td>
<td></td>
</tr>
<tr>
<td>AGFI</td>
<td>≥0.80</td>
<td>&gt;0.86</td>
<td></td>
</tr>
<tr>
<td>NNFI</td>
<td>≥0.90</td>
<td>&gt; 0.90</td>
<td></td>
</tr>
<tr>
<td>CFI</td>
<td>≥0.90 or ≥0.95</td>
<td>&gt;0.96</td>
<td></td>
</tr>
<tr>
<td>RMSR</td>
<td>≤0.10</td>
<td>&lt;0.068</td>
<td></td>
</tr>
<tr>
<td>RMSEA</td>
<td>≤0.06 or ≤0.08</td>
<td>&lt;0.076</td>
<td></td>
</tr>
</tbody>
</table>

GFI = goodness-of-fit index; AGFI = adjusted goodness-of-fit index; NNFI = non-normed fit index; CFI = comparative fit index; RMSR = root mean square residual; RMSEA = root mean square error of approximation.
The observed variable (human capital, organizational capital, external capital, social capital, technological capital, firm size, innovation, entrepreneur, location and experience) used to predict the latent variables (knowledge management awareness, sustainable growth, demographic, turnover) in structural equation modeling. Table shows the coefficients, standard error, error variance, t value and p value and describes the acceptance and rejection of hypothesis.

5.4 Structural Paths
\[
Z_2 = \beta_{11} Z_1 + \beta_{12} Z_3 + \beta_{13} Z_4 + \varepsilon_5 \quad \text{.................... (1)}
\]

5.5 Findings:-
The results show that hypothesis 1, 2,3,4,5,7,8,9,11,12,13 are accepted whereas hypothesis 6 and 10 are rejected. Therefore we can say that turnover and entrepreneur have no impact on sustainable growth that’s why the recommended model is different from that of our model. In the recommended model turnover and entrepreneur were taken out from the model.

**DISCUSSION AND CONCLUSION**

From the above interpretation of the results it is clear that all the variables are affecting the sustainable growth of the SME’s in Pakistan except entrepreneurship and turnover. So we can conclude that human capital, external capital, technological capital, organizational capital, social capital are significantly contributing towards knowledge management awareness which ultimately contributing towards sustainable growth of the firm (Salojärvi, 2005). Hence our results validated the previous studies. It means in SME’s of social capital, human capital, external capital, technological capital and organizational capital have a positive impact on the knowledge management awareness which ultimately impact the sustainable growth of the SME’s. From the above results it can be concluded that innovation has an impact on the sustainable growth of SME’s in Pakistan. Here our findings support the previous study (Acs and Audretsch 1987). The results shows that firm size do have an impact on the sustainable growth of SME’s in Pakistan. Similarly according to (Beck, 2005) there is a strong and positive association among the firm size and growth and rate of economic growth. Here in case of Pakistan, firm size is effecting growth as confirmed by the above mentioned results.

**SME’s, Turnover and Entrepreneurship**

From the above mentioned results it is clear that turnover is not affecting the sustainable growth because in Pakistan low or medium skilled labour which is necessary for the SME’s is available because of high unemployment rate in Pakistan. So if the worker leaves, its vacuum can easily be filled as the employers have a vast pool of human resource. From the above results it is clear that entrepreneurship has no impact on the sustainable growth of the SME’s in Pakistan. Here our findings do not support the previous research. The failure of financial market and other institutions impede the growth of SMEs. i.e. some financial institutions lend money to well established firms and to those with whom they have longstanding relationships, rather than lending money to new comers with better outlook and efficient projects. This trend discourages
entrepreneurship. Schumpeter argued that the bank plays an important role in entrepreneurship and innovation in the society. As these financial institutions tend to mobilize the savings, this is a very crucial and important decision to which firm the credit should be given. If the financial institutions give credit to their relatives or cronies or near one means they are discouraging entrepreneurship, innovation and overall prosperity of the economy (Schumpeter, 1912). Same is the case with SMEs in Pakistan. Due to irregular and wrong credit financing entrepreneurship is being discouraged as it is validated by the above mentioned results. According to the results entrepreneurship is not contributing significantly towards sustainability and growth in the SMEs. The demographics (location and experience) in case of Pakistan are also significantly associated with the growth of the firm and it is justified by the above mentioned results. The location of the firm has an important effect on the productivity and growth of the firm. If the firm is located near the big cities, the firm has an easy access to the raw material and it will be easily available to the firm. If the firm is located in rural the raw material will not be timely available and hence growth rate will be retarded (Beck, 2005). Similarly experience of the worker too contributes towards the sustainable growth, innovation and competitiveness of the firm (Salojärvi, 2005). So from the above results we can conclude that human capital, social capital, external capital, organizational capital, technological capital, knowledge management awareness, firm size, innovation, demographics are positively associated with the sustainable growth of the SME’s of Pakistan. It means that if these variables are given space and implement in true letter and spirit, it can enhance the sustainability and can create competitive advantage for the SME’s.

Managerial and academic Implications

Several interesting implications arise by the investigation of this study for academia, business, and research. This study is valuable from managerial or business point of view because practitioners can consider all these variables helpful not only for small industries but for the multinational organizations. Above all this study can be helpful for the management decision-making because this will play a significant role to enhance the sustainability and productivity of organization. This study besides its managerial worth has its academic implications too. For business education, case studies can be added up in the curriculum that raises the students’ ability to investigate and learn more and more about the small and medium size enterprises. To enhance the aptitude of students, case studies can be given. To create awareness about knowledge management, the students should be given different tasks. On the other side there is some responsibility of institutions also that they must revise their academic programs and must add up some moral awareness courses like, knowledge management, social capital, human capital etc. This research study helps in knowing the factors that have some impact on sustainable growth and creating mutually beneficial decisions.

Practical Limitations

The study has several limitations as the research was limited to the small industries located in different cities all over Pakistan but the major issue was of the time and cost constraint. Hence the findings can be generalized. However this field requires further research to have a clear and broader picture of the relationship and factors that affect the knowledge management, innovation and sustainable growth in SME’s of Pakistan. The sample size was limited due to time and financial constraint however the response rate was good enough. It is believed that the non-response bias has not unsubstantiated the results of this study. However, generalizing the results to other Asian Countries may be not a wise idea as the economic and political situations are very much different among the third world countries.
Future Research projection and Conclusion

This study can be expanded to other Asian countries, Gulf and Turkey. Time constraint and cost of surveying were the biggest limitations in conducting the study. Unfortunately in our country Pakistan we don’t have research environment that is the biggest hindrance in producing quality of results. The study still has many gaps which are required to be filled as many other variables were not analyzed. The model can be further improved by the addition relevant variables in future and then finding out the effect on sustainable growth of SME’s. New instrument was developed to check the relations and impact of several variables on sustainable growth. The instrument helped us a lot to quantify the results and finding of the research. Therefore, this study helped in filling the knowledge gap existed in knowledge management and sustainable growth in SME’s of Pakistan.

Investigation of the Corporate Social Responsibility (CSR) Dimensions in Private Financial Institutes (Case Study: Two Iranian Private Banks)

Dr. Mehdi Kazemi
Associate Professor, School of Management and Accounting, Department of Management
University of Sistan and Baluchestan, Zahedan, Iran,

Sadaf Estanesti
Master of Business Management-Finance Management
University of Sistan and Baluchestan, Iran

Abstract
The main objective of this study is to recognize and prioritize the dimensions and criteria of the Corporate Social Responsibility from the viewpoint of top managers of private financial institutes. The statistical population of the present study includes managers of the central branches of Iranian targeted private banks. After interviewing a number of bankers and experts, a questionnaire was prepared and distributed among nine managers of the two targeted financial institutes in person. The hierarchical analytical approach of the data has been carried out using Super Decision software. The findings show that leadership (vision) has occupied the first place and Marketplace occupying the bottom position. Also, Workplace, accountability, and Community relations have taken second, third, and forth positions respectively. In addition, in a general comparison of all categories from the viewpoint of the interviewees, organizational missions, codes of ethics, formulating the organization’s strategies were among the most important ones.

Keywords: Corporate Social Responsibility, Bank, Leadership, Workplace, Accountability, Marketplace

1. Introduction
Corporate social responsibility (CSR) is becoming an important and mainstream issue for many organizations. A large number of companies appear increasingly engaged in a serious effort to define and integrate CSR into all aspects of their businesses (Zu & Song, 2008:3). The banking sector has been quite slow in considering the consequences of the issue of sustainability, despite of the fact of their exposure to risk having an intermediary role in the economy (Viganò & Nicolai, 2008:5)

In addition to their undeniable influence on the society through management of the performance evaluation, financial institutes, in fact, have a pivotal role in encouraging and motivating customers to act responsibly and decrease the negative impacts of their social and environmental activities. Banking, in this regard, has a remarkable role in instilling social responsibility thought nationally and internationally, and it is anticipated that banking surpasses other rival industries in achieving social responsibility (CSR development center, 2008). As an indication of the customer service and satisfaction, CSR has turned into one of the most important issues in the Iranian banking system. In spite of this fact and based on the results of several studies done in
this field, financial institutes—it is sad to say—are losing larger and larger numbers of their customers due to their failure in areas and activities including CSR, but the majority of them are not aware of this even worsening situation (Ekhtiari Bidhendi, 2008). According to the interviews with related officials of banks and CSR development center on the topic of CSR, we are confronting limitation of resources and, therefore; it is undoubtedly important to identify and prioritize the categories, components, and principles of CSR in the field of banking, since it greatly assists bank managers with the best possible programming and allocation of resources in this field, hence, the main objective of the present study is to answer this basic question: What are the priority of the most important dimensions and criteria of CSR in the Iranian private banks from the viewpoint of their top managers?

2. Review of Literature

2.1 Corporate Social Responsibility (CSR)

The general meaning of the CSR paradigm in academic literature, which can be traced back to the 1920s (Perrini, 2006:306; Sheth, 2006:3), when business tycoons such as Carnegie and Ford began donating funds to improve social conditions (Sheth, 2006:3; Clark, 2000:364), What is referred to as the modern contribution to this topic developed when both academic and managerial literature began to assign social duties to companies (Perrini, 2006:306). Finally, the developmental history of the CSR construct is commonly divided into three phases: (1) rise and extension (1950s), (2) further expansion (1960s), and (3) full-fledged proliferation (1980-1990s) (Jamali, 2007:3; Kang & et al, 2010:73).

The evolution of CSR in 1950s is mainly known as the social responsibility (SR) more than as CSR because the corporate had not yet occurred (Chutkaew, 2006:18). In the 1950s and 1960s focused on the behaviour of businessmen rather than on the company (Jamali, 2007:3; Carina & Sofia, 2008:16). Bowen (1953) firstly points out the emergence of social responsibility to CSR into the seminal book ‘Social Responsibilities of the Businessmen. Carroll claims that it is the modern period literature on this subject and named Bowen as ‘The Father of Corporate Social Responsibilities (Nemeth, 2008:10; Chutkaew, 2006:18). According to the Bowen’s literature, the action of large corporations impact on the lives of citizens. After the early works related to CSR the 1960s see a fair development in the literature, especially those concentrating on the definition of the construct, (Nemeth, 2008:10) and names as Davis, Frederick, McGuire, and Walton dominated this period (Chutkaew , 2006; Matthew, 2007). In the 1970’s there were great achievements in the fields of society and environment. In 1980s, this period is named as ‘few definitions, more research, and alternative themes (Chutkaew, 2006:21). In 1990, CSR shifts to alternative approaches and themes including stakeholder theory, business ethics theory, CSP, and corporate citizenship (Nemeth, 2008:11; Chutkaew, 2006:21).

There is no agreement in the literature on the meaning of Corporate Social responsibility (CSR). Without doubt organizations and institutes have a major impact on the social system; hence, they must minimize the negative consequences of their activities and simultaneously maximize the positive ones. They also have to worry about the long-run requirements of the society as the most effective component and try to alleviate them. As a result, appropriate actions in proper times in relation with CSR are of utmost importance.
2.2 Dimensions of Corporate Social Responsibility

2.3 Previous studies

The first study on the aspects of CSR was done by Aupperle et al (1996) based on Carroll’s model. The results showed that the economic aspect places first followed by the legal-ethical and discretionary aspects in the second and third places. Pinkston and Carroll replicated Aupperle’s study in 1996 to see if orientations would differ in an international sample and to assess if they had changed over time. Using Carroll’s 1979 definition, they found the order to be the same, with the gap between economic and legal responsibilities decreasing, ethical responsibilities increasing, and discretionary responsibilities decreasing (Sastararuji, 2007:11; Sheth, 2006:4). Another important study carried out in the field of CSR is "a Quantitative Approach to Corporate Social Responsibility Programmer Formulation "by (Brice &Wegner, 1989). The objective this study is to investigate a qualitative approach to prioritize CSR programs via using a hierarchal analytical approach to support managers’ decision making in allocating limited resources to competitive requirements in the field of CSR. The study was carried out in two South African joint-stock insurance and oil companies. The findings of the study showed that South African organizations have gradually started allocating more and more strategic roles to CSR programs and its regulations. The hierarchical analytical approach of the study analyzes value judgements of decision makers and provides a base to concentrate on more important fields. The present approach is also considered a supportive means for CSR procedures and programs as well as a controlling means of CSR budget. Two other researches "Corporate social responsibility programs choice and costs assessment in the airline industry—A hybrid model " by (Tsai and Hsu, 2008) and "An integrated approach for selecting corporate social responsibility programs and costs evaluation in the international tourist hotel" by (Tsai and et al, 2009), have been done in the field of CSR. The objective of these two studies is to present a technique to decide on CSR programs and estimating the costs. The two studies have applied an eclectic model to select and estimate CSR programs. In the first place, the categories and characteristics of CSR have been analyzed using network and hierarchical analytical techniques.

3. Theoretical Framework

As mentioned earlier, the theoretical framework of the present study is Vilanova and other’s model of CSR. The improved dimensions and criteria of the model are presented in Table 1. Each of these dimensions consists of criteria extracted from two sources: Global reporting Initiative (2011) and Business in the community (2011). After taking the viewpoints of experts into account as well as the geographical and native conditions of or country, they were applied in the standard questionnaire of hierarchical analytical procedure.
4. Methodology

The main objective of the present study is to identify and rank CSR dimensions and criteria from the viewpoint of private banks’ highest executives. Therefore, having decided on the theoretical premises, a questionnaire was provided and passed out and interviews were carried out with private bank managers in person to collect Field data. The researchers made appointments with the targeted bank executives and passed the questionnaires out among them in person. The managers were also asked of the reasons of CSR importance, the answer to which has been utilized in analyzing the research findings.

The statistical population of the study includes managers of the central branches of targeted private banks located in Tehran based on the classification of the Iranian Central Bank. In order to have an acceptable sample, two conditions were stipulated to select the samples (Table 2) and thus the targeted private banks were limited to Eghtesad-e-Novin and Parsian banks.

Based on experimental research (Sheth, 2006; Lantos, 2001) as well as the emphasis on the undeniable role of directing managers, public relation officers, and organizational marketing in developing CSR activities, the research questionnaires were merely passed out among directing managers, head of the managing board, public relation managers, marketing deputies, and the managers of organizational promotion or members of the managing boards who were sufficiently aware of CSR situations. Since the questionnaire was corrected and improved according to the ideas of several experts form and content, the validity of the questionnaire (Bazargan, et al., 2008) was ascertained. Also, due to the fact that the ranking disagreement rate of all the categories showed less than 0.1 (equal 0.07), the Reliability of the research was ensured either. Twelve questionnaires were then distributed among the targeted managers of which nine were approved of as acceptable after the final reconsideration and edition. The findings were evaluated the priority results of categories and characteristics are presented.

4.1 Analysis Tools

The AHP is a mathematical method for analyzing complex decision problems with multiple criteria. It is developed by Saaty (Saaty, 2002). The AHP can assist in identifying and weighting selection of criteria and expediting the process of decision making (Sener, 2010). AHP is used in many fields, such as planning; selecting the best alternative; resolving conflicts; and optimization problems with other techniques, such as linear programming, fuzzy logic, and quality function deployment (Vaidya and Kumar, 2006). The problems are then structured in a hierarchical form to allow for weighting of the preferences by pairwise comparisons (Phua and Minowa, 2005). Brad used AHP in 1986 as a multi-objective methodology for selecting sub-system automation options (Brad, 1986). Braglia used AHP for analyzing multi-attribute failure mode analysis (Braglia, 2000), and Ceha and Ohta used AHP for evaluating of air transportation network (Ceha and Ohta, 1994) and Ghodsypour and Brien applied AHP with linear programming for supplier selection problem (Ghodsypour and Brien, 1998).

4.2 Super Decisions

The Super Decisions software is used for decision-making with dependence and feedback (it implements the Analytic Network Process, ANP, with many additions). Program was developed by Dr. Thomas Saaty (2001) and was written by the ANP Team, working for the Creative Decisions Foundation. Such problems often occur in real life. Super Decisions extends the Analytic Hierarchy Process (AHP) that uses the same fundamental prioritization process based on deriving priorities through judgments on pairs of elements or from direct measurements. In the AHP the elements are arranged in a hierarchic decision structure while the ANP uses one or more flat networks of clusters that contain the elements. Most decision-making methods assume
independence between the criteria of a decision and the alternatives of that decision, or simply among the criteria or among the alternatives themselves (Saaty, 2002).

5. Results

5.1 The results of CSR dimensions ranking in private banks

Table 3 shows the weight (W) and ranking (R) of each CSR dimension from the viewpoint of the private bank managers. “Leadership” occupied the first position (0.525) and “Marketplace” became the lowest priority (of the five CSR dimensions). CSR in the Workplace, accountability, and Community relations earned second, third, and fourth positions respectively. The disagreement rate was 0.0761.

5.2 Ranking results of CSR criteria in private banks

5.2.1 Ranking criteria of “leadership”
Table 4 shows the weight (W) and ranking (R) of each criteria of leadership from the viewpoint of private bank managers. Of the six criteria of leadership in private banks, organizational missions (0.32) and codes of ethics (0.262) occupied first and second positions, formulating organizational strategies (0.008) and applying structural modifications (0.076) were the lowest criteria. Working principles and codes and intra-organizational procedures ranked as third and fourth positions. The disagreement rate was 0.0833.

5.2.2 Ranking criteria of "Workplace"
Table 5 shows the weight (W) and ranking (R) of each criteria of Workplace from the viewpoint of the managers of private banks. Of the seven criteria of Workplace in private banks, staff health and safety (0.184) and education and Empowerment (0.176) were the most important criteria. Encouragement Staff to report violation of the organization principles and values (0.094) and encouragement staff to participate in volunteering social activities (0.096) ranked as the lowest criteria with a very slight difference. Balancing of life and work for the staff, equal job opportunity policy, and practicing non-discriminatory policy, earned third, fourth, and fifth positions. The disagreement rate was 0.0734.

5.2.3 Ranking criteria of "accountability"
Table 6 shows the weight (W) and ranking (R) of each criteria of accountability from the viewpoint of private bank managers. Of the five criteria of accountability in private banks, information and evaluation anti-bribery policy (0.344) was the most important criteria and receiving certificates and standards (0.055) was the least important one. Dialog and interaction with the stakeholder, reporting the social and environmental impacts, disclosing the organization’s information and performance ranked as second, third, and fourth positions. The disagreement rate was 0.0735.

5.2.4 Ranking criteria of Marketplace
Table 7 shows the weight (W) and ranking (R) of each criteria of Marketplace from the viewpoint of private bank managers. Of the five criteria of Marketplace in private banks, encouraging customers to use products and services responsibly (0.361) was the most important criteria and considering environmental conditions while giving loans and other services to clients (0.158) was the least important one.
5.2.5 Ranking criteria of Community relations

Table 8 shows the weight (W) and ranking (R) of each criteria of Community relations from the viewpoint of private bank managers.

Of the five criteria of Community relations in private banks, Educating and informing people of the services and financial affairs of banks (0.289) was the most important criteria and measuring society’s overall view of its performance (0.128) was the least important one. Giving loans and other services according to non-discriminatory nationwide, decision-making in order to support local communities and less prosperous areas, and taking actions in favour of poor people to have an easier access to financial resources, ranked as second, third, and fourth positions. The disagreement rate was 0.0740.

5.3 Ranking of all CSR criteria in comparison with each other

Here, all the CSR criteria were compared with each other. Organizational missions (0.103), codes of ethics (0.097), and formulating organizational strategies (0.082) were ranked as the most important CSR criteria. On the other hand, evaluating business partners based on CSR criteria, equal opportunities for partners to support social programs, considering CSR criteria in contracts, and considering environmental conditions while giving loans and other services earned the lowest score of just 0.011. The disagreement rate was less than 0.1 (in fact it was 0.072) that corroborates the comparison.

6. Conclusion and Recommendation

The present study embarked on prioritizing the CSR dimensions and criteria using hierarchical analytical approach and from the viewpoint of private bank managers. Brice and Wegner(1989), argue that applying hierarchical analytical approach in the field of CSR not only facilitates the procedure of decision making for the managers, but it is also a supportive means that prioritizes CSR categories which, in turn, provides the possibility of changing human judgement into measurable criteria to formalize and standardize decisions to allocate social responsibility resources.

Generally speaking, the findings of the present study corroborate the considerable importance of leadership in the Iranian private banks. Many other studies have approved the same supposition, for instance Brice and Wegner (1989), Maignan and Ferrell (2004), sheth(2006) and carina and sofia (2008) all emphasize on the importance of leadership in CSR. They also believe that an active, knowledgeable manager competent of the internal and external CSR values and regulations is of utmost necessity.

The results of interviews with the targeted managers of the study brought up some reasons with regard to the importance of leadership. “Generally, it is the idea and insight of the highest executive of the organization that determines its social responsibility in different fields; the leadership determines organizational missions and policies of CSR; if the leadership is carried out properly in the organization, even in the static, undesirable conditions, the organization can successfully carry out its own responsibilities; the most important barrier on the way of social responsibility is a lack of motivation and stimulant; no progress is achieved until the organization leadership manifests awareness, accountability, and affirms social responsibility”.

Another remarkable result of the study is the importance of "workplace". Based on the Review of Literature, paying the staff due attention is one of the most important duties of every organization. Since the staffs are the backbone of each organization, it is undoubtedly essential that their requirements are met in the best possible manner. Carina and sofia (2008) argue that it
is the staff that implements organization strategies and, hence, it is absolutely vital to give the employees motivation and encouragement to enforce policies. Without their full cooperation and enthusiasm, every way, every solution, every action is unquestionably doomed to failure. Satisfied employees equals satisfied clients, satisfied clients equal more and more interest which benefits both the employees and the organization. Employees naturally prefer to work for an organization that is famous for the well-treatment of its staff.

Managers of private banks believe that in order to gain more interest and satisfy the shareholders as the main beneficiaries, paying due attention to the employees goes without question, since promoting their job security and alleviating their preoccupations results naturally in the organization’s progress and development. Other sections and fields will also benefit if the employees share social responsibility attitude. If the employees feel satisfied and social responsibility dominates the working atmosphere, beneficiaries outside the organization will also benefit. An active, dynamic working environment yields employees more and more responsible.

Another argument with regard to CSR is “accountability”. Beck, Giddens and Lash (1994) argue that the most effective achievement of a trade organization is increasing its shareholders’ profit through applying serious and rigid CSR regulations and a feeling of responsibility and accountability towards the beneficiaries. Accountability is a concept closely tied to responsibility. Each organization has specific responsibilities and has to be accountable toward its clients. It ought to report on the organization’s performance regularly (Unerman& O’Dwyer, 2007:338).

Carina and sofia (2008) believe that the success or failure of an organization is strongly related to the way in which an organization meets the needs of and satisfies its beneficiaries.

Some suggestions are recommended to targeted financial institutes and organizations as follows:

1- Cooperating with NGOs especially the Iranian Center for Developing CSR to hold training courses for the managers of different levels in the organization

2- Coordinating CSR programs with the strategic ones of the organization, in other words, considering CSR programs as a sub-category of the strategic programs because it leads to a sustainable competition and is the pathway for the organization to obtain its objectives. In their Review of Literature, Werther and Chandler (2006) explain in full detail strategy formulation and merging.

3- Communicating and holding regular meetings with the beneficiaries to determine and prioritize responsible policies, paying due attention to the beneficiaries and employees and asking for their opinions on different issues in order to inform them of the responsible banking principles and instructions. Prioritizing these enterprises and actions largely helps identifying and materializing important objectives.

4- Preserving the environment: banks are one of the most important social institutions and can participate actively and responsibly in providing and implementing environmental policies.

5- Assigning more important roles to NGOs and non-profit organizations. Having access to the required knowledge and expertise in the field of financial management, banks can improve greatly the conditions of less prosperous areas as well as non-profit organizations.

WOMEN EMPOWERMENT AND CHILD DEVELOPMENT IN 
JAMMU AND KASHMIR : WHERE WE STAND?

Dr. Darakhshan Anjum, Assistant Professor 
School of Management Studies, 
Baba Ghulam Shah Badshah University, 
Rajouri - 185131, Jammu and Kashmir, India.

Abstract
Children are considered as the assets of the future. Their protection, welfare and development is essential for the growth of future economy. Women are vital and productive workers in National economy. “Concept of Bharat Nirman”, “Feel Good”, “Socio Economic Development” and “Good Governance” is not possible without participation and empowerment of women. Women’s protection, welfare, participation and empowerment are, thus, important for human development and growth in economy. Women constitute about 47% of the total population of the State. This paper provides a complete look about present status of women in J&K, Occupational Status of Women, Unemployment rate for J&K State, vis-a-vis All India, and Funds received under Integrated Child Development Scheme (ICDS), Supplementary Nutrition under ICDS, Non-nutritional Assistance under ICDS, Number of beneficiaries under ICDS. And suggest suitable measures to overcome the problems.

Keywords : Child Development, Demography, Education, Integrated Child Development Scheme, Nutrition, Rural, Women Empowerment.

Introduction
Development of children is undoubtedly at the centre of the 11th Five Year Plan. The Plan strives to create a productive environment which will ensure every child’s rights to survival, participation and development. The education is the crucial input for empowering children with skills and knowledge and giving them access to productive employment in future. Improvements in education are not only expected to enhance efficiency but also augment the overall quality of life. Women development, no doubt, has been part of the development planning since the inception of five years plans but the shift in approach from welfare to the development of women took place in the 6th Plan. 7th Plan laid emphasis on identification and implementation of various beneficiary oriented schemes. 8th Plan promised to ensure that benefits of development do not by-pass women. The 9th Plan changed the strategy for women from development to empowerment and adopted a system of preparation of Women Component Plan (WCP) through which not less than 30% of the funds / benefits were to flow to the women from all the women related development sectors. The 10th Plan further strengthened the implementation of Women Component Plan.

Objectives of the study:
The focus of the study is on the following objectives:
1. To review the present status of women in Jammu and Kashmir.
2. To review the occupational status of women in Jammu and Kashmir.
3. To review the unemployment rates for J&K state vis-a-vis all India.
4. To review the funds received under Integrated Child Development Schemes.
5. To review supplementary nutrition under Integrated Child Development Schemes.
6. To review the number of beneficiaries under Integrated Child Development Schemes.
7. To identify the problems and suggest suitable measures to overcome the problems.
Methodology Adopted:

Significant part of the study depends on secondary sources. But information has also been obtained from primary sources which include interviews, comments, observations, opinion, notes, etc. of the persons concerned. The primary information was also gathered through discussion with persons in Social Welfare Department, Directorate of Economics and Statistics, J&K. Materials for the present study were collected from the published records available in the library of BGSB University, Rajouri, Jammu and Kashmir, various Economic Survey, Planning Commission, Govt. of India, Digest of Statistics 2007-08, Govt. of India, India 2010, Statistical Abstract 2007, magazines, journals and periodicals, have also been gone through to derive information pertaining to the present study.

Limitations of the Study:

Nothing is perfect so is this study. The present study suffers from certain limitations. The study is based on the information from secondary source which reduce the degree of reliability. However, attempt has been made to collect maximum information from the official record of Women Development Department in general and J&K in particular on the various aspects of the study. Most of the departments neither publish the information nor do they allow the outsiders an access to their records, internal working etc. On the pretext of maintaining secrecy. This restricts the data availability. It was difficult to collect all the necessary data from grass root level.

Moreover, the Women Development Department was emphasized to monitor closely on continuing basis the flow of benefits to the women. These initiatives have helped in improving the status of women in various spheres to a great extend, yet the imbalance exists. The present status of women in terms of demographic features, access to social services and employment is enunciated below:

Demographic Profile

Female population of J&K State rose very marginally from 47.1% of the total population in 1981 to 47.2% of the total population in 2001, with an increase of 19.60 lakhs. At 69.44%, the growth rate of female population for the two decades (1981-2001) was slightly higher than the male population growth rate of 69.40% over the period. This is because the life expectancy for women (64.5 years) is higher than male life expectancy of 63 years. Demographic imbalance between men and women, however, continue to exist.

Sex Ratio

Sex ratio is an important indicator of the social condition particularly with respect to women’s status of any society. Low sex ratio shows indulgence of artificial interventions, distorting the biological trend and natural balance in terms of number of females per thousand males. An important concern in the present state of Jammu and Kashmir’s demographic transition relates to adverse sex ratio. The sex-ratio as per census 2001 is 892 (females per thousand males) which is very unfavourable to the women of the State. Although the recent survey conducted by the Directorate of Economics and Statistics in the year 2006 has shown the sex ratio as 925 and the result of NSS Survey 61st round has also revealed a sex ratio of 923, the sex ratio in the State is still below the National average of 933. The position is worse in the urban areas where the sex ratio is only 819 as against 917 in rural areas as per the Census 2001. However, the position has improved as per NSS 60th round results which exhibit sex ratio in urban areas at 919 and rural areas at 925.

Women education in J&K

Education of the women is very effective tool for women’s empowerment not only from the point of view of literacy, but has inter-linking with other social parameters viz. population growth, health care, education of children etc. It enables rural women to acquire new knowledge and technology, required for improving and developing their tasks in all fields. Female education is essential for higher standards of health and improved “maternal competence” which leads to
lower infant mortality. It also raises women’s economic productivity. Despite its linkage to so many positive outcomes and the progress made over the past 50 years, female literacy remains very low in Jammu and Kashmir State as compared to men.

As per census 2001, the literacy rate in the state was 55.52% and for females it stood at 43% with a corresponding dispersion at Rural and Urban level as 36.74% and 61.98% respectively. While as for males the indicator stood at 66.60% with a corresponding dispersion as 61.65% and 80% at Rural and Urban level. The female literacy in the State is only 43%. The gender gap in literacy is 23.6%. Gender differential exist both in Rural and Urban areas but it is high in Rural areas. This can be attributed to a number of factors viz. lack of access to schools, parents feeling insecure about sending girl children to school, their engagement in agricultural and other domestic activities etc.

**Employment Status of Women in J &K**

UN Commission on status of women says that women constitute half of the world population, accomplish about two thirds of the work hours and receive one tenth of the world income. There is need to strengthen selfemployment of women, which will generate additional income, leading to their economic independence.

Women are significant contributors to the growing economy. The total work force in 2001 was 37.54 lakh workers consisting of 26.80 lakh males and 10.74 lakh females. This work force consisted of 26.09 lakh main workers and 11.45 lakh marginal workers. Work participation rate amongst females was 22.45% in 2001.

The sectoral breakdown of women workers reveals that 56% women are cultivators, 5% are agricultural labourers and 10% workers in the household industry. The Census 2001 figures with regard to status of working women are as follows:

The work participation rate of women revealed by 62nd round of NSS constitutes an important source of information on unemployment. The unemployment indicators have been worked out at three basic principles are as follows:

1. Usual Principal Status (UPS) – indicator of chronically unemployed.
3. Current Daily Status (CDS) -- indicator of unemployment on the day of the conduct of survey.
The unemployment rates revealed by 62nd round of NSS for the State in comparison to Nation are given in the following table:

**Table No. 2**

**Source:** Govt. of J&K, Economic Survey 2009-10, Directorate of Economics and Statistics, J&K.

The analysis of the above information reveals that in rural areas the indicator in respect of females is better than that of males where as at National level the indicator is better for males than females.

In case of females at urban level, their position of employment is worse than that of males in the State, as well as at National level.

**Economic Empowerment of Women**

Women have suffered the most during the last two decades because of the militancy related events, economic empowerment is the only way to help the women in distress. Government has been implementing various programmes which support women to take up new ventures and start self employment, which has been categorized under following heads:

**Diagram No.1**

Economic Empowerment of women

A) State Women Development Corporation (SWDC)

The State Women Development Corporation has been declared the channelizing agency for implementation of the schemes for welfare of women. The State Government is implementing a number of development schemes for social economic upliftment of the females of the families, living below the poverty line, through J&K State Women’s Development
Corporation established in the year 1991. The main objective of the Corporation is to render financial assistance to the activities like Food Processing units, Videography, Agricultural activities and other viable units. The following schemes are in operation through SWDC:

Schemes financed by National Minorities Development and Finance Corporation (NMDFC)

- J&K’s Women Development Corporation is raising loan from NMDFC and releasing the term loans to female beneficiaries for starting income generating units. Rs. 17.33 crores have been obtained from NMDFC and 3300 beneficiaries have been covered during 10th Plan. During the year 2007-08, 811 beneficiaries have been benefited with an input of Rs. 3.87 crores. During 2008-09, 546 beneficiaries were covered with a financial assistance of Rs 3.20 crores.
- NMDFC also sanctions loan for education of women belonging to minority communities at nominal rate of interest.

Schemes Financed by National Backward Classes and Finance Development Corporation (NBCFDC).

Under this scheme loans are advanced to females of backward classes for setting up of their income generating units financed by NBCFDC. 158 beneficiaries have been benefited during 2007-08 and 163 beneficiaries were covered during 2008-09 by incurring an expenditure of Rs. 0.79 crore.

Swayam Sidha

Swayam Sidha is the modified version of Indira Mahila Yojana as Integrated Programme for women’s empowerment. Swayam Sidha envisages execution of composite and integrated projects for women’s empowerment for duration of 4-5 years at the block level by Project Implementing Agencies.

The scheme is meant for economic empowerment of women by framing Self Help Group. 13 blocks have been identified by Govt. of India in 13 districts of J&K State, 06 in Jammu, 06 in Kashmir and 01 in Ladakh.

B) Social Welfare Department

Social Welfare Department is also implementing various schemes for development of the women. These are as follows:

- Development of Vocational Skills

Females in the age group of 15 to 35 years are imparted training in various crafts through Social Welfare Training Centre run by the Social Welfare Department so that they can become self dependent and can become able to earn their livelihood. At present, there are 150 Social Welfare Centers engaged in imparting training to the women folk. The number of inmates in each centre is 25. The inmates are being provided training for 11 months and are being provided stipend @ Rs 100/- per month.

- Lady Vocational Training Centers

Apart from this, there are four ladies vocational training centers in the State one each at Jammu, Srinagar, kargil and Leh. In these centers, besides imparting advanced trainings in various crafts, training in stenography is also imported.

C) Rural Development

- Under antipoverty programmes like SGSY, Which have the objective of bringing the beneficiaries above the poverty line by helping them in setting up income generating ventures through a mix of bank credit and Government subsidy, at least 4% of the swarozgaries have to be women.
Under Indira Awas Yojana the houses are allotted in the name of female members of the beneficiary household or in the joint names of husband and wife. Among females, priority is given to widows and unmarried women.

DEVELOPMENT OF CHILDREN IN THE STATE OF JAMMU AND KASHMIR

Children are considered as the assets of the future. Their protection, welfare and development is essential for the growth of future economy.

Education:
The education is the most crucial input for empowering children with skills and knowledge and giving them access to productive employment in future. Improvement in education are not only expected to enhance efficiency but also augment the overall quality of life. The strategy in primary and secondary schooling is the most important intervention for giving children their due rights. Efforts have been made under SSA during 10th Plan to bring all out of school children to school. SSA envisioned to bring all children to school by 2005. Due to the late start of Sarva Shiksha Abhiyan in the State, the target could not be achieved in time. However, the 11th Five Year Plan envisages to bring all out of school children to school.

Goals of 11th Plan:
Successful integration of survival, development protection and participation is closely linked to all aspects of a child’s well being. 11th Plan envisages strategies to ensure that every child enjoys the childhood and all rights without any fear and without the need to work. Some specific goals of 11th Plan are as follows:

(A) Integrated Child Development Scheme (ICDS)
Currently ICDS is the only programme that reaches out to lakhs of woman and children living in remote villages. It is and will continue to be the flagship programme with a holistic package of six basic services for children up to six years of age and for pregnant and nursing mothers. These services are: health check-up, immunization, referral services, supplementary feeding, pre school education and health and nutrition education through one platform i.e. Anganwadi Centre. At present there are 141 ICDS projects with 25,483 Sanctioned Anganwadi Centres against which 23029 centres are presently functional for providing services to approximately 7.93 lakhs beneficiaries comprising of 5.30 lakhs children and 1.32 lakhs pregnant and lactating mothers and 1.30 lacs adolescent girls.

During the past four years, the position of funds received both from State Government as well as Central Government is as follows:

Under nomenclature of Non-nutrition, a number of items figure in the scheme which are essential for providing nutrition by way of cooked food to the beneficiaries. These items include Kerosene stoves, Pressure Cookers, utensils etc. Play way material for the children, medicine kits, weighing machines are also provided. The total expenditure for Non-nutrition is as follows:

The sharing pattern of the ICDS (Non-nutrition) has been changed by the Government of India w.e.f. 01-04-2009 from 100% to 90:10%.

**(B) Sarva Shiksha Abhiyan**

Sarva Shiksha Abhiyan, the flagship programme for universalisation of elementary education and universal retention, shall be continued with the mission to achieve the following objectives:

- Universal enrolment of 06-14 age group children including the hard to reach segment.
- Substantial improvement in quality and standards as per NCERT quality tools.
- All gender, social gaps in enrolment to be eliminated by 2007-12.
- Universalisation of Mid-Day-Meals scheme at Primary and Upper Primary level.

**(C) The National Commission for Protection of Child Rights (NCPCR)**

NCPCR was set up in March, 2007 for effective implementation of child rights in the country. Rajiv Gandhi National Creche Scheme for children of working mothers has been launched to provide its services to the children of age group 0-6 years. It includes supplementary nutrition, emergency medicines and contingencies. At present about 28000 creches are functioning under the scheme benefiting about 7 lac children.

An autonomous organization of Ministry of Women and Child Development Central Adoption Resource Agency is functioning with the goal to promote domestic adoption and intercountry adoption under the guidelines of the Government of India. CARA is also implementing the Shishu Greh Scheme for providing institutional care to children up to the age of 6 years.

**(D) Residential Institutions**

Residential Institutions have also been set up for Blinds, Orphans and destitute women. Free boarding, lodging, medical care and educational facilities are provided at Bal Ashrams. 24 Bal Ashrams have been set up sofar, having capacity of 1105 inmates.
Suggestions

The State of Jammu and Kashmir is situated in the extreme north of India and is bounded by China in the north and east, by Afghanistan in the north-west by Pakistan in the west and by the States of Punjab and Himachal Pradesh in the south. The State of J&K can be divided into three regions i.e Kashmir valley, Jammu and Ladakh. The J&K State has suffered badly from disturbed condition prevailing in the state for almost more than two decades.

The State of J&K should follow the national policy for empowerment of women. It should set certain clear-cut goals and objectives and create and environment through positive economic and social policies for full development of women to enable them to realize their full potential. The de-jure and de-facto enjoyment of all human rights and fundamental freedom by women on equal basis with men in all spheres - political, economic, social, cultural and civil.

Equal access of women to health care, quality education at all levels, career and vocational guidance, employment, equal remuneration, occupational health and safety, social security and public office etc. Strengthening legal systems aimed at elimination of all forms of discrimination against women.

Education of the women is very effective tool for women’s empowerment not only from the point of view of literacy, but has inter-linkage with other social parameters viz. population growth, health care, education of children etc. Women should to acquire new knowledge and technology for improving and developing their tasks in all fields.

In order to uplift the employment status of women, the State Government should come forward to provide training programme in traditional sector viz. Agriculture, Animal Husbandary, Dairying, Fisheries, Handlooms, Handicrafts, Khadi and Village Industries, Sericulture Social Forestry and Waste Land development etc.

Need of the hour to facilitate employment of women and to support the working women away from their homes/towns, who come in the cities and towns for undergoing short term training courses. Working Women Hostels with day care centers and crèches should be open in the State of Jammu and Kashmir.

Care and protection of women in distress should be focussed area for attention. To ensure security, development and well being of women in every sphere of life and ensure implementation of steps against gender discrimination should be launched at the state level.

Provision of Law, regarding prohibition of use of child labour for domestic purpose should implemented more vigorously so that children are not misused and the children are able to develop to their full potential.

A monitoring system with regards to the implementation of the schemes relating to Women Empowerment and Child Development should introduce and monitor on a regular basis.

All the beneficiary oriented schemes should be monitored to ensure that proportion of female beneficiaries to total beneficiaries, is not less than that fixed under the guidelines of the scheme.

Conclusion

Children are the assets of the future. Their protection, welfare and development is essential for the growth of future economy. The education is the most crucial input for empowering children with skills and knowledge and giving them access to productive employment in future. Improvements in education are not only expected to enhance efficiency but also augment the overall quality of life. “When women move forward, the family moves, the village moves and the nations moves” these were the words of Pandit Jawaharlal Nehru which is fact. Women are vital and productive workers in National economy. “Concept of Bharat Nirman”, “Feel Good”, “ Socio Economic Development” and “Good Governance” is not possible without participation and empowerment of women. Women’s protection, welfare,
participation and empowerment are, thus, important for human development and growth in economy. Education of the women is very effective tool for women’s empowerment not only from the point of view of literacy, but has inter-linkage with other social parameters viz., population growth, health care, education of children etc. Women are significant contributors to the growing economy.

Abstract

Evaluation of instruction effectiveness among academic staff of university of Maiduguri Nigeria is a theoretical study in an attempt to find out whether or not the effectiveness of teaching and learning is worthwhile. The study examines the stages of teaching effectiveness based on the criterion of annual performance evaluation measurement reporting system, which include: qualification, teaching experience, time in rank, teaching load/quality, professional practice/activities, research publication, academic/admin leadership and community/public service. The authors also argue that, for effective evaluation of instruction, there is daring need for blending both formative and summative evaluation together for the optimum realization of the objective of the teaching and researching activities in the tertiary level of Nigerian educational system. Moreover, the authors iterated that, for synthetic approach to teacher evaluation to function effectively, it should involves not only employers (school administration) but also students who are at the centre of learning, as such students’ online feedback survey on the effectiveness of teachers’ instruction should be created and used in the evaluation and assessment of teachers’ effectiveness.

Keywords: Evaluation; Instruction and effectiveness

Introduction

The University of Maiduguri alongside other second generation federal universities (situated in Kano, Ilorin, Sokoto, Jos, Port-harcourt and Calabar) were established in 1975 and went operational in 1976/78 academic session with students in various faculties (Arts and Education, Social Science, Law and Science). It is the mission and vision of University of Maiduguri to achieve excellence in the area of teaching and research and to promote moral and civic character of all persons who pass through her portals (The University of Maiduguri bulletin August-September, 2007 vol. v. No 3). The process of accomplishing this mission begins with the recruitment, development and retention of world-class teachers. To achieve excellence in teaching and research we must provide these teachers with the fair compensation and opportunities they deserve; this includes a thorough and meaningful evaluation process. Education is the key to a lasting economic development; building a professional and well-rewarded and appreciated teaching workforce is in the best interest of the students, the university mission and vision and the nation’s economic future.
The aim of this study is to find out after nearly three (3) decades of the existence of University of Maiduguri if it has put in place a fairly and accurate evaluation system that identify effective instructors’ who are pillars in achieving its mission and vision.

THE CONCEPT OF INSTRUCTION EFFECTIVENESS

The concept of instruction effectiveness in the evaluation and assessment of academic staff teaching performance is an area of considerable concern and debate. The question revolves around what should be assessed. First of all, we need to know what we are trying to assess, that is, what are the dimensions of teaching effectiveness. This is because it is difficult to establish a teacher evaluation system without a widely agreed-upon benchmark for “good teaching”. Once defined, evaluation mechanisms need to promote the benchmark and ensure teachers are attaining it. The most accepted criterion for measuring good teaching is the amount of students’ learning that occurs. Consistent high correlations between student rating of the “amount learned” in the course and their overall ratings of the teachers and the course have been reported by Cohen, 1981, Theall and Franklin, 2001. Angelo (1993) also asserted that “teaching in the absence of learning is just talking”. The teacher effectiveness is about the students’ learning. While others like Medley (1982) and Medley and Shannon (1994) affirmed that teacher effectiveness is a matter of degree to which a teacher achieves desired effect upon students. Elis (1984) opined that effective teachers are those whose students show statistically significant gains on achievement tests.

Thus, the aforementioned definitions consistently show that teachers’ instructional effectiveness are related to students’ achievement and that effective teachers have the greatest potentials to influence students’ education.

EVALUATION STRATEGIES

The primary objective of evaluating teacher effectiveness is to improve the quality of instruction and thus improve the overall quality of education and by extension encouraging the professional growth and development of the teachers. This type of evaluation is called formative evaluation. Research into a variety of strategies/procedures of measuring effective teaching has indicated that their effectiveness is a matter of degree (Benneth 1978). There is no clear consensus and much disagreement regarding how teacher effectiveness assessment models are to be constructed and what variables are to be included within the evaluation model (Peterson and Walberg, 1979; Borich, 1977 and Dickerson and Wiersman 1980). Furthermore, if assessment is to have a purpose, there is a very real need to identify salient characteristics upon which quantitative and qualitative aspect of measuring teacher effectiveness would be based. Professionals in the field of teacher evaluation suggested that data collected from the following method, should be used in evaluating teaching effectiveness: students rating, peer review, teaching portfolios and self evaluation (Doyle, 1983, Gentra, 1993, Ory, 1994, Seldin, 1999 and Ory, 2001). Others identified teachers experience having positive effect on teacher effectiveness, specifically the “leaning by doing” effect is most obvious in the early years of teaching. (Rice, 2002 and Hanushek and Kain 1998). Another research findings suggest that Teacher preparation programs and degrees in form of prestige of the institution a teacher attended has a positive effect on teacher effectiveness. This may partially be a reflection of the cognitive ability of the teacher (Theall and Franklin; 2001). Teachers coursework in pedagogy seems to contribute to teacher effectiveness, particularly when coupled with content knowledge Rice, 2003). Also tests that assess the literary levels or verbal abilities of teachers have been shown to be associated with higher levels of student achievement (Hess, 2002).
Given that many dimension of teachers characteristics matters in evaluating teacher effectiveness- *students rating, peer review, teaching portfolios, self evaluation, teacher experience, teacher preparation programme and test scores*- the findings from the literature implies that student ratings tend to be statistically reliable, valid and relatively free from bias or need for control, probably more so than any other data used for evaluation. The use of students rating for evaluating teacher effectiveness is the single most researched research in all higher education. Over 2000 articles and books have been written on this topic over the past 70 years (Ory, 2001).

Research findings indicates that teachers benefits most from formative evaluation when they have helped to shape the questions posed, when they understand the feedback that is provided, and when assistance and resources for making improvements are available (Gaubatz, 2000). Therefore students’ rating is a form of formative evaluation because it is meant to improve teaching and learning. Research findings indicate that students are the most qualified source to report on the extent to which the learning experience was productive, informative, satisfying, or worthwhile. While opinions on these matters are not direct measures of teachers’ effectiveness, they are legitimate indicators of student satisfaction, and there is substantial research linking student satisfaction to effective teaching (Theall and Franklin, 2001).

March, 1982 and Gaubatz, 2000 found out that there are consistently high correlations between students rating of the “amount learned” in the course and their overall ratings of the teacher and course. The studies provided the strongest evidence for the validity of student ratings since their studies investigated 41 research studies on the relationship between students rating and students learning. Murray 1994 and Felder 2001 also reported that research on student evaluation of teaching effectiveness generally concludes that students’ rating tends to be reliable, valid, relatively unbiased and useful.

**ASSESSMENT OF INSTRUCTION EFFECTIVENESS**

In the University of Maiduguri, based on the findings of this study assessed the quality and effectiveness of instruction of its academic staff using annual performance evaluation form (APER FORM) and the assessment exercise revolve around the use of performance indicators which include: Qualification, Teaching experience, Time in rank, Teaching load/quality, Professional practice/activities, Research publication, Academic/administrative leadership and Community/public service.

Based on the performance evaluative indicators above a table of minimum eligibility showing scores that have been allocated to each of the indicators is presented in table I below.
Table 1: Table of minimum eligibility scores showing weights of the scoring areas.

Source: University of Maiduguri criteria for appointment, appraisal and promotion of academic staff, 2006.

The University of Maiduguri assesses the instruction quality and effectiveness of its academic staff using the performance indicators listed above. Based on the academic staff attainment of minimum eligibility scores as indicated in table 1 above an academic staff is eligible to be promoted to the next level, deficiency in the minimum eligibility scores means there is no going to be change in status of the academic staff.

A cursory look at the table will reveal that the assessment exercise has the following strength, based on the cross-sectional examination of the above mentioned evaluative indicators.

**Teaching Experience:** To become a professor, reader, senior lecturer, lecturer I and lecturer II you must based on your teaching experience have scored 10%, 10.6%, 10.9%, 9.6%, and 10.5% respectively out total minimum eligibility serve for the above mentioned levels that you are aspiring to; although the empirical basis for allocating these percentages is not established however these percentages are not too much for teaching experience. This is because in the review research findings like that of Rice, 2003, and Hanushek and Kani, 1998 identified teacher experience having positive effect on teacher effectiveness, specifically the “learning by doing effect” which is most obvious in the early years of teaching.

**Research and Publications:** Academic staff is employed to teach and carry out research in the university. Looking at the percentage of the minimum eligibility score that has been allocated to research and publication which ranges from 60% to 21% from professorship to lecturer II indicates that the assessment exercise encourages research and publication outputs among the lecturers.

Notwithstanding the above mentioned strength of the assessment exercise has its own weaknesses in the sense that and more especially in the area under mention:

**Teaching Quality:** Since academic staff is employed to teach and conduct research, it is expected that both should be allocated about the same score of minimum eligibility for promotion. While research and publication is allocated between 60% to 20% of the total minimum eligibility score from professorship to lecturer II, teaching quality is allocated 4%, 5%, 8%, 12%, and 21% of the total minimum eligibility serve for professorship, readership, senior lecturer, lecturer I and lecturer II respectively. This shows that teaching quality and ability of academic staff is not considered as important as their research and publication ability. Even these scores that have been allocated to teaching quality are expected to be shared among the following quality of teaching performance indicators as contained in p. 10 of 2006 criteria for appointment, appraisal and promotion of academic staff.

- Number of courses taught, and extent of syllables coverage.
- Effectiveness of communication.
- Teaching methodology- Use of teaching aids like visual aids.
- Up to date content of teaching.
- Devotion to academic duties in the form of willingness to help students
- Promptness in setting examination questions and marking examination scripts.
- Assessment by external examination reports and sample answer script of students and
- Student evaluation.
A careful look at the quality of instruction evaluative performance indicators above, the assumption is that inferences about the quality of teaching can be made from these performance indicators. Looking at these performance indicators:

This is about number of courses taught in other words teaching load of an individual academic staff. Surely ones workload does not and can never indicate the quality of one’s teaching!

The second one “effectiveness of communication”. The annual performance evaluation form and the criteria for appointment, appraisal and promotion of academic staff of the university has neither provision for gathering data on effectiveness of communication of an individual academic staff nor any provision for evaluating such data.

The third requires individual academic staff to use visual aids etc, however, the evaluation exercise has totally ignored ways of generating information on individual staff teaching methodology (use of teaching aids). Class room observation or periodic checking of individual staff lecture plan or notes would have been ways of assessing individual staff ability to deploy appropriate teaching methodology. The same process could be applied in ascertaining staff use of up to date content of teaching and devotion to academic duties which is in performance indicators IV and V. Promptness in setting question papers and marking can adequately be determined by head of departments based on an individual staff response to datelines. However, student evaluation which is the seventh Performance Indicator is totally ignored because for the past fifteen (15) years based on the findings of this study student evaluation of teacher is not in use, students who are at the centre of the educational process are totally ignored. Their views will be very useful in determining the quality of teaching and learning.

**The Learning Quality:** The assessment process totally ignored the quality of learning i.e. the educational process itself. It has no provision for measuring what students are actually taught? How are they taught? What do they learn? Etc. The exercise also has no attempt to use value-added measure i.e. relating the number of graduates to the quality of students on admission. A reasonable assessment of the effectiveness of an individual academic staff ought to include the number of students he graduated and their performance on the job which should be reported by the employers.

**The Weighing of the Performance Indicator:** The relative weight of the performance indicators is somewhat arbitrary. On what basis are the various indicators scored and why? The logical, rational and/or empirical justification for allocation of scores to each of the performance indicators should be explicitly stated and made known to the academic staff. For example, why 60% of the minimum eligibility scores of becoming a professor should be allocated to research and publication while only 4% is allocated to quality of teaching!

**EVALUATION STRATEGIES: A SYNTHETIC APPROACH**

The assessment of teaching effectiveness in University of Maiduguri is dominated by summative evaluation. It totally ignored formative evaluation which encouraged professional growth and development of teachers. Scriven (1967) drew attention to the distinction between formative and summative evaluation of teachers. He asserted that if a school system institutes a system of assessment in order to encourage the professional growth and development of its teachers, it is engaged in formative evaluation. On the other hand, if the school system established an accountability system of evaluation in order to select teachers to license, hire, give tenure to promote/demote or dismiss staff it is engaged in summative evaluation.

The evaluation procedure in place in the University is the one that seek to promote or demote an academic staff (summative), it has no provision for formative evaluation that encourages the professional growth and development of its academic staff. Therefore, the university needs an approach that incorporates both formative and summative evaluation. Such an approach is the synthetic approach to evaluating teaching effectiveness. Stiggins (1980) commented on the value of these types of evaluation from the point of view of them contribution to overall school quality. The survey of teacher evaluation that was conducted by Stiggins and Duke (1990) led them to
suggest that there were several necessary conditions for the teacher growth model of teacher evaluation to succeed. They were not dismissive of summative evaluation. Rather they argued that highly developed accountability-based evaluation protects teachers’ property and rights to due process and protect the public from incompetent teachers.

Since the primary objective of formative teacher evaluation model is to improve the quality of instruction and thus improve the overall quality of education and encourage the professional growth and development of teachers. Then it suggests that teachers benefit most from formative evaluation. Students ratings/evaluation of teachers which is a form of formative evaluation became it improve teaching and learning should also be incorporated in the evaluation of teachers in University of Maiduguri. Incorporating it does not mean just mentioning it as a performance indicator but developing scales that students would use to evaluate their teachers and allocate meaningful percentage of the minimum eligibility scores to it. This is because they are substantial research findings that are linking students satisfaction to effective teaching (Theall and Franklin, 2001) and it has also been established that students ratings/evaluation of teaching effectiveness tend to be reliable valid and relatively unbiased (Murray 1994, Felder, 2001).

RECOMMENDATION

The quality and best practices of instruction and research engagement in higher institutions of learning, particularly universities cannot be compromised at this era of immense advocacy of international standard organization (ISO,2009) on the quality assurance for effective instruction delivery and intake of knowledge. As such, for effective instructional assessment and evaluation of instructors particularly universities lecturers, there should be an integrative approach to encompasses both formative and summative evaluation on the process of either promotion or otherwise of university’s instructors. The yard-stick for the evaluative indicators scores should be inferentially justified in order to check-mate victimization and favoritism.

The institutions of higher learning particularly universities should provide a viable means to students participation on the assessment and evaluation of instruction and instructors effectiveness. For example this can achieved through creating online students’ feedback survey on the decision of the quality and effectiveness of both instruction and instructors ability in conveyance the contents of the subject-matter diligently efficiently and effectively and this should constitutes part of the formative evaluation of the university’s instructors.

CONCLUSION

Evaluation of instruction effectiveness among academic Staff University of Maiduguri, Nigeria is a study aims at investigating the effectiveness of the processes employed in measuring the teachers’ instructional content delivery. It should be noted that for progressive change to prevail in the area of evaluation and assessment of effective instruction, there is need for of both employers (school administration) and students who are at the centre of learning in the evaluation of instructors’ instruction. The approach also has an implicit faith in the professional development and competence of academic staffs which are pillars in producing quality students because the approach respects students’ views and consider it useful in determining the quality of teaching and learning. Finally deploying both formative and summative evaluation in evaluating teachers will contribute in overall school quality.

Assistant Professor, Department of Social Work, University of the Punjab, Lahore-Pakistan.
Muhammad Arshad
Lecturer, Department of Social Work, University of the Punjab, Lahore-Pakistan.

Abstract

Early roots of the concept of welfare can be traced in almost all the societies and primarily all the religions have asked its followers for the welfare of human beings. However, Islam has envisaged a system of mutual help and social assistance that provides basis for the modern concept of Social Welfare. This paper addresses the concept of welfare in Islamic perspective and discussion is supported by Holy Quraan and Hadiths. It has been tried to highlight the different provisions and services which Islam seeks to provide for the disadvantaged, underprivileged, destitute, needy and vulnerable segments of the society. To ensure the protection of these vulnerable population, Islam has determined the roles & responsibilities of all the elements of the society i.e. Individual, Family, community and state as recipients and contributors. It was a desk-based exercise; researchers have made an effort to take on a systematic overview and analysis of existing literature. The secondary data was collected from libraries, government & Non-Governmental organizations, civil society organizations, internet and other available sources.

Keywords: ISLAMIC CONCEPT ; SOCIAL WELFARE

1. INTRODUCTION

The concept of welfare has been existing in almost all the societies. “The feeling of belongingness, provision of mutual assistance and protection is as old as human beings” (Lander, 1961). It commonly manifested in every religion of the world. Judeo-Christian and Muslim practices and beliefs underlie many of the early attempts to provide help to the poor, the sick, widows, orphans, the "insane" (Leighninger, 2008). Generally the word “welfare” means the well-being of individuals or a group to ensure their health, happiness, safety, prosperity, and fortune. The term “welfare” is also referred as “statutory procedure or social effort designed to promote the basic physical and material well-being of people in need: "rights to education, housing, and welfare" (Welfare, 2011).

Encyclopedia Britannica defines it as "a system of laws and institutions through which a government attempts to protect and promote the economic and social welfare of its citizens usually based on various forms of social insurance against unemployment, accident, illness and old age" (Welfare State, 2011).

The historical perspective of Social Welfare in Europe, USA and Sub-continent reflects that almsgiving and charity for poor, orphans, widows, blinds and lames were appreciable and source of salvation. This tradition remained in practice for thousands years. Provision of protection to
helpless, needy and vulnerable segments of the society was the obligation and liability of tribal and the religious leadership. “Two thousand years before the birth of Christ, a ruler of Babylonia, Hammurabi made the protection of widows and orphans an essential part of his code (Leighninger, 2008). Further the presence of the Xenodochia (guest houses) in Greece and Egyptian temples has been a part of this ancient tradition.

The records also confirm the existence of welfare system of Jews that included the education of orphans, burial of the dead, consolation of the bereaved, visitation of the ill and infirm, and the care of widows, divorcees, and the aged. Provision for the poor was made primarily through various agricultural practices, which included “gleanings,” or the practice of leaving grain dropped during the harvest which could be picked up by the hungry” (Leighninger, 2008).

In Christianity, the church has also responded to the matter of human illness both by caring for and healing the sick and by expressing concern for them. The practice of healing has retreated into the background in modern times, but healing played a decisive role in the success of the early church and was important in missionary apologetics. In the Gospels, Jesus appears as a healer of body and soul (Christianity, 2011).

The concept of welfare and mutual assistance was the most prominent feature of this religion as the early Christians used to help each other. As Christianity in medieval period became state religion, the church had the authority to administer welfare services. The administration of welfare services and charity was entrusted to the bishop, the local priest and the deacons. Beggary was a tool of welfare during this period and considered socially accepted and respected.

In this period, Institutions for the poor were established for the monasteries, serving as orphanages, as home for the old, the sick and the handicapped and as refuge for the homeless (Lander, 1961).

In 6th century, Islam also contributed to charitable traditions which emphasizes on social reforms. Islam promotes the welfare of disadvantaged through its compulsory contribution in the form of Zakat. In addition to this, other contributions were also made, called Sadqa, Khiraat and Usher (Syed, 1975; Shaghil, 1989; Sardar, 1979).

The religion of Islam seeks to maximize human welfare based on justice, benevolence and Ehsann55. Islamic ethics and values inculcate the thoughts of sacrifice and social assistance. It also endorses virtues in the individual that make it achievable for him to lower his own interest and giving priority to the collective good of the community. Thus it makes the attitude of an individual operative.

The Holy Quraan has given broad principles of values governing the socio-economic aspects of man’s life. These basic principles deal with the general conduct and obligatory precepts of an individual. Collectively they determine social behavior of the Muslims. The process of socialization in Islam becomes unique and singular when it aims to develop a religious principle in which Muslims live and move and have their being. As guiding and directive way of life this idea gives the mankind the concept of organic whole where each dimension is interrelated and coextensively diffused with the other, and where each unit is integrated with the other in harmony.

Islam therefore, envisages a system where individual becomes as much important as the society and the family as much meaningful as the community. It gives full recognition to the proclivities of man. It considers the family and the community as the important institutions for perpetuating life and goodness.

55 Ehsan (or Ihsan or Ahsan) is an Arabic term meaning goodness or excellence, which is related to the word "goodness" (Arabic Husn). It is a matter of taking one's inner faith (Iman) and showing it in both deed and action, a sense of social responsibility borne from religious conviction. Ehsan is one step ahead of Adl (Justice) when someone is prepared not only to gives other's rights but he is also prepared to sacrifice his own rights to make others happy (Ehsandotcom, 2011).
Islam has to transform individual, family, community and state as the constituents of a Muslim society and social justice which promotes the ultimate goal of social wellbeing. Contributors and recipients for welfare in a Muslim society can be perceived as individual, family, community and state. Islam creates a sense of social responsibility in human beings and organizes them in a society and a state.

**INDIVIDUAL**

An individual in Islamic terminology is interpreted as the vicegerent of its creator and bearer of this trust is conceived in terms of his accomplishment on earth. God created man of the best stature announcing him the best of many of His creations.

“And recall when your Lord said to the Angels, I am about to place a vice-generate in the earth”. (Quraan 2:30)

He is the best creation of God, who created him in his own image. Being God’s best creation he is endowed with inherent worth and dignity and is therefore worthy of respect as a human being, irrespective of considerations of color, creed, race, religion or social class. Within his appointed term of earthly bondage he must distinguish himself from other beings in his efforts of servitude as he is free to make options and choices in relation to other entities. Man is also viewed with reference to the social conditions. Virtue does not mean abandoning the value of life or seeking spiritual elevation of the self by isolating from the social milieu.

Every idea externalized by him as an action is either moral or immoral. The patterns of interrelationships so formed must also transfer ethical implications to succeeding generations. They essentially commence from an individual and then extend to the family, eventually taking into their folds the future Muslim communities. Islam in this way emulates an individual as dynamic cosmos of integrity, capable of retaining its individuality as well as becoming a part of a greater corporate personality. An individual enjoys complete liberty of holding an opinion and that of action even adopting any religion and following way of life.

In Qur’an, it is said:

(say, “the truth is from your lord”. Let him who will believe and let him who will reject (it)
(Quraan 18:29)

The religion of Islam recognizes the worth and dignity of individual. Though it doesn’t believe in the individualism emphasizing collectivism. The five pillars of Islam are in conformity to this fact. However, it supports socialized individuals and it protects the rights of individuals as human beings. Yet, it values the significant role of individual in the process of development. It is believed that the individuals whose rights are protected and welfare is ensured are expected to contribute their full potential in the development and stability of the society. On the other hand, the deprivation from protection and welfare may result in the societal collapse and disintegration. In Islam, the first and foremost right of the citizen is the protection of their life, property and honor, together with the assurance that this right would not be interfered with, except on valid legal ground. The rights of the protection of personal freedom, liberty of opinion and beliefs and the provision of basic necessities of life are also emphasized in Islam.

Islam also recognizes the individual’s right to private property and maintains the economic freedom. However it does not favour accumulation of wealth in a few hands. “In order that it may not (merely) make a circuit between the wealthy among you” (Quraan 59:7). Islam seeks to create a just and peaceful society based on moral principles. It strives that economic inequalities do not grow wider by discouraging the concentration of wealth in fewer hands. It takes necessary steps to stop this antisocial practice. The Holy Qur’an provides guidance in this regard:

O you who believe! Verily, there are many of the (Jewish) rabbis and the (Christian) monks who devour the wealth of mankind in falsehood, and hinder (them) from the Way of Allah (i.e. Allah's Religion of Islamic Monotheism). (Quraan 9:34).
“In Islam the concept of social welfare is not opposed to the attitude of economic development. It is squarely contributory to it. Islam exhort every citizen to acquire knowledge, enlightenment and skills, to develop himself fully and to work hard and produce to the best of his capacity and contribute his share to the development of his family, community and nation” (Ansari)

The measures which operate at individual, communal as well as state level are integral parts of socio-economic system of Islam. They are not merely being derived on capacities of production and arithmetical calculations of wealth produced and its distribution from an individual to state level. It is drawn and conceived in the light of a comprehensive system of morals and principles, where each institution is related to the other.

Islam has introduced a socio-economic system for the welfare of human beings, *Zakat, Sadaqat, Khairat and Fitra* are instituted which translate the spirit of Islam. “This tradition is operationalized through the requirement that all Muslims who are financially able shall contribute 2.5% of their net wealth each year for support of the needy. This practice, called Zakah, is not considered to be charity but rather an act of social justice through the redistribution of wealth”. (Leighninger, 2008). Almighty Allah says:

[And who] establishes prayer and gives zakah (Quran 2:177)
They are obligatory on those “who have” and socio-economic security for those “who don’t have” the Holy Quraan has given a rationale. Almighty Allah says that:

And what Allah restored to His Messenger from the people of the towns - it is for Allah and for the Messenger and for [his] near relatives and orphans and the [stranded] traveler - so that it will not be a perpetual distribution among the rich from among you. And whatever the Messenger has given you - take; and what he has forbidden you - refrain from (Quraan 59:7).

In Islam, Haququal-Ibad is as important as Haquaquallh. The Holy Quraan guides us that:

“It is not righteousness that you turn your faces towards the east and the west but righteous is the one who believes in Allah, and the Last Day, and the angels and the Book and the Prophets, and gives away wealth out of life for him to the near of kin and the orphans and the needy and the wayfarer and to those who ask” (Quraan 2:177).

The Holy Quraan has given a wide range of people deserving and to be looked after financially:

Alms for the poor, and for the needy, and those employed to administer the funds, for those whose hearts have been (recently) reconciled to truth, for those in bondage, and in debt, in the causes of God and for the wayfarer. (Thus is it) ordained by God, and God is full of knowledge and wisdom (Quraan 9:60).

**THE FAMILY**

Family is a universal social institution and an inevitable part of human society. It is defined as a primary group and a basic unit of social structure and plays a significant role to ensure that children are satisfactorily socialized according to the norms and values of society. It also provides economic support for other family members and satisfies their emotional needs of love and affection as well as security.

Nimkoff (Nimkoff, 1977) says that family is a more or less durable association of husband and wife with or without child or of a man or woman alone with children. Kingsley Davis (2011) describes family as a group of persons whose relations to one another are based upon consanguinity and who are therefore kin to one another while Malinowski (Malinowski, 1913) viewed that the family is the institution within which the cultural traditions of a society is handed over to a newer generation.

We live in an era in which the nature, function, and structure of the family has been effected severely. However, Islam takes a conventional stance, arguing that the family is a divinely
inspired institution. One of the most striking features of Muslim society is the importance attached to the family. The family unit is regarded as the cornerstone of a healthy and balanced society (Sheikh, 1998).

Family is first school for children to nurture and teach basic morals and etiquette so that they can appreciate Islamic ethos and values. A stable family generates a stable society and ultimately a stable civilization. Family values have immense significant and play an important role from the Islamic point of view. Islam aims to develop durable long term & strong bases for relationships within the family which is the building block of a society. When each of these blocks is firmly placed, the social structure of the society rests on a strong foundation. Where the cohesive bond gets diluted, the society begins to disintegrate.

The family in Islamic society is regarded as a natural orientation of human urges. From prehistory to the modern era the family has been the foundation of society. The individual devoid of family ties, responsibilities and obligations cannot form meaningful enduring human relationships. “Islam therefore, views the family as commitment to itself, to society and to the dignified, meaningful survival of the human race. It is regarded as a medium of accomplishments through which individuals can constructively contribute and can effectively contribute and render services to the other members of the community. In fact Islam has clearly identified and defined the mutual obligations of family members towards one another e.g. obligations towards parents, children, siblings, relatives etc” (Ahmad, 1974).

The Holy Quraan also ordains to look after the indigent segments of the society besides nourishing the kith and kin.

“No blame is there upon the blind nor any blame upon the lame nor any blame upon the sick nor on yourselves if ye eat from your houses, or the houses of your fathers, or the houses of your mothers, or the houses of your brothers, or the houses of your sisters, or the houses of your fathers' brothers, or the houses of your fathers' sisters, or the houses of your mothers' brothers, or the houses of your mothers' sisters.

THE COMMUNITY
Islam is the religion of truth and has brought message of peace and tranquility among different communities of the world. The idea of Community in Islam provides a holistic view of life. Quraan and Sunnah provide guidance to the Muslims.

The bases of the Islamic community are not on race, nationality, locality, occupation, kinship, or special interests. It goes beyond national and geographical boundaries. In Quranic terminology, muslims are a part of Ummah. The considerable role of the Islamic community is further restated in the Quraan:

Surah 2, Ayah 143 "Thus, have We made of you an Ummah justly balanced, that ye might be witnesses over the nations, and the Messenger a witness over yourselves."

The foundation of the community in Islam is the attitude of the human beings towards complete submission to the Will of Allah, obedience to His Law, and commitment to His Cause. The Islamic community has a history and long tradition of mutual assistance and welfare that goes far beyond mere survival, sheer power, breeding, or physiological continuity. Such a mission is described in the Quraan as follows:
According to Islam, human beings are equal before God and basically have originated from a single pair and spread into tribes and nations.

It is said in Holy Quran that:

'O people! We created you from one man and one woman and made you branches and tribes that you may recognize one another. Undoubtedly, the most respected among you in the sight of Allah is he who is more pious, verily, Allah is knowing, aware. (Quran 49:13).

No doubt it has expanded but the Holy Quran declares that: “Mankind was one community, and Allah sent (unto them) prophets as bearers of good tidings and as warners, and revealed therewith the scripture with the truth that it might judge between mankind concerning that wherein they differed. And only those unto whom (the scripture) was given differed concerning it after clear proofs had come with them, through hatred of one another. And Allah by His will guided those who believe unto the truth of that concerning which they differed. Allah guideth whom He will unto a straight path” (Quran 2:213).

The Holy Prophets in his last speech from Jabal-e-Arfat declared that:

“And your slaves! See that ye feed them such food as ye yourselves eat, and clothe them with the stuff ye yourselves wear; and if they commit a fault which ye are ready to forgive, then part with them for they are the servants of your Lord, and must not be ill-treated. The slaves who say their prayers are your brothers”.

Slaves were ill-treated prior to Islam. Slavery doesn’t exist any more in modern and civilized nations, yet this command may be relevant in the case of domestic servants. Because servants can also in a way be equated to slaves. The difference being that the slaves were purchased and sold and servants are engaged on payment of wages etc.

Islam encourages collective action for collective good. The faithful are ordained to pray collectively in the mosque five times a day which is not only a place of worship but also a center for deliberating and discussing common problems and concerns at the community level.

“The historic role of the Islamic community” is to be the true embodiment of the virtuous, the wholesome and the noble. A truly Islamic community is the alert guardian of the virtue and the bitter enemy of vice. What is required of the community at large is likewise required of every individual member. This is because the whole community is an organic entity and every individual is accountable to Allah. The identity of the Islamic community thus centers upon the principles of consistent balance, exemplary conduct, unity of purpose, reciprocity of feelings, solidarity and equity. The rules of marriage and inheritance, the duties of Zakat and Hajj, the mutual rights and obligations of Kin, the individual conscientiousness and social belonging—all these are oriented to healthy continuity of the community of Islam (Elsaie, 2004).

THE STATE

According to the New Dictionary of Cultural Literacy, Welfare State is “An economic system that combines features of capitalism and socialism by retaining private ownership while the government enacts broad programs of social welfare, such as pensions and public housing.

In Collins English Dictionary, Welfare State is referred as “a system in which the government undertakes the chief responsibility for providing for the social and economic security of its
population, usually through unemployment insurance, old-age pensions, and other social-security measures”.

In modern era, the term “Welfare” is taken as a form of financial or other aid provided to needy people and can take several forms as the Welfare systems differ from country to country (Welfare , 2011).

In the developed states, the welfare services are the sole responsibility of state and mostly provided by the government authorities. It may also be organized by charities; informal social groups; religious groups; or inter-governmental organizations. Welfare services are usually provided to individuals who are unemployed, sick, or those with disability, the aged and elderly people and other destitute and underprivileged sections of the society (Spicker).

The states where the welfare of its citizen is owned and ensured are known as welfare states. A welfare state is a concept of government where “State” plays the primary role in the protection and promotion of the economic and social well-being of its citizens. It is based on the principles of equality of opportunity, equitable distribution of wealth, and public responsibility for those unable to avail themselves of the minimal provisions for a good life. The general term may cover a variety of forms of economic and social organization” (Welfare State, 2011).

There are some other schools of thoughts which have been criticizing the welfare state, arguing that such a system will make citizens dependent and less inclined to work. According to socialists, allowances and concessions are made by the capitalist class in order to keep the working and middle class away from socialism (Encyclopedia of Marxism, 2011). Another criticism on the concept is that these welfare states allegedly provide its citizens with a similar level of income to the minimum wage arguing that scamming, fraud and economic immobility are apparently quite common now in the United Kingdom and France. It is also criticized that welfare services provided by the state are more expensive and less efficient than the same services would be if provided by private businesses (Welfare State, 2011).

However, several studies substantiate that there is no connection between economic performance and welfare expenditure in developed countries, rejecting that welfare states impede progressive social development (Goodin, 1999). The idea of welfare state is substantiated by the historic role of the Islamic community. It necessarily takes into consideration the will of the people to execute prescribed goals of the community. This, however, is complemented with the perennial institutions of Zakat, Sadaqat, Bait-ul-mall, Khariat and Fitra. The state is required to assume the functions of preserving, energizing and expanding the culture of the society and to build the personality of the individual within the framework of the Islamic values. It is supposed to put in place institutions and mechanisms that ensure the well being and welfare of the weaker and indigent sections of society. The socio-economic securities are held not only as sacred duties which must be accomplished for social justice, equality and equity but also built in within institutional framework organized and coordinated with due regard to the exigencies of life. Bait-ul-Mall (an Islamic Treasury) is instituted in which Zakat, Sadaqat and other gifts are deposited and delivered to the needy and deserving people.

According to Islam, the ruler of a state is made responsible of wellbeing of its citizen. As the Prophet (SWS) has categorically declared that “Any ruler who is responsible for the affairs of Muslims but does not strive sincerely for their well-being will not enter Paradise with them” (Muslim, 875). This guiding principle of the Holy Prophet (PBUH) was followed by his
descendants, the Caliphs of Islam and ultimately during the reign of Umar Bin Abdul Aziz, the socio-economic system was so planned, organized and efficient that it was difficult to find even a single receiver of Zakat (Ahmad, 1971).

Conclusion

The religion of Islam believes in the well-being of mankind and has developed a socio-economic system. The prime concern of an Islamic welfare system is to establish a model society which ensures social justice, protection of its citizen’s rights, emphasize on equality, equity and *Ehsan*. Islam does not emphasizes only on Allah’s worship like *Salat* (offering prayers), *Hajj* an Islamic religious obligation which is performed by every Muslim who can afford it) and but equally stresses to establish the welfare system. Both the religious and social systems of Islam aim at the well-being of the individuals, groups and communities. The functions of an Islamic state is to make sure the welfare of its people by providing them the basic necessities of life, establishing a comprehensive social security system and ensuring the social justice.

The Islamic concept of social welfare also provides fundamental principles for the protection of indigent sections of society. This concept of welfare is comprehensive in nature, aims at achieving the welfare of mankind in totality, of which economic welfare is merely a part. Strong emphasis has been given on Zakat and other charities which is significant for proper understanding of the true nature of the Welfare system in Islam. An Islamic welfare system aims to combat poverty as well as ensures a just and equitable distribution of wealth. Zakah in Islam a powerful redistributive tool, transfers money from the hands of the rich to the poor, ensuring that each of its citizens enjoys a minimum standard of living.

A PARADIGMATIC REVIEW OF ‘WONDER BANKS’ ADVENTURE AS A NEGATIVE CATALYST IN THE NIGERIAN BANKING INDUSTRY

Dr. Clement Adewole
Assistant General Manager in Zenith Bank Plc

Dr. Joseph Bamiduro
Head of Department of Business Administration, University of Ilorin, Nigeria;

Abstract

“Wonder banks” have contributed immensely to the high degree of fraud in the Nigerian Banking Industry. The menace has contributed in many banks collapse, and many investors and depositors funds trapped. The “wonder bank” conjures an image of a deposit collecting organization operating outside the ambit of the Central Bank of Nigeria and the law. They offer interest rate beyond the range of commercial banking and have become a canker worm that has eaten deep into the fabric of the financial sector or the Nigerian economy, and should be addressed. This is a motivation for this study, and would serve to identify the wonder banks, their investors, causes of their fraudulent practices, its impact and means of controlling it. The study is a survey research and questionnaires were used for the collection of primary data while libraries, journals and write-ups seminars and conference papers were used for the secondary data. The findings show that there is need to entrench the ideals of corporate governance in the private sector. The obsession with naming the wonder banks’ schemers as fraudsters, whose motive is wholly fraudulent obliterate a number issues which are critical to corporate governance. It was concluded that the menace thrived basically on ignorance, greed, and observed regulatory lapses. Also a situation where mutual funds interest rate cannot match average stock market return provides additional impetus to redirect investments to unconventional structures. Policy options suggested are the promotion of the preventive role of education through curriculum review, positioning regulatory agencies to focus on enforcement and follow up on securing convictions of fraudsters.

Keywords: Wonder Banks, Fraud, Fund Management and Nigerian economy.

Background to the Study

In Nigeria, frauds have assumed a frightening scale and sophistication consequent upon the general economic challenges of the post two decades. Oludefsidipe (1994) stated that even though the Nigerian Banking industry is becoming more militant and vigilant, millions of Naira is still lost on a daily basis. He attributes the most significant percentage of these frauds to collusion between staff of banks and external fraudsters. The Nigerian banking industry is likened to a battle front with a clear cut firing line featuring “wonder banks” and bandits with a veritable mine field in which some banks and their top management staff are in secret leagues with the enemy, according to Shongotola (1994).

Young (2002) opines that ample evidence exist that individual integrity of those running the banks today has never been at a higher level. Furthermore, employees as well as firms in many industries engage in fraudulent practices all over the world. Although the existence of frauds in our banks is not an uncommon or unexpected behavior, the prevalence of it is what is worrying because it poses various problems especially when untraceable [Ogwuma, 1985]. The sources of bank fraud can be classified into institutional factors, lapses or inadequacies and environmental/societal factors [Adewunmi, 1988].
The hallmark of a ‘wonder bank’ is the offer of irrational interest or pay-back on investment funds. Ideally, interest rates should be reflective of market fundamentals; Otherwise, interest rate may be seen as arbitrary, and as with ‘wonder banks’, outrageous and unsustainable. In a commentary by Nigeria Galleria [2007], the team wrote that ‘the term “wonder bank” conjures an image of a deposit collecting organization operating outside the ambit of the Central Bank of Nigeria and the law, promising out of this world returns while having no visible corresponding business or investment to drive the growth’. These ‘wonder banks’ offer interest rate beyond the range of commercial banking on various investment schemes. One of such schemes promoted by a ‘wonder bank’ in Nigeria promised returns of 10% – 30% per month (240% – 360% per annum) at a time that funds could have been sourced at 24% per annum in conventional commercial banks, and at a period when average interest on deposits was 12% per annum. These institutions offering ‘wonder banking’ are variedly described in esoteric terms, such as ‘wonder banks’, ‘miracle banks’, or ‘wonder people’. These descriptions underscore their unconventional nature, and suggest something extra-ordinary in their operations. Interestingly, the business names of many of these institutions are also not only catchy, but subtly communicate the offer of some unprecedented gratification. Some of these names are: Treasure Link; Wealth Zone; Fortune Access; Wealth Solution; Wealth Transfer; Money Field. A critical look at the motives of the promoters and patrons of wonder banks would assist in examining the paradigm that wonder banks are in all cases set up with fraudulent intentions.

A Glimpse of Investment Fund Management in Nigeria

The wonder banks essentially operate illegally as investment fund managers. A fund manager is the professional who is engaged in the management of a pool of money such as mutual fund, pension fund, insurance fund, or venture capital. The fund manager is primarily concerned with the maximization of the fund’s returns at the least risk possible for a fee.

According to Nigeria’s Securities and Exchange Commission [SEC], the requirements for registration as a venture capital fund manager are:

i. Write-up on the general nature of the business in which the fund will be invested.
ii. Projected yield of the fund.
iii. Certificate of Incorporation of the company certified by the Corporate Affairs Commission.
iv. Form C07 certified by the Corporate Affairs Commission.
vi. Latest Audited Financial Account/Management Account or Audited Statement of Affairs of the Company if in operation for less than one year (should not be more than six (6) months old).
vii. Two (2) copies of Memorandum and Articles of Association of the company. The object clause should empower the company to engage in venture capital fund management.
viii. Where applicable a Memorandum of Understanding between the parent company and its subsidiary to the effect that the parent company will not unduly interfere in the management of the subsidiary or the fund.
ix. Detailed information about the fund provider (e.g. the parent company).
x. Evidence that the minimum paid up capital of the fund manager complies with the requirements of the Commission as stipulated in the Rules and Regulations.
xii. Modalities of operations of the scheme for handling Small and Medium Scale Enterprises application(s) or other projects.
xii. Fidelity Bond representing 20% of the paid up capital.
xiii. Submission of two (2) sets of completed SEC Form 2 for a minimum of two (2) sponsored individuals to be accompanied with:
   a. Detailed Curriculum Vitae (copies of all educational certificates).
   b. Three reference letters as specified in SEC Form 2.
   c. Resignation and acceptance letter from previous employer(s) where applicable.
   d. Police clearance (a referral letter to be obtained from Lagos Zonal Office to FIIB Alagbon Close, Ikoyi, Lagos).
   e. Previous employer’s report.

xv. Post Registration Requirements:
   a. All registered venture capital fund managers shall be inspected periodically.
   b. Authorization fees – 1% of the take off funds of the company.
   c. Operational guidelines of the fund.

xvi. Renewal
   a. Renewal of Registration – Every two (2) years, N20000.
   b. Renewal of sponsored individual – Every two (2) years, N1000 per individual.

xvii. Submission of Form SEC 2A & B for Transfer of registered individuals (where applicable).

xviii. Submission of Form SEC7 for the amendment of registration information (where applicable).

xix. Submission of Form SEC 9A & B for Renewal of registered individual (where applicable).

These stringent registration requirements are meant to ensure that a solid foundation is laid for effective corporate governance in firms that will be soliciting for investment funds, and to ensure that investments are professionally managed and judiciously invested in various capital and money market instruments. A major investment vehicle is called Mutual Funds or Unit Trust Schemes, where funds are pooled together from a group of people and invested in stocks, bonds, properties and other securities on behalf of investors. These investment channels constitute underlying assets which are missing in ‘wonder bank’ cases. The Mutual Funds come in varieties of forms, depending on investment channels, risk and benefits.

The firms that engage in ‘wonder banking’ are usually not dully registered as investment fund managers. Some of the firms are registered for businesses completely different from funds management. A critical analysis of the motive of these firms may support a number of conjectures.
These firms have huge operational finance gaps and may not have the wherewithal to appropriately secure finance from commercial banks;

- These firms see profitable business opportunities in financial intermediation arbitrage and are out to exploit these opportunities.
- Being aware of the illegality of these ventures, these firms are out to exploit the ineffectiveness of financial regulation.
- As there is no credible deterrent to this illegality, some firms are actually set up to deceive investors and simply steal their funds.

**Review of Related Literature**

Many countries have implemented deposit insurance schemes to prevent bank runs and to provide liquidity to banks in case bank runs do occur. The advantage of a deposit insurance system that provides a blanket guarantee is that it fully eliminates bank runs. The disadvantage is that it destroys all potentially beneficial information production and monitoring by depositors.

Bhattacharya, Boot and Takor (1998) shows that partial deposit insurance encourages market discipline, exercised through bank monitoring by informed depositors and that regulatory measures such as bank closure rules, may control bank risk taking. Many empirical studies have applied various methods. Duan and Yu (1994) calculated deposit insurance premiums for ten exchange-listed depository institutions in China. Duan (1994, 2000) implied maximum likelihood estimation method to assess implicit deposit insurance premiums.

The outrageous interest rates structure offered by wonder banks essentially thrive on *Ponzi* schemes. The Ponzi scheme thrives on an investment structure where there are not verifiable underlying assets, and investment from new investors is used to pay off old investors. In a Ponzi scheme, a swindler “touts outsize returns, parries questions about legitimacy with hefty dividends and creates the illusion of solvency by paying off early investors with capital raised from later entrants” [Altman, 2009]. This scheme, also known as a Pyramid Scheme [Hayden, 2008], dates back to 1919 when Charles Ponzi in Boston offered investors about 50% return in ninety days at a time when the prevailing interest rate was 5%. Zuckoff [2008] explained the dynamics of Ponzi’s scheme, and concluded that he was just a dreamer without a good exit strategy. His design was actually built on a valid investment plan and arbitrage opportunity, suggesting that he did not set out to defraud. It soon turned out that the arbitrage plan was not feasible, but the cash flow became a torrent and Ponzi was kept busy handling the money, acquiring properties and enjoying a life of luxury.

Since 1919 there have been several Ponzi schemes. In Costa Rica, three brothers defrauded clients of $400million in a 20-years unregulated loan scheme that started in the late 1980s. About 6,300 individuals (mostly American and Canadian retirees) were affected in this scam. According to A.M. Costa Rica, the ability to pay outrageous interest was attributed to the partners’ existing agricultural aviation business, investment in unspecified European high yield funds, and loans to Coca Cola, among others.

In the 1990s, a massive two-thirds of the population in Albania invested in government endorsed Ponzi Schemes. This robbed them of more than $1.2billion in losses. Jarvis [2000] noted that the schemes which were actually fronts for laundering money and arms trafficking could no longer make payments once the number of investors grew to include two-thirds of Albanians. This
resulted into riots and overthrow of the government. Also in the 1990s, the Florida Greater Ministries International Church defrauded about 18,000 of its flock of $500 million through an investment scheme in gold coins. The church, led by Minister Gerald Payne offered worshippers investment in gold coins. He created an investment plan that would “double the ‘blessing’ that people invested”. According to the Anti-Defamation League, the Ministry bribed church leaders around the U.S. to keep ‘donations’ coming in, and promised the church members double their money back, citing Biblical scriptures. Most investors never got their money back.

In the early 2000’s, Ponzi Schemes in Haiti ran advertisements, some of which featured Haitian pop stars. These schemes ended up being a massive swindle, with 60% of Haitian GDP lost in 2001. In 2008, the US Securities and Exchange Commission reported that $23.4 million was raised from thousands of investors in the Haitian-American community through a network of investment clubs. According to the director of the SEC’s Division of Enforcement, ‘This alleged Ponzi scheme preyed upon unsuspecting member of a close-knit community, attempting to take advantage of the trust they had in each other. It was also further said that “this case demonstrates that individuals will often rely on a shared affinity to gain investors’ trust”. Also in 2000’s, Lou Pearlman perpetrated one of the largest and longest running Ponzi schemes in American history, leaving about $500 million in debts. His Trans Continental Savings Program was indeed a massive fraud, as the scheme was neither a savings nor loans. According to U.S. Department of Justice in 2008, Pearlman was successful in raising millions of dollars based on false representations about two companies affiliated with him. A Mexican resort owner, Michael Kelly schemed retirees and senior citizens of $428 million by offering them phoney investments dubbed “Universal Leases”. Most of his victims used and lost their retirement savings, thinking they would get solid, low risk returns.

Bernard Madoff’s scam appears to be the biggest contemporary Ponzi scheme, defrauding famous people, funds, non profits, banks and countless others of $50 billion. The global financial crises triggered the inevitable collapse of Bernard Madoff’s Ponzi scheme. That scheme was a $50 billion fraud which spread from Europe to Asia and America, through a great pyramid structure.

**Wonder Banks in Nigeria**

On November 22, 2007, SEC took 37 wonder banks before the Investment and Securities Tribunal (IST). SEC advised IST to authorize the closure of the offices of these companies, for the reason that they did not obtain the necessary licenses to operate either as Fund or Investment Managers in the Nigerian Capital market. [Obiora, 2009]. These wonder banks included: Fortune Access Interlinks Network, Pennywise Investment Limited, Cyber International Limited, Gold Power Unique Services Limited, Gorutrans Nigeria Company Limited, Interglobal Investment Limited, Money Field Limited, New Freedom Diversified Investment Limited, Open Gate

According to CBN, a total of 560,882 claims amounting to N106.9billion had been submitted by members of the public against 440 illegal companies/wonder banks by July 2010. It was further revealed by the apex bank that 36 illegal funds managers accounted for N1.04billion, or 97.3% of the total collated claims. Nospetco Oil and Gas Limited, one of the illegal fund managers, accounted for 48% of these claims.

In 2008, an interagency committee was set up to stem the menace of wonder banks in Nigeria. The committee comprises: Central Bank of Nigeria, Nigeria Deposit Insurance Corporation (NDIC), Securities and Exchange Commission (SEC), Corporate Affairs Commission (CAC) and the Police. The broad objectives outlined for the Committee were:

- Put in place appropriate mechanism for inter-agency collaboration to stop the activities of wonder banks and prevent resurgence in the future.
- Map out modalities for pursuing cases against offending companies at the Investment and Securities tribunal and
- Establish procedures for returning the trapped funds to the depositors/investors of the illegal funds managers.

In spite of the press releases from the Inter-Agency Committee warning the public against patronizing these firms, Nigerians still patronize them. This may be because of their attractive outrageous interest rates. While some analysts attribute the patronage to ´ignorance´, others attribute to ´greed´, or both. An interesting conversation on stock marketingnigeria.com blog is instructive. A blogger wrote: “The Central Bank of Nigeria (CBN) has taken a decisive and definite position on the activities of suspected dubious deposit takers and money lenders, otherwise referred to as wonder banks. Their activities have been banned while the full weight of the law will be brought on the perpetrators…..”

This topic attracted the following two interesting responses:

- “Not involved because I am not that gullible. However, [there is] no way CBN can ban them. They do not call themselves finance house or a bank so [they] cannot be regulated by Central Bank of Nigeria (CBN). They are not breaking any laws either, so why ban them [as] it is not illegal to feed on the GREED of Nigerians. Bring your money and I will double it for you. You agree and we make a deal. Until they start to default, nothing spoils. When it is time to default, the major promoters will be out of the country. Offices will be turned to restaurants. People will queue up there wondering what has hit them. Nothing!!!! Just the greed in man…….”

- “Isn’t it telling that the Central Bank of Nigeria (CBN) could not find any evidence of illegal activity? How can anyone then begin to conclude that they are “scammers”? The
main reason to not invest in these scammers, for those who wish not to invest, is the lack of understanding of what they do. I would say, rather than vilify the owners and investors it is the failure of the Central Bank of Nigeria (CBN), and obvious jealousy of the bank chiefs, that should be the news. The Central Bank of Nigeria (CBN) couldn’t find any evidence of illegal activity, so they send out a bad word about the schemes so as to bring them down; this is a shame and a failure of the regulating body”.

These two responses above are really instructive, and reflect widely held beliefs. The issues to ponder on are:

- Is it correct to say that there is no illegality in the operations of the wonder banks?
- Is it correct that the Central Bank of Nigeria (CBN) is unable to find any evidence of illegal activity by the wonder banks?

In contrast, Central Bank of Nigeria (CBN) press releases suggests that these firms are engaged in unlicensed and illegal operations, and the Bank went further to ensure the closure of several of them. There are however no records of convictions of the promoters of these illegal institutions. Perhaps the position of Central Bank of Nigeria (CBN) and Security Exchange Commission on this issue would be better understood and appreciated when there are records of convictions of promoters of these wonder banks as is regularly the case in the USA. Consider the following fifteen (15) recent convictions:

- Kenneth Star, who managed funds for high net worth business executives in US, concocted an elaborate $33million fraud. He was sentenced to 7 1/2 years imprisonment in 2010.
- Scott Rothstein, a south Florida schemer received a 50-year prison sentence in 2010. He was convicted of running a $1.2billion investment scam.
- Debra Villegas, an ex-aide of Florida lawyer Rottistein who ran a $1.2billion ponzi scheme was jailed for 10years in 2010.
- Shawn Merriman is currently serving 151months in prison on a mail fraud conviction, after he bilked $37million from investors through a ponzi scheme.
- Marietjie Prinsloo, a South African woman and her family were convicted in 2010 on nearly 395,000 charges with a total penalty of 29 years in prison for masterminding a massive pyramid scheme. She is to serve 25years in prison, while her ex-husband, daughter, son and niece will each spend 12years behind bars.
- In 2010, Bean Diamond was sentenced to 15 1/2 years in US prison for running a fraudulent and sophisticated ponzi scheme that made victims out of 193 people who thought they were members of a foreign currency trading club.
- Sean Mueller, a former hedge fund manager in US was sentenced to 40years in prison in 2010 for racketeering, securities fraud and theft in a $17million ponzi scheme.
- Bernie Madoff the New York business man who pleaded guilty to a $65billion ponzi scheme, received 150 years jail sentence.
- Tom Petters was sentenced to 50years in US prison in 2010 for running a $3.65billion ponzi scheme.
- Floridian ponzi schemer Authur Nadel was sentenced to 14years in prison for defrauding investors of more than $168million over ten years. His plea for reduced jail term in light of his life-threatening cardiac and urological conditions was denied.
Frank Castaldi raised more than $77 million from 473 investors in a ponzi scheme. The scheme collapsed in 2008, and left him owing $31.6 million to more than 300 individuals and investor groups. In 2010, he was convicted and sentenced to 253 years in prison.

In 2010, a confessed Ponzi Schemer Gerard Cellette Jr. was jailed for 8 years when found guilty of 36 counts of securities fraud. Cellette confessed that he had run a $53 million scheme, and decided to shut it down himself, and made complete disclosure.

Convicted UK fraudster, Kelvin Foster was jailed for 10 years in 2010 for running an unauthorized investment business and for stealing investor funds through his £34 million scheme.

Earl Jones pleaded guilty in 2010 for running a pyramid scheme that started in 1982 and included at least 158 victims. He got an 11 years sentence for orchestrating this massive fraud scheme.

In 2011, David Hernandez was sentenced to 16 years in prison in Chicago for swindling investors of more than $6 million. He used the money in a ponzi type scheme, paying investors with other peoples’ investment.

There has not been any reported high profile conviction in Nigeria. This would have to be seen as the core of that objective of the inter-agency committee which requires the committee to map out modalities for pursuing cases against offending companies at the Investment and Securities Tribunal. An issue to also consider is the current legal framework for charging offenders, and whether statutorily prescribed penalties are appropriate and adequate as deterrent.

**The Wonder Bank Investor**

A brief demographic analysis of some failed Nigerian wonder banks investors would throw some light on the level of investors’ understanding of the risks involved, and the motivation for investment. It would also serve as a primer for research work on the rationality or irrationality of investors’ choices. Questionnaire was made available for victims who came out to officially lodge complaints against their failed wonder banks at various regulatory agencies in Lagos, Nigeria. Specifically, the questionnaire sought to know:

- Name (Optional) of Investor
- Education
- Profession and Position
- Name of the Finance Company/Organization [Wonder Bank]
- Age at the time the investments were made
- Approximate amount invested
- Approximate amount yet to be recovered
- The promised return
- Other promises made
- If the investors perceived any risk in the investment, and the nature of the perceived risk
- The investors rated the following risk factors according to how strongly they believe in the possibility of occurrence (on a scale of 1 – 4, with 1 representing least possibility and 4 representing highest possibility):
  - (a) Variation of the share/slot trading price
  - (b) Possibility of the organization to go bankrupt
  - (c) Probability of not receiving any dividend/interest in cash
- If the investors had any prior experience in capital investments
Which of these information sources did the investors rely on in taking the investment decision:
(a) Financial statements of the organization
(b) Articles in press
(c) Recommendations from friends/associates/advisors

If the investors found out what their money was to be invested in, and what it was
If the investors thought of the possibility that recouping investment at some time would depend on new investors bringing in fresh funds

A summary of the responses from sixty one investors [victims] is presented below.

</table>
Findings

The average age of investors is about 26 years, and 71% of respondents are graduates [with minimum of HND or University Degree]. This suggests that the bulk of those who patronize these wonder banks [within the limited sample] have tertiary education. 43% of the respondents had prior experience in capital investment, leaving majority as first timers. Those with prior experience in capital investment however accounted for 77% of the total amount invested by these respondents. This shows that those with prior investment experience tended to invest higher sums. A further analysis according to level of education revealed that risk perception was higher with higher education as shown below:

The investors were obviously aware of the risk of bankruptcy [of the wonder banks], as this risk was mostly rated highest. They were mostly concerned with bankruptcy possibility and least...
worried about variation in share or slot price. Interestingly, the risk perception was higher with higher education. With more education, there is generally more risk awareness. But also with more education, there is more willingness to stake more in investments. The average risk perception was: Variation in share price [1.92 points]; Bankruptcy possibility [2.21 points]; and No dividend on investment [1.95 points].

The information source that influenced the decision to invest in these firms was mainly the recommendation of friends, associates and advisors. All the respondents agreed to have obtained information through this source. Additionally, 28% and 18% of the respondents also acknowledged the role of press articles and financial statements respectively in providing information.

Only 34% of the respondents had knowledge that recouping their investment may depend on investors bringing new funds. Interestingly, this 34% cut across all education cadres. Though education played a key role in risk perception, same cannot be said of the knowledge of the dynamics of the pyramid scheme. It may however simply be a reflection of ‘denial’, since the risk of bankruptcy was strongly underscored especially by higher education cadres.

The lessons are quite clear, and have implications for regulatory agencies efforts to check this practice. The investors are mostly inexperienced graduates who are attracted to the unrealistic returns and promises made by these firms. The most vulnerable investors are those with prior successful investment experience. They may have invested higher sums because of their prior investment experience, or because they have more disposable income. The latter reason probably supports why those with higher degrees invested higher sums, even though they also have a greater awareness of the risks involved. The scheme also thrived more with informal communication channels. Through the recommendations of friends and advisors, more investors are mobilized. These advisors are either paid agents, or early investors who got rewarded.

Though most of the investors acknowledged the risks involved, about 66% had no knowledge of the fact that recouping their investment might depend on investors bringing new funds. Given this fact, it may not be correct to completely rule out ‘ignorance’ as a factor fuelling this practice. The ‘greed’ factor is also apparent given the kinds of unrealistic promises made by these firms. These firms claimed that the investment funds were going to be used for a variety of purposes. Some of them are so varied, and ought to have raised the suspicion of the investors as to whether such ventures were authorized, or within the capacity of the firm’s management. Most of the firms claimed that investors’ funds were to be invested in the following projects: Gold, Forex trading, Real Estates, Oil and Gas, Shares and Agricultural products. In addition to outrageous interest rate promises, one of the firms promised an investor ‘entry visa to USA’, while another promised to ‘finance the education’ of the investor.

**Conclusion and Policy Options**

An issue to consider is whether all wonder banks are inherently fraudulent, or slip along the line into some deceptive scheme as a result of observed or perceived regulatory lapses. Also, how contributory a factor is the presence of a fertile environment where investors are either fraudulent as well, or responding to an imperfect market pricing situation. The average stock market return is a fair bench mark for returns in the capital market. Currently mutual funds interest rate cannot match average stock market return, thus providing additional impetus for redirecting investments to unconventional structures.
A wonder bank scheme is often taken and analyzed in isolation, with little focus on the component of corporate governance failure, which really is the issue. The obsession with naming the schemers as fraudsters, whose motive is wholly fraudulent obliterate a number of issues which are critical in corporate governance. In reality, the scheme might actually be broader than simply soliciting for investment funds for an outrageous and unrealistic dividend, and using new investors’ funds to pay off old investors. It is actually possible to see a ponzi in every fraud situation, such as in extortions, looting, and contract inflation where there are no underlying legal, appropriate and adequate assets. The ideals of corporate governance ought to be entrenched. This can be done by ensuring the implementation of legislative and regulatory updates on risk and corporate governance practices.

Ponzi scheme is all about a slip into deception where the environment permits or encourages a sleaze to occur. In most cases, ponzi schemers are described as inherently fraudulent, and the investors poor victims who must be rescued. The danger in this analysis is that the issue is over simplified. The victims are usually aware of the risk involved, but are willing to stake their money for quick huge gains that cannot be obtained elsewhere. They are quick to claim ‘ignorance’, but are largely driven by ‘greed’. The schemers would always be encouraged by the apparent weakness of regulation and the fact that there are no strong deterrents to this practice. But we cannot overrule the preventive role of education. The education curriculum in tertiary institutions should feature more prominently entrepreneurship and investment studies. Regulatory agencies would necessarily have to focus on enforcement and follow up on securing convictions for fraudsters.

Total Safety Performance Evaluation Management (TSPEM)

SAEED GHOLAMI
Doctor of Business Administration (DBA)
MMU University- Kuala Lumpur

Abstract
Rapid changing of Technology creates hazards and complex risks in the work world. These events enforced the organizations to prepare a modern safety program and effort to improve safety performance. Performance evaluation as a process plays the pivotal role in decision making pertaining to safety programs and has to evaluate periodically and formally. The key causes of safety performance evaluation management are discrimination of both strengthens and weakness points of on organization and performance of an improvement mechanism of these points. At present, most of the organizations plan to evaluate their performance based on reactive indicators and the lack of proactive perspective and special indicators, as well as the key performance indicators are main reasons to discuss in this article.

Keywords: Total Safety Performance Evaluation Management (TSPEM), Key performance indicator (KPI), Total safety performance evaluation (TSPE),

Introduction / Background

Rapid Improvement Of Technology in The World has Caused hazards and different, complex, ambiguous risks apart from Preparing Welfare. These Resulted in Industrial Events and Disasters. The Explosion Of Chemical Reactor In Bopal In India(Murti 1991; Joseph, Kaszniak et al. 2005) and The explosion of Nuclear Reactor in Chernobyl in Ukraine(Tronko, Bogdanova et al. 1999; Zhdanova, Zakharchenko et al. 2000) are two examples of These events.

There for gradual Improvement of these events in different societies, enforced the organizations to prepare a modern safety program. Yet many organizations lack enough knowledge about the results of their safety programs while performing them(Smith, Cohen et al. 1978; Zohar 1980). It is a consequent of lacking a total performance evaluation management(Grote and Künzler 2000; Pronovost, Weast et al. 2003). Furthermore these organizations the opportunities to improve safety performance. Most of managers believe that not happening an event in an organization does not mean it’s safety, and unknown hazards with high risks may exist and destroy the whole organization in a moment.

Performance evaluation is a process by which the results of secure organization output will be evaluated periodically and formally(Mikolajczyk and Schmid 2005). The main causes of safety performance evaluation management are discrimination of weak and strong points of on organization and performance of improvement mechanism of weak and strong points(Miner 1992; Vredenburgh 2002).

Today not only safety performance evaluation is for the output control of the organization but also it has a conductive aspect. It will conduct the organisation in this field correctly. All these facts show that:

- organizations cannot discriminate critical and weak points in safety cases systematically (Izquierdo-Rocha and Sánchez-Perea 1994; Ye 2006).
Their approaches are fundamentally based on retrospective studies (BIGOS, SPENGLER et al. 1986; Mantel and Haenszel 2004).

Using a total management tool to evaluate the safety performance of the organization, they can discriminate the gap between their safety program and desirable condition so they will determine improvement opportunities their performance and move toward constant improvement and investment unity. These are possible by applying a total management tool to evaluate the safety performance.

Occupational safety has been one of the main approaches of eminent organizations and million hours of safe job prove this claim (Chimezie 1988). Surely achieving this important affair depends on the performance and appliance a total performance evaluation management to get promotion opportunities of occupational safety (Goetzel, Guindon et al. 2001) (Rahimi 1995; Tam, Tong et al. 2002; Mearns, Whitaker et al. 2003).

At present most of the organisations plan to evaluate their performance on the basis of reactive indicators but constantly we see that even lack of events cannot be the reason of safety in an organization not evaluating the safety performance, organizations never will be able to appoint their situation to achieve the outlook and evaluation of achievement of higher goals is one of the procedures of performing improvement affairs of organizations (Mohamed 2003; Rivard, Rosen et al. 2006; Nordine, Knox et al. 2007).

Research objectives

The general objective of this paper is using literature review about safety performance evaluation management of companies. The subs objectives are:

1- To design holistic framework for total safety performance evaluation management according literature review.
2- To express suitable hypothesis.
3- To determine dependent, independent, and control variables.

Literature review

In this research a management approach to evaluate a total safety performance (Odenheimer, Beaudet et al. 1994) will be considered in addition to a key performance indicator (Thomas Ng, Pong Cheng et al. 2005). Thus the organization will be able to perform a good and suitable plan of self-assessment (Davis, Mazmanian et al. 2006) and find improvement opportunities based on its results.

At present there are different approaches about safety performance evaluation of organizations divided to two groups:

a) Key performance indicator (KPI)

b) Total safety performance evaluation (TSPE)

In the first group organisations evaluate their performance on the basis of retrospective and postponed indicators aroused form the results of the events. Among these indicators we can point to Accident Severity Rate (Griffiths 1985), which is the ratio of waste days...
resulted from the events in lieu of one million occupational hours. The less is this coefficient, the better is the safety program of the organization. Retrospective and postponed indicators have a Reactive condition and cannot be the representative of organizational safety performance. Thus it’s necessary that in addition to these indicators organizations use pioneer ones.

Now most of the organizations use less proactive indicators to evaluate their performance, and most of them believe that their safety situation is good as they reach acceptable results by calculating reactive indicators. But their results are the same as bubbles and once a disaster can happen in the organization and ruin it.

In this research we plan to study creative indicators emphasizing on Proactive and pioneer indicators besides present indicators.

In the second group different methods have been suggested for safety performance evaluation management of organisations which the most important of them are:

1- International safety Rating system (ISRS)
2- European Foundation for Quality Management (EFQM)
3- American Voluntary Protection Program (VPP model)
4- Partners for Injury reduction Health and safety Audit (PIR2 Protocol Canada).

**Integrated model**

1- International safety Rating System (ISRS)

The basis of ISRS refers to the last of 1960s and the early of 1970s in America specially one of the biggest of American insurance companies (INA). After 1987 ISRS was founded and improved under the leadership of frank E.Bird(1974) and the founder of International loss Inspection company (ILIC).
As the central part of security audit system and loss control ISRS contains 20 elements which have 120 subdivisions. These elements are mentioned in question forms and in more than 600 indicators partially. The questions are formed by valuable factors which may be obtained by some percents of order and rating for safe activity to compare the dependent element in ISRS (Bird and Association 1974).

Generally ISRS (Eisner and Leger 1988; Guastello 1991) is an overall program that contains ten audit systems all of which are unified. It involves a questionnaire of less than 90 to 620 questions from the simplest to the most complete ones. Thus ISRS can be used in smaller and larger companies or organisations started their safety program and those that have a more creative program. ISRS also allows compatibility with special necessities of the organisation for practical application in related place or organisation. This is done by turning the indicator of ISRS into protocols. Finally ISRS can be applied as a source to create organisational management system. thus the elements studied in ISRS are (Leongsrisook 2005):

1- Leadership  
2- Leadership training  
3- Planned inspections and maintenance  
4- Critical task analysis and procedures  
5- Accident / incident investigation  
6- Task observation  
7- Emergency preparedness  
8- Rules and work permits  
9- Accident / incident analysis  
10- Knowledge and skill training  
11- Personal protective equipment  
12- Occupational health and hygiene  
13- System Evaluation  
14- Engineering and change management  
15- Individual communication  
16- Group communication  
17- General promotion  
18- Hiring and placement  
19- Materials and services management  
20- Off- the – job safety

According to the results of the audit, some suggestions can be given for improving controlled activities and right management system of organization. In fact some suggestions from the main part of a good audit system are followed automatically through taken audit results and reports (Guastello 1991; Timmannsvik and Hovden 2003).

ISRS can be a very important tool for safety improvement and knowledge increase of danger and generally organizational improvement. ISRS is capable of gradual compatibility with the organization. It prepares a path for people education and performance of desirable and necessary activities to result in acceptable results. ISRS is a tool to change the procedure to obtain better results by itself (Robson and Bigelow 2010).
During periodical audits, ISRS is an excellent tool to protect desirable level of safety care (Guastello 1991). ISRS can influence a better perception of safety aspects specially in top management levels. ISRS reveals a subject which is nearly important and unknown for most people. To make such a procedure possible, it is important that the audits and advisors who work by ISRS, perceive the management meaning and procedure basically. ISRS is led into the control of undesirable events and for this reason it can be the main basis of the procedure that improves organizational quality and control of unnecessary expenditures (Robson and Bigelow 2010).

Risk management means controlling the hazard (and its related finances.) Suitable control of the risks can be obtained from an organization with a high level of knowledge about risk. ISRS is a tool that causes knowledge of hazard in an organization along gradual improving procedure (Tinnmannsvik and Hovden 2003). This is a means that unifies risk management of each organization and increases people knowledge of occupational risk by risk control activities and planning for them (Hale, Heming et al. 1997; Zimolong and Elke 2006).

Through improvement of management system ISRS enables us to maintain a structure in the organization with the results for from conventional safety – whenever a structure exists, other management techniques, tools and educational activities can find their position easier.

2) Occupational safety and health Administration Voluntary protection Program (OSHA VPP):

Safety and health management program or guidelines of occupational safety and health administration voluntary protection program, prepares necessary guides for the companies that are to achieve the best safety system (Parsons 1988; Su, Tsai et al. 2005).

This program has been performed by OSHA to encourage the employers to reduce the hazards, interiorise new programs and manage present safety and health programs. When a company is accepted, it will be exempted of systematic or accidental OSHA inspections but in return antecedents and coefficients of the company should be given to OSHA for review (Chelius and Stark 1984). The company will be confirmed periodically and recurrently every 3 years. Approval of a company to perform a voluntary supervision program by OSHA not only represents following their standards but also proves the necessity of practical management aims at all dangerous and insecure conditions (Wu and Babcock 1999).

Cooperation with voluntary protection program includes 3 levels given to a company as soon as it applies the performance of VPP and succeeds in explanatory evaluation of OSHA. During evaluation, the precision of applying affairs is studied, strong and weak points of safety programs are determined and usability of safety and protection program against probable hazards is guaranteed (UNLIMITED 1994):

2-1- Star symbol is given to companies that interiorise overall safety and health programs and those that succeed in risk reduction. This prize represents that the recipient company is a pioneer in creative ways of preventing damages and diseases. This special star symbol is used by VPP for promotion and positive influence on public opinion.
2-2- Qualification (Merit) symbol is given to the companies that pose possibility and necessity to gain it. These companies have been very successful in safety and health affairs. Yet they have to perform some improvements to gain this symbol. A company that possesses this symbol are evaluated annually.

2-3-good faith symbol shows that companies have gained demanding qualification symbols by using other methods or equivalent methods for safety. Generally this symbol is given to small commercial and constructive factories. Places that receive this symbol are evaluated once in a year(Spielmann 2006). Necessary elements of VPP presented by OSHA include following factors(O'Rourke 2001):

1- Safety management program
2- Objectives and policy
3- Cooperation and management commitment
4- Cooperation of the staff
5- Conventional workers
6- Program review
7- job hazard analysis
8- basic investigation
9- job inspections
10-Prevention and hazard control
11-Procedures methods and protective equipment
12-Accommodations , maintenance and repairing of process equipment
13-Hazard informing service
14-Injury and hazard analysis
15-Emergency plan
16-Medical care program
17-Health and safety training
18-The content of safety and health training
19-Managers , supervision preparedness

The mentioned guides about VPP include effective management to prepare safety and health among the staff that are effective and decisive causes in reducing improvement and severity of occupational injuries and diseases. Effective management considers all the problems and hazards resulted from the occupation including potential risks as results of condition Changes. Management discuss about the risks appointed by governmental standard in all cases.

Given VPP guides can be used for public industries. Any of the mentioned parts can be analysed in an institute and factory through related guides , necessary methods and defined observations and checklists(Miller and Sonics 2005).

3- European Foundation for Quality Management (EFQM):

The most commonly used self assessment framework is the EFQM Excellence Model developed by the European Foundation for Quality Management. This is the basis for the UK Business Excellence Award and the results can be benchmarked against those of other organisations. It consists of nine criteria which are the core of this model and the basis of evaluation of
an organisation. the Fundamental bases and perceptions is goals that should be achieved by an eminent organization. The goals are usually extravagant, thus the organization requires the criteria which their performance causes achievement of the goals. As it has mentioned in the preface of EFQM model, important basic concepts have been placed in the indicators of this model (Hillman 1994; Nabitz, Klazinga et al. 2000). EFQM’s criteria are divided into two main groups:

3-1- Enablers: the first five criteria of this model which enables the organization to reach to excellent results.

3-2- Results: They are the results achieved by the eminent organization in different fields and state the achievements of suitable performance of enablers.

In EFQM model, the criteria totally have 1000 scores (500 scores for enablers and 500 scores for the results.)

In other words if an organization succeeds in performing this model, it can gain 1000 scores. European organisations can demand EFQM model for annual evaluation. If the organisation can prepare the least of EFQM expectations and gain the highest evaluation score among the applicants, it is introduced as a winner and will receive the main prize. (It is reminded that getting 700 scores out of 1000 scores, only can be achieved by universal class companies)

In the following figure criteria, their relations and scores are presented.

![Diagram showing the ENABLERS and RESULTS of EFQM model](image)

The logic to measure an organization according to EFQM model is called RADAR taken from initial letters of Results, Approach, Deployment, Assessment and review. It is stated through this logic that that an organization must have a suitable program and approach to achieve desirable results. This program and approach should be transmitted and performed in the organization bases. Finally organization performance should be evaluated and reviewed necessarily.
4- Partners for injury reduction health and safety (audit protocol Canada - PIR2):

This protocol provides company basic activity by safety and health evaluation of management systems. It can be evaluated within 3 stages performed by partners of Albert forest association for audit agreement of injury reduction health and safety (PIR2/ forest care) (Tucker 2003; Elke 2006).

The main task of a skilful and well-known audit of PIR2 is to inspect the companies and to gather information during several days. Audit results are used to calculate the paint out of the whole scores in percent. Following key points are determined during evaluation:

4-1 Summary of strong points (presents suggestions for improvement with ranking performable activities).

4-2 summary of summarized suggestions for improvement on this stage complete action plan is suggested with ranking so that the improvement of safety and health management systems continues. This report should be one of the tools that acts as a guide in time of planning special improvements.

The table below contains the elements and given points to each of them which are confirmed by PIR2.

Propose new model

The final goal of this research is representing a model for total safety performance evaluation management of companies. The model involves 9 criteria (5 enabler criteria with 700 scores and
After achieving the goals and defined hypotheses, key Performance Indicators (KPI) are determined and a management approach for total safety performance evaluation and self-assessment is given. An organization level (5 levels) will be determined corresponding with the obtained scores.

In the following figure, there are model criteria relation together and the score of each of them.

Each criteria is divided into some subsidiary divisions that are divided into some other specialities. For instance, subsidiary divisions of process are risk management, critical occurrence management, and procedure control, each of which have some features (speciality). RADAR logic is used to measure indicators of TSPEM model.

Hypothesis

- Safety performance evaluation does not have relation with safety improvement opportunities?
- Safety performance evaluation indicators have equal weights?
- Reactive and proactive indicators are not different from each other?
Conclusion

This model helps top managers and decision makers to evaluate their programs in the safety field and design suitable action plans for both reactive and proactive actions. As a result, they can estimate and determine objectives as long term and target for short term according to following statements:

Determination of an organization’s safety performance level, e.g. organization X (annually)
- Determination of safety reactive indicators of organization X (annually)
- Determination of safety proactive indicators of organization X (annually)
- Determination of TSPEM indicators of organization X (annually)

Abstract

This paper aims to study the affect of various rewards practices and the structure along with policy of an organization about rewards as well as the awareness of employees about these policies upon organizational performance. This investigation is based on survey research design that proposes a hypothesized theoretical model. The hypotheses developed were tested to examine the relationship between rewards practices and organizational performance. Structural equation modelling and LISREL 8.8 software were used to evaluate data, test the proposed model and all the hypotheses. The Mobile Telecommunication Industry of Pakistan was sample population for this research study. The results of the study confirmed that intrinsic rewards motivate the employees more than the extrinsic rewards for enhanced organizational performance. In addition, the results of this study show that the familiarity of employees to the extrinsic rewards structure and policy prevailing in their organization does not significantly contribute to the organizational performance.

Keywords: Rewards Practices, Extrinsic Rewards, Intrinsic Rewards, Extrinsic Rewards Structure and Policy, Structural Equation Modeling, Mobile Telecom Industry in Pakistan.

1. Introduction

In the last few decades, Government of Pakistan made many efforts and succeeded in making the environment conducive for increasing investment in the country. These organizations in the Telecommunication, Banking, Oil & Gas and other sectors are playing significant role in the economic development of Pakistan. However, the importance of the Human Resource Management Practices in a business cannot be undermined for un-exhaustive operations and enhanced organizational performance.

1.1 An Overview of Telecom Industry in Pakistan

The mobile telephone industry is changing the lifestyle of the people in Pakistan. It is a pivot in making the life patterns of masses easier day by day. The mobile Industry in Pakistan is quite vibrant and is growing in a highly dynamic, sophisticated and competitive market environment. The history of mobile telecommunication services can be traced back to early nineties, having a substantial standing in Pakistan’s telecom sector with the cheapest calling rates in South Asian region. In addition, the mobile service providers are also providing new services, like DSL (Digital Subscriber Line), Local Loop, LDI (Long distance and International), WLL (Wireless Local Loop) and ISP (Internet Service Provider). Compared to the developed countries there is
still room for improvement in the service like the inclusion of WiMax and 3G cellular systems, etc.

Having said this, the deteriorating law and order situation in the Pakistan and financial slump is a hindrance in the development in the cellular industry in Pakistan. However, this industry still has a good profit margin that is being reduced for the service providers due to competition. As per the report of Pakistan Telecom Authority (PTA) (2008), Mobilink is the market leader with 35.3% market share and followed by Ufone (20.8%), Telenor (20.5%), Warid (17.8%), Zong (5.4%) and Instaphone (0.4%) and the overall cellular subscriber base in Pakistan reached 9.2 million in September 2008. Currently, Instaphone is totally out of service and not in competition anymore.

A study by Rafiq and Gao (2008) revealed certain important aspects about the market dynamics of mobile telecommunications industry in Pakistan as a complex system of humans and technology is operational in the mobile telecom industry in Pakistan. The study also elaborated the robust growth of mobile telecom industry in Pakistan as a result of relatively favorable conditions for growth. They further contended that a current competitive environment for mobile telecommunications is backed by fair regulations and policies devised by PTA. Their study also illustrated that the healthy competition among mobile operators is affecting the working patterns of mobile phone companies and they are providing improved value-added services at highly compatible rates to their consumers. Due to tough competition, some companies also died out.

1.2 Rewards and Organizational Performance: A Basic Motivation Tool

Miller & Hamblin (1963) and Rosenbaum et al. (1980) analyzed the impact of various different combinations of rewards on team productivity and processes. They deduced that improper mix of rewards leads to lowered efficiency and productivity. If not motivated, a skilled employee can become a poor performer. One of the effective ways to enhance employee motivation and performance is to provide pay for performance compensation (Delaney and Huselid, 1996). The rewards system positively augments performance as the interests of employee and the organization is on the same wavelength, thus resulting in improved efficiency and performance (Kalleberg and Moody, 1994; Huselid, 1995; Kling, 1995). The reward system rotates around the expectancy theory- good performance of employees is directly linked to the rewards system (Fey and Bjorkman, 2001; Guest, 2002; Mendonca, 2002).

Lawler (2005) reported that organizational performance and effectiveness, organizational design and change management are the outcomes of an outstanding Human Resource (HR) system. Hewitt (2004) and Saratoga Institute (2006) concluded that for the betterment of the various HR functions, specific indicators are required to be empirically measured and reported by HR Systems. Consequently, this approach will shift the HR systems and functions from traditional personnel administration towards Strategic Human Resource Management (HRM) with a wide range of growth opportunities for an organization. Therefore, reward and performance are closely linked with one another in a way that improvement in rewards system results in an increase in organizational productivity.

To improve organizational performance, motivation plays key role in enhancing employee effectiveness and focuses the effects of intrinsic and extrinsic “rewards” in shaping employee behavior. Therefore, we can say that rewards could be and often are being used as a motivator to enhance organizational performance. The decision of an employee to join an organization and perform well depends, among others, upon the prevailing rewards and incentives system (March and Simon 1966; Rosenstiel 1975; Weinert 1998).
1.3 Extrinsic versus Intrinsic Rewards

Based on the work of various researchers, rewards are divided into two main categories known as intrinsic and extrinsic rewards. The intrinsic rewards exist in the job content and include variety, challenge, and autonomy etc. Extrinsic rewards refer to the context of job such as pay and fringe benefits, promotion or advancement opportunities within the organization, the social climate, and physical working conditions. Brief and Aldag (1977) suggested that it is useful to have a distinction between extrinsic and intrinsic rewards offered. However, Crino (1978) highlighted that extrinsic and intrinsic rewards are not only different types of outcomes; these two are separate ends of a same band. Contrary to this, Guzzo (1979) suggested that differentiating extrinsic and intrinsic rewards is inadequate for understanding of different types of rewards and incentive in organizations’ systems.

Porter and Lawler (1968) reported that there is an equivocal relationship between extrinsic and intrinsic rewards with performance. However, there is a weak relationship between extrinsic rewards and work performance because it is very difficult to maintain consistency and fairness in rewarding work performance. One more reason is an inherent difficulty in performance management system and evaluation to measure qualitative tasks. On the other hand, intrinsic rewards can easily be linked to performance, as these rewards are associated with soul and spirit of a person. Intrinsic rewards focus on achievement of something good that is urgent, immediate and directly aligned with performance; such rewards are not bothered by situations and are not externally controlled. Porter and Lawler (1968) further contended that the combined effect of extrinsic and intrinsic rewards result in the satisfaction of employees and adds to their performance positively.

On the other hand, Deci (1972a) advocated that both extrinsic and intrinsic rewards do not improve motivation level rather extrinsic rewards when surpasses certain level, it overpowers the impact of intrinsic rewards. Resultantly, there is a negative impact of extrinsic rewards on intrinsic motivation at times when the work performance is linked with extrinsic rewards only.

1.4 Extrinsic Reward Structure and Policy

Although not much work has been done on linking the ‘awareness of extrinsic rewards structure and policy’ with the performance, some researchers have found significance association among rewards and incentives tied to organizational performance. A study by Bau and Dowling (2007) found that there is a close relationship between the reward and incentive systems established within an organization. They further suggested that organizations having large number of skilled and qualified employees usually have better financial and non-financial reward practices while the smaller organizations with fewer staff cannot manage to have structured extrinsic rewards practices.

In order to achieve the goal and objectives of an organization, extrinsic monetary pay is considered to be an integral part of the rewards awarded (Heneman and Judge 2000; Milkovitch and Newman 2004). According to Gardner et al. (2004) for work performance, an extrinsic reward in the shape of monetary pay is often administered. Monetary pay is also used for retention of workforce (Trevor et al. 1997). Contrary to this, another point of view suggests that employees perceive monetary pay administration in negative terms, which shows that pay is not considered to be a positive motivator for effective performance and retention of employee (Currall et al. 2005; Tekleab et al. 2005; Trevor et al. 1997).

In addition, it is argued that salary raise and benefits have strong impact upon creating a sense of commitment and gratitude because is the employees feel that they are being fairly treated. Therefore, there is an indirect link between different facets of job attitudes with pay and benefits. As Williams et al. (2002) stated that overall job satisfaction has a positive relationship with benefit level and system. Dulebohn and Martocchio (1998) commented that knowledge and
usefulness of pay plan is significantly related with organizational commitment. Various authors of the same field maintained that satisfaction of the employee is greatly tied with the extrinsic rewards that are given to the employees based on his performance. So, based on the findings of the research work done, an empirical investigation about the extrinsic reward structure and policy needs to be conducted. In addition, reward structure and policy becomes more important when a new firm is initiated. A company needs to develop the major components of the reward and incentive system with the passage of time, as a young firm will have an unstructured reward and incentive system. This reward and incentive system contains various types of rewards such as financial rewards and social incentives, which evolve as the company grows.

The approach to adopt the extrinsic rewards structure and policies in organizations depends upon the perception of employers, market dynamics and strategic approach of the firm in question. The compensation schemes of the organizations greatly assist in increasing their profit margins in the related industry. Based on the SWOT (success, weakness, opportunities and threats) analysis for its effectiveness, the reward practices for the whole organization is formulated (Stoughton and Pong Wong, 2007)

3. Theoretical Framework and Hypothesized Model

The framework of the study includes a model based on three independent variables that are assumed to have a significant impact on organizational performance. The job satisfaction (JS) model as presented in Figure 1 includes three independent variables including Extrinsic Rewards, Intrinsic Rewards and awareness to the Extrinsic Rewards Structure and Policy (ERSP). Organizational Performance is the dependent variable in this hypothesized model.

3.1 Hypotheses of the Study

Based on JS model shown in Figure 1 and literature search foundations, three hypotheses of this study have been developed. The survey instrument was designed based on the proposed model of JS and the following hypotheses:

H1  Extrinsic rewards lead to better organizational performance.
H2  Intrinsic rewards lead to better organizational performance.
H3  Awareness of the extrinsic reward structure and policy positively affects organizational performance.

4. Methodology

4.1 Data, Sample and Procedure

This empirical study is designed as an exploratory survey research to test the hypotheses developed based on JS model under consideration. A survey instrument was developed to test the hypotheses of this study and primary data was collected from employees of various mobile telecommunication organizations working in the twin cities of Islamabad and Rawalpindi, Pakistan. This instrument was designed with the help of various stakeholders and was pre-tested for content validity. Its language and content both were fine-tuned on the basis of comments received.

The sample size was 150, out of which 98 questionnaires were received back and 95 were found completed in all respect. The demographic information as well as responses on research variables was collected followed by a SEM (Structured Equation Modeling) and interpretation of
results to identify the importance and predictive power of the model.

4.2 Measure
The questions in the survey instrument were grouped together into four categories out of that three categories measured the three independent variables - extrinsic rewards (ER), intrinsic rewards (IR) and awareness of extrinsic rewards structure and policy (ERSP) and the fourth group measured the dependent variable - organizational performance (OP) in this study. The survey tool was a two-part questionnaire consisting of demographic as well as research variables questions. Respondents were asked to answer the questions on a seven-point Likert scale ranging from absolutely dissatisfied/disagree (1) to absolutely satisfied/agree (7).
The independent variable ER was measured on 11 items scale having reliability statistic of 0.83 whereas IR was measured on 05 items scale having reliability statistic of 0.77 and third variable named as ERSP was measured on 39 items scale. The reliability statistic for third measure was 0.92.

5. Analysis of Data and Results
According to Bollen (1989), SEM was used to measure relationships between the latent variables since early 20th century for the first time. Moreover, Gefen et al. (2000) commented that the SEM model is concerned about a grounded reality or null hypothesis and its pattern of linear relationships between a set of observed and unobserved variables. The rationale behind using SEM is to determine whether the model based on null hypothesis is valid, rather than to identify and explore a proper workable one. SEM models consist of observed variables also called measured variable or MV in short form and unobserved variables also called latent or LV in short forms. LVs are based on hypothetical constructs that cannot be directly measurable, and in SEM, they are shown as an indicator of various multiple or measured variables (MVs). The SEM model is an a priori hypothesis about a pattern of linear relationships among a set of observed and unobserved variables. The objective in using SEM is to determine whether the a priori model is valid, rather than to ‘find’ a suitable model.
SEM has been explained as a combination of exploratory factor analysis and multiple regressions (Ullman, 2001). Moreover, path analysis and confirmatory factor analysis are two special cases used in SEM and are broadly utilized in social science research. Path analysis (PA) models spell out the patterns of directional and non-directional relationships among observed and unobserved variables. The only LVs in such models are error terms (Hair et al., 1998).
In order to identify the impact of independent variables upon dependent variable, LISREL 8.8 Software was used for statistical analysis of the data by using path analysis and SEM of ordinal data series to identify the strength of proposed independent variables upon dependent one. Goodness of fit indices was computed and the potential impact in terms of statistical values of independent variables upon dependent one was interpreted in next few tables and paragraphs.

5.1 Descriptive Statistics
Table 1 to 6 represents descriptive statistics of sample under consideration which include demographic characteristics such as Age, Gender, Employees having shares in Organization, educational level, Job Tenure and Size of Organizations.

Insert Table 1 Here
Insert Table 2 Here
5.2 Proposed Model Analysis & Hypotheses Testing

Path analysis was conducted using SEM for ordinal Data Series. A JS model as shown in Fig.1 was proposed/constructed relating extrinsic rewards (ER), intrinsic rewards (IR) and extrinsic rewards structure and policy (ERSP), which is represented by a latent variable, ‘rewards’ to organizational performance (OP). This model has been validated and showed model fit indices clearly are illustrating a statistically significant positive relationship (p<0.01) for IR and ER on OP, and a successive insignificant relationship of ERSR on OP. No negative relationship was reported in this model fit statistics. The goodness of fit indicators was found strong enough for hypotheses testing in this case.

The job satisfaction (JS) model was verified by having clear and tangible results on the respective hypothesis tests. The first hypothesis (H1), that is extrinsic rewards leads to better organizational performance, was confirmed by the data (path coefficient=0.60, t-values = 2.66, p<0.01).

In addition, second hypothesis (H2) intrinsic rewards leads to better organizational performance. This hypothesis was also found significant at p<0.01 with a path coefficient of 0.60 and t-values = 2.68. Moreover, insignificant result was found to support H3, which tested that extrinsic reward structure and policy awareness positively affects organizational performance. The path coefficient for H3 was reported as 0.42, t-value and p-value were insignificant.

Table 7 illustrates the model fit statistics for the hypothesis H1, H2 and H3.

Furthermore, LISREL estimates and structural equation for the model clearly is portraying that the model having three independent variables, which are indicators of a latent variable i.e. REWARDS accounts for most of variation in dependent variable i.e. organizational performance (OP).

The Equation 1, 2, 3 and 4 shows LISREL Estimates based on Maximum Likelihood Estimation having three measurement equations and a structural equation of independent, latent and dependent variables used in the proposed model.

5.2.1 Measurement Equations

The measurement equations for the same model are as under:-
ERSP = 0.42*REWARDS Errorvar. = 1.90……….. #1
Standerr (0.28)
T-values 6.75
5.2.2 Structural Equation

The structural equations for the same model are as under:-

\[ \text{REWARDS} = 1.18 \times \text{OP} \quad \text{Errorvar.} = 0.52 \quad \text{#4} \]
\[ \text{Standerr} (0.44) (0.23) \]
\[ \text{T-value} 2.69 \quad 1.29 \]
\[ \text{P-values} 0.007 \quad 0.197 \]

The measurement equation # 1 shows that Extrinsic Rewards Structure and its policy have insignificant relationship with latent variable, Rewards, having no standard error, t-value and p-value calculated.

However, the measurement equation # 2 shows significant relationship of Extrinsic Rewards with latent variable, Rewards, having standard error = 0.23, t-value = 2.66 and p-value = .0008.

Likewise, the measurement equation # 3 shows strong and significant relationship of Intrinsic Rewards with latent variable, Rewards, having standard error = 0.22, t-value = 2.68 and p-value = .0007.

Finally, the structural equation (Equation # 4) illustrates the strong and significant relationship of REWARDS being used as a latent variable for intrinsic, extrinsic rewards and ERSP upon Organizational Performance. The equation is having standard error = 0.44, t-value = 2.69 and p-value = .0007 shows a model fit for further use.

The Figure # 2 shows the tested the Model using path analysis technique and SEM for ordinal data series. The path coefficients and residuals are shown in the figure for the same model. The bold blue line shows significant relationships and a gray line shows insignificant relation among the variables.

Moreover, the whole model summary such as R Square and Adjusted R square values are significant which are presented in Table 8.
6. Discussion and Conclusion

This paper focuses on the impact of rewards and its practices upon organizational performance. The rewards practices play a decisive role in motivating the workforce and augmenting organizational performance and HR specialists are required to be more focused to discover the key factors that are more imperative and of significant importance for motivating the workforce and gaining organizational effectiveness. Succinctly, the most important finding of the study is the high level of importance and value that has been given to intrinsic rewards than extrinsic rewards. Moreover, least concern was reported about extrinsic rewards structure and policy awareness upon organizational performance by the sample understudy.

The results obtained support the investigation made by Ryan & Deci (2000) who commented that employees who are intrinsically motivated/rewarded when compared to those who are extrinsically motivated/rewarded, were found to have more interest in work, shows excitement, feel fun at work, and are more confident which ultimately leads to enhanced organizational performance, determination, creativity and innovation, job security, and high level of self-esteem, among other benefits. Likewise, intrinsic motivation enhances participation and high level of satisfaction along with improved competency level contrary to extrinsic motivation, which increases anxiety, and decreases self-esteem (Frederick and Ryan, 1993).

The sample of employees in this study recognizes intrinsic rewards as a better motivating instrument than extrinsic rewards and they are found least concerned with their rewards structure and policy being administered in their organization. Therefore, it is concluded that approaches to enhance intrinsic reward practices as a motivator are significant and prime value for better and enhanced organizational performance followed by secondary importance given to extrinsic rewards and finally, extrinsic rewards structure and policy.

7. Research Implications/Limitations

The HR experts may alter reward practices and its administration in order to make organizational performance better. Therefore, this study provides empirical evidence to the HR managers about the considerable relationships and links between rewards practices and organizational performance. This study has revealed certain significant facts regarding perceptions of employees of Mobile Telecom Industry of Pakistan about rewards practices and its impact on performance of any firm, which were not already explored yet. Although, a sample chosen for this study was very limited in number/size, however, the response rate to our survey was fair enough and it is confidently said that the non-response bias is not significant in the results of this study.

8. Future Research Opportunities

The future research may focus on the impact of rewards practices in public sector telecom industry organizations of Pakistan so that to have a clear comparison of perceptions among corporate and public sector companies.

EMPLOYMENT-UNEMPLOYMENT ISSUES AND SOLUTION SUGGESTIONS
ADIYAMAN EXAMPLE

Dr. Mücahit ÇELİK
Adıyaman University
Faculty of Economics and Administrative Sciences

Mehmet Tatar
Business Consultant
Turkish Employment Organization Provincial Directorate of Adıyaman

Abstract
Unemployment is currently one of the significant problems of each country. Constantly occupying the agenda of world countries, this issue generates one of the biggest obstacles against development of Turkey. Unemployment problem having a profound impact on social and economic structure of Turkey is felt rather more in eastern cities. In order to handle this issue, considering the specifications of unemployment, appropriate struggling policies, socio-economic structure of country/city and possible sectors of labor is essential. In this particular study, labor structure, opportunities for reducing unemployment to a reasonable level and applicable strategies intended to increase employment are emphasized so as to contribute to the unemployment problem of Adıyaman.

Key Words: Employment, Unemployment, Specifications of Unemployment, Struggling against Unemployment, Adıyaman

1. Introduction
Employment and unemployment, attracting our attention each day on newspaper columns, are one of the biggest contemporary economic and social issues. In order to establish a welfare society in an economic and social sense, these two concepts are required to be emphasized. Because the most significant precondition for development and growth is to generate employment (Bozdağlioğlu, 2008).

Labor force is the biggest source for prosperousness. However, as it is for each source, if the labor force is not correctly and appropriately used, it gives damage instead of providing a benefit. Correct usage of labor force is possible with employment. Because this source has a more dynamic and lively nature when compared to the surface and underground sources. Natural resources do not require any other thing to continue their existence. Labor force, however, is generated by humans and humans need other sources (food, beverage, money etc) to survive. Meeting the requirements of the source of labor force is only possible with the assessment of this labor force, in other words through employing (employment).

In countries where labor force assessment is low, there is a high increase of unemployment. Unemployment is like a powder keg. As a matter of fact social revolts originating from Tunisia get its strength from not using the labor force, in other words from unemployment. This case is the same in all countries experiencing revolts. Turkey is a country that maintains its struggle with unemployment starting from the day of its foundation. In order to conduct this struggle in a consistent and planned way, it has established Public Employment Offices and has formed a pool that may bring together labor and labor force.
In handling unemployment problem, demographic, cultural, social and economic structure of a country make a major contribution. In this sense, these aspects of the province have to be analyzed carefully in handling the issue of unemployment in Adıyaman. The goal of this study is to analyze the population structure of the province, overall view of the market, sectoral distribution of employment, educational background of employees, reasons of unemployment and ways for struggling against unemployment within the scope of unemployment level, and to demonstrate it through using statistical data.

This study also aims to bring light to unemployment and employment problems of Adıyaman, to pull attention of the authorities towards these issues and to support the continuation of their studies in the light of resolution suggestions offered in respect of these problems.

2. Concepts of Employment and Unemployment

2.1 Employment

The definition of employment is recruiting and using. In a broad sense employment is the level of using the production factors (labor, land, capital) that a country has within a year (Köklü, 1973, p. 67).

Employment is the utilization of labor force which is available to participate in production activities, turning towards production. (Doğan, 2011:1) In other words, it is the state of recruiting one person in a particular work (Sönmez, 2006, p. 182).

Human is by his very nature, a consumer. Consumption is an incident occurring in connection with production. In other words, it is required to produce a product at first so as to consume it. Despite the fact that technology oriented production is being maintained currently, man is required in use of technology. Within this vicious cycle Man is recruited even for utilizing technology, in other words s/he is employed.

Employment, due to its being the antonymous of the state of being unemployed, has a close relationship with unemployment (Sönmez, 2006, p. 1). Unemployment has a complex structure as well as a simple structure. Because, although unemployment is defined as the state of a person who cannot find a job, it can also be defined differently in respect of its types.

2.2 Unemployment and General Definition

Unemployment is the state in which people, who have the talent and working capacity and who would like to work at a prevailing wage, cannot find a job. People at this condition are defined as unemployed. Unemployment has several reasons and types. Most frequently observed unemployment types are as follows.

2.2.1 Unemployment and Types of Unemployment

2.2.1.1 Voluntary Unemployment

The type of unemployment, where adult individuals become unemployed as they do not want to work for various reasons in spite of the fact that they have the opportunity to work at a prevailing wage, is defined as voluntary unemployment. The reason behind voluntary unemployment is that people become unwilling to work using the job, place of work, wage level etc as an excuse as they have an assurance to live on. In this type of voluntary unemployment, while one or two people are working, the lady of the house, daughter or son of the house are unwilling to work deeming the employment opportunities as not worthy. In the event that they are hired, they quit the job with little excuses. People who do not work for a long time in this way grow lazy and eventually lost their will to work (Dinler, 2003, p. 451).
Voluntary unemployment is most frequently observed in European countries. Because the government with its more social structure, provides a subsistence wage to unemployed until they find a job again. This makes it difficult for the unemployed people to get hired. Because the fact that s/he is recruited and works 35-40 hours a week, does not cause a drastic difference in his/her unemployed wage. This hampers the unemployed from having fears and concerns and prevents them from putting forth a serious effort to find a job.

2.2.1.2 Involuntary Unemployment

It is the state when people cannot find jobs although they are willing to work at the going wage. People in such conditions are defined as involuntary unemployed. In underdeveloped countries, disguised unemployment, cyclical unemployment, seasonal unemployment and technological unemployment caused by technological progresses are all types of involuntary unemployment. The reason behind this type of unemployment is either demand insufficiency or both demand and capital insufficiency (Aren, 1998, p. 6).

2.2.1.3 Temporary (Frictional – Incidental) Unemployment

Skills, abilities, experiences, efforts of workers, geographical locations and desired working duration for the time spared for working are wide-ranging. Likewise, the employers who would like to recruit workers have various requirements on work experience and skills of workers, working conditions, employment place, hours and wages to be paid. Due to these differences, it will take some time for workers to find an available job for themselves. Temporary increase in unemployment in the case when workers are seeking for a job and employers are looking for available work force is defined as the frictional unemployment. Thus, Frictional unemployment is a temporary period (Gürler, 2000, p. 130).

Frictional unemployment is frequently encountered during crisis periods. Enterprises compensate the reduction in their sales through turning their workers into temporary unemployed. As a matter of fact, as observed in most of the countries in latest economic crisis experienced in 2008-2009, rising unemployment rate begins to decrease at its former rate with the overcome of the crisis.

2.2.1.4 Seasonal Unemployment

Seasonal Unemployment is a type of unemployment occurring when economic activities lose their intensity in certain periods of time.

Seasonal unemployment is the state when individuals living in countries whose economy depends on agriculture cannot find a job in dead seasons when there is no agricultural activity although they are willing to work at prevailing wage. This type of unemployment is mostly observed in seasonal sectors as tourism, agriculture and construction.

In certain sectors, while the labor demand increases in specific seasons, in rest of the year the labor demand decreases at minimum level and seasonal unemployment is observed. For instance people working in agriculture and construction sectors become unemployed in winter season which is considered as the dead season. On the other hand, people working in winter tourism become unemployed during summer and the ones working in summer tourism become unemployed during winter (Dinler, 2003, p. 456).

2.2.1.5 Cyclical Unemployment

Cyclical unemployment is a type of unemployment occurring as a result of the recession in production volume from time to time (Türkay & Alkin, 2001, p. 163).

Cyclical Unemployment was most frequently observed during world economic crisis occurred in 1929. As a type of Involuntary Unemployment, cyclical unemployment may continue for a couple of years according to the intensity of the economic crisis (Dinler, 2003, p. 455–456).
2.2.1.6 Technological Unemployment

As the capital accumulation increases in underdeveloped countries it is observed that the new production techniques are more capital-incentive than the former production techniques. In other words, certain capital amount in recently accepted production techniques provides less requirement of labor. The companies while manufacturing more with recent technologies are requiring fewer workers. Especially in the agriculture sector, as the size of enterprises increase and desire of modernization in production methods become evident, certain works that have been carried out by manpower is performed by the machines and this leads to technological unemployment (Uluatam, 1998, p. 329).

2.2.1.7 Structural Unemployment

It is the unemployment occurring in periods when economy remains at stagnation level collectively and continuously with all its sectors (Orhan & Erdoğan, 2001, p. 163).

In certain sectors economic activities decelerated and sometimes ceased due to some social and natural reasons. Deceleration and standstill period has a negative impact on employment level. Particularly in relation with the climatic conditions the agriculture sector, construction sector and tourism sector are negatively affected. Also it is difficult to continue employment in sectors producing demanded products and service in certain days and months of the year such as days and New Year’s Day. This kind of employment recession is caused by social structure of economy. Unemployment caused by this or such reasons is defined as the structural unemployment (Güran, 1989, p. 84-85).

2.1.2.8 Chronic Unemployment and Disguised Unemployment

In economy conditions that make a particular sector not profitable and attractive against others, decline the production of the particular sector and thereby, reduces the demand for labor force for a long period of time. Unemployment caused by the stagnated sector is defined as the chronic unemployment. (Gürler, 2000:131).

Disguised unemployment, on the other hand, is the unemployment occurring in the case when some people pretend to work, some of these people withdraw from that line of business and do not work, yet this does not cause a decrease in production (Köklü, 1973, p. 76).

Types of unemployment can be increased, however in a general sense unemployment is defined as the people who are capable of working cannot find a job.

3. Dimensions of Employment and Unemployment in Adıyaman

Adıyaman is surrounded by provinces namely; Atatürk dam Lake at south, Kahramanmaraş at west, Atatürk Dam Lake and Şanlıurfat at south and Malatya at north, which are in Southeastern Anatolia Region, are one of the priority cities for development and are within the scope of Southeastern Anatolia Project (GAP).

Adıyaman became a province in 1954. First population census was performed in 1955 as indicated on Table 1. While the population of the province was recorded as 208.755, the population of Turkey was recorded as 24.064.763. In 1955 Adıyaman constituted 0.87 % of overall population of Turkey. In 1955-2000 period the population of the province tripled and the population of country increased to 2.8 times. The population of country and the province displayed an increase at the same period. However, except for 1960 and 1980 census years, the population growth rate of the province is higher than the population growth rate of country. Population Growth rate (annual average) have been 022.59 % in period of 1955–1960, 026.84 % in period of 1960–1965, 025.42 % in period of 1965–1970, 026.72 % in period of 1970–1975,
011.59 % in period of 1975–1980, 031.70 % in period of 1980–1985, 035.01 % in period of 1985–1990 and 019.53 % in period of 1990–2000 (Table 1). While the population of province was recorded as 590.935, the population of Turkey was recorded as 73.722.988 (Development Bank of Turkey Directorate of Research, 2003, p. 13; Turkish Statistical Institute (TÜİK)).

Table 2 and 3 provide information about distribution of population. According to this; as from 2010, 58, 8 % of the population is living in city and 41,2 % of population is living in rural areas. (Table 2)

Table 3, illustrates the distribution of the population of Adıyaman province and its districts together with the population of the rural areas. According to this, the biggest district of Adıyaman is Kahta. 117655 people are living in this district and 58726 of them are female. Besni with 81304 people, Gölbaşı with 47906 people are respectively following this district. The minimum population is observed in Samsat with 9872 people.

Almost half of the population in Adıyaman is living in villages (Table 3). This rate can be grounded on to the availability of living conditions in villages, fertile soil or to the considerable number of people above certain age who are unwilling to leave the places that they become accustomed. However, the increase of mechanization in agriculture, separation of land due to inheritance and succession have resulted with the increase of unemployment in rural areas and caused the citizens living in countryside to migrate inland or abroad. As a result of this and suchlike incidents, an inversely proportional increase has been observed in the population of the city. Reasons contributing to the increase of city population can be listed as follows (Adıyaman province Economic and Commercial Report, 2005, p. 15):

1. Within the scope of Southeastern Anatolia Project (GAP) lands of 1 district, 12 villages, 46 hamlets and 26 settlements are buried under Atatürk Dam. Population having settled in these places migrated to city (Adıyaman) instead of recently established settlements.

2. Insufficiency of soil available for cultivation in forest villages caused the countryman to have financial difficulties and migrate to the city.

3. The fact that there is a considerable amount of business opportunities in cities and particularly in metropolitans and the consideration that the welfare level is high in these places, has brought about an active internal and external migration (Adıyaman Economic and Commercial Report, 2005, p. 15).

One of the important qualities of a population migrating in this way is not creating an area of employment. Because, as the lands of the migrating population were disappropriated, they were given a considerable amount of money and while they could have made significant investments (factory, premise etc) with this money, instead they purchased houses or constructed them and bought such vehicles as autos, trucks, busses. Since these created an employment area for few people, they do not have an important impact on reducing the unemployment of the district. However, disappropriation money could be used for making industrial investments and for creating new employment areas. Today, most of the people who did not benefit from the opportunities at the time are contributing to the rise of the ranks of the unemployed in streets and coffeehouses.

3.2. Categories of Economic Activities prominent in the Economy of the province

Service industry, Industry sector and especially the textile sector provide the most important contribution to the economy of Adıyaman. A considerable progress is also observed in Construction sector. Especially, the recent increase in housing construction and people’s preference to live in apartments instead of detached houses, has made construction sector become one of the important sectors (Alpaydın, 2010). Moreover this preference of people also increased the urbanization population rate.
According to the data provided by Adiyaman State Hydraulic Works Special Provincial Administration, 17% of the lands of Adiyaman is wetland. Because of this, 60% of the population is working in agriculture and in relation to this the economy of the province is based on agriculture.

Table 4, provides the number of business and employed workers of the three important sectors that generate the economic structure of Adiyaman. In the light of this, as from December 2010 there are 429 establishments. These establishments employ 12956 workers and 10492 of them are male. Agriculture sector, on the other hand employs 629 people in 17 establishments and 585 of them are male. The industry sector being the locomotive of economy in Adiyaman is particularly based on textile and clothing.

As from 2010, 9,289 people have been employed in 244 establishments which have industrial registry certificate in different sectors in the province of Adiyaman. The biggest share in terms of employment belongs to textile with 54.96%.

Along with promotion law no 5084 that has been taken into force, industry of Adiyaman has displayed a progress and 54 establishments have entered into service. A total of 113,214.733 TL (December/2010) energy support has been provided to our industrialists (Adiyaman Provincial Directorate of Industry and Commerce)

Table 5, includes information concerning the social security that the employees are subject to in Adiyaman at the end of 2010. According to this, as from December 2010, a total of 73,254 people are benefitting from social security institution, 15,531 of them from government retirement fund, 19,276 of them from the social security organization for artisans and self employed and 38,447 of them from social insurance Institution.

When distribution of unemployed in respect of their ages and registered labor force in İŞKUR (Turkish Employment Organization) in Adiyaman at the end of 2010 is analyzed, there are apparently 10,861 labor force and 10,288 unemployed in our province. According to table 6, it is apparent that the number of registered labor force and unemployed is low in 15-19 age range. This is largely due to the fact that individuals of this age range are still students. It is apparent that the biggest work force (3079) and the largest number of unemployed (2889) is observed in 25-29 age range. Right after this age range, 30-34 age range is observed with the biggest work force (2438) and the largest number of unemployed (2276).

Table 7, presents the distribution of Labor force and unemployed registered at İŞKUR at the end of 2010 in respect of their educational background. According to this; primary school graduates (4,201) constitute the group where unemployment is most apparent. Secondary education graduates, graduates of associate degree, literate group, graduates of Bachelor’s degree, illiterate groups, and postgraduates are following this group respectively.

Since the data of 2010 year TÜİK on the basis of provinces (Turkish Statistical Institute) has not been published, according to the latest published data of TÜİK, as from 2009 on the basis of province the population of Adiyaman is 588,475, in this population the unemployment rate of individuals at working age is 17,9 % and employment rate is 31,2 % (table 8).

3.3. Employment Problems in Adiyaman and Reasons of Unemployment

Unemployment and employment are keeping on appearing as an important problem in Adiyaman just like in nation-wide. Failure to increase the employment opportunities at an adequate level increases the number of unemployed in Adiyaman. Province of Adiyaman is a settlement facing a considerable unemployment. The facts that a great number of the unemployed in the province are unqualified and that the number of people willing to work in private sector is low due to
various reasons and that there are no conglomerates in the province cause some people to seek jobs in other cities and work in seasonal labors out of province.

Since the population migrating to city from villages, are not fully employed, they have begun to be employed in illicit works. Such works as itinerant merchants, street hawkers at every step are one of the epitomes of illicit working. It is possible to list the reasons delivering the unemployment in Adiyaman as follows;

- **High Population growth rate and failure to provide adequate employment opportunities for rising generation.** Particularly the fact that some lands have been submerged due to the construction of Atatürk Dam specifically between 1985-1995 and that the migration of population, who face difficulty in finding a source for income, to city centers as the agricultural lands have been constricted, all lead to an increase in unemployment.

- **Establishments in Adiyaman could not have maintained a corporate structure yet.** This condition brings about unproductiveness in investments. Unproductiveness in investments, on the other hand, causes a constriction in employment areas. The fact that the establishments in Adiyaman have not maintained a corporate structure and that a management model depending on affinity and friendship relations is carried out, bring about an increase in unemployment. Because the management has always been turned over to the older brother instead of the talented one. Deficiency of a good manager not only fails to develop the business but also brings about such an outcome as failure to maintain the preexisting condition.

- **Having a considerable importance on the economy of Adiyaman, agriculture and agricultural employment have been negatively affected by the quota application on certain products.** Especially because of the restriction on manufacturing tobacco, unemployment has displayed an increase in agriculture areas. Failure to commence irrigated agriculture, not growing alternative crops or failure to create this awareness sufficiently is the other reasons for the increase of unemployment in agricultural areas (Adiyaman Provincial Directorate of Agriculture).

- **Another reason increasing the unemployment is the efforts of Adiyaman community to get hired by a public institution.** Because government is perceived as a source for employment and stability. This perception has a negative effect on people to set up their own business and put forth their effort on this objective. Majority of Adiyaman community is still dreaming to get hired by a public institution one day.

- **The fact that the businessman of Adiyaman are not investing in their home town also gives rise to the incapability to broaden the employment opportunities.** In this regard, this can also be considered as a reason for the increase in unemployment.

- **As a result of the failure to incorporate in a professional sense at the city center and failure to unite the capitals, aggregate corporations are not formed,**

- **Rejection of savers who have weak entrepreneurial spirit to turn towards multi-partner investments.**

- **Failure of local authority to canalize strictly the private sector investments, which are one of the most significant factors in the development of a city, to the region.**
3.4. Ways of Struggling against Unemployment in Adıyaman

Resolving poverty, increasing the standard of living and providing balanced income distribution can only be possible with suggesting solutions for unemployment and employment problems. As a result of the discussions with the representatives of public institutions and organizations, trade associations, members of non-governmental organizations and civil society in Adıyaman; applicable solution suggestions concerning the “increasing the employment and reducing unemployment” can be listed as follows:

- Economic and technological developments change the manufacturing types and labor market. This alteration and developments derogate the preexisting condition. All the entrepreneurs who make investments and create an area of employment; have to support the labor education for the purpose of meeting the need for qualified employees in respect of protecting the existing employment areas against economic fluctuations and continuing their existence.

- Labor force in rural areas; has to be directed to such fields as beekeeping, milk and stockbreeding, carpet, rug business, green housing and horticulture, and training projects must be implemented on these areas (Adıyaman Provincial Directorate of Agriculture).

- When entering the labor market; measures must be taken for overcoming the problems in employment of young unemployed, woman, long term unemployed, handicapped and ex-convicts who are facing difficulties, special projects must be performed for these groups. In this context, a serious cooperation has to be maintained particularly between university and industrial organizations and adaptation of the young to the employment market must be obtained (İŞKUR Adıyaman Provincial Directorate).

- Through establishing education-employment relation, a comprehensive and qualified education policy focusing on occupational and technical training has to be adopted. Education system, must reform itself continuously in such a manner to fulfill all the need of labor market, and education and employment must be approached in harmony. For the purpose of choosing the most convenient occupation, providing their work placement and adjustment through the consideration of the needs of labor market and interests, skills, personal and physical qualities of individuals, Profession and Vocational Counseling Services must be carried on effectively (İŞKUR Adıyaman Provincial Directorate).

- The unemployed who have no profession, has to be ensured to get hired through being trained in particular professions required by the labor force. Applicable projects must be carried out for the purpose of employing such groups with difficulty in employing as handicapped and ex-convicts or setting up their own business as entrepreneurs. Necessary coordination must be achieved in-between IŞKUR (Turkish Employment Organization), University, chamber of commerce and industry and organized industrial zone (İŞKUR Adıyaman Provincial Directorate).

- Agriculture is an important source of income reducing the unemployment. Agricultural activities in Adıyaman are mostly performed in outdated methods. There are few individuals competent of conscious and professional agriculture. The quota system applied on production of certain products in recent years has
given rise to the increase of unemployment. In this regard, it must be placed a further emphasis on boosting agriculture, commencing to irrigate farming and raising farmers. Farmers must be guided to perform fruit growing and grow different crops (Adıyaman Provincial Directorate of Agriculture).

- The government must be no longer perceived as a source of employment, working in private sector must be promoted.

- Businessman of Adıyaman must be provided to make investments at their home town. Businessman and Industrialists must be ensured to transfer some of the investments made in western cities to Adıyaman. This will both restrain the migration out of province and increases the employment.

- Training courses bringing out talents and skills must be extended by the public and private organizations for the purpose of providing the young who cannot continue their education regardless of whatever the reason is and the labor force that are not well-educated must be ensured to acquire qualification and supported to be employed.

- Enterprises employing the young who are students of Vocational high school and apprenticeship training centers must be provided with such conveniences or incentives as tax reduction, insurance premium reduction.

- It is required to promote professional fishery in villages having a coast to Atatürk Dam and to provide necessary support and training to develop fresh-water fishery (Adıyaman Provincial Directorate of Agriculture).

- It is required to provide necessary training on handicraft, tailoring and carpet business to young girls and housewives who are staying at home in the position of a consumer and necessary financial support must be provided to them during this training. In the event that centers are established to display and commercialize these products, employment will increase.

- It is required to provide collective working instead of individual working in villages, and to undertake some incentives such as irrigation, green housing, arboriculture that will provide employment areas and generate income in the long run, which will be maintained through the money obtained from the sales of redundant agricultural vehicles. In other words, studies have to be carried out to develop the cooperative system (Adıyaman Provincial Directorate of Agriculture).

- It is required to provide incorporation in a professional sense at the city center, establish aggregate corporations with trustworthy people and unite the capitals and generalize the culture of shared working (Adıyaman Provincial Directorate of Commerce and Industry).

- Necessary measures must be taken for the prevention of illicit employment (Adıyaman Provincial Directorate of Industry and Commerce).

- It is necessary to maintain the support of a specialist in such studies as business development etc. In this regard, it is necessary to make Adıyaman University take an active role in socio-economic life of the province.

- Bureaucracy must be reduced in process of establishing a business. University-Industry affiliation has to be provided in real terms. The qualification of the University has to be increased (Başar & Kamlılı, 2011, p. 163).
It is required to develop regional projects, perform agricultural production at international standards, make use of the energy based on petroleum and construct geothermal green houses and develop fishery (Journal of Adıyaman Provincial Directorate of Agriculture, 2010, p. 5).

It is required to improve vocational and technical training environment, and increase the qualification of the instructors. Moreover, it is also necessary to put forth the incentive mechanism for the employment of vocational and technical training graduates and owners of national vocational qualification and also for their setting up of a new business (Çağsem, 2010, p. 6).

Another sector required to be mentioned here is Tourism due to its contribution to the socio-cultural structure, although it has not still maintained the place it deserved. Considered to be the eighth wonder of world, the busts remaining from Mount Nemrut and Kingdom of Commagene have even become the symbol of Adıyaman and they are believed to maintain/achieve the significance and value they deserved in the short term. As from December 2010, 188,198 tourists have visited Adıyaman and 145,336 of them are domestic tourists. Existing accommodation premises have a total of 1,149 bed capacity in Adıyaman. However there are no 5 star hotels in Adıyaman yet. In the event of the establishment of such a hotel, at least 100 people will be employed. And this will become a remedy for the financial difficulties of 100 families (Adıyaman Provincial Directorate of Tourism, 2010).

In order to successfully perform the solution suggestions eliminating unemployment that have been listed so far and can further be listed, all the public institutions and organizations, trade associations, local administrators, industrial unions, all non-governmental organizations must cooperate and shoulder a shared responsibility. All these organs have to collaborate and provide a stability environment. Thus, investments will increase in Adıyaman, there will be an economic boost and growing economy will generate employment.

The instructor labor force playing the role of an educator in most of the existing courses in Adıyaman, either have associate degree or work in existing schools. It is also another point to be searched how adequately do the tutorial labor force, displaying a considerable part of his/her performance at school during daytime as part of his/her job, having an associate degree or being students who cannot still complete their education, train the course attendees. Therefore, ultimate attention must be shown on the instructor labor force to work only at the training course and have a high level of education.

4. Conclusion and Suggestions

It is a known fact that unemployment is one of the prominent problems of our province and our country. Unemployment is not merely an individual problem. Quite the contrary, it is a social and subtle problem. While struggling against unemployment it is necessary to consider the reasons behind unemployment and to find appropriate keys for the situation.

In order to make unemployment off the agenda, it is required to increase production and perform the investments in a stable way. In a country where there is unemployment, the solution of economic and social problems is not simple.

One of the most prominent factors generating unemployment is the insufficiency of education. Unqualified education provided in both vocational schools and higher education institutions and failure to meet the needs of the market bring about jobless graduates. And this brings along the preexisting unemployment problem to become a labyrinth with no way out.
It is not enough just to own a diploma to find a job. The individuals require achieving qualifications to be employed and developing and regenerating these qualifications in order to maintain their economic standards and compete in a market that is variable depending upon the improvements in science and technology. This can only be achieved through lifelong learning. In this regard, a serious system in secondary and high education must be generated that can meet the need for qualified staff. Vocational high schools and vocational courses opened up for this purpose must be ensured and the studies carried out must be supported.

A majority of the problems in employment area in Adiyaman and in a general manner in Turkey originate from the absence of a well-conceived planning. For this end, a new and well planning model is required. It is required to make a good research to maintain a good planning. In the light of the data obtained from the research it is required to perform a planning that is realist, and conforming to the conditions of the locality. By means of this planning, the unemployment problem of Turkey can be solved in a limited scope and the problem of Adiyaman can be solved substantially. It is not possible to eliminate unemployment completely. As it is known, there is apparently no country that can overcome this problem. Countries even during periods of high welfare, cannot maintain full employment. However unemployment can be reduced to a reasonable level through employing one person from each house. Perhaps, in this respect it is required to form a socialist structure in sources of employment and employment sources must be distributed to houses. In other words, local administrations, public institutions and organizations, private institutions and enterprises must give priority of employment to the families who have no working member.

Abstract
This research paper highlights the issue of “Creation of Quran”. Islamic history treats this issue of Abasid period as apoch-making. In the reign of which Caliph this issue came up and which was that Caliph who evinced keen interest and which was that group who received the patronage of the then Govt. What was the reaction of the counter-group? Afterward the basic viewpoints relating differences we dissected and discussed. Different parties broached discussion on these differences and proffered their arguments and answers. Ahly Sunnah first of all gave their arguments and objections. Their most important standpoint has been that the Quran is an old testament what are the religions and social outcomes. After this the second group presents their arguments and objections. Conclusions (pithy) are presented. In the end, political cum historical aspects of this issue has been detailed out. Owing to this detailed discussion issue of creation of Quran’ becomes quite crystal & clear politically, historically and nothing is left vague and ambiguous.

Keywords: Issue , Creation, Quran

INTRODUCTION
During Abasidi period this issue was differed. Point of variance being whether the Quran was ‘Hadis’ or old, whether it was a creature or otherwise; whether it was related to Kalam-e-hafsi or it is based on words. This issue was dubbed and given the name of creation of Quran.

BACKGROUND OF CREATION OF QURAN
The issue of Creation of Quran has been attached with “motazila”. Whenever and wherever motazila comes under discussion then at once this issue comes to limelight. It was motazila which brought this issue in Abasidi period. Being impressed, Abasidi Caliphs forced the mohadasin and religious scholars to accept & embraced their viewpoint and some of them were subjected to torture and affliction of extreme nature. This issue captured the mind the thinking of the people during the days of Mamoon Rashid, Motasim Billah & Wasiq Billah. This rendered the people perplexed and left them in utter confusion.

Zahra (2001) this issue of creation of Quran developed before the advent of three Calipha. Jaad Bin Dirhim talked about this issue. Khalid Bin Abdullah ruler of Kufa put him to sword. Jaheem Bin Safwan also gave vent to his feelings signifying that Alllah is exempt from verbal talk and is also free from new things. According to Jaheem Quran is not an old creature.
DIFFERENT SHADE OF OPINIONS RESPECTING CREATION OF QURAN

Ahle Sunnah’s Opinion
Zahra (2004) according to Ahle Sunna words and meanings of Quran, both of them belong to non-creature group. Quran presents the version of Allah only. Imam Ahmed Humble addressing Caliph Mutawaqil wrote clearly that a number of old people of the yore took Quran non creature and he himself accepted the same version. He further attempted to vouch safe (affirmed) that, that thing is authentic which is mentioned in the Quran or has been authenticated by the holy Prophet, Caliphs or by the Tabain. Any thing which is not said by the Prophet that version/diction is not acceptable at any cost.

Zahra (2001) Imam Ahmed Bin Humble & Ahle Sunnah did not consider it an old version which is recited everyday. Imam Ahmad Humble remarked those who assert that Quran is a creature; he would straightaway be thrown in inferno. One who considered Quran as non-creature, he indulges in schism.

OPINION OF MUTAZILA
Tayyib (1999) Motazila group dies not deny the quality of version propounded by Allah. According to Motazila wherever Allah attributed His holy version, it signifies that Allah created His version at one place and it came to the front. When he accosted Hazrat Musa it is also based on the same reality. God has created/given power to a tree to speak. According to Motazlia Quranic version is the version of Allah and it was revealed through afflatus upon Muhammad Peace be Upon Him Quranic afflatus.

Tayyib (1999) Words and its meanings are considered as creature. Motazila believed as God created different other things similarly quality kalam was also created. According to this belief they claimed that Quran is creature.

Ahmad (1999) Motazila scholar namely Jahiz wrote in his journal “Alansari” that Christain scholar exaggerate that Quran is Allah’s version and therefore, this version is non-creature. They think that Quran is old. Thus due to this interpretation Jusus is also old. This thing is proved from Quran that Jusus used to hold conversation with Allah therefore, all conversation ascribed to Allah is old. Therefore, Jusus is old anyone who endorses this stand points, he endorses the view point of Christain.

MISCELLANEOUS OPINIONS
1. **Abul Hassan Ashri**
   Zahra (2001) He is the founder & father of Ashri School of thoughts. He says that Motaizla’s belief is that it overshadows. The refusal of infedils of Arab who maintain that Quranic version is the version of one man & Quran was considered by them as a version of human-beings.

2. **Imam Merni**
   Numani (2001) He was the student of Shafi. He is of the view that if Quran is creature, he is non-believer.

3. **Waki Bin Jirah**
   Numani (2001) According to him anyone who thinks that Quran is Hadis he is non-believer.

4. **Yazid Bin Haroon**
   Numani (2001) He is of the view that anyone who believes that Quranic is version is creature, by God such kind of person is infidel.
5. **Abdur-Rehman Bin Mehdi**

Mujeeb ur Rehman (2004) His version is that if anyone is heard saying that Quran is creature, I would rather kill him.

**AMA BU MUMSORI MATARIDI**

Mujeeb ur Rehman (2004) He is founder of Matareed School of thought. His viewpoint on the creation of Quran is that Quran is the quality of God. It is established one. This quality is permanent as God Himself is old and timeless. This Quran is not an amalgam of words and sentences rather it is hadis. Hadis cannot stay with wajib. The words & sentences which convey meanings, tell us that Quran is hadis, because significance of Quran presents the combination of words and their meanings. If words are hadis then Quran is invariably hadis. Motazila and Materdia seem to the chips of the same block. Materdi like Motazila believe Quran as hadis, but do not take as is creature.

**IMAM BOKHARI**

Sindhi (1999) Imam Bokhari has distinguished. According to his pronunciation of quran is hadis and thus is creature. Imam Bokhari takes Quran as creature. Allah’s version is old and non-creature.

**MAULANA ABEDULLAH SINDHI (1999)**

Maulana Sindhi says that God cannot be comprehended properly. How can God and humanity are brought at one platform. Tajali which is inspiration, it iwas understood by mohadseen and they talked about. Message and sender of this message are two separate things. Difference came here that Mohadiseen negated ghir zat and Motazila refused to accept zat. This discussion can be easily deciphered through an easy example. For instance, Zaid is an officer, Bakir is his servant and Munir is a clerk. Zaid gives a letter or oral message to Bakir asking him to convey his message or letter to Umar the clerk. Now Bakir is serving Umer as Zaid. In reality it is Bakir who has brought Zaid’s message, because it is Zaid’s message, Umer and Bakir will consider it. Zaid is a different man; similarly Bakir is also a different character. Mohadiseen did not accept the qualities like; Imam Ahmed Bin Humbler Allah’s version was not accepted.

Mohadiseen do not interpret this Quranic version. Matakalimeen interpret this variously flood of light expresses this thing that flood of light speared on Irsh. Allah’s version is hadis.

Sindhi (1996) Issue of creation of Quran is settled in this way. He talks on historical and political perspective of this issue and further elaborates and says that Haroon’s son Amin succeeded against his brother. It was an Iranian victory.

Sindhi (1995) Mamoon converting the Arab animosity and Ajmi conflict Mutual tug of war between the two warring tribes did a good turn. During Mamoon period issue of creation of Quarn also came up. One of the groups was of the opinion that Quranic version is old one but those words which were revealed upon holy Prophet they were creature and hadis. According to Mohdiseen that Quranic version is old at all cost. Mamoon helped Motazila and under the auspices of Mohadiseen Imam Ahmed Bin Humble led them. During the days of Mamoon the Arabs were snatched of their leadership and all the resources were taken away from them. It was only tongue and they were bent upon to get it known as a tongue to be used in the way of Allah. Mamoon wanted to curb the Arabs’ mentality which was full of pride. Mamoon thought that Mohediseen took the words of Quran non creature and this acted a big hurdle / impediment and curbed Arabic, Persian mentality. As it was a snag in the smooth functioning of the govt,
Mamoon therefore, took bold steps. In this era non-Arab scholars who were in no way less than other, did not take Quranic version non-creature like Imam Ahmad Bin Humble.

Sindhi (1999) comments upon this period in this way. Motazila was free and Imam Ahmed Bin Humble took the lead. Ashry Ilm-e-Kalam was in the direct hit of Motazila Ilm-e-Kalam. Imam Abul Hasan Ashry and Imam Abn Munsoor arranged Ilm-e-Kalam.

Sindhi (2009) in short Motazila was not a new sect. It was the group that interpreted “Din Islam” A revolution came into being Din Islam got a firmer grip on political, Economic social horizons concomitant result / outcome of this predominance was this that all the knowledges were to go with the banner of Islam and Islam was to become international system. During this period of Abasid Caliphs transplantation work of Greek & Persian translation work were taken into hand. Due to this people started doubting. Motazila was the first group to face this dubious abysmal situation. After Haroon Rashid / Mamoon Rashid regin was an amalgam of Arabic and Ajmi powers. The Arabs were leading Administrative set up was in the hands of Ajmi. They had their own thinking. Their questions first of all, were answered by Motazila. But history abounds in examples that in the initial stage blunders sometimes are committed. Mohadiseen pointed out these blunders perpetrated. Because varied new issues were there. There raised a lot of hue and cry and they cast slur on each other invariably.

CONCLUSION
The outcome of the entailed discussion that this vital issue cropped up for giving scope of Din Islam. New Dins entered in Islam. New nations enlarged and widened the scope of new questions. In the light of these questions several issues came up for discussion. We can understand them. Motazila believe that God is only old. If we guarantee the qualities old, then existence of multi-gods will become inevitable. This in the gospel maintained by Christain who firmly believe the Jusus is the son of God and talk about. The Motazila point stands strengthened and confirmed. Aehly Sunnah believe that Quranic words are hadis but meanings of Quran are old. Basically the significance is the same which has been ibrani, seryani and some time it has been Arabic, Aehly Sunnah viewpoint seems strong and potent. Motazila basically do not differ here, rather they (Motazila) decline to accept their stand-point and try to accept the words of Quran old. They resort to such kind of abortive effort. This effort / attempt appear to be fruitless.

Improving of Organizational Intelligence in Academic Environment  
(Case study: Islamic Azad University of Mashhad)

Hossein Shariat  
Department of Management, Islamic Azad University, Bardsir Branch, Kerman, Iran

Masoomeh Zareh Kaseb  
Department of Management, Islamic Azad University, Kerman Branch, Kerman, Iran

Abstract  
Although the traditional approach of cost quality and time as value proposition simply it is not enough, Allee (2003) further explained that the new economy offers an opportunity to radically rethink how prosperity might increase. Intangible assets (knowledge assets) are a better foundation for creativity and true prosperity than are physical materials. The path to a sustainable future is an ability to innovate: to create knowledge, convert it into viable products and services, and apply it for the profitable growth of an enterprise, the vitality of a nation’s economy, and the advancement of society. In addition, Contrary to conventional wisdom, market access barriers faced especially by developing countries are not decreasing, quite the contrary, for some of their most important export sectors. In such situation, organizational intelligence can provides a framework to better understanding of competitive environment. This study tries to appear what is the current of organizational intelligence in Iran universities using an open ended questionnaire comprised with a convenient sample and improve the current situation using a QFD Model that conduct among 18 higher education experts in Islamic Azad University of Mashhad. We found 14 service elements for 7 OI dimensions.  
Keywords: Organizational intelligence, Academic environment, Factor analysis  

Introduction  
Allee (2003) validated Teece (1998) and Garvin (1993) argued about the need for businesses of renewal forces and sensing capacities to absorb unexpected changes, reconfigure business processes, and react and take action to continuously compete and survive. Allee (2003) also argued that the nature of intangibles is such that individuals can give them away, trade them or sell them and enjoy a multiplier effect, which contrary of physical resources that when used up are gone, can be re-used. So the importance of the versatility of knowledge and the impact those intangibles have in a global economy namely organizational intelligence. Moreover, researchers sustained that the compounding effect of the speed of change of multiple variables lead to think that old traditional policies and practices are not sufficient to succeed in the knowledge era. In addition, they argued that the organizations that are able to manage their innovation infrastructure, within which ideas are created and commercialized will be considered market leader.
On the contrary, Spender (2008) argued that the future of both knowledge management and organizational learning is actually a return to a past when our theorizing was more robustly grounded in what we now choose to ignore, managers’ experiences and morally burdened practices as they apply their imagination to creating organizations.

Spender (2008) appealed to the basic formulation of individual capacities as a mean to build a foundation for strategic planning. Spender (2008) further argued that these capacities are the massively important engines of our society and economy, and that indeed there are no more important human artifacts, for our ability to organize absolutely delimits our ability to shape the human condition. Malhotra (1998) also agreed that inflexible organizational structures could not cope when the ground is shifting as rapidly as it does in today’s markets. He suggested that as part of the reinvention process that any organization must fulfill to maintain itself competitive, managing tangible and intangible assets are crucial to succeed. Any business living system needs to new itself in order to continually exist. Part of that renewal process comes from investments in tangible and intangible assets. These two types of assets have the ability to create value.

Allee (2003) and McElroy (2003) argued that the new foundation of the new knowledge economy is its people and their intelligences. They also highlighted the importance of technology to connect people and processes. Similarly, Cross and Parker (2004) defined this connectivity process as a social network, which will be the centre of execution strategy and performance and can have a substantial impact on performance, learning and innovation. This social web will keep the knowledge flow and will hold the organization together. Mendelson & Ziegler (1999) developed the Organizational IQ model. This model measures a company’s ability to quickly process information and make effective decisions. It provides strong results that have both economically and statistically significance, providing confidence on the development of the organizational IQ concept.

Matheson and Matheson’s (1998) nine-principle model correlates IQ with performance, with smarter organizations significantly getting a high IQ score. These organizations not only perform better but more consistently. Organizations in which the principles are strongly rooted are better able to adopt decision-making best practices and to achieve superior results. The model fits very well with the purpose of this research as it allows the researcher to examine the processes through which Hispanic entrepreneurs make strategic decisions and make them as effective as their operational process.

**Literature review**

In order to develop competencies, business owners must adopt cognitive development practices to survive in a dynamic economy. According to (Kull, 2000), organizational intelligence (OI) represents an intuitive understanding that links knowledge management with performance measurement. He characterized organizational intelligence as an organization’s cognitive capacity to leverage knowledge and employ reasoning to meet its perceived challenges. Glynn (1996) distinguished OI as an organizational capability to process, interpret, encode, manipulate and access information in a purposeful, goal-directed manner so it can increase its adaptive potential in the environment in which it operates. Organizational intelligence, then, is the ability to allow organizations to grow, survive, and prosper. This ability requires a proper organizational structuring and functioning, and the management of human resources, technology, knowledge, and organizational learning. According to Liebowitz (2000), an important part of organizational intelligence is the renewal process in fostering organizational learning within the entity. The ability to transform individual learning into organizational learning is a challenge in the organization. Recognizing and addressing all the processed involved in knowledge management
may allow organizations to create a more fertile knowledge-sharing environment, to increase organizational learning and a higher organizational intelligence. Matheson and Matheson’s model established that in order to succeed, organizations need to develop world-class products and services on a continuous basis, and deliver them at prices that establish value leadership.

Value leadership determines the future of the organization. They develop the concept of smart research and development (R&D), which is a tool that holds the future of the organization. These researchers based their study in the creation of a smart organization. According to them, a smart organization is defined by the act of being smart (i.e. make smart decisions) and acting smart (i.e. carry-over those decisions). According to them, an organization can become smart by improving their organizational Intelligence Quotient (OIQ). The OIQ can be improved by creating effective decision-making strategies. To improve the decision-making process, organizations must develop their cognitive resources behind those decisions: decision makers, which are responsible to capture all information around them, create knowledge and use it to produce effective decisions.

OIQ, a quantifiable measure of how organizations assimilate information and put together their decision and information architecture, is based on nine principles of smart organizations supported by best practices. The nine principles are: value creation culture, creating alternatives, continual learning, alignment and empowerment, discipline decision making, open information flow, outside-in strategic perspective, embracing uncertainty, and system thinking. All of these principles transform the power of decision-making process. It allows making smart decisions.

Methodology & Results

Quality Function Deployment (QFD) is a structured, multi-disciplinary technique for product definition that maximizes value to the customer. The application of the QFD process is an art that varies somewhat from practitioner to practitioner, but the graphic on the next page illustrates a typical application of the QFD process. The graphic shows a concept called the QFD House of Quality (HOQ), a device for organizing the flow of thinking and discussion that leads to finished product specifications. The House of Quality is built by a firm's own multi-disciplinary team under guidance from a trained QFD facilitator (preferably a facilitator with both marketing and technical experience). In this study some interviews did toward implementation of HOQ that illustrates in figure 1 that change 7 OI dimension into 14 service elements.
Conclusion

From the perspective of epistemology, structuration theory helps managers to assess and to operationalize organizational intelligence. Organizational intelligence does not represent the "IQ" of managers, similar to managerial cognition, nor is it the sum of the individuals. The assessment of organizational intelligence goes beyond the cognitive perspectives. Since, organizational intelligence develops from and is embedded in the day-to-day activities of the organization, its assessment involves social, emotional, behavioral and cognitive dimensions. In this sense, organizational intelligence is a multidimensional and multifaceted concept involving the recursive interplay of cognitive, behavioral and emotional capabilities.
of organizations. This study tried to develop some new service element toward a better OI in academic sector using a QFD model.

A Remedy based Concept: Impact of Encounter Service, Culture and Employees Training on Customers Satisfaction of Hospitality Industry

Muhammad Sajid Tanvir
Institute of Riphah International University, Islamabad, Pakistan
Ashfaq Hussain
Institute of Riphah International University, Islamabad, Pakistan
Shoaib Janjua
Institute of Riphah International University, Islamabad, Pakistan

Abstract
This research is developed to evaluate the problems encountered by local and exclusively the foreign travelers/visitors and customers of hospitality industry in the Pakistan. The research is based on the concept that under prevailing globalize environments; hotel business services in developing countries like Pakistan are not compatible with those of the developed countries and hence are not healthy to the future of industry. The purpose was therefore to evaluate and compare the hotel services being provided to the travelers visiting the hospitality industry of Pakistan with that of the under developed neighboring countries, with a view to determine the prevalent shortcomings and recommend mood for the customers satisfaction. The research finds that foreign travelers focus on the well expected and slandered hospitality services as that of the highly developed countries, however under the garb, desire the low expenses with these high quality hospitality services. The research also elaborated the importance of hospitality industry in the context of prevailing culture and security environments besides highlighting the shortage of trained and skilled manpower in the industry.

Keywords. Hospitality Industry, Foreign Travelers, Encounter Services, Culture, Traveler Satisfaction.

Introduction
The advent of new era of present century has seen revolutionary ideas to restore the traditional practices in feasible and robotic venture in order to augment proficiency, control and productivity. Management by Objective (MBO) has made an attempt to change the perception and standards of middle and senior management to set short and long-term goals and devote complete efforts to attain these set standards. The standards are accomplished by assuming not only the latest techniques, software and trends to develop various models so as to encourage the foreign travelers and customers to visit hospitality industries but also provide them the well-matched essential services and facilities of different hotels like Bread & Breakfast, Boarding & Lodging, Hotel & Motels and Guest House etc to bring revolutionary changes in the hotel industry of under developed countries. Brotherton (1999), Brotherton and Wood (2000), Lashley (2000) define the hospitality as social and cultural facilitations. The hospitality industry of developing countries is also flourishing alongside the industry of developed countries, which has become almost one of the emerging backbone economies of the industrial growth throughout the world. The growth of industry is dependent on different local and foreign travelers like business, leisure & pleasure, medical & religious and young & economy travelers with frequent visits, due to the provision of well expected services. To boost the hospitality business an interaction between these travelers and employees is deemed necessary. Chase and Tansik (1983) noticed that for high contact services a classic interaction between employees and customers is a right path to the business success. With the increase of global competition, as the world has become a “global village” (Ger, 1999), impact of the local culture with present services, has to be reviewed compatible to the highly valued services offered to theses travelers in their native countries. With the increase of global competition, the cultural impact of hospitality services is required to be understood more critically to enhance and boost the hospitality business (Riddle, 1992). Lashley (2000) differentiates different principles of hospitality culture, manipulating the impact of services appearance on hospitality,
however during going through this phenomenon (cf. Lashley et al. 2007) argued the hospitality concepts as series of services. Olesen (1994), King (1995) and Hemmington (2007) also throw light on the same concerts and try to divert the main focus of hospitality from minor to major social, cultural and encountered services and quality for the expected customer satisfactions. Pucik and Katz, (1986) explained that each culture has become an important aspect that grants customers and travelers, the structure, social interactions, rules and ultimately the expectations of hospitality services. The symptoms of cultural differences on hospitality encountered services etc have always been great (Lashley and Morrison 2000; Lugosi 2003, 2007a, 2007b; Molz and Gibson 2007). Training of the hospitality managerial staff and employees to boost the industry business as expressed by Goldstein (1980) is, attainment of the skill, ideas and attitudes to obtain the desired performance and results. Hospitality industry is strongly related to the satisfaction of travelers, to inspire them for their repeated visits and also dependent on the factors impacting encountered services (compatible to the native facilitation culture of traveler’s country) by fully trained managerial and lower employee staff. Contributing factors impacting the customers’ satisfaction are highlighted in the Figure 1 below.

![Diagram of factors impacting customer satisfaction]

(2) Researchers own processing.

The above Figure clearly indicates that customer satisfaction is dependant mostly on the hospitality industry encountered services, employee training and cultural aspects of hotel industry, which are highlighted as impacting factors as well.

Significance of Research
The hospitality industry of early 21th century in the world generally and in Pakistan exclusively, relies on the local and exclusively the foreign travelers. There is an appalling need to introduce new innovations and creative trends with respect to the hospitality encountered services for hotel customers. These encountered services are to be compatible with the foreign customer’s native cultural facilitations, and to be provided by the fully trained staff, so as to satisfy the travelers’ expectations, which is a hallmark of industry success. As hospitality industry in the world has become one of the major economic growth industries, it has also emerged as one of the backbone industries of strong national economy of Pakistan; and contributing a lot towards strengthening the prevailing competitive culture of hospitality business with encountered services in the country.
Objectives of Research
The objectives of research are to explore different avenues on the subject as follows:-

- To identify the importance of encountered services of hospitality industry.
- To highlight the importance of Managers/ Employees staff training to boost the hospitality services as expected by the travelers.
- To differentiate and enhance cultural aspects, maximizing the expected hospitality services.
- To determine the impact of encountered services, culture and employees training of hospitality industry on customers satisfaction.

Literature Review
Research studies are compiled through different methods like review of old literature in the relevant fields, direct and indirect observations and different surveys etc, taking guide line from the previous work done in relevant fields. Previous literature provides additional direction to the research besides weakening the chance of any duplication of efforts. Anyhow, precious information and different research methods can be added from the previous researches and results. Concise review of relevant studies is explained in the succeeding paragraphs.

The study has been focused on differences between the Western and Asian consumers' perceptions of highly qualitative encountered services. The prior pragmatic evidences observe that, different the cultures, different even the types of behaviors indicating the good services (Winsted, 1997). Research on the hospitality encountered services clarify that provision of such services increase customer's satisfaction along with organization called” recovery paradox” (Maxham, 2001; McCollough et al., 2000; McCllough, 1995; Michel, 2001; Smith and Bolton, 1998). Highly sophisticated expectation based hospitality encountered services provided by first class hotels to the travelers, besides travelers’ good interaction with qualified employees, truly attract them for their frequent visits (Lovelock, 1983). Winsted (1997) explained that customers’ expectations from different countries regarding hotel services are normally based on the limited knowledge; therefore Winsted (1997) suggests that some of the former experimental evidences can also highlight different types of behaviors indicating expected good services. Malhotra (1994) perceived that influence of the culturally relevant encountered services on the hospitality services though has been observed very minimal, but most of the cases culture has also been seen exerting great influence on customers expected encountered services. Riddle (1992) segregating the hotel services being offered, based on different peoples with different cultures, also expresses the offered services, comparing Asians as mostly the desirous of personality based services, with the Westerns having less such desires, evaluating thereby finally the services for the westerns as highly valued. That is why that even low earning Asian people expect much high level hotel services (Schmitt and Pan, 19960). Gronroos (1990) elaborates that functional quality of hotel services for any western traveler may not be that much of important as important is the efficiency and time saving. Because western people more focus on completion of the expected objectives with efficiency therefore may prefer services delivery with just in time, as required by most of the individuals (Riddle, 1992). The traveler witnessing other cultural hospitality services facilitations may be emotionally viewed as miscalculated / different, as compare to its native cultural emotions (Bond and Hwang, 1986). Gilbert (1991) said that motivating the travelers has been meant as influencing their perceptions of hospitality industry encountered services. An attractive hospitality services entail degree of front line employees involvement based on their interaction during provision of services encountered (Gardner and Wood, 1991). Carbone and Haeckel (1994), Berry et al. (2002) and Berry and Bendapudi (2003) elaborate that trained employees can intentionally plan and maneuver the encountered service environment to guide customer perceptions so as to obtain desired results. Prior research reveals that trained
managerial, employee staff and hospitality customers were the culminating figure of making service encounters (McGrath and Otnes 1995; Price et al. 1995; Carù and Cova 2006). Culture influences and tilts the hotel employees towards expected high standards and valued encountered services. Hofstede’s (1980, 1991) one of the dimension “power distance” also explains the Western and Asian hospitality customers expectation of the services based on this power distance. In Asian culture, Indians, Malaysians and Indonesians expect the encountered services based on large power distance (Hofstede, 1991), but in Western culture of Canada, France Holland etc, people expect the encountered services based on the small power distance (Hofstede, 1991). Tansik and Chase (1988), also highlight the importance played by the culture in shaping, as to how customers expect the hospitality encountered services. However managerial staff and employees are to make them abreast the cultural based customers expectations.

Research Methodology
Researchers visited two four star international hotels of Rawalpindi and Islamabad, Pakistan and noted 120 incidents of interactions with foreigners at different occasions through observations. Qualitative observations were taken and tabulated systematically. Regarding establishing the contemporary hospitality industry, the researchers carried out intensive and extensive literature survey and found different variables. Based on these variables, the further research was developed.

Limitation of Study
As controlled laboratory experiment is needed to validate the findings, therefore field study design has emerged as an important limitation of the study. However, a survey/field based research can further validate the study results.

Proposing a Model
Hospitality industry in the under developed counties besides security, economic crunch and newly growing industry, is at its critical situation, primarily due to the cultural differences leading to the dissatisfaction of visitors against encountered services and employees training. The study thus proposes a model highlighting the different variables with relations the expected customer’s satisfaction.

Independent Variables:
Encounter Services, Culture and Employees training r independent variables.

Moderating Variable:
Customers Expectation is the moderating variable.

Dependent Variables:
Customers Satisfaction is the dependent variable.
**Employees Training**

It was observed and noted that inquiring both the Western and Asian culture based travellers, importance of the trained employees in the hospitality industry was argued more valued by the Western customer instead of the Asian customer. Employees training was thus considered the most significant factor of customers expected encountered services based on compatible cultures, to make the customer/foreign traveller satisfy. With respect to the hospitality industry, the employees having interaction with customers to whom offering the services, require lot of on the job training, to be fully conversant with customer dealing. In the modernized hospitality industry, competence of employee’s qualities plays a vital role, which comprises knowledge, skill and thoughts, leading to the industry boom and long life, hence fully trained employees with these knowledge, skills and valid thoughts get inspired to work in a befitting manner for the industry besides proving the job importance. High rating hotels include employee training as their significant expansion strategy, because efficient training normally gives good personal characters and professional abilities. This is how employees, management and organization are benefited not only by the employees training but also the advantage of increase numbers of customers and guests. Employees training also make the basic goals attained by equipping its employees with competencies, knowledge, skills and attitudes, thereby attracting the more customers. The importance and value of staff training has long been recognized, just like, give a person a fish and you feed him for a day, teach a person the fish and you feed him for a lifetime.

**Findings derived from Observations**

Based on the observations recorded during the incidents of foreigners’ interactions, following findings have been derived.
Culture

During observing and recording the incidents, it was noted that culture being an important segment having influence on the customers’ expectations and perception of encountered services leads to customers’ satisfaction. It was also noted that Western traveler expected and stressed upon the highly valued indigenous culture based comparative services, whereas Asian travelers visiting the developed country also urged the same, but with the difference of no such desire from the local hospitality industry. Cultural dimensions and service quality dimensions are interrelated. In Pakistan there are numbers of cultural dimensions for foreigners travelling, which require special attentions. Some of which are:-

- Islamic culture and traditions have believes in one Allah and Quran and a full respect for the last Prophet. As Pakistani Muslims have strong sentiments for their Holy Book and Prophet therefore foreign travelers were noticed respecting these traditions during visit of Pakistan.
- Pakistanis due to religious faith do not like liquor therefore to perform this activity; foreigners were observed restricting to their livings and specific places for such activities.
- Hand shake in Pakistan by women is not a tradition and foreigners had taken care of this.
- Similarly full dress noted worn by foreigner ladies and open romance by the foreigners was not noted as commonality.
- Road network is less developed in Pakistan and foreigners travelling were observed facing these traffic problems.
- Terrorism has emerged as new phenomenon in Pakistan which has affected hospitality industry to a greater extent. Foreigner’s security by hotels management has been noted as an additional aspect.
- Pakistani nation has been traditionally a very hospitable one therefore this aspect was noted as a true reflection in its hospitality industry as well.

Encountered Services

The services not seen, felt and heard are familiar as intangibles. The affiliation between the service environment and consumer experiences is recognized since long (Pullman and Gross, 2004). The encountered services were crux of the observation to chalk down the theoretical phenomenon based on the expected customer satisfaction by the hospitality industry. During the incidents recordings, it was noted that foreign travelers visiting Pakistan normally expect the quality encountered services as per the high rating hotels, therefore Czepiel, (1990) said that quality service as perceived by the customer meeting expectations is a value. It becomes an important issue to boost customer satisfaction (Geetika, 2010). Even Cronin and Taylor (1992) explored this important antecedent to customer satisfaction. Encounter service quality besides playing the important role to satisfy customers (Grzinic, 2007) also measured as a value driven for consumers and a way forward to place product in a dynamic environment. Knowing the customers’ requirement regarding service quality attracts more visitors.

Customers Expectations and Satisfaction

Role of customers’ expectations culture as a moderating variable has significantly influenced encountered services by the trained employees towards customers’ satisfaction. Research was focused on the focal point of how best related are all the dependant and moderating variables to the expected customers satisfaction. A fully satisfied customer proves to be permanently affiliated to that service or product besides uttering favorable word-of-mouth and being the highly patience against any non satisfaction provision (Bearden and Teel, 1983; Oliver, 1980;
Satisfaction as a person’s feelings of pleasure or disappointments resulting from comparing a product is perceived, performance with respect to the customer expectations. Oliver (1997) took a more myopic view and stated customer satisfaction as a consumer’s fulfillment response. It is saying that customer is a king and hospitality industry proves it a worth by providing the quality services.

Contemporary Hospitality Industry Analysis

Malaysian and Indian hospitality industries and services have been compared with that of Pakistan due to their cultural, societal, and traditional resemblance.

- **Malaysians Hospitality Industry.** Hospitality industry in Malaysian is under surge due to prevailing lack of hotel services traditions, culture of temporary services offered to the customers and shortage of trained staff. Therefore, due to these deficiencies, Malaysians hospitality industry is trying to introduce some extraordinary initiatives to overcome shortfalls of compatible cultural assumptions, essentially required for expected encountered services in the industry. The initiative includes wonderful sports facilities, prevention of normal/untamed pests and insects in the hotels like mice, rats, flies, bedbugs and cockroaches that cause high risk of spreading the disease, nuisance or distress to the customers. High quality service by trained staff is being emerged as a main tool of the Malaysian hospitality industry surge.

- **Indians Hospitality Industry.** Hospitality industry of India is also facing the shortage of trained/skilled employees besides threat of poverty, political instability, and safety concerns and diseases leading towards unsatisfied hospitality encountered services. Basing on white collar instead of blue collar employees, because of the technological substitute to the human being, has further reduced the growth potential of Indian hotel industry. However present economic boom of India has lead the Indian hospitality industry to put forward the planned and expected hotel services to the travelers. This may prove to be the culminating point of hospitality industry boom in India.

- **Pakistan Hospitality Industry.** The hospitality services provided to the travelers in Pakistan has been questionable since terrorist attacks on the industry. The prevailing lawless culture and phenomenon has lead the trained employees to flee the industry, offering thereby less services and so the reduced foreign tourists/ travelers. The great attention towards hospitality encountered services, addressing the prerequisites of developed countries culture has some extant met the expected foreign traveler’s satisfactions.

Conclusion

The research study has tried to differentiate between routine culture based hospitality encountered services provided by the less trained staff and travelers’ indigenous culture based encountered services by the highly trained employees. Since last three decades, Western countries in general and developing Asian countries exclusively, have always been engaged to promote culture based encountered services of hospitality industry to satisfy and convert these temporary customers as their permanent customers. Characterizing culture as directly related to the desired expectations of hospitality encountered services by the customer’s satisfaction, helped to develop more understandable aspects on the subject. The study also indicates that trained employees have much more knowledge about the cultural based encountered services requirements of the foreign travelers instead of less trained staff. Highlighting Asian and Western leisure travelers would definitely be having different perceptions of services.
encountered as compared to the business or economic travelers. Therefore importance of the service encounters depends mostly on the customers perceptions. The study argues that expected customer’s satisfactions may be well predicted by different encountered services for different cultural based customers. The study also indicates that trained managerial and employees staff must benefit themselves from knowledge of the cultural background influenced encountered services. Finally research finds that customer’s satisfaction based on the expected valued cultural encountered services is really the hallmark of success of hospitality industry in developing countries.

**Recommendations.** Following recommendations have been offered to the both researchers and the hospitality/ hotel industry management.

- **Shortage of trained employees.** One of the furthermost challenges out breaking the hospitality industry is the unavailability of trained workforce, required to cope the need of time.
- **Retaining quality/Skilled workforce.** Retaining the qualified and skilled workforce through training and development in the hotel industry has become a problem as attrition levels has been too high and reason is unattractive wage packages. Though there is boom in the service sector, but even then most of the qualified and skilled managers and employees are fleeing away from hospitality industry. Resultantly, the hospitality industry has faced the shortage of good professionals which is of immediate concern
- **Pakistani culture Pamphlet.** In order to get the long stayed foreign visitors familiar with Pakistani culture, traditions and values, there is a need to make small pamphlet by hotel industry of Pakistan to avoid cultural issues.
- **Security Situation.** Security issue is a major concern for foreigners travelling in Pakistan. All foreigners must be fully guided regarding security measures at hotel and also the concerned places during travelling.

**Future Research.** The study described in this article was analyzed on culture to culture base expected encountered services by travelers/ customers. A theoretical concept, based on the contemporary hospitality encountered services has been offered, however, survey data based research can further be analyzed by the future researchers.

**Acknowledgement.** The authors gratefully acknowledge the support of the Management Sciences department of Riphah International University, Islamabad, Pakistan, and especially the worthy supervisors Dr. Hummayoun Naeem for valuable guidance and encouragement.

ABSTRACT
Importance of olive (Zatoon) has been discussed in the light of holy Quran and the sayings of the holy Prophet. A few people know Hazrat Muhammad (Peace be upon Him) treated the men spiritually but he physically also treated them. The prophet treated many diseases and gave medicines for them, one of them is olive (zatoon) which is an effective treatment of leprosy, typhoid, tuberculosis, paralysis, ailments of heart and stomach and vaginal diseases. If new advance research is conducted, it can come to limelight that olive (zatoon) can be used in the treatment of several diseases of the modern time. This article will provide scheme of work for the researcher so that to have detailed information in this regard.

INTRODUCTION
Olive (Zatoon) is available boon given by Allah and has been discussed in holy Quran and sayings of the prophet and its mention is available in the old books. This olive (zatoon) is considered a very good thing. It is used as an item of diet and for treatment for many disease discussed above. Since the gone by days people have attached much value with olive (zatoon). That is why its important has remained intact and many people have benefited from the use of olive (zatoon).

DICTIONARY SIGNIFICANCE OF ZATOON
In Arabic, Persian, Urdu, Bangla, Punjabi, Sindi, Kashmiri it is called zatoon. In pushto it is named as Khoon, and in English it is called olive. (Akram A,1976) It is fruit and the name of a tree. This olive (zatoon) tree lives for two thousand years. (Encyclopedia A,1982)

HISTORICAL IMPORTANCE OF OLIVE (ZATOON)
Olive (Zatoon) happened to be the oldest tree. According to some researcher after Deluge of Nooh the very first tree was the tree of olive (zatoon) which has it mention in the Bible as well; that a dove brought a fresh leave of olive in its beak, so Nooh knew that the water had gone down. (Shafi M,2008) This was taken as a sign of peace. Thus the olive branches havehafi been ancient symbols of peace and victory. (Encyclopedia A,1982)

WHERE OLIVE (ZATOON) IS FOUND?
Olive (Zaton) is found in Syria, Greek Spain, Itly, Turky, Tunis, Africa, Rome, Maxico (America) Kelifornia, Peru and Australia, in plenty. It is also found in cold weather countries of the world. In Rome it
Olive is cultivated as oil producing tree on large scale. In the northern areas of Pakistan it is grown in a wild/crude form. The plants have been imported from Italy and Spain and have been grown at Attock. Olive (Zatoon) has many kinds. Lilac is the kind which is much fragrant. Olive wood is used in making agricultural instruments and are also in the making of common articles of use. Olive wood is a heavy wood. It is not eroded. Decoration items are made out of it, hence it has gone very expensive. Mostly people are ignorant of the importance of it. If its leaves are dried in shade, they can be used as green and black tea. It is very useful and gives pleasant tastes. Olive tree is of the length of 25 to 70 feet high and leaves are long to 3 inches. Tree carries small bunches of white flowers. The olive fruit is of reddish colour, somewhat blackish and blue. Fresh fruit is bitter hence is not edible. Its bitterness is removed through chemical process. Raw olive is dry, prepared olive is black and dry leaves are warm in nature. (Abdul-Rasheed, 2008). Olive contains oleic-acid 8.4%, linoleic acid 10%, palmitic acid 3.38%.

QURAN AND OLIVE (ZATOON)
The importance of olive, its medicinal value can be safely determined because it has been mentioned in the holy Scriptures Torait, Bible and in Quran it has been mentioned at four places. Allah has sworn by olive too. God says, fig, olive (zatoon) and Toor-e-Saneen, we have created man in best form. (Al-Quran) Allama Shabir Ahmed Usmani writes, fig and olive (zatoon) have great utility and advantages for man. The Quran swears about it (zatoon) therefore, contains great advantages and those things which have unique relationship with man. (Shabeer A, 2009) Attention is drawn to them so that we may derive benefit from them properly. Surah Abis olive (zatoon) has been discussed, God says "We have grown olive, dates for the good of the man". Oil burns, Olive tree is neither in the earth nor in the west its oil burns. Olive and its tree are useful thing. Scholars count a number of advantages of olive. Its oil gives lucid burning. The characteristics of olive oil is even the cork of bottle is removed, the ants do not come near it and when this oil is burnt in a lamp it does not leave smoke behind. Olive being advantageous for men. It has been mentioned repeatedly. How useful it is for human health. God says, dates mazrooat, the tastes of these things are different. Olive and pomegranate which are almost of the same shape, eat them when they are fully ripe. (Al-Quran) This means when the fruits are ripe it is good to eat. Dates gets ready for eating in summer, it is good to eat. Defensive power of the body gets increased. Sohra Namel God says, "He is the same God who sends rain, people drink that water. This water is used in growing trees, you graze your animals in the pastures and with the same rain water olive and dates are grown and other green vegetations grow. Those who deliberate and ponder over it have got useful signs hidden it. (Al-Quran)

In sohra Momanoon: "Man has been persuaded to benefit from olive in such a persuasive way that every sane man gets impressed by pondering over it and the greatness of the benefactor become quite evidence and man starts saying "Oye the Ahasanul Khaliqueen", Allah says "You should grow such garden in which you may grow dates, grapes and other fruits you eat voraciously. On Mountain of Toor there is a tree, oil is extracted out of it you can eat it in your stew. From all this it can been concluded that this fruit has got
MEDICINAL USEFULNESS OF OLIVE (ZATOON) AND ITS IMPORTANCE IN LIGHT OF HOLY SAYINGS:

As God has repeatedly said about olive and has said that it is very useful. The prophet has advised to eat and do massage with it. Umer Ibne Khatab says that once prophet was heard saying eat the olive and get the treatment from it, because it is a good tree.(Zakriyya,2008) It gives strength to body and treats the diseases. Khalid bin Saad says that he once came to Medina with Ghalib bin Aljaber and I fell ill in the way. Ibne Atique came to see him. He quoted Ashiya that Kalvingy is a very good thing to take. Kalvingy be made powered and mixed up with oil, be put in the nostrils. We did the same and Galib Bin Jabar got recovered.

Abu Horara says the prophet has advised the use of zatoon because it is pure and pious. Ulomas hold different views. Some says that it is produced in Syria and Syria is of great importance, because many prophets have been born here. Some say it gives handsome profit to the grower. According to Abu Naeem 70 diseases are cured with it, lepercy is one of them. Ibne Abbas says its oil is used in eatings, burning. Its ashes is used in washing silk.

Zaid Bin Arqam says, that the Prophet had ordered us to treat plucy with the oil of olive . From termizi Zaid has quoted that zatoon oil has much utility. Ashab ul Ilm says about tuberculosis it is useful. Allama Abdullah Mubarak Puri has called plursi as a kind of tuberculosis.(Nazar A,2009) A medicine which was once given to Prophet it was zatoon oil. Ume-Salma says that prophet developed pain in the house of Mamuna, when the pain reduced the Prophet came and offered his prayers. When he felt the intensity he asked the people to go and lead the prayers. The Prophet took the medicine felt relief and asked as what they served him as drug. People said it was "ood Hindi" along with a few drops of oil of olive . Asma Bint Umase suggested this as a medicine and this had come from Habsha. To protect the mouth from multiple mouth diseases olive misvak is the best. The Prophet Muhammad (Peace be upon Him) and his predecessors used olive misvak which emits pleasant sweet fragrance in the mouth. Prophet loved it.

ISLAMIC VIEW POINTS ABOUT OLIVE( ZATOON)

From the holy verses and the traditions of prophet we came to know the fruit and oil of olive are quite useful and are best for heart and brain and other vital organs of the body. Olive is a food and medicine too, that is why olive is used in Itly, Arab and in Africa in lieu of Ghee. It is more useful for health and specially for heart patients. By using olive oil cholesterol level is reduced. Heart attack mostly occurs due to excess of cholesterol. Dr. Afridi says that if instead of butter, fats and ghee we use those oils which do not freeze, cholesterol level falls down. That is why in northern area of Italy due to butter-eating heart attacks are frequent, but in the southern part because olive oil is used therefore rate of heart attack is small. That is why all the old and modern doctors talk high of olive. In winter for pain, for weak children
used as a nerve tonic olive oil is very good. Olive oil is a laxative also. It is also effective for internal swelling. For colic and intestinal swelling olive oil is the best remedy. When the holy prophet praises a thing how can be that thing otherwise.

Al-hafiz Abne Qayim writes that olive is hot in nature. It is taken for all the diseases of the stomach and kills the worms. Old olive is useful in old age. In short, it has multiple, numerous advantages. (Ibne Qayyam, 2009) Olive strengthens the stomach, removes the reduced libido and increases the appetite. Olive treats lepercy eye and the carbuncle of the eye. If it is taken with honey and chander Ani, it has great value. Toothache is also cured. Olive is also very useful for brain and excretion of sputum. If its pickle is made with vinegar it lends strength to stomach and it is apetiser. If the core of olive mixed up with flour is pasted on leper person gets better. If any woman keeps its as aray in her body the bleeding is stopped. Colic pain is also treated with. If scorpion stings some one, olive oil sets him right at one. Olive oil blackens hair and the head massage removes the pain.

In all the dental diseases of complex nature olive oil mixed up with honey is pasted on teeth, bleeding etc is removed. For constipation olive oil milk and honey if taken it is very efficacious. Similarly olive oil with honey, if it is applied in hair and later washed with shampoo, hair become more healthy and shining. There are people whose longevity is remarkable. They are the people of Azerbijan and Russia. The secret of their long life is hard work, milk, honey and olive oil. These things reduce the effect of old age and almost all the stomach diseases are caused with it. When olive oil becomes old, it becomes sweet. With the constant use of olive oil, the hair neither fall nor go white. If put in eye cataract is destroyed. If olive oil is applied on checks, they become beautiful. Hard stone in kidney is also destroyed. All sorts of poisons and their effects are removed. Cancer of intestine, burning in the stomach, bad cold typhoid, for all such kinds of diseases olive oil is panacea. Indian experts have also considered it of great value for the treatment of joint pain weakness, skin diseases of all sorts, exema etc. (Khalid, 2009) Olive which has been attached greatest value by Islam as a complete diet and a medicine for multiple uses in many diseases. It is therefore recommended that on international level its quantity may be increased to maximum extent, because it treats a big variety of diseases of people ailing and dying untimely.

Abstract
The aim of this paper is to examine the impact of financial liberalization on financial markets volatility. To this end, we use GARCH- and DCC-based econometric tests (GARCH (1,1) and Dynamic Conditional Correlation GARCH). Examining a sample of 7 countries, observed during the period 1 January 1995 to 1 Mars 2009 on a daily basis, we noted that conditional correlation between these countries is high with an amplification cycle starting from the year 2008. The introduction of the two variables measuring financial liberalization in the variance equation allowed us to notice that among the retained 7 countries, only 4 exhibit a significant yet negative effect of financial liberalization on stock returns conditional volatility.

Key words: Financial Liberalization, Financial Markets volatility, DDC-GARCH

1. Introduction
Studying the impact of financial liberalization on emerging markets returns volatility has been the subject of an abundant literature. During these last decades, many developing countries engaged themselves in an openness process of their financial markets to foreign investors by eliminating many restrictions like taxes, investment limits, and change and capital control. The empirical studies examining the effect of financial liberalization on markets volatility reached inconclusive conclusions. Indeed, some studies plead in favour of markets volatility increase during the post-liberalization period, whereas other studies point to the opposite, i.e. a decrease of volatility. For instance, Huang and Yang (2000) examined the impact of financial liberalization on the volatility of 10 emerging markets during a post-liberalization period and found out that indeed volatility level has increased in South Korea, Mexico and Turkey and a decrease in this volatility in Argentina, Chile, Malaysia and Phillipine. The authors insist that no volatility was detected in Thailand, Taiwan and Brazil. Levine and Zervos (1998), studying 16 emerging markets with the aim of assessing the impact of capital account liberalization on stock returns volatility, noted an excessive volatility in these markets during the post-liberalization period. The same conclusions are delivered by Uppal (1998) while examining stock returns volatility variation in Pakistan. More specifically, the obtained results point to a high volatility in the Pakistani market which witnessed stable high volatility levels after the liberalization process. Garbel (1995), studying Chile, Columbia, Venzuela and South Korea, noticed high volatility during the post-liberalization process. However, the author noted a less significant increase in volatility in Argentine and Phillipine. Koot and Padmanbhan (1993), using a GARCH model, found out a significant high volatility in the Jamaican stock market. Recently, Jaleel and Samarakoon (2009) studying Sri Lanka noted that stock market volatility is amplified following the liberalization policy. The author used ARCH and TGARCH models to study weekly data observed during a period of 16 years. Umultu, Akdeniz and Salih (2010), studying some emerging markets, tested whether the degree of financial liberalization affects stock returns volatility. The results point to the existence of a negative relationship between degree of liberalization and crises effects. Moreover, the authors noted that financial liberalization degree transfers its negative impact to the returns volatility and the idiosyncratic and local volatilities (inherent to the stocks). In other words, financial liberalization reduces stock returns volatility. In the same line of thinking, several studies indicated that markets volatility smoothens following financial liberalization. Indeed, Kassimatis (2002), using an exponential GARCH model to examine Brazil, India, Pakistan, Phillipine, South Korea and Taiwan, showed that market volatility has considerably decreased following the liberalization process adopted by these
governments. Kim and Singal (2000) used both ARCH and GARCH models to study the impact of openness on returns volatility variation of 14 emerging markets. They noted that volatility after and before liberalization did not change significantly and pointed to a significant decrease in stock returns volatility during the fourth and fifth year following liberalization. Bekaert and Harvey (1997), studying 17 emerging markets, indicated that stock returns volatility has significantly decreased following liberalization in Brazil, Mexico, Taiwan, Portugal and Argentina. However, this decrease is not significant for the rest of the sample. Kwan and Reyes (1997), studying the Taiwanese market, noted that financial liberalization significantly softens stock returns volatility. De Santis and Imrohoroglu (1997) found no significant effect of liberalization on market volatility of several European, Middle Eastern, Asian and American markets. The same conclusion has been reached by Spyrou and Kassimatis (1999) who pointed to the absence of a significant effect of liberalization on market volatility in Mexico, Chile, Pakistan, Taiwan and Argentina. The financial liberalization-market volatility nexus has been subject to many empirical investigations. Some studies, mainly those of Huang and Yang (2000), Levine and Zervos (1998), Jaleel and Samarakoon (2009) and Umultu, Akdeniz and Salih (2010), show that financial liberalization tends to increase financial markets volatility. Other studies, however, highlight the opposite trend, i.e. financial liberalization decreases volatility (Spyrou and Kassimatis (1999), Kassimatis (2002) and Kim and Singal (2000)). Nonetheless, the negative effects of the different financial crises which periodically flood international financial markets lead us to wonder about the presence of a contagion phenomenon across the different financial markets. To answer this, it is necessary to define the notion of contagion which, despite a number of attempts, remains a phenomenon difficult to apprehend. Contagion is defined as the spread of markets disturbances of one country to other financial markets. Indeed, the economics literature identified many mechanisms through which shocks spread from one market to another (Allen and Gale (2000), Kyle and Xiong (2001), Kiyotaki and Moore (2002), Kaminsky, Reinhart and Végh (2003), Brunnermeier and Pedersen (2005, 2009)). Accordingly, we propose within a third hypothesis framework to determine the cause-effect link between financial liberalization, financial contagion and financial crises.

The remainder of this paper is organized as follows. The second section presents the econometric approach used in our study. Section 3 presents the sample and reports the results and their interpretation. Section 5 concludes the paper.

2. Econometric approach

2.1. Presentation of the DCC-GARCH Technique

This technique has been introduced by Engle (2002) and then extended by Tse and Tsui (2002). It is a multivariate GARCH model with dynamic conditional correlation which consists in estimating simultaneously dynamic conditional correlation coefficients and the variance-covariance dynamic matrix. This technique allows viewing the evolution of correlation coefficients through time. To illustrate this model, we denote by $x_i$ as a vector of the order 3x1 containing return series, volume an implicit volatility. The mean equation is as follows:

$$x_i = \mu_i + \epsilon_i,$$

where $\epsilon_i \sim N(0, \Omega_i)$

with

$$\mu_i = E[x_i|\Omega_{i-1}],$$

the conditional expectation of $x_i$, given the past information $\Omega_{i-1}$;

$\epsilon_i$, the autoregressive errors vector. It is supposed to be a conditional normal multivariate distribution with null means and a variance-covariance matrix $H_i = \{h_{ij}\}$. Under the hypothesis that the returns series, volumes and implicit volatilities are determined by a set of information available at time $t-1$, the model may be estimated using a maximum likelihood method with the supposition that the conditional covariances matrix $H_i$ is positive and defined for all the values $\epsilon_i$. Engle (2002) supposes that $\mu_i$ has the following attributes:

$$\mu_{ij} = \Phi_0 + \Phi_i x_{i-1}, \forall i$$

$\Phi_i$, measures the ARCH effect of the three series. In the case of a traditional multivariate GARCH model, the variance-covariance matrix is written as:
\[ H_i = G_i R_i G_i \quad \text{avec} \quad G_i = diag \left( \sqrt{h_i} \right) \]

\[ h_i, \] denotes conditional variance estimated through a standard GARCH (1,1) model in the following way:
\[ h_i = \omega_i + \alpha_i e_{i,t-1}^2 + \beta_i h_{i,t-1} \quad \forall \ i \]

\[ R_i, \] denotes the matrix of the conditional correlation coefficients which vary in time.

According to the equation, the variance of each market is modelled according to a constant, the squared residues \( e_{i,t-1}^2 \) and the past conditional variance.

The matrix of the dynamic correlation coefficients of the DCC model is written according to Engle (2002) as follows:
\[ Q_i = \left( q_{ij,t} \right) \]
\[ \left[ diag(Q_i) \right]^{-\frac{1}{2}} = diag \left( \frac{1}{\sqrt{q_{11,t}}} , \frac{1}{\sqrt{q_{22,t}}} , \frac{1}{\sqrt{q_{33,t}}} \right) \]

In order to normalize error terms, Engle (2002) proposes \( z_t = G_i^{-\frac{1}{2}} e_t \) with \( G_i \), is a diagonal 3x3 matrix of the conditional standard deviation.

\( z_t \), is the vector of standardized residues with a null mean and a variance equal to the unit. Engle (2002) suggests as well the following estimation process of dynamic correlation:
\[ \rho_{y,t} = \frac{q_{y,t}}{\sqrt{q_{11,t} q_{\bar{y},t}}} \]

with
\[ q_{y,t} = \bar{\rho}_y + a (z_{i,t-1} z_{j,t-1} - \bar{\rho}_y) + b (q_{ij,t-1} - \bar{\rho}_y) \]
\[ = (1 - a - b) \bar{\rho}_y + a z_{i,t-1} z_{j,t-1} + b q_{ij,t-1} \]

The dynamic correlation coefficients within a DCC-GARCH model may be divided into two groups. The first group noted \( \rho_{y,t} \) denotes unconditional correlation coefficients. The second group \( a z_{i,t-1} z_{j,t-1} + b q_{ij,t-1} \) translates the conditional covariance which varies in time. The contribution of the DCC-GARCH method is to analyse the evolution of conditional correlations in time.

### 2.2. Effect of Financial Liberalization on Stock returns Volatility

In this section, we examine the effect of financial liberalization on stocks returns volatility of 20 emerging markets in our sample. To this end, we adopt a methodology similar to that suggested by Jaleel and Samarakoomb (2009). Indeed, the authors suggested the use of the GARCH and TGARCH models, introducing in the conditional variance equation two additional variables measuring financial liberalization. More formally, it is written as:
\[ R_t = \phi_0 + \phi_1 R_{t-1} + \epsilon_t \]

with \( z_{t-1} \sim N(0, h_{t-1}) \)

The variance equation
\[ h_t = \alpha_0 + \sum_{i=1}^{q} \alpha_i \epsilon^2_{t-i} + \sum_{i=1}^{p} \beta_i h_{t-i} \]

with
\( R_t \) : current return;
\( R_{t-1} \) : past return;
\( h_t \) : current conditional volatility;
\( h_{t-1} \) : past conditional volatility.
The coefficients $\alpha_0, \alpha_i$ and $\beta_i$ are all positive and the term $\sum_{i=1}^{n} \alpha_i + \sum_{i=1}^{n} \beta_i < 1$. This latter measures volatility persistence.

In our study, we introduce in the variance equation two binary variables representing financial liberalization. Then, the variance equation becomes:

$$h_t = \alpha_0 + \alpha_i e_{t-i}^2 + \beta_i h_{t-i} + \lambda_i Lib_t + \lambda_i Postlib_t$$

with

$Lib$ : a binary variable which takes the value of 1 during the financial liberalization period and 0 otherwise.

$Postlib$ : a binary variable which takes the value of 1 two years after financial liberalization.

3. Data and empirical results

3.1. Data and descriptive statistics

In this section, we propose to analyse markets volatility during liberalization. To this end, we consider a sample of stocks returns of 7 countries; Argentina, Brazil, Indonesia, Korea, Malaysia, South Africa and Venezuela, during the January 1 1995 to Mars 1 2009 period using daily data.

Most stock returns show a negative skewness and a kurtosis superior to 3. Consequently, returns are not normally distributed, it is rather leptokurtic. The Jaque Bera test confirms this conclusion.

Before proceeding to analysing the relationship between stocks returns volatility and financial liberalization, it is necessary to examine the dynamic conditional correlation between the different markets of our sample. Indeed, with reference to the literature, financial liberalization favours openness by allowing investors to detain stocks in different markets across the world. This financial liberalization policy allows to favour integration of financial markets and to increase correlation between economies.

Relying on the premise, we propose to examine correlation between stock markets of our sample using the Dynamic Conditional Correlation GARCH technique (DCC-GARCH).

3.2. Applying the DCC-GARCH Technique

In this section, we propose the evolution of conditional correlations in time of the different markets of our sample. Our objective is to check whether financial liberalization induces an increase in correlation between markets.

As shown in the graphs above, we notice a correlation sometimes negative and some times positive. Most markets, taken in pairs, exhibit correlations which vary in time. Sometimes, correlation is amplified, sometimes it decreases. However, starting from 2008, it is possible to observe a common phenomenon for most markets of our sample; dynamic conditional correlation has considerably increased. Indeed, starting from this date, correlations exceeded 80%. This result translates a strong relationship between markets, a relationship provoked essentially by financial liberalization adopted by these markets. Moreover, it is possible to attribute the high correlation observed in 2008 to a contagion phenomena induced by the subprime crisis which hit the real estate market in August 2007 and spread towards many international markets. However, it is convenient to admit that even if this explanation is more plausible, certainly it is common sense to admit that crises propagation is essentially due to markets interdependence mainly caused by financial liberalization.

It is possible to notice that financial liberalization helps reduce conditional volatility of stocks returns. This effect is significant in Brazil, Indonesia, Malaysia and Venezuela. These results are consistent with conclusions proposed by Kassimatis (2002), Kim and Singal (2000), Bekaert and Harvey (1997) and Kwan and Reyes (1997) which assume that financial liberalization softens financial markets volatility.
4. Conclusion

In this paper, we studied the relationship between financial liberalization and financial markets volatility. To that end, we used two econometric tests based on GARCH (1,1) and DCC-GARCH models. Studying a sample of 7 countries, observed during the January 1 1995 to Mars 1 2009 period (daily data), we noticed that conditional correlation between these markets is high and tends to amplify starting from 2008. This observation points to the presence of a contagion phenomenon across these markets, mainly during the subprime crisis (August 2007). The introduction of two variables measuring financial liberalization in the variance equation allowed us to notice that among the retained 7 countries, only 4 countries exhibit a significant yet negative effect of financial liberalization on stocks returns conditional volatility. This conclusion is consistent with the results reported by Kassimatis (2002), Kim and Singal (2000), Bekaert and Harvey (1997) and Kwan and Reyes (1997).

Chinese Business Context in Establishing of Wholly Foreign Owned Enterprise in People’s Republic of China

Boštjan Polajžer
University of Primorska Slovenia
Cesta na Markovec 2a, SI-6000 Koper, Slovenia

Abstract
The purpose of the following article is to present research outcomes of registering a wholly foreign owned company in China, and to compare it with the establishment of a limited liability company in the European setting. With the help of an interview method, we obtained information from the selected respondents, and this information served us to verify and to compare the European and Chinese ways of company registration. The information obtained in this manner was analyzed, and served as a basis to draw up a model of registering a wholly foreign owned enterprise in China. A comparative theoretical study of company registration models in the selected European countries was used, on the basis of which we observed that registering a limited liability company in the European setting does not differ significantly from country to country. All national and local legislation as well as the procedures in the EU countries are relatively similar, the only difference in the European setting can be observed in the amount of the start-up capital required and the time for establishment that can take from 1 to 30 days. The research enabled us to set up a uniform theoretical model of establishing a limited liability company in the European setting. On the basis of the research, we established a uniform model that should serve as guidance to future foreign entrepreneurs who intend to establish a wholly foreign owned company in China. The research contributed towards the clarification of some important issues faced by European as well as other international investors who plan to establish a wholly foreign owned company in China, or a company resembling those they establish in their own countries, in their full ownership. The mentioned research and the model of establishing a wholly foreign owned enterprise can serve a guidance or instruction to foreign investors planning to establish their own company in China.

Keywords: China, entrepreneurship, management, WFOE.

Introduction
Globalization can be defined as a process in which the role of geographical distances in international and regional economic, political, socio-cultural relationships is becoming less significant, which influences the potential borderlessness and internationality of relationship networks and co-dependence (Lubbers and Koorevaar, 1999). In the past decades, the role of geographical distances diminished also in China, which is a result of the globalization process, which left its mark in China in the field of economy, politics, culture, society and security. From the economic perspective, globalization often means a rapid growth in international trade and exchange of goods, currencies, technology, and capital, in an increasingly open, integrated and borderless international world of economy (Intriligator, 2001).

China remains a great, though multi-layered, opportunity for the world. On the one hand, the developing Chinese market with 1.3 billion inhabitants offers infinite business opportunities, while on the other hand, the country as a whole remains gravely undeveloped, and consequently, the price of its workforce low. Numerous Slovenian companies should seriously consider both alternatives if they wish to survive and win in the global competitive game. Companies operating
in global industries that are multiplying are being forced to internationalize their activities from the strategic point of view (Kotler, 1997).

Through the process of economic reforms, China has succeeded in achieving something that the western world required more than hundred years. Economic reforms modelled on the capitalist states have transformed China into an important power in the world economy. From the beginning of the reforms in 1979, which aimed at opening up the market, and until today, China has become one of the fastest developing economies. From 1979 to 2010 China’s GDP grew at an average rate of 9.3% - 10.5%, and China has the second largest economy in the world, following the USA, measured in purchasing power parity; nevertheless, per capita GDP is still relatively low. Chinese prefer to deal with foreign overseas compatriots, which is called the "blue eyes phenomenon" (Schlevogt, 2000). By continuing this trend, in 2040 the Chinese economy is expected to reach 123 trillion dollars, or nearly three times the economic output of the entire globe in 2000. China's per capita income will hit $85,000, more than double the forecast for the European Union, and also much higher than that of India and Japan (Foreign Policy, 2010). In case China proceeds with intensive growth of trade, the country will reach the highest point of the world trade and will be considered the strongest economy in the world.

Small and medium-sized companies are increasingly included into international exchange. This is particularly evident in small countries such as Slovenia, where it is very difficult to attain any visible advantages brought about by the economy of scale and maintain efficiency and competitiveness without expanding beyond the national boundaries (Trtnik, 1999). Moreover, there is high constraint concerning labour market as the level of flexibility is very low, which also influences companies to expand abroad (Franca, 2007). In addition, studies covering Slovenia (Nastav and Bojnec, 2008) reveal that within-country factors of rigid legislation, high tax wedges, and transaction/administration costs, hamper the development of small and medium-sized companies – pushing them to look for business opportunities both within (i.e. shadow economy) and outside of domestic markets (i.e. internationalizing). Studies of Slovenian companies have revealed different levels of internationalization of companies from various regions and branches (Glas, et. al., 1999). As opposed to small enterprises in large countries, new dynamic companies in small countries cannot develop for long within their own countries, as they soon become limited by small national markets. Therefore, they should focus on international markets, where modern technologies, fast and available communications and changes on the international market enable them to have a more active role in global operations. Even in large developed countries, such as the USA, the report on small exporters (SBA, 2008) reveals that their export share tripled between 1987 and 1997, and in 1999 already amounted to 31% of the total export, with a tendency of further growth.

Fletcher (2001) notes that companies wishing to internationalize have certain characteristics in common, of which, the most important are: readiness to develop a product for other markets, technological advantages, readiness to enter foreign markets, and focus on research and development and the nature of products.

China has developed special principles of foreign trade that are a base for commercial cooperation with foreign countries. Nevertheless, new circumstances and an increasingly liberal legislation, particularly after China joined the WTO, have forced China to operate in a totally different direction, and its foreign trade is based on special principles (Dezan & Associates, 2006).

The EU is the second largest partner of China (immediately after the USA) in the exchange of goods; however, according to the National Bureau of Statistics of China, the EU should soon
become number one Chinese partner (European Commission, 2006). At the beginning of 1980, the EU enjoyed trade surplus with China, however, according to Eurostat, the EU is now facing trade deficit with China, and in 2009, the deficit amounted to EUR 128 billion (Pappalardo, Nowak, 2010). This is the largest bilateral trade deficit of the EU. In the first half of 2010, China was the EU27’s second most important trading partner after the USA, accounting for 8.5% of EU27 exports and 17.8% of EU27 imports (EUROSTAT, 2010).

Theoretical background

The focus of the paper is to define a process of establishing a new company in the People’s Republic of China (PRC). The PRC is one of the fastest growing markets in the world. China has clearly become a major participant in world economy. It is virtually certain it will become even more important in the future due to its size, dynamic economic growth, and continuing policy reforms (Lardy 1994, VII). Consequently, foreign investors are ever more present in the PRC and its growing economy. From this point of view it was necessary to carry out this research because foreign investors do not have enough information regarding the establishment of a company in the PRC. A wholly foreign owned enterprise is a type of a company most commonly used by foreign investors in China. This form enables foreign investors to perform independently on the Chinese market, and gives them a complete control over all company operations (Invest in China, 2009).

After a record 14 years of consultation, China’s long awaited new Property Rights Law was finally passed on March 16, 2007, and came into effect on October 1 of that year. Referred to as “China’s next revolution” by The Economist, the law offered equal protection to socialist public property and private property, stated explicitly for the first time. This was a huge step in reforming secured lending and building a modern secured transactions system (Marechal et. al. 2009, 12).

When investigating the process, all basic elements that influence establishing a company in China have to be identified, as well as specific features that are a result of political and social environment, and this subsequently have to be compared to Europe. A model was then set up that can serve as a basic tool for other enterprises wishing to establish their own company in China. As Fernandez and Shengjun (2007, 100) suggest, it is nearly impossible to propose a general model on how to organize international operations valid for every type of company. It is true that it is impossible to carry out a general model of establishing a wholly owned enterprise in the PRC, but our research has revealed that it is possible to make an approximate model of establishing a Wholly Foreign Owned Enterprise (WFOE) in the PRC. This model cannot be applied to any type of business due to fact that each business is unique, and foreign entrepreneurs must pay attention to these distinctions when registering their own company in the PRC.

The main purpose of our research was to compare the establishment of a company in the European setting and in China, and thus set up a uniform model that could serve to future foreign investors as a framework or a guide for registering a Limited Liability Company (LLC) in China. A project objective is precisely defined, financially limited and has a deadline; the project objective is specific (Keeling, 2000). Likewise, the establishing of the company in the PRC has its own deadline and must be carefully defined, particularly one needs to have a lot of information relevant for establishing a WFOE in the PRC. This project is costly and time consuming. It cannot be compared to any European system of establishing an LLC in the European environment. Thus the main purpose of the research was to analyze and present the
establishment of companies in the PRC. The European economy shows a huge interest in doing business in China, but at the same time is not familiar with the discussed establishing of an LLC.

The Doing Business 2011 has compared data for China of starting a business to good practice and comparator economies all over the world. According to their data the average time to start a business in China in 2011 is 38 days (7, 2011). Based on relevant literature review and empirical research we were not able to compare the stated average time to starting a business in China by The Doing Business 2011 data for China. All other data are comparable with our findings.

Primarily, data was obtained from relevant literature review and content analysis of relevant documents connected with establishing a WFOE in the PRC and establishing a LLC in selected European countries. For the purpose of this research a pluralistic methodology was adopted, incorporating both qualitative and quantitative approaches, where research bias was minimised by methodological triangulation (Simon, Sohal, 1994, 34). The choice of method depends on the aim of the study (Robson 1993). Information has been gathered from several sources and data presentation can be best described trough “triangulation of methods” (Simon, Sohal, 1994, 34).

To get a better validity of the research, a triangulation of respondents as sources of information was made. The first group of respondents consisted of three European managers, who were actively involved in establishing WOFE companies as subsidiaries in China. The second group of the respondents consisted of two lawyers from international law companies who are particularly involved in setting up new enterprises in China. The third group of respondents were consultants from Chinese governmental institutions who are help foreign entrepreneurs to set up a WOFE company in China. A method of in-depth interview was chosen. In-depth interviewing is a qualitative research technique that involves conducting intensive individual interviews with a small number of respondents to explore their perspectives on a particular idea, program, or situation (Boyce and Neale 2006, 2). With the help of in-depth interviews information from the selected respondents was collected, and this information served to examine and compare the European and Chinese ways of company registration based on the of analysis of relevant literature and sources. All collected data from primary and secondary sources were analyzed and served us to set up a model of registration procedure in China.

**Methodology**

The method evolved during the initial research, following both the investigation of the literature and new learning in qualitative research and descriptive methods. The literature enlightened our understanding of practical and effective methods for researching psychological phenomena in organizational life. New learning in qualitative and interpretive methods enabled the adaptation of appropriate methods for the unique focus of this study. The experience with research methodology is described below, and then summarized in the approach.

A possibility of establishing a company in the PRC was researched, as recently an increasing number of companies have been deciding to establish production companies in this business and economic environment. For this purpose, a qualitative research – a case study was conducted. Data and information were obtained with the help of an interview.

Interview was chosen as a research method which enabled a better checking of the facts on the ground. An interview is relatively an unstructured and a direct way of obtaining information, its purpose is to identify beliefs and opinions of interviewees (Malthotra and Birks, 2003). In addition, the theme of establishing of WFOE and comparison to European model of establishing of LLC in Europe is relatively unexplored, which means that it is fundamentally more
A semi-structured in-depth interview was used for the purpose of our research. This method was chosen mainly because of the nature of the selected topic and the realistic state in the Slovene economy. Interview is by nature a cultural and collective phenomenon. The meaning of an answer is not a straightforward matter of external or internal reference, but also depends on the local and broader discursive system in which the utterance is embedded (Wetherell & Potter, 1988, p. 169). From this perspective, the use of a semi-structured interview seemed the optimum choice, as on the one hand, it helped us to learn about the experience of Slovenian companies and managers, and a manager from the European setting, who decided to register a wholly foreign owned enterprise in China, and, on the other hand, it enabled us to check the stated facts with specialized consultants who are employed by the Chinese government and work for its benefit. In spite of being less structured, in-depth interviews are well accepted by managers and allow deeper insights into the research problem (Arzenšek, 2010). The questionnaire comprises of 12 main uniform questions (see Appendix 2). In the sample three officials from the Chinese governmental advisory offices from different provinces were included, who advise foreign investors about foreign investments, establishment of businesses and companies in the PRC. Two managers from Slovenian companies who have registered a WFOE company in the PRC were also included, and one manager from Holland, who registered a WFOE company as a subsidiary in China. These businessmen shared with us their views and experiences at registration and entry of firms on the Chinese market. The diversity of answers given by officials working in specialized institutions for registering foreign companies from three different provinces, and three entrepreneurs who registered companies in the PRC were compared. Information obtained in this manner was analysed with the help of the content analysis method as defined by Esterbay-Smith, Thrope and Lowe (2002); from the information obtained, key characteristics were identified and, at the same time, managed to retain the richness of the material, which was used to prove our final conclusions and to set up a model of establishing a company in China.

Our semi-structured in-depth interview contained 12 research questions, as presented in appendix 2. The questions were set in a manner which enabled us to obtain as much information as possible about the registration procedure of a WFOE in the PRC. Interviews were conducted with European managers and Chinese consultants for registration of foreign companies in the PRC, as well as in specialized institutions which offer assistance to foreign investors when opening a company or representative office in China. Our research was carried out in Guangdong, Shanghai, Zheijiang and Jiangsu provinces, where the majority of foreign investment is made and the majority of companies are registered. Different provinces were researched in order to establish whether a uniform system of establishing a wholly foreign owned production company exists in China.

In the course of our empirical research, the limitations in the sense of contents, methodology, space, time, and language mainly had to be overcome. One way to increase the validity, strength, and interpretative potential of a study, decrease investigator biases, and provide multiple perspectives is to use methods involving triangulation (Denzin, 1970). By triangulation, i.e. examining the selected topic from different perspectives, which were represented by different respondents, the credibility of our research was raised. A Chinese consultant found himself in a double role - in the role of an official of the PRC, who has to act for the benefit of his people and
their social interest, and in the role of a consultant advising foreigners in his own country. This can bring about ethical dilemmas.

**Results**

Analysis and the interpretation of information was divided into two sets: analysis and interpretation of information collected from theoretical sources, such as various sources and literature studied in the theoretical part, and information obtained with the help of our interviews. Theoretical information was compared to the information obtained with the interview; and on the basis of this information, a uniform model of establishing a wholly foreign owned enterprise in China was set up.

From the analysis of the relevant documents and sources, it can be concluded that a more or less uniform system of registering a LLC exists in Europe as can be seen in table 1, which has enabled us to set up a uniform registration model, as evident from Appendix 1. Furthermore, relatively similar statutory regulations and secondary acts for establishing a LLC exist in different EU countries, the main differences can be observed in the amount of the initial capital required, tax on revenue from capital, and publication of a company in various public documents. A LLC in the European economic setting can be registered within 2 to 30 working days.

On the basis of information gathered from literature and sources, a more or less uniform model of registering a LLC can be established, containing certain specific features that were identified in individual countries.

When examining Chinese literature and sources on establishing a company in China, it can be concluded that uniform rules and regulations concerning the establishment of a company or WFOE in China exist, however, these can differ from province to province. Other secondary acts and regulations exist in certain provinces, which must strictly be observed when establishing a company.

On the basis of our research, it has been discerned that local customs and rules must be observed, as these enable a smoother registration of a wholly foreign owned enterprise. If one wishes to register a company, one must be well-informed about local rules and regulations; while at the same time, it is highly recommendable to hire a specialized local organization that is not owned by the state, but working independently as a consulting firm, with the experience in the field of registration of such companies; we particularly recommend an international company that has references in the field of company registration in the PRC. It can be concluded that local consulting firms operating under the auspices of the state are not neutral, but operate for the benefit of the state and local authorities. At the same time, it can be concluded that the registration of a WFOE is much simpler in the economic and tax-free zones rather than outside. These zones already contain all infrastructure; already constructed premises or land can be hired and a facility that suits our needs can be built, in compliance with the rules of the zone and local spatial planning regulations.

Types of foreign owned companies are universal throughout China, however, foreign investors most frequently decide to register wholly foreign owned enterprises, as this type enables them a certain level independence, as well as the protection of their interests and know-how. It is well-known that Chinese authorities want to acquire as much foreign knowledge and technology as possible, and want to utilize these for their own benefit and the development of their own
capacities, as well as launch them on their national and foreign markets. There is still a great threat of technology leakage and plagiarism in China.

Registration Procedure Model for Establishing an WFOE in the PRC

On the basis of the carried out research, analysis of relevant literature and sources about establishing a wholly foreign owned enterprise in the PRC, a registration procedure model for establishing a wholly foreign owned enterprise – WFOE was drawn up, which could serve as a basic framework during registration procedure of a WFOE in the PRC. The model was adopted from Dezan Shira & Associates (2006, 43) and modified with results of this research which contains all essential elements that appear during the registration of WFOE and all particularities that foreign investors should pay attention to prior to and when registering a company. The elements in the model were obtained from theoretical findings and conclusions made on the basis of the research (interview) that was carried out in China.

The set up model contains all elements that offer investors a quick and up-to-date insight into the registration procedure of a wholly foreign owned enterprise, the course of registration and foreseeable costs related to company registration. The model also enables us to see the time course of the registration and its duration.

The registration procedure model of a wholly foreign owned enterprise (WFOE) is demonstrated in Figure 1, and has been divided into five main steps that lead to an official establishment of a WFOE; however, official establishment does not necessarily mean that the company may begin its operations. In order to complete the registration, several other procedures have to be carried out, some of which overlap or can be carried out simultaneously, while others cannot be carried out prior to the step ahead.

The model reveals that six to eight weeks are required for registration or obtaining a business license, however, a company cannot start operating immediately, as other registration procedures before other state authorities, for instance, tax, customs and inspection authorities have to be carried out. In order to obtain all licenses and to open an RMB and foreign currency account, we need 16 to 20 weeks. Nevertheless, any procedure can get prolonged, since much depends on correct documentation submitted to individual state authority. Length of the procedure also depends on a province and local legislation.

Registration of a company in the PRC must be approached in the same manner as project work. The project of establishing a company in the PRC begins with an idea and continues with team approach that leads to company registration. As various researchers (Devetak, 2003; Potočan et. al., 2008; Meško et. al., 2009; Fatur and Likar, 2009) pointed out, an idea is only a step on the way towards innovation, which, in our case, is a registration of a company in the PRC.

The model was set up on the basis of findings from literature, sources and research work in the PRC, and can be applied to the most common type of production companies that register a WFOE in the PRC.
Discussion and Conclusion

This research paper presents a registration of a WFOE to anyone intending to register a company in China in the future. It aims at contributing to a better understanding of Chinese registration procedures. The establishment process was presented from the perspective of a project approach, since establishing a company is a project that begins with an idea and ends with obtaining a business license.

Characteristics of registering a WFOE were presented through the analysis and synthesis of numerous, mainly foreign, literature and sources dealing with the registration of a WFOE, and through examining relevant legislation and local rules and regulations, which was later verified by the empirical research based on interview.

The research helped us to shed more light on some key problems and dilemmas faced by European and foreign investors that have or will establish a Wholly Foreign Owned Enterprise (WOFE) in China. We believe that our research can offer additional help to companies deciding to enter China through their own WOFES, or can serve as a good reference material.

Initially, a theoretical research of company registration in the European setting was carried out and it was observed that the procedures for registering a LLC in the European environment do not differ significantly, apart from certain specific features.

In China, the establishment of a wholly foreign owned enterprise was investigated, which bears the greatest similarity to a LLC in the European setting. The research revealed that a unified umbrella law governing the establishment of a WFOE in China exists, however, local rules and customs have to be observed in various provinces.

The research enabled us a deeper insight and understanding into registrations processes, which had previously been analyzed theoretically. The initial analysis of legislation, rules and regulations, literature and sources, enabled us to carry out a high quality research. Findings from literature, sources and our research enabled us to set up a model of establishing a WFOE in China. The model demonstrates the entire registration procedure of such a company in the PRC.

The model can serve to foreign investors who have decided to register a WFOE in the PRC as a basic framework for registering such company, as it clearly demonstrates and describes the procedure that must be followed if one wants to successfully register a company in China. The registration of a WFOE is very complex, and it has been concluded that it cannot be compared or equalled to registering a LLC in the European setting. Certain similarities in some procedures do exist; nevertheless, the entire registration procedure differs greatly from the European one and is much more time consuming. The research itself makes a great contribution to economy and science. For the economy, the research offers a quick insight into the registration procedure of WFOE in China and can be used as an extended research to research of Doing Business 2011. The results of this research can be used as basic guideline for new entrepreneurs who would like to set up an WOFE in China. For science, the research presents a base which can be further expanded through the research of registration procedures for other types of companies in China, or to compare registration procedures between local and foreign investors.

Appendix 2:

1. Please, can you provide us the actual law and regulations for establishing companies in PRC? What can you provide to us about setting up a company in China, the existing laws and regulations?

2. Which are forms of companies that a foreign investor can register in China and which is a recommend form of company that foreign investor can register? Foreign investors registered in China to be able to, then what kind of companies need to form? Foreign investors want to register, then recommend what form the company?

3. Which is the most common form of company that foreign investors choose? Will foreign investors to choose the most common form of what kind of company?

4. Why is this form of company (WFOE) the most proper for production company? For manufacturers, the form of why this company (WFOE) is the most appropriate? It really is for the foreign (to set up a production company) in terms of what the best way?

5. Do foreign investors get some benefits at registering any form of a company in PRC? Registered in China to any form of company, whether foreign investors will get some benefits?

6. Is WFOE the most proper legal form of foreign investment for Production Company? WFOE is the creation of production-oriented foreign investors the most suitable legal form of business?

7. Can you describe a process of registration of company in your invironment? Can you describe where you need to register a company process?

8. What is most important at registration of WFOE? WFOE registration, what are the most important issues?

9. How long does it take to register WFOE? Registration WFOE take?

10. How much does registration WFOE in PRC cost? Registered in China WFOE takes the amount?

11. Where should we be especially careful at registration of WFOE? WFOE registration when and where need special attention?

12. Can we expect any obstacles at registration of WFOE? (Either economical or law) The WFOE registration process, we will encounter obstacles which may occur (economic and legal)?
An Empirical Study of the Relationship between Car Loan and Lifestyle of people of Bangladesh

Dr Ataur Rahman (Corresponding author)
Assistant Professor, Department of Marketing
University of Dhaka, Dhaka-1000, Bangladesh

Abstract
Bangladesh is a developing country. The middle class and fixed income group in this country is not solvent enough to pay the price of an essential product (like car) at a time from their savings. So, they need car loan to buy the car for doing their lifestyle activities, satisfy their desired interests, and express their opinions. The purpose of this article is to identify the car loan impacts on lifestyle of consumers of Bangladesh. 576 respondents in a survey were asked to rate the importance of 16 lifestyle variables related to car loan. These data were tested via factor analysis (the principal components method with varimax rotation) by using SPSS program. The results show that people borrow money to buy car to do their work, satisfy their desired interests and express their opinions. The article will make contribution to our understanding that people need car loan to increase their lifestyle.

Keywords: Consumer, car loan, lifestyle, activities, interests, opinions.

1. Introduction
Bangladesh is a developing country. A sizeable portion of our population is coming up as a consumer class every year. The middle class and fixed income group belongs to this and they are in continuous race to elevate the standard of their living and quality of life. In doing so, it can not afford to possess basic necessities of life by paying the price at a time out of their savings (National Bank Bangladesh Ltd., 2008). Because of limited income, they (especially the salaried professionals) have no ability to buy essential household durables (like car) to enhance their lifestyle after fulfillment of their basic needs. In this situation, credit is necessary for them to buy car. But their financial positions do not allow them to get micro credit; because micro credit is for poverty alleviation. They have no ability to get mortgage loan. To materialize their cherished goal of becoming the owners of the durable goods (like car), at first Islami Bank Bangladesh Ltd. offered an attractive opportunity of installment buying through a consumer credit scheme named ‘Household Durable Scheme’ in 1993 in Bangladesh (Brochure of Islami Bank Bangladesh Ltd, 1994). It was followed by Prime Bank Ltd. and Social Investment Bank Ltd., all of which started their services in 1995. Soon several other banks joined and today 19 of the 48 commercial banks offer consumer credit services (Bangladesh Banks, 2008).

The banking sector as a whole plays an important role in the economy of a country irrespective of its level of development. The commercial banks have greater responsibility both in the areas of product growth and in the performance of
individual and social obligations. Car loan is a product of commercial banks. By lending these products, commercial banks play an important role in individuals and society. By borrowing the loan, consumers can easily buy their car. Using car, they can speed up their activities; satisfy their desired interests, express their opinion. Therefore, the objective of the present study is to identify the consumer credit impact on lifestyle of consumers of Bangladesh.

2. Literature Review
Consumer credit /consumer credit institutions were first introduced at Chicago in 1878 (Beckman & Foster, 1969). These spread after World War II. After 1952, attitudes towards consumer credit changed dramatically. After 1968, sub-continental countries began to introduce it (Suneja, 1994). At first Islami Bank Bangladesh Ltd. introduced consumer credit(car loan) scheme in Bangladesh in 1993(Islami Bank, 1994).

Researchers have identified that consumer credit is for purchasing consumer goods (like car) and services(Stokes & Artt, 1955), personal consumption (Prather, 1969), nonbusiness use (Garman & Forgue, 1991), improving standard of living (Suneja, 1994). So, consumer credits/car loan are loans granted by bank to individuals’ who may feel inclined to purchase consumer durables(like car) to improve the lifestyle.

Previous researchers have identified lifestyle as distinct mode of living (Lazer, 1963), way to allocate income(Zablocki and Kanter,1976), unified pattern of behavior(Berkman and Gilson, 1978), pattern of individual and social behavior (Veal,1989), pattern of living reflected by activities, interests and opinions (Kotler & Armostrong, 2007). So, lifestyle can be defined as: Lifestyles are consumer pattern of living in the world as expressed in their activities, interests and opinions, pattern of consumption, spending time and money along with product, service and media.

Plummer (1974) measured people’s lifestyle in terms of (i) how they spend their time, (ii) their interests, what they place importance on in their immediate surroundings, (iii) their opinions in terms of their view of themselves and the world around them, and (iv) some basic characteristics such as their stage in lifecycle, income, education, and where they live. He listed the elements included in each major dimension of lifestyle. These elements are: activities-work, hobbies, social events, vacation, entertainment, club membership, community, shopping, sports; interests-family, home, job, community, recreation, fashion, food, media, achievements; opinions-themselves, social issues, politics, business, economics, education, products, future, culture; demographics-age, education, income, occupation, family size, dwelling, geography, city size, stage in life cycle. The Plummer concept helps the marketer to find out the basic need of the consumer and how the products fit into their lives.

From the definition and measurement of lifestyle, and definition of consumer credit it can be assumed that there may be relationships between car loan and lifestyle activities. Following discussion will also help to assume the relationship between car loan and lifestyle.
Amling and Dromes (1982) explained that consumer credit facilitates enjoyment of life because it enables people to obtain goods without delay. Garman & Forgue (1991) opined that consumers have to wait long time for buying household goods if they have no savings. Consumer credit helps them to enjoy immediate use of the products. Buying a car on credit allows the consumer immediate use of the product. Some researchers (Gladwell, 1990; Reimer, 1995) are employing a battery of items to capture a more holistic picture of people's lifestyles that included their hobbies, vocational interests, work, recreation and social activities. People need credit for buying car to do their work, satisfy their interests, and express their opinions.

People need credit for buying the car. A car is necessary for outdoor activities and recreation. In this regard, Research by the "Outdoor Industry Foundation" (Outdoor Industry Association, 2000) explored active lifestyles of people participating in outdoor activities. In relation to outdoor recreation and tourism, a study by MacKay et al. (2002) identified outdoor recreation, sightseeing, and cultural activities as niche markets. People in these niche markets participated in different activities during their vacations. In examining tourism and cohorts (i.e., people born in the same time period), Pennington-Gray et al. (2003) found that "different cohorts may be attracted to different activities at different times" of their lives. Another few studies also explored lifestyle activities oriented research, such as going to church, playing with children or grandchildren, drinking wine, visiting a theater, gardening, eating out (Morgan & Levy, 2002; Vyncke, 2002).

Combray (1987) found that more and more people are becoming involved in charity, volunteer work & social service activities. Social oriented people need credit to buy car for maintaining interaction with others of the society.

Kotler & Armstrong (2007) identified that observers have noted a shift from ‘me society to we’ society in which more people want to be with and serve others. More and more they want to get out of the house and be with others. This trend suggests a greater demand for social support products and services that improve direct communication between people, such as health club, vacation & games. It also suggests a growing market for social substitute things that allow people who are alone to feel that they are not, such as car, TV, vcp, computer etc. So they need credit to buy social support and social substitute products for doing their charity, volunteer & social service activities. They can communicate with others for using car.

Amling & Droms (1982) identified the association between consumer credit and peoples’ interest to solve the necessity of their personal or family needs. They are responsible for many of their occasions: birth, death, sickness and similar events, which demand a large immediate outlay. Very often credit is necessary to solve these emergency conditions. People need credit to buy car to get affiliation of family solidarity; family relaxant; conflict reduction and relationship maintenance (Lull, 1990).

Assael (1998) described that the focus on time savings convenience in the 1990s has created two trends in interests to food consumption: (i) Grazing- It is the need to eat on the run. People eat breakfast in the car on the way to work, munch on a sandwich
while walking, or eat lunch at their desks. (ii) Refueling refers to less time spent in preparing and eating dinner. The primary reflection of this trend is the growing importance of household goods (like car, microwave ovens, fridge, pressure cooker and blender) in people’s lives for preparing food and eats in the car. People need consumer credit to buy these products to satisfy their interests to food.

Beckman & Foster (1969) identified that consumer credit provides the desired article first and then encourage the buyer put aside a certain amount weekly and monthly in payment for it. People became economize in order to be able to meet installments when they become due. Amling & Droms (1982) opined that credit allows a consumer to purchase items requiring a major cash outlays and then pay for this items in small amounts over an extended period of time. Most people would be unable to purchase a new car, for example, if they had to pay the full cost in cash. By using credit, they can pay for the car from current income while they are using it. They also keep their savings intact. This example illustrates two additional advantages of credit: (i) Preservation of savings: Using credit as an alternative to withdrawing savings allows people to preserve the hard-earned savings dollars and still makes major purchase. (ii) A pay as you go system: The use of credit allows people to have the immediate use of an item and to pay for this item while they are using. Lewis (1996) argued that if low income families can not save, financial resources during emergencies will be insufficient. So they buy goods and services at first by consumer credit and pay later. They used this mechanism for savings.

People need credit to buy consumer goods to show their social status for expressing their lifestyle. In this regard, Eastman et al. (1997) opined that status is seen more through ownership of status products than through personal, occupational, or family reputation. Consumers demonstrate their social power by displaying their material wealth because wealth is the best indicator of power in modern society (Bell, 1998). The consumption of goods and services has an important role to play in processes of lifestyle formation since lifestyles are usually understood as the material expressions of people’s identities (Wilska, 2002).

Wang & Wallendorf (2005) explained that debt is not only related to people’s personalities and values, but is often influenced by others. For example, people may accumulate more debt in order to reduce obligations with someone who provides financial support. On the other hand, debt may change one’s perception of his/her position(s) in the network and propel him/her to function differently in the network. One’s strong ties are especially relevant to his/her debt situations. Kotler and Armostrong (2007) explained that people’s orientation to their society influences their consumption patterns, level of savings and attitudes toward the market place.

Beckman and Foster (1969) explained that the standard of one’s living is judged in large measures by the number and kinds of durables goods and costly articles in his possessions, as well as by his consumptions of items yielding cultural and aesthetic satisfaction. Installment credit may be an aid to raise the levels of one’s living in terms of these standards. Installments plan encourages culture to enjoy the better things in life. People need credit to buy car for maintaining their culture.

From the above discussion, it is clear that previous researchers found link between car loan and peoples’ lifestyle. But no research has been done to investigate the
relationship between car loan and lifestyle of consumers of Bangladesh. This article seeks to make a substantial contribution in this area. Thus, the article seeks to answer three important research questions (R.Q.).

R.Q.1: How does car loan help to improve the lifestyle activities?
R.Q.2: How does car loan help to satisfy the desired interests?
R.Q.3: How does car loan help to express the opinion?

3. Conceptual Frame Work for this Study

Based on the findings of the existed study, the major factors which may influence to borrow car loan to improve their lifestyle can be classified into lifestyle activities, interests and opinions. A conceptual model of car loan impacts on lifestyle of people has then been derived and presented in figure-1 (see appendix)

The model is a comprehensive one and should be capable of capturing the relevant factors underlying the problem. A number of variables have been included to measure car loan impact on the lifestyle of people of Bangladesh. The variables are involved under categories of lifestyle factors. These are lifestyle activities, interests and opinions

Each variable in these three major categories may have marginal effect on lifestyle by using car loan. Using statistical method, the probability of car loan impact on lifestyle can be found out by considering marginal effects of all variables. Variables in these three major categories and their specifications are discussed in the following sections.

Hypotheses (H) as formulated in this section along with the expected effect on the car loan impacts on lifestyle are summarized as follows:

H1. There is a strong association between car loan and lifestyle of people of Bangladesh.
As lifestyle includes activities, interests, opinions; therefore, for the purpose of the study, it can develop the following three sub-hypotheses.

H1a. There is a strong association between car loan and people’s activities.

H1b. There is a strong association between car loan and people’s interests.

H1c. There is a strong association between car loan and people’s opinions.

4. Methodology

The strategy adopted for this study is the personal interview survey. Considering the nature of the present study, a combination of structured and unstructured interview schedules was used in order to explore both quantitative and qualitative information.

6 sets of questionnaires were used to collect information. Dhaka—the capital city of Bangladesh was chosen as study area for this study. Addresses and phone numbers of borrowers (respondents) were collected from office file of the sample branches by the employees of the banks for interview. Sample size determination formula is used for identifying total number of samples.

Sample size determination method:

\[ N = \frac{p(1-p)z^2}{d^2} \times df \]

N = size of the sample

P = the proportion to be estimated = 0.5
Z = value of standard normal variate = 95% level of significance = 1.96
D = the amount of tolerated margin of error = 0.05
Deft = design effect = 1.5
Number of sample = \[
\frac{[0.5(1-0.5)(1.96)^2]}{(0.05)^2}\] * 1.5 = 576

576 borrowers were selected as sample for interviewing. At first target population is divided into mutually exclusive and collectively exhaustive subpopulation or cluster. That means 301 clusters (branch as cluster). Random sample of cluster (branch as cluster) is selected based on probability sampling technique. Here, 30 (branches as cluster) clusters are selected as sample by using probability proportionate to size sampling method from 301 branches. All borrowers in each selected branch (cluster) could not be included in the sample because of time and cost constraints. For this reason, probability proportionate to size sampling of two stage cluster sampling method is used for selecting number of borrowers from each branch. Each borrower is selected by using systematic manners of simple random sampling method.

Data were collected on relevant variables from primary and secondary sources. Primary sources included borrowers who bought car by car loan scheme from the banks. Secondary data have been collected from the published contents of the annual reports, relevant brochures, sales figures, and prior research reports of the listed banks internal sources and suppliers, different kinds of Journal.

5. Analysis Result

For the analyses, cases with incomplete profiles were deleted. Further, responses to individual items of "Refused" were recorded as missing data. The statistical program, SPSS for Windows (SPSS, 2004), was used for all analyses. For identifying car loan impacts on lifestyle, respondents in a survey were asked to indicate their degree of agreement with 16 statements/variables (appendix, table-7) using a 5-point likert scale (1 = strongly disagree, 5 = strongly agree). These data were analyzed via principal components analysis. The factor analysis using the principal components method with varimax rotation was run to determine the underlying benefits consumers seek of their lifestyle activities, interests, opinions from the use of car borrowed by consumer credit.

The correlation matrix, constructed from the data obtained to understand lifestyle activities is shown in appendix (table-1). There is a relatively high correlation among v1, v2, v3, v4, v5, v6, v7 variables. These variables are to be correlated with the same set of factors. Likewise, there is a relatively high correlation among v8, v9, v10, v11 variables. In the same way, there is a relatively high correlation among v12, v13, v14, v15, v16 variables. So above variables are correlated with each other. These variables may also be expected to correlate with the same factors.

Kaiser-Meyer-Olkin Measure of Sampling Adequacy (KMO) and Bartlett's Test of Sphericity statistics are applied to test the rating data for factor analysis (appendix, table-2). The approximate chi-square statistics is 1927.37 with 120 degrees of freedom, which is significant at the 0.05 level. Calculated value (1927.37) is greater than table value. So, this Bartlett's Test of Sphericity is highly significant. The value of the KMO statistics (0.845) is also large (> 0.5). So the data are suitable for factor
analysis. Thus, factor analysis is considered an appropriate technique for analyzing the correlation matrix of appendix (table-1).

Priori determination, approaches based on eigenvalues, scree plot and percentages of variance accounted are applied to identify the number of factors. Three factors are extracted from lifestyle activities variables by priori determination method.

Under “Communalities”, “initial column”, it can be seen that the communality for each variable, v1 to v16, is 1.0 as unities are inserted in the diagonal of the correlation matrix (appendix, table-3). Appendix (table-4) labeled “Initial Eigenvalues” gives the eigenvalues. The eigenvalue greater than 1.0 (default option) results in three factors being extracted (appendix, table-4). The scree plot associated with this analysis is given in appendix (appendix, figure-2). From the scree plot, a distinct break occurs at three factors (appendix, figure-2). Finally, from the cumulative percentage of variance account for, it is seen that the first three factors account for 66.87 percent of the variance, and that the gain achieved in going to three factors is marginal (appendix, table-4). Thus, three factors appear to be reasonable in this situation. So the three factors are extracted for determining the underlying dimension of lifestyle related to car loan.

The coefficients of the rotated factor (component) matrix are used to interpret the factors (appendix, table-5). In table-5, variables v1, v2, v3, v4, v5, v6, and v7 are correlated highly with factor 1 after rotation. Likewise, v8, v9, v10, v11 are correlated highly with factor 2 after rotation. The remaining variables v12, v13, v14, v15 and v16 get correlated highly with factor 3. The rotated factor matrix forms the basis for interpretation of the factors.

Interpretation is facilitated by identifying the variables that have large loadings on the same factor (appendix, table-5). That factor can then be interpreted in terms of the variables that load high on it. In the rotated factor matrix of appendix (table-5), factor 1 has high coefficients for variables v1 (Borrowed car loan to purchase car helps to go to office or working center), v2 (Borrowed car loan to purchase car helps to go to shopping mall or store for shopping), v3 (Borrowed car loan to purchase car helps to visit enjoyable place and feel comfort), v4 (Borrowed car loan to purchase car helps to go to auditorium, cinema hall or theater hall for enjoying programs like speeches, drama, dance, cinema, song etc.), v5 (Borrowed car loan to purchase car helps to go to stadium for enjoying football, cricket, tennis, athletics, wrestling, motorcycle racing, boat racing, bicycle racing etc.), v6 (Borrowed car loan to purchase car helps to carry out social roles), v7 (Borrowed car loan to purchase car helps to transmit value to others). Therefore, this factor may be labeled as activities factor. Borrowed consumer credit to purchase household goods (car, computer, sewing machine, washing machine, almira, khat, motor cycle etc.) helps people to do their work.

Likewise, there is a relatively high correlation among V8 (Borrowed car loan to purchase car helps to go to maintain community center for performing community activity), V9 (Borrowed car loan to purchase car helps to get affiliation of family solidarity, relaxation and relationship), V10 (Borrowed car loan to purchase car/motorcycle helps the family members to visit enjoyable places for recreation), V11 (Borrowed car loan to purchase car/motorcycle helps to exhibit family status). Thus
factor 2 may be labeled as interests’ factor. Borrowed consumer credit to purchase car helps people to satisfy their desired interests.

Similarly, v12 (Borrowed car loan to purchase car helps to go to school/ college/ university/ madrasa for learning), V13 (Borrowed car loan to purchase car helps to save time & money because of going anywhere in a short time), v14 (Borrowed car loan to purchase car/ motorcycle helps to communicate with others), V15 (Borrowed car loan to purchase car helps to differentiate the identity from others in the society), v16 (Borrowed car loan to purchase car helps to get possessions as reflection of the values). So, factor 3 may be labeled as opinions factor. Borrowed consumer credit to purchase car helps people to express their opinion.

In appendix (table-6), it is seen that only 29 residuals are larger than 0.05, indicating an acceptable model fit. From the above analysis, it is proved that there is a strong association between car loan & lifestyle of people of Bangladesh.

6. Findings

The findings of the article show that people mainly use car loan to buy car to do their activities, satisfy their desired interest and express their opinion. Factors loading of the variables and % of variance of the factors (appendix, table 7) proved the hypothesis that there is a strong association between car loan and lifestyle of people of Bangladesh. The following is a brief discussion of each factor in the order of its contribution to the total variance.

**Factor-1: Lifestyle activities.** The examination of car loan impacts on lifestyle activities reveals that all seven variables were significant (appendix, table 7). People borrow money to buy household goods to do their work. The car helps people to go to office, working center or shopping mall in a convenient time. They feel comfort, relax & easy to go to office by car which helps them to speed their work or services. Tension free, comfortable & easiest return to home is also possible by using car after doing work. It motivates people to perform their work effectively & efficiently.

Borrowed money to buy household goods helps people to do their entertainment activities. Car/motorcycle, for example, helps people to go to park, museum, zoo, Children Park, garden, big lakes, sea port & near the hill etc. to enjoy natural and modern picture or scenery. It is help to go to a function, a ceremony, a cinema hall or a theatre hall. It is also necessary to visit art galleries to see artistic picture of great artesian. It helps people to go to stadium or venue to enjoy football, cricket, tennis, athletics, wrestling, motorcycle racing, boat racing, and bicycle racing etc.

People in society are connected with activities in which people meet each other for pleasure. A car, for example, helps them to meet each other. People transmit their value to others by using car. A car is necessary for going to community center. From the discussion, it is clear that limited income people need car loan to buy household goods like (car, motorcycle etc.) for doing their activities.

**Factor-2: Lifestyle interests.** The findings of the study summarized in appendix (table 7) show that people use car loan to buy household goods for the interest of their family members’ relaxation, relationship, recreation and status. Factors loading
of variables and % of variance of the factors shown in appendix (table 7) prove the hypothesis that there is a strong association between car loan and people’s lifestyle interests. People need credit to buy car for satisfying their desired interests to get affiliation of family solidarity, relaxation and relationship. The car helps them to show their family status. The status is seen more through ownership of status products than through personal, occupational, or family reputation (Eastman et al., 1997). Borrowed money to buy car helped people to do recreation. People can attend any community activities very easily if they have a car. A car is a prestigious product with very much relation to maintain community. The people who are very much interested to visit enjoyable place for recreation, they need a car. Some people want outdoor recreation. They want to go to park, museum, zoo, restaurant, lake and other enjoyable places. From the discussion, it is clear that consumer credits have great impact on lifestyle interests’ factors. People need credit to buy car mainly for satisfying their lifestyle interests.

**Factor-3: Lifestyle opinions.** Factors loading of the variables and % of variance of the factors given in appendix (table 7) proved the hypothesis that there is a strong association between car loan and people’s lifestyle opinions. People borrow money for buying car to express their view. They need credit to buy car to build blocks of their lifestyle. They often choose products, services, and activities over others because they are associated with a certain lifestyle. They borrow money to buy car to express their view of themselves. The car helps them to find reinforcement for their personal values (achievement and success, activity and involvement, efficiency and practicality, progress, material comfort, individualism, freedom, humanitarianism, youthfulness, and fitness and health).

People need car loan to buy car to save time and money. In economics’ sense, one’s lifestyle represent the way one has elected to allocate income, both in terms of relative allocation to different products and services, and to specific alternative within this categories (Zablocki & Kanter,1976). The car helps people to go any places in a short time.

People need credit to buy car to communicate with others. A car is more than a symbol of solvency of prestige. Having a car means not depending on the kindness of others where people and their family need to go. People opinion is made up from behavior and value of the society where they live. Possessions focus the value of the customer. People try to occupy possessions (like car) for differentiating them from other in the society. The possession helps them to maintain relationships, network ties and organizational affiliations.

People borrow money to buy car to express their view of education. A car helps them to go to school/ college/ university/ madrasa etc. People borrow money to buy car to state their view of culture. Limited income middle class people require money for buying car for getting intrinsic cultural and aesthetics enjoyment. People can go auditorium by car for enjoying cultural function like drama, dance, and song etc. From the above discussion; it can be concluded that there is a strong association between car loan & people’s opinion.
7. Implication and Conclusion of the Study

This article establishes the relevance of car loan influence on consumer lifestyle. This implies that managers of banks are likely to benefit considerably in targeting and positioning their media communication by focusing their attention on the ongoing changes in lifestyle of their consumers by using car borrowed by car loan.

People borrow money to buy product to increase their lifestyle activities, satisfy their desired interest and express their opinion. Lifestyle is expressed by activities, interests and opinion. The car is very much helpful to increase the flow of work performance. It is also necessary for satisfying their family members’ interest to recreation, relaxation, relationship, status, value, and expressing the opinion to education, economy, society and the value. These are justified by factor analysis of this study. The managers of banks have opportunity to focus attention on the segment of the consumers who are interested to increase their lifestyle by borrowing money.

From the analysis of this article; it is proved that there is a strong relationship between car loan and people’s lifestyle. So people borrow money to purchase car for doing their lifestyle activities, satisfy their desired interests and express their opinion. In a consumption environment, a person chooses a product or brand, which seems to possess a maximum possibility of the definition or elaboration of his lifestyle. This article will help managers to understand the individual’s car loan consumption behavior by analyzing the details of his lifestyle system, which will help them to take marketing strategy to expand the car loan scheme. They can make different strategy for improving the car loan scheme so that it can be ensured the upgrading of the lifestyle of people. Consequently, this thesis shows that there is a causal effect of the individual’s lifestyle on his car loan consumption behavior. This article will help manager to make different strategy for overcoming the limitation of existing car loan scheme in different banks of Bangladesh. This article will help manager to make different strategy for improving the car loan scheme so that it can be ensured the upgrading of the lifestyle.

Affective Commitment: An Outcome of Organizational Climate  
(An Empirical Evidence)

Mohammad Irshad Khan Mohmand,  
PhD Scholar, Management Sciences,  
Qurtaba University of Science and Information Technology

Abstract  
This study was conducted to investigate the impact of organizational climate on affective commitment. Data was collected from 337 teachers of private sector colleges of KPK through time tested questionnaires which were adapted from different papers published in international journal. Data was operated by using SPSS (15 edition). Correlation showed a significant positive relationship between independent variables which are consideration, intimacy, disengagement, production emphasis, role conflict, role ambiguity, distributive justice, procedural justice, recognition and autonomy and dependent variable which is affective commitment. Regression also proved that 59 % of the variance is due to independent variables discussed above.  
Keywords: Affective Commitment; Outcome ; Organizational Climate; Empirical Evidence

Introduction  
Private sector colleges play a vital role in the dissemination of education to hundreds of thousands of students. No country can stand on its feet without education. Quality of education is dependent upon the commitment of employees. If employees show low level of commitment, what will happen? Affective commitment, if low, culminates in a decreased desire to contribute to the organization, a decrease in organizational citizenship behavior, decreased motivation and an increase in absenteeism and turnover (Meyer & Allen, 1991; Mathieu & Zajac, 1990; Tett & Meyer, 1993).

Objectives  
To investigate the impact of consideration, intimacy, disengagement, production emphasis, role conflict, role ambiguity, distributive justice, procedural justice, recognition and autonomy on affective commitment.

Hypotheses  
H1: consideration affects affective commitment  
H2: intimacy affects affective commitment  
H3: disengagement affects affective commitment  
H4: production emphasis affects affective commitment  
H5: role ambiguity affects affective commitment  
H6: role conflict affects affective commitment  
H7: autonomy affects affective commitment  
H8: recognition affects affective commitment  
H9: distributive justice affects affective commitment  
H10: procedural justice affects affective commitment
Methodology

Data Collection

Data was collected through time tested questionnaires. Questionnaires along with covering letters that shed light on the objective of the study were administered to private sector schools’ teachers. Each questionnaire was accompanied with a return envelop duly stamped and having address of the researcher written on them. The participants were requested to mail back the completed questionnaires through that envelop. It took almost three (3) months to distribute and 5 months to get back the completed questionnaires.

Seven hundreds (700) questionnaires were distributed to private sector schools’ teachers. Within five (5) months duration three hundreds and eighty one (381) questionnaires returned that showed a return rate of 54.42%. Forty four (44) questionnaires were disposed of because they contained incomplete information and the remaining 337 questionnaires were coded for research purpose.

Measurement

Consideration, intimacy, disengagement and production emphasis were measured through questionnaire adapted from Borrevik (1972). Five point likert scale (from “Event Almost Never Occurs” to “Event Almost Always Occurs”) was used to measure Consideration, intimacy, disengagement and production emphasis. Role Ambiguity and role conflict were measured through questionnaire adapted from Rizzo, House, and Lirtzman (1970). Seven point likert scale (from “Very False” to “Very True”) was used to measure the Role Ambiguity and role conflict. Distributive Justice and procedural justice were measured through questionnaire adapted from Price and Mueller (1986). 7- point likert scale (from “Strongly Disagree” to “Strongly Agree”) was used to measure Distributive Justice and procedural justice. Affective Commitment was measured with the following 8 items adapted from Meyer and Allen (1997). 7- point likert scale (from “Strongly Disagree” to “Strongly Agree”) was used to measure Affective Commitment. Recognition and Autonomy was measured through items adapted from Minnesota Satisfaction Questionnaire. 5- point likert scale (from “Strongly Disagree” to “Strongly Agree”) was used to measure the level of Recognition.

Findings

Table 1 Correlation between Consideration and Affective Commitment

<table>
<thead>
<tr>
<th>Affective Commitment</th>
<th>Consideration</th>
</tr>
</thead>
<tbody>
<tr>
<td>Pearson Correlation</td>
<td>.692(***)</td>
</tr>
<tr>
<td>Sig. (2-tailed)</td>

</tr>
<tr>
<td>N</td>
<td>337</td>
</tr>
</tbody>
</table>

Table 1 indicates that there is a significant correlation between consideration and affective commitment (r=0.692, p<.01). Therefore H1 that states that consideration affects affective commitment was accepted in the present study.
Table 2 Correlation between Intimacy and Affective Commitment

<table>
<thead>
<tr>
<th>Affective Commitment</th>
<th>Intimacy</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Pearson Correlation</td>
</tr>
<tr>
<td></td>
<td>Sig. (2-tailed)</td>
</tr>
<tr>
<td></td>
<td>N</td>
</tr>
</tbody>
</table>

Table 2 indicates that there is a significant correlation between intimacy and affective commitment ($r=0.609$, $p<.01$). Therefore H2 that states that intimacy affects affective commitment was accepted in the present study.

Table 3 Correlation between Disengagement and Affective Commitment

<table>
<thead>
<tr>
<th>Affective Commitment</th>
<th>Disengagement</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Pearson Correlation</td>
</tr>
<tr>
<td></td>
<td>Sig. (2-tailed)</td>
</tr>
<tr>
<td></td>
<td>N</td>
</tr>
</tbody>
</table>

Table 3 indicates that there is a significant correlation between disengagement and affective commitment ($r=0.743$, $p<.01$). Therefore H3 that states that disengagement affects affective commitment was accepted in the present study.

Table 4 Correlation between Production Emphasis and Affective Commitment

<table>
<thead>
<tr>
<th>Affective Commitment</th>
<th>Production Emphasis</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Pearson Correlation</td>
</tr>
<tr>
<td></td>
<td>Sig. (2-tailed)</td>
</tr>
<tr>
<td></td>
<td>N</td>
</tr>
</tbody>
</table>

Table 4 indicates that there is a significant correlation between production emphasis and affective commitment ($r=0.726$, $p<.01$). Therefore H4 that states that production emphasis affects affective commitment was accepted in the present study.
Table 5 Correlation between Role Ambiguity and Affective Commitment

<table>
<thead>
<tr>
<th>Affective Commitment</th>
<th>Role Ambiguity</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Pearson Correlation</td>
</tr>
<tr>
<td></td>
<td>Sig. (2-tailed)</td>
</tr>
<tr>
<td></td>
<td>N</td>
</tr>
</tbody>
</table>

Table 5 indicates that there is a significant correlation between role ambiguity and affective commitment ($r=-0.397, p<.01$). Therefore H5 that states that role ambiguity affects affective commitment was accepted in the present study.

Table 6 Correlation between Role Conflict and Affective Commitment

<table>
<thead>
<tr>
<th>Affective Commitment</th>
<th>Role Conflict</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Pearson Correlation</td>
</tr>
<tr>
<td></td>
<td>Sig. (2-tailed)</td>
</tr>
<tr>
<td></td>
<td>N</td>
</tr>
</tbody>
</table>

Table 6 indicates that there is a significant correlation between role conflict and affective commitment ($r=-0.492, p<.01$). Therefore H6 that states that role conflict affects affective commitment was accepted in the present study.

Table 7 Correlation between Autonomy and Affective Commitment

<table>
<thead>
<tr>
<th>Affective Commitment</th>
<th>Autonomy</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Pearson Correlation</td>
</tr>
<tr>
<td></td>
<td>Sig. (2-tailed)</td>
</tr>
<tr>
<td></td>
<td>N</td>
</tr>
</tbody>
</table>

Table 7 indicates that there is a significant correlation between autonomy and affective commitment ($r=0.609, p<.01$). Therefore H7 that states that autonomy affects affective commitment was accepted in the present study.
Table 8 Correlation between Recognition and Affective Commitment

<table>
<thead>

Table 12 shows the value of coefficient of determination (R Square) which is .594. It means that 59% of the variance in affective commitment can be accounted for by the independent variables which are procedural justice, Role Ambiguity, distributive justice, Intimacy, autonomy, role conflict, recognition, consideration, disengagement and production emphasis as mentioned in table 14. Table 13 indicates the value of F which is 47.745 and it is significant at .000 level. So the model is significant.

a Dependent Variable: Affective Commitment
Conclusion

This study was conducted to investigate the impact of organizational climate on affective commitment. Data was collected from 337 teachers of private sector colleges of KPK through time tested questionnaires which were adapted from different papers published in international journal. Data was operated by using SPSS (15 edition). Correlation showed a significant positive relationship between independent variables which are consideration, intimacy, disengagement, production emphasis, role conflict, role ambiguity, distributive justice, procedural justice, recognition and autonomy and dependent variable which is affective commitment. Regression also proved that 59 % of the variance is due to independent variables discussed above.

Abstract:
Individual investment decision is influenced by a variety of influencers. Current study examines the impact of corporate social disclosure (CSD) on the actual individual investor’s investment decision to understand the societal and cultural differences in developed and less developed countries for social disclosure policies, practices, and individual investment perceptions. An experimental study made for investigating this relationship by taking actual investors as our population. Results are slightly different from the prior literature as negative influence of CSD is evidenced on short run investment decision but it is observed that long run individual investment decisions are positively influenced by CSD.

Key Words: Investment Behavior, Corporate social Disclosure, Stakeholder theory, Pakistan

Introduction
Performance of business firms is widely affected by their strategies, operations in the market and non-market environment, and due to their planning (Barons, 2000). A main construct that might capture a large portion of non-market policies and set of strategies is corporate social disclosure (CSD). CSD can be elaborated as a business organization’s disclosure of patterns and design of principals based on social responsibility, processes, policies, programs, and the observable outcomes, as their relation to the firm’s societal associations (Wood, 1991). The enhanced influence and power of activist groups and the role of media in adding western societies are expected to tend organization towards non-market strategies and policies in a significant and important manner, but this exposure and impact of social responsibility is not significantly witnessed in eastern societies such as Pakistan.

Current study examines the impact of corporate social disclosure (CSD) on the actual individual investor’s investment decision. Reason for selecting this area is two recent studies that have been conducted in the area of CSD. First one is an experimental study (sample size: business graduate students that serve as surrogates) made by Smith, Adhikari, Tondkar, and
Andrews, (2010) which indicates positive influence of CSD on individual investment decision in developed western and Asian countries of U.S., Japan, France, and Sweden. Second study made in Pakistan on the influence of CSR (Corporate Social Responsibility) on consumer purchase intentions in cellular industry shown that CSR having insignificant influence on consumer purchase intentions (Ali, Rehman, Yilmaz, Nazir, and Ali, 2010). This bring the question that in developed countries like U.S., France, the impact of CSD and CSR is influential as mentioned by Smith et al. (2010), but it is not that much in less developed countries as Pakistan (Ali et al., 2010). Current study examine this influence of CSD in individual investment decision in Pakistan to understand the societal and cultural differences in developed and less developed countries for social disclosure policies, practices, and individual investment perceptions.

This study contributes to the literature in worthy dimensions as it bridges the gap between literature recently indicated by Smith et al. (2010), as previous studies were conducted on business graduate students which serve as surrogates or proxy for actual individual investor, instead we take actual individual investor of stock markets of Pakistan as our target population to align and analyze more accurate results that could give a more comprehensive understanding of influence of CSD on individual investor decision. Secondly we take corporate social responsibility as moderating variable that will influence investment decision; it will help understanding an influential impact and relationship of CSD towards investment criteria of individuals as cultural differences in eastern and western countries differentiate.

Stakeholder theory is used as a base framework for our analysis, as it is tested in prior researches by (Smith et al., 2010). Experimental studies show that CSD impacts investment decisions (Belkaoui, 1980; Chan and Milne, 1999). We adopted a stakeholder scale to measure potential investor’s beliefs about the extent to which they value corporate social responsibility from (Smith et al., 2010). Total 113 respondents are taken as sample, which are actual individual investors in two different stock markets of Pakistan (Lahore, and Islamabad stock exchange).

Section 2 discusses the theoretical framework and background literature review and literature justification of hypothesis for exploring this relationship between corporate social responsibility, stakeholder view, investor beliefs, and investment decision. Section 3 explains the sample population, data collection procedures and analysis tools. Results are elaborated and presented along with discussion in section 4. Conclusion, limitations, and suggestions for future research are summed up in section 5.

**Literature Review**

Stakeholder’s theory seeks to recognize that what stakeholder group earns the main attention of managers. The foundation that constructs this study is the extent to which a corporation is responsive towards the societal norms and values that shape the individual beliefs and perceptions about the image of the corporation. The stakeholder beliefs influence the reporting practices of a firm or corporation such as CSD, and the individual investor behavior on his investing decision.

High corporate social disclosure heights a company’s competitive advantage as of their weighing and concentration of claims of different constituent in a social, fair, and rational responsible manner (Jones, 1995). CSD often represent an area of comparatively high managerial and stakeholder prudence, the instigation or annulment of intended social and environmental policies may influence on the availability of funds (McGuire, et. al., 1988). Prior studies explored the relationship between economic performance and financial performance and analytical forecast (Al-Tuwajjri et al., 2004; Aerts et al., 2007). Finding of these researchers indicates that CSD is desirable and esteemed by the investors. Experimental studies openly investigate the influence of CSD on the investment beliefs and perceptions of individual
investors (Hendricks, 1976). Other evidences of experimental studies also shows positive influence of corporate social disclosure on the invest behaviors of individual investors (Belkaoui, 1980; Chan and Milne, 1999). Corporate social disclosure is a main source of measuring the corporate social performance and its affections with the corporate financial performance and investment decisions (Orlitzky, Schmidt, and Rynes, 2003).

Firms having an increased level of CSP may utilize corporate social responsibility and disclosures as one of the informational indication upon which stakeholders (suppliers, banks, and potential investors) can make foundation of their appraisal of corporate standing under the situation of incomplete information (Charles, and Shanley, 1990). According to the prior researches, a firm’s communication with outside parties regarding its level of CSP can help in making a positive picture to its customers, potential investors, bankers, and vendors (Charles, and Shanley, 1990). This positive relation is also affirmed by various researchers stating that organizations with higher CSP and CSD status ratings may improve their relationships with banking sector and individual as well as institutional investors and thus ease their access to potential capitals (Barry, 1978).

It is evident from prior researches that two directional studies have been made in CSR and CSD. One is the market response studies or capital market exploration, where the reactions and responses of investors are considered by estimating stock market variables such as price and risk relative to CSP and CSD (e.g. Ullmann, 1985; Mathews, 1996). Such studies concentrated towards assessing the responses of market towards disclosure of social responsibility and disclosure measured through share prices, level of investments, and risk association. Some of the studies reported a positive association of CSR and CSD on risk, investment, and stock price, which educe a favorable market reaction (Anderson and Frankle, 1980; Belkaoui, 1976; Preston, 1978). On the other hand there are studies which reports that no market reaction is associated with such type of CSD and CSR (Freedman and Jaggi, 1982) or even negative market and investor reactions are found also (Ingram and Frazier, 1983).

The second type of research pattern which has been used to study investor perceptions and reaction to social disclosure is survey based. It focuses on the actual individual investors who in reality invest in the stocks depending upon the information available to him. However few researches have applied this methodology for determining such relationship.

After extensive review of literature, following hypothesis are developed:

**H1.** Stakeholder’s beliefs will have a positive influence on the individuals’ investment decision.

**H2.** Positive CSD (Corporate Social Disclosure) will positively influence the individual stock investment decisions.

**H3.** The impact of CSD on individual investment decision will be positively related to their scores on the stakeholder scale.
Methodology

Experimental study design

We have chosen the experimental study design to investigate the influence of CSD in investment decision as experimental studies are deemed to be more suited to indicate and interpret the actual results as compared to attitudinal study (Rikhardsson, Holm, 2008). The current experimental study design consists of two groups of actual investors who actively participate in two main stock exchanges of Pakistan. The cause / effect relationship of variables is explained in Fig. 1. As Fig. 1 shows that stakeholder’s beliefs and independent variable influence the individual investment decision that is dependent variable. The effect of individual decision regarding the investment is operationalized as the change in investment decision of individual after introducing CSD.

Participants

The population size of the study consisted of 113 individual investors taken from two cities of Pakistan (Lahore and Islamabad) who regularly participate in the stock market in short term and long term investments. This target population makes the study more powerful as actual investors will strengthen the results in a more accurate manner as compared to the previous studies, which use business graduate students as sample size that serve as surrogates to actual investors. Out of 113 respondents 17 questioners are eliminated from the study as they were not properly filled up and three of the respondents quit the experiment in the middle, so actual complete responses of 93 are included for interpretation of results. Beliefs of the stakeholders are measured through a stakeholder scale taken from the experimental study made by (Smith, et al.,
Other factors i.e. category of CSD (corporate social disclosure), sex, age, educational qualification, and experience and knowledge identified in previous research as having influence on investment judgment serve as moderating variables.

**The experiment**
The experimental study was divided into three sections. In first section contains financial information regarding net income, dividend per share, cash dividend, and earning per share on two companies: X and Y for the last five years is provided. All financial information is similar except company X’s net income and earning per share is more than company Y’s information for 4-7% per year almost. Then individual investors are asked to allocate Rs.200,000/- in above two firms on the basis of given financial information.

In section two CSD is introduced in terms of labor laws, practices, and policies followed by both firms. Where firm Y is more friendly and coherent as compared to firm X. After introduction of CSD investors are asked to now again allocate Rs.200,000/- in both firms considering the financial and CSD aspects.

Third section consists of demographic details such as, age, gender, marital status, and experience, and six perceptual questions. The results of these questions form the stakeholder scale.

**Results**
Descriptive statistics of respondents, Age, gender, working experience, and education is represented in table 1, which describes the frequency distribution of the respondents. Results show that as compared to western stock markets, eastern stock markets are mainly operated by male individual investors.

### Discussion

Descriptive statistics on investment change by the individual investor indicates a positive change in investment is related to the exposure of CSD and a negative change represents negative effect of CSD on investment. The mean values of investment in long term shows a small positive change in the individual investor’s decision to invest in the long term decision after disclosure of CSD, as mean before investment indicates 12.45 as compared to the mean taken after the disclosure of CSD which is 13.03. There is a negative influence of CSD on short term investment decision as mean before CSD exposure is 13.93 which comes to 13.69 after the exposure of CSD.

These results are common as compared to stockholders score card which comprises of scale attached in appendix A which shows in table 2. The mean of stakeholder score card is approximately 3 which shows as equal response near to neutral that is consistent with the investment decision of exposed CSD there is a slight increase in long term investment but it is also off-settled by short term investment which slightly decreases after the exposure of CSD.
Though it is observed as CSD influence the investor decision making positively this is consistent with the prior studies of Smith et al. (2010), but relatively this study do not indicate a strong positive influence of CSD as indicated before. This is also supported by the prior studies of CSD and CSR which state that there is not significant impact of CSR and CSD on customer and individual investor. Studies made in countries like Pakistan also indicated such insignificant relationship and impact such as Ali, et al. (2010). This low level of CSD influence might be due to the difference in developed and less developed countries as prior studies made regarding the influence of CSD on individual investor are made mostly in developed countries but Pakistan is a less developed country and this low significance of corporate social responsibility is also noticed by the recent researches made by Ali, et al. 2010.

Conclusion

The current study examines the impact of CSD on individual investment behavior. Results shows that null hypothesis 1 is accepted as individual investor belief positively effect the individual investment decision as discussed in the results there is a slight positive increase in long term investment decision though there is slight decrease in short term investment decision. But overall change in investment decision indicates a positive influence of CSD on individual investment decision, as the mean indicates overall influence of CSD as positively, so we accept the Null hypothesis. These results also lead to accept the null hypothesis 2 that positive CSD will influence positively the investment decision. This also supports the 3rd null hypothesis that impact of CSD is positively related to stakeholder scale.

Limitations and future research

Though this study indicates a number of practical implications that are important for corporate governance and social disclosure policy making and monitoring, but it still have some limitations. First of all this study covers only Pakistan, that can be further extend to cross national study in less developed countries like Nepal, Srilanka, and Bangladesh. Further current study sample consisted of 93 respondents which should be increased further. Third investment behavior after exposure of CSD should be measured in various sectors on stock market.

Abstract
Using GMM technique, this paper investigates to what extent gender inequality in education affects economic growth. The results suggest that the gender inequality in education has a direct impact on economic growth because it lowers the average quality of human capital. Indirectly, this inequality lowers the productivity of physical capital, lowers availability of skilled labour force and increases growth rate of population. The analysis suggests that low investment in female’s human capital is not an efficient economic choice for a developing country like Pakistan.

Keywords: Female employed working age population; Generalized method of moment (GMM), economic growth

Introduction
Education plays an important role in human capital development which is a key to scientific and technological advancement. Education is also regarded as a sustainable route to economic prosperity, it combats unemployment, confirms sound foundation of social equity, awareness and cultural vitality. It raises the productivity and efficiency of individuals and produces skilled manpower capable for leading the economy towards the path of economic development. If there is a single indicator of a government’s commitment to social justice and economic development, it is its allocation of budgetary resources for education. Often governments are very quick to put policies and laws in place that promote education, but they seldom match this with the necessary budgetary allocations that actually translate the policies into transformation of people’s lives. That is why UNESCO (1992) has emphasized that investment in education should be 4 percent of Gross Domestic Product (GDP) of the country. However, during the last sixty years, education expenditure in Pakistan remained closed to only 2 percent of GDP. Further, although gender distribution of population is almost even in Pakistan (Pakistan Economic survey, 2006-07) yet there is a noticeable gender difference in acquisition of education. For example, the literacy rate for males is 65 percent in 2006 compared to 42 percent for females which is 23 percent higher than females. However, the encouraging is the fact that female literacy rate is improving over the years. During the last five years, male literacy rate improved from 58 percent to 65 percent while the female literacy rate improved from 32 percent to 42 percent.

Studies have shown that gender inequality in education has significant impact on economic growth and it appears to be an important factor in poor performance of human development in Pakistan (Shahnaz & Siddiqui, 2001). Gender inequality may also have adverse impacts on number of valuable development goals. For example, gender inequality in education may prevent a reduction of child mortality, of fertility, and an expansion of education of the next generation (Klasen, 1999).

Literature review
Before focusing on the benefits and obstacles of female education, we want to know the reason why parents tend to invest less in their girls’ education. Gertler and Alderman (1989) point out that there are three reasons why parents might invest more in the education and health of boys
than of girls. First, it may be that the return from girls' schooling may be lower than that for boys. This may be due to the fact that the labor of males and females are imperfect substitutes in some activities. Another possible reason is that even if the social returns to educating boys and girls are the same, parents expect more direct benefits from investing in sons’ education, as they provide food and shelter in their old age, while daughters tend to leave and become part of a different household economic unit. In this case, the wedge between private and social returns generates a market failure and the private decision to invest in girls' schooling is likely to be suboptimal. Third, parents may simply have a preference for educating boys over girls due to lack of job opportunity for girls or market failure.

In a developing country like Pakistan, female education can have direct as well as indirect effects on female labour force participation rates that could potentially promote economic development. Direct effects result from greater marketability of skills acquired through education. Indirect effects could arise due to declining fertility rates, which increase the women time to spend in the labour force. The studies have shown that female education also reduces corruption [Dollar, and Gatti (1999); Glick and Sahn (2000)] prevents diminishing return to capital [Barro and Sala-e-Martin; 1995] hence, average per capita income increases if the wage and productivity remain the same (Largelof; 1999).

However, if women find it harder to join formal sector, the labour cost would increase which could reduce the international competitiveness of the country (Largelof; 1999). The evidence [Khan (1985) and Schult (1993)] have shown that in developing countries, the rates of return on female education are higher than the returns on male education. A handful of literature has identified that many factors play important role in female education. The most important of these are: Parents’ own education [Irfan (1985)], household income (NIPS; 1992), single-sex school, cultural mores, household work, area of residence, distance to school, availability of better infrastructure, birth order of a girl in the children, household head (either male or female), availability of water and gas, family size, presence of children under five in a household (King et al, 1986). In addition, some studies have point out other factors like number of adult earners in the household and son preference (Dahl and Moretti, 2004; Sathar, 1993), indirect taxes (Malik and Sazib, 1985 & 1989), average per capita income (NIPS, 1992), labour market imperfections or less job opportunities for females, dowry and early marriages (Khan-Sirageldin, 1979), presence of private schools especially in the rural areas, urban rural wage differential (Khan, Siddiqui and Hussain, 1986), government spending policy (Khan at el, 1986), household resources [Burney and Irfan (1991), FBS (1998), Khan (1993), Sathar and Lloyd (1993)].

The above discussion and literature indicate that the gender differential in education has negative impact on economic growth. Using Generalized Methods of Moment Technique (GMM), this paper attempts to highlight the direct as well as indirect impacts of gender differential in education on economic growth in Pakistan.

Data and Econometric model

Following previous literature (for example Klasen, 1999) we construct a four equations simultaneous model after satisfying the order and rank conditions. The structural model is given below:

\[ GGDP = \alpha_0 + \alpha_1 GGDP + \alpha_2 POP + \alpha_3 GLF + \alpha_4 GFMH + \alpha_5 GIM + \epsilon_i \]  
\[ GK = \beta_0 + \beta_1 GGDP + \beta_2 POP + \beta_3 GLF + \beta_4 GFMH + \beta_5 GIM + \epsilon_i \]  
\[ GPOP = \gamma_0 + \gamma_1 GGDP + \gamma_2 POP + \gamma_3 GLF + \gamma_4 GFMH + \gamma_5 GIM + \epsilon_i \]  
\[ GLF = \delta_0 + \delta_1 GGDP + \delta_2 POP + \delta_3 GLF + \delta_4 GFMH + \delta_5 GEX + \epsilon_i \]

Where GGDP, growth in GDP; Gk, growth in capital stock as a proxy for physical capital stock; GPOP, growth in population; GLF, growth in labour force; GIM, growth in import; GEX,
growth in export; GFE-WAP, growth in female employed-working age population; GPRI, growth in primary enrolment level; GFMPRI, growth in female–male primary enrolment; GM, growth in middle enrolment; GFMM, growth in female-male middle enrolment; GHI, growth in high school enrolment; GFMHI, growth in female-male high school enrolment; GPC, growth in professional college enrolment; GFMPC, growth in female-male professional college enrolment; GAASC, growth in arts and science college enrolment; GFMAASC, growth in female-male arts and science college enrolment; GSVI, growth in secondary vocational institutions enrolment; GFMSVI, growth in female-male secondary vocational institutions enrolment; GUNI, growth in university enrolment; GFMUNI, growth in female-male university enrolment.

The data on import, export, population, Gross Domestic Product, Gross Fixed Capital Formation (Proxy for Investment) and enrolment at seven level of education was taken from Pakistan Economic Survey while the data on Civilian Labour Force was taken from labour force survey. The data on female employed-working age population was constructed manually. First we checked the stationarity of a series by correlogram and Augmented Dickey Fuller (ADF) test. All the variables were in growth form and stationary at level either at lag 0 or 1. GDP, import and export data were at constant prices of base 1980-81=100. We used two types of variables for education: the first variable would capture the impact of total enrolment (at various levels of education) and the second variable female-male enrolment (at various levels of education) capture the gender bias in education on all the four dependent variables.

Result of the model at Different levels of Education

The estimated results of total education and the gender biasness in education on the growth in GDP, growth in capital stock, growth in population and growth in labour force which are presented below. We estimated our model seven times for the seven levels of education.

</tbody>
</table>
In regression 1 the dependent variable is growth in GDP. Only growth in female-male Arts and Science enrolment has a positive impact on economic growth, which highlights the importance of science and Arts education in the economic growth of the country. It also shows that if the gender differential in education is reduced, it may significantly increase economic growth. GFMM, GHI, GFMPC and GFMSVI all have a negative impact on the economic growth. The negative sign shows that the quality of education, expenditure on education and syllabus of education do not meet the modern requirements and skills needed by jobs (khan, et al. 2009). The ratio of female–male enrolment is increasing slowly over time but a wide gender gap in enrolments still exists at all levels. The above analysis shows that if male-female ratio is improved in education, expenditure on education is increased, and the curriculum is revised to meets the job requirement, the impact of each educational level can be positive and significant.

In regression 2, the dependent variable is growth in capital stock. GFMPC, GSVI, GFMSVI and GFMUINI have a complementary impact on the physical capital formation. Growth in primary, middle and high enrolments has not a complementary impact on physical capital formation. This may be due to the miss-match between education attainment and practical job requirement. The result shows that university and industry linkages can play important role in making education more productive and practical and improved female-male ratio may increase the efficiency of capital stock. For this purpose, government should create favorable environment in the country that increases education industry linkages. This will significantly improve human capital standard in the country and ultimately increase the physical capital formation and economic growth.

In regression 3, the dependent variable is growth in population. Most of the education levels have negative impact on the growth in population. The results are analogous to prior expectation and literature. The growth in female-male in primary, female-male in middle, high and secondary vocational enrolment has a negative and significant impact on population growth.
while the other educational levels also have a negative but insignificant impact on population growth. The possible reason for this insignificant impact may be due to cultural problems in Pakistan. For example, most of the families are male-headed, and therefore, the decision on the number of children more likely depends on male education. The results also show that the increase in ratio of female labour force participation leads to decrease population growth. It shows that the opportunity cost of female time increases due to labour force participation. Hence, labour market barriers such as more job opportunities for female and flexible working hours may be helpful in reducing the growth of population.

In regression 4, the dependent variable is growth in labour force. The result indicates that growth in primary, female-male in primary, middle, and female-male in middle and university enrolments has a positive impact on labour force growth. The result shows that education leads to more demand for labour increases. However, the growth in female-male in Arts and Science and secondary education has a negative impact on growth of labour force. The negative impact may probably due to labour market imperfections, less job opportunities for females due to gender biasness, cultural barriers and possibly due to less skills level of female (khan, et al. 2009). The above analysis indicates that to improve gender inequality is the only right and expeditious way to attain sustainable economic growth.

Conclusion

Economists are always interested to know what factors are responsible for rapid economic growth. In earlier production functions, physical capital and labour force were the two important factors of production. Later on technology was also introduced. But, in spite of having the same technology, some countries grew rapidly because they invested more to improve the skill of their people through training and education. In return due to adaptation of new technology, they grew much faster than others (Qaisar Abbas, 2001). Therefore, education came out to be the most important factor of economic growth. In this paper, we were not only concerned with the direct impact of education but also with the indirect impact through growth in physical capital input, growth in population and growth in labour force on economic growth in Pakistan. We estimated a simultaneous equations model to differentiate the direct and indirect impact of education and the gender bias in education. Our results confirmed that gender bias in education retards economic growth. We summarized here the impact of two variables such as growth in total education and the growth in gender biasness in education on the growth in GDP, growth in capital stock, growth in population and growth in labour force. The result shows that growth in enrolment has a positive contribution in economic growth. Growth in Professional, female-male in Professional, Secondary Vocational, female-male in Secondary Vocational, University and female-male in University enrolment are necessary to physical capital formation. Further, education significantly reduces population growth. The education, particularly of females has strong impact on labour force participation. The negative sign shows that the quality of education, expenditure on education and syllabus of education do not meet the modern requirements. The ratio of female –male is increasing over time but still there is a wide gap between the enrolments at all levels. Therefore, if gender differential in education at all level is reduced, the economy can move toward convergence and will achieve a high sustain growth and living standard. Concerted efforts are required to improve the skills levels of men and women without discrimination. The improvement of gender inequality is the only right and expeditious way to attain sustainable economic growth.

Policy Implication

A brief literature and the analysis of the study show that in Pakistan education was not given much importance in the past. Not only the government’s education budget remained inadequate
but its utilization also remained questionable and discriminatory. At all levels of education, gender differential is very high. Gender inequality in education is responsible for low level of economic growth, high population growth and wastage of human capital. To improve gender equality in education, following policy implications are recommended:

- The annual budget allocation for education in Pakistan is very low. Given the importance of education, particularly education of females as discussed in the study, it is necessary to give higher priority to this sector in public fund allocation.

- The ratio of female-male enrolment will only be improved if the government reduces direct as well as indirect costs of education for women. Incentives for female education, provision of female teachers in schools, transportation facility are all desirable and can have positive impact on female educational attainment in Pakistan.

- Human capital embodied labour effects positively and significantly to economic growth. The policy option may be to encourage investments in training programmes for labour and technical education. The university-industry linkage should also be promoted.

The Impact of Quality of Services
Provided by Peugeot Company on Customer Satisfaction

Dr. Marwan M. Shammot
King Saud University, Riyadh Community College, Faculty of Administrative Science,
P.O.Box 28095, Kingdom of Saudi Arabia

Abstract
This study aims to highlight the relationship between the services provided by Peugeot Company and the customer satisfaction. The related data was collected through a questionnaire distributed on a sample of 100 customers representing the existing customers and potential customers. The findings of the study pointed out that there is a strong relationship between the provided services and the customer satisfaction.

Keywords: Impact; Quality; Services; Peugeot Company; Customer Satisfaction

Introduction
Nowadays, the factors affecting the customer behavior became more complex and multiple, technology revolution especially information and communication has a significant role in shaping the customer behavior. The manufacturers now are using the internet technology worldwide to showcase their products, including qualities, values and prices of these products, to provide the customer in front of him several options for a particular commodity. And it becomes more complicated in view of durable goods. Declaring a car for example, includes in addition to the previously stated; engine capacity, speed, the country origin, comfort and safety, fuel consumption, payment facilities and other information affecting the consumer's decision. This study aims at measuring the customer satisfaction by having a car "Peugeot", and the services provided by the Agency for Peugeot, in Jordan.

Problem statement and questions
The formulation of this study's problem goes as follows:
"The agency of Peugeot cars in Jordan, provides multiple services that increase the degree of customer satisfaction". This problem will be discussed according to the following questions:
1. Does the agent have a variety of cars and prices to suit the Jordanian consumer income?
2. Does the agency provide free maintenance for the car for a certain period after the sale?
3. Are spare parts available continuously in the market?
4. Are the maintenance and repair of the vehicle conducted by professionals' technicians, or by those who work in a manner of trial and error?

The importance of the study
In Jordan before forty years, cars were been considered as luxuries, but now, cars are considered as a necessary commodity, for different types of groups and individuals such as business organizations, hospitals, universities, government institutions, families, employees, university students, etc... And because the car is durable commodity which has a long useful life, it needs extra care related to maintenance and availability of its spare parts. Therefore, the Jordanian customers, especially those from low-income group will prefer to buy the car; that its agent could responding to their needs efficiently and effectively, through providing the right
maintenance at the right time. The importance of this study lies in the ability of the agent of "Peugeot" achieving customer satisfaction for the current customers and potential customers through services provided by the agency.

**The study objectives**

This study aims at discerning the level of customer satisfaction in Peugeot Company according to the following aspects:

- Pre-sale services such as communication with potential customers, the announcement of the payment facilities, and the quality of the car.
- After-sale services such as quality of maintenance and availability of spare parts.

**Theoretical background and literature review**

- A study by Laura Eboli and Gabriella Mazzula (2007) under the title "Service Quality Attributes Affecting Customer satisfaction for Bus Transit". The study aimed at measuring customer satisfaction in public transport, by using a structural equation model to explore the impact of the relationship between global customer satisfaction and service quality attributes. The study population was the students of University of Calabria who use the bus service to reach the campus from Southern Italy. The main findings of the study were: "An improvement of the service in terms of service planning and reliability can be more convenient for transport operators because the service planning and reliability latent variable has the greatest effect on global customer satisfaction". And the transport services represented by frequency of using the bus, information for users, number of complaints, bus stop furniture (comfort, and cleaning), over crowding, safety, cost, and environmental protection.

- A study by Myungsook, and Yonghwi Noh (2009) under the title "Airline Customer Satisfaction and Loyalty: Impact of In-Flight Service Quality". The study aimed to verify the impact of the quality of air transport services on customer satisfaction and loyalty from the perspective of passengers from two classes: Prestige (business) and economy. The results of the study showed that each class evaluates the quality of the services through different factors. Six services quality factors of importance according to the perspective of the business class; the availability of alcoholic and non-alcoholic beverage, responsiveness and empathy, reliability, assurance, presentation style of food, and food quality, while the economy class showed five important service quality factors ranked as follows: Responsiveness and empathy, food quality, alcoholic beverage, non-alcoholic beverage, and reliability. The benefit derived from these two studies to the current study is, that providing services to clients should be under a plan to ensure immediate response to the needs of all segments of customers.

- A study by V. Kumar, P.A. Smart, H. Maddern and R.S. Maull (2008) under the title "Alternative Perspectives on Service Quality and Customer Satisfaction: The Role of BPM. (BPM: Business Process Management). The study aimed to investigate the linkages between business process management (BPM) and Customer satisfaction. Also, to reduce the dominance of the customer contact perspectives, on service processes, and to build a more systematic focus on the totality of service design. The results recognized the role of satisfaction and elements of service quality, and this means that the satisfied employee is able to satisfy customers. Also, the study highlighted the importance of business process management (BPM) as critical factor in driving customer satisfaction.

- A study by Zima Liliana Adela (2009) under the title "Service Quality in the Automotive Industry". The study aimed at helping automotive companies to reduce the biggest single cause of customer dissatisfaction in the service department, which are customer comebacks. And to overcome this problem, it requires providing the good service from the first time. The study pointed out that comebacks generally arise because of problems in one of four basic
areas of operations: Training of employees, tooling and equipment, job system (procedures and manpower loading), parts operations. This study is very useful for the current study because it presents some suggestions that may reduce customer's complaints.

Review of Auto Industry

The automotive industry is one of the few industries; that have obvious continuous growth since their foundation. Even during the global economic recession following September 11th, the automotive industry managed to gather up a total of 55 million motor vehicle sales world wide, matching the sales of the previous year (2001) (Automotive Intelligence, www.autointell.com). In general, the automotive industry continued to be extremely dynamic industry in terms of its production techniques. The industry involves two main manufacturing sections; assembling the vehicle, and producing the components. While the automotive industry began with the belief that, an automotive manufacturer was required to produce absolutely all components related to the assembly of vehicles, since 1970, there has been a steady restructuring of the industry. Today's vehicles may consist of close to 12,000 parts, provided by a geographically broad network of suppliers who the majority of their production is outsourced. Moreover, the geographical base of the car assembly itself was widened, and the manufacturers of assembly plants are spreading all over the world (Automotive Intelligence, www.autointell.com).

Review of Jordanian auto market

The beginning of automotive market in Jordan was in the 1950s, when Shammout United Trade Co. entered the Jordanian market establishing a branch in Jordan, as one exclusive agent of Jianghuai Automobile Co. (JAC) and exclusive agent of BYD Auto (www.shammoutunited.com). After that, many of the agents, Jordanian, or others entered the Jordanian market with several kinds and types of cars. Those agents such as; Faoui Trading Company who represents Isuzu Motors in Jordan, Bustami and Saheb Trading Co. represents Nissan Jordan, Top Car Jordan, considered as a strong distributor for the most famous car brands such as Mercedes, BMW (www.arabo.com). For Peugeot car, the new dealer of Automobile Peugeot is AL-Khayyat Group, was established in 1996 under the name of AL-Khayyat Motors Est. since its beginnings, the group is working to re-enable a Peugeot car in the Jordanian market by offering a wide range of models to meet all the customer's needs, and support it with a reliable after sales services. The fruit of these efforts is to get Peugeot to third place in terms of new car sales in Jordan among all brands, number one selling among the European brands. In the year 2003 AL-Khayyat group joined Mazda cars to its business, and to change the name to be: Arab Resources Co.- AL-Khayyat United. One of the pre-sale services provided by the company is that the customer can use the company website to receive information about Peugeot related products and services through his email or his location. In order to provide the best quality of after sales services to the customers and to strengthen its position in the highly competitive automotive market, AL-Khayyat motors have activated its after sales services and facilities available in the recently inaugurated service center located in AL-Bayader. Advanced equipment and tools, are using to ensure that problems or requests are processed efficiently and effectively. Peugeot's owners can get a comprehensive range or services; light service maintenance, Peugeot fixed price offers Peugeot assistance, training center, body work repair and maintenance, Peugeot's genuine parts, Peugeot's network services. Also, AL-Khayyat Group was one of the first in Jordan to introduce of roadside assistance service for the customers (AL-Khayyat Group, website).

Jordan's automotive market information indicated that:
- 800,000 vehicles are registered in Jordan.
- About 30,000 vehicles registered yearly.
- Percentage distribution of cars in Jordan by the country of manufacture refers to 60% Korean, 20% Japanese, 15% European, 4% American and 1% Chinese.

The main challenges in the automotive market in Jordan are; Fuel prices, availability of spare parts, after sales service and used cars. From here, one can conclude that the Peugeot dealer in Jordan is selling the vehicle to the customers and at the same time providing the services associated with the vehicle.

**The definition of services**

The literature suggests that there are many organizations that sell a particular commodity, and this sale is not complete without service or a range of services provided by the organization itself or specialized organization. In this area, business dictionary pointed out that many businesses are selling a unique item including both a tangible or physical good and intangible service, where some times the quality of service is more important than the physical product, eating a meal in the restaurant for example, may explain this, there are plenty of customers interested in the method of presenting food for them more than their interest in food itself (Sims, 2007, P.5). In the context of his research on the factors influencing the decision to buy a car, (Shawawrah, 2006) indicated that service after buying is a significant factor for the study sample. Defining services requires a crucial understanding of what classifies something as service, managers, engineers and designers tend to deem that services are: intangible, perishable, experiential, and co-produced between customers and providers (Dolfsma, 2010). Intangibility is the main attribute of services, and this approach could be the sense of the definition of the economist magazine of services, where services were defined as "products of economic activity that you can't drop on your foot" (The Economist Magazine, 2006). Access to marketing literature, we note that there are several definitions of services according to their characteristics, the U.S Bureau of Economic Affairs (BEA) defines services as products that cannot be stored and that are consumed at the time of their purchase (http://bea.gov/bea/mp-nationa.html).

**Conceptual framework of service quality management**

In a turbulent environment and perpetual motion, are rising ferocity of competition among business organizations, whether organizations producing goods, or service providers. And with the entry of global companies to markets around the world, the process of selecting product or service has become more spacious for the customer, which called the attention of companies to increase the quality of their products either goods or services. Quality has an integral role in all managerial activities. The main goal of any business organization today is to maximize its profitability which enables it to continue. And managers became aware that maximizing profitability requires increased volume of sales, and this will not be without delivering high quality products and services on time. According to (Batagan, et. al. 2009), "there is a multidimensional relationship between the quality of a service and the organization that is providing that service". To highlight this relationship, let us assume that there is someone in front of two options, to get a doctorate degree in law, either from the Sorbonne University, or from a university in the Caribbean islands, if this person cares about quality of education, he will choose Sorbonne University, because it is an ancient university, and with a global reputation. From here, we can say that quality management is a way of doing business that allows an organization to design products and services that meet or exceed customer needs and build operational processes that achieve high levels of performance and quality (Massoud, 2010). While the quality of service defines as "the collective effect of service performances which determine the degree of satisfaction of a user of the service". This definition leads to consider the customer as the final judge on the service and its quality, because quality is the customer's perception of a delivered service (Doug, 2010).
Research methodology
This research was accomplished by using the descriptive analytical approach, in order to measure the level of customer satisfaction for services provided by the dealer of Peugeot cars.

Data Collection
Secondary data relating to the subject matter were collected through books, periodicals, previous research. Also, the internet has been used to gather data belonging to the Peugeot through the company website. The primary data, was collected through a questionnaire designed for this purpose, has been distributed to a sample of existing customers and potential customers.

Research Population and Sample
This research population is composed of the following categories:
- Existing customers of Peugeot.
- Potential customers of Peugeot.
In addition to the administrative manager, sales manager and maintenance manager in the company, the study sample included 50 from the existing customer and 50 potential customers, with different demographic characteristics such as; age, sex, education, and income.

Research hypotheses
This research was conducted under the following hypotheses:

HoA: There is no statistically significant relationship between the services provided by the company and the customer satisfaction. And this hypothesis is divided into the following sub-hypotheses:
- HoA1: There is no statistically significant relationship between quality and safety factors of Peugeot and the customer satisfaction.
- HoA2: There is no statistically significant relationship between the price of Peugeot and the customer satisfaction.
- HoA3: There is no statistically significant relationship between the maintenance efficiency and the customer satisfaction.
- HoA4: There is no statistically significant relationship between the prices of the Peugeot spare parts and the customer satisfaction.
- HoA5: There is no statistically significant relationship between the efficiency of the employees in providing the service and the customer satisfaction.
- HoA6: There is no statistically significant relationship between the methods of announcement and the customer satisfaction.
- HoA7: There is no statistically significant relationship between the spread of the car and the customer satisfaction.

The Research Model

Statistical methods used to data analysis

Data were analyzed statistically by using SPSS program, where frequencies were calculated for the demographic characteristics of the member of the sample. The results of this analysis are shown in the following tables:

**Table 1: Frequency According to the Sex**

<table>
<thead>
<tr>
<th>Sex</th>
<th>Frequency</th>
<th>Percentage</th>
</tr>
</thead>
<tbody>
<tr>
<td>Male</td>
<td>38</td>
<td>76%</td>
</tr>
<tr>
<td>Female</td>
<td>12</td>
<td>24%</td>
</tr>
<tr>
<td>Total</td>
<td>50</td>
<td>100%</td>
</tr>
</tbody>
</table>

Males accounted for the vast majority of the respondents (76%).

**Table 2: Frequency according to the age variable**

<table>
<thead>
<tr>
<th>Age</th>
<th>Frequency</th>
<th>Percentage</th>
</tr>
</thead>
<tbody>
<tr>
<td>Less than 25</td>
<td>14</td>
<td>28%</td>
</tr>
<tr>
<td>Less than 35</td>
<td>17</td>

*Significant at $\alpha \leq 0.01$
From the above results, there are positive and significant relationships between all quality of service dimensions (independent variables) and customer satisfaction, which means the rejection of all null hypotheses and accept the alternative hypotheses, so, the hypotheses of the study will be accepted as follows:

**HoA1:** There is a statistically significant relationship between quality and safety factors of Peugeot and the customer satisfaction.

**HoA2:** There is a statistically significant relationship between the price of Peugeot and the customer satisfaction.

**HoA3:** Statistically a significant relationship between the maintenance efficiency and the customer satisfaction.

**HoA4:** There is a statistically significant relationship between the prices of the Peugeot spare parts and the customer satisfaction.

**HoA5:** There is a statistically significant relationship between the efficiency of the employees in providing the service and the customer satisfaction.

**HoA6:** There is a statistically significant relationship between the methods of announcement and the customer satisfaction.

**HoA7:** There is a statistically significant relationship between the spread of the car and the customer satisfaction.

As we notice from table 5, the strongest relationship appears to be between the spread of the car and customer satisfaction, and the lowest one is between the efficiency of the employees in providing the service and customer satisfaction. All over quality service dimensions affecting customer satisfaction positively with a coefficient of correlation equals to 0.799 and in significant manner.

**Recommendations**

The study presents the following recommendations for Peugeot company to increase the level of customer satisfaction:

1. Need to focus on safety factors available in the Peugeot in the media and advertising.
2. To focus on the luxuries available in the car.
3. Reduction of car prices in general, and put a class of Peugeot cars in the market at prices suited to low-income people.
4. Reduce the prices of spare parts means greater in promoting of the car.
5. Need for finding the vehicle maintenance centers in major cities in the Kingdom.
6. The company must develop a plan for the periodic maintenance of the vehicle and distribute booklets for the customers.
7. Reduction the number of customer's comebacks for a given maintenance or repair.

Organizational Commitment in Educational Departments

Saeed Sayyadi (PhD)  Hamideh Taheri Sarvtamin
Department of Management, Islamic Azad University, Kerman Branch, Kerman, Iran

Abstract
This study tries to appear what dimensions of Quality-of-work-life in university, can influence on employees organizational commitment and what is the role of Quality-of-work-life changes in this case. Three questionnaire surveys were developed and distributed to Mashhad University. In this study in order to test the hypothesis significance we used Pearson correlation coefficient. Analysis of the data shows a high rate of commitment in this society. We found that there is a significant relationship between QWL and organizational commitment and it shows that with increasing of QWL we will achieve to a higher level of organizational commitment in Mashhad University.

Keywords Organizational Commitment, Education, Service Organization employees

Introduction
One of the most important issues in management is the human capital in the organization and the way we safeguarding their interests. Paying attention to this issue shows the managements importance on this subject. The connection between workforce competence and customer service quality is conceptually strong since most service delivery or tasks are often performed by an organization's employees. After years of organizational restructuring and work re-engineering, management comes to recognize that a productive workforce is increasingly important to attain sustainable competitive advantages for business organizations on a global basis (Bohl et al., 1996). As the composition of workforce continues to change, companies offering better benefits and supportive working environments are expected to gain leverage in hiring and retaining valuable people.

QWL is a major issue for employees, and how organizations deal with this issue is of both academic and practical significance. Therefore, it is no wonder that thousands of studies revolved around the concept of job satisfaction, and stress as the core concepts of it. QWL and its relationships with employee health and performance became an explicit objective for many of the human resource policies in modern organizations (Dolan et al., 2007a, b).

A number of researchers, however, have raised concerns about the level of employee loyalty and commitment that can be expected in an environment of less secure and shorter term employment contracts (e.g. McClurg, 1999; Hartman and Bambacas, 2000; Gallagher and Sverke, 2005). Organizational commitment in this context remains important because of its potential effect on employees’ identification with the organization’s goals, the desire to retain membership with the organization and the level of effort exerted (Meyer and Allen, 1997; Hartman and Bambacas, 2000; Jaramillo et al., 2005; Van Breugel et al., 2005). Focusing on public universities, organizational commitment and QWL management approaches become crucial in order to reinforce their role in national innovation systems within the new economy for different reasons. On the one hand, because universities main inputs and outputs are basically intangibles and only a small part of these are identified and very limited instruments exist to measure and manage them, there is a main importance for measuring related indicators in this organizations. Due to this, we decided to conduct this research and search about the relation between these two important and effective issues on an sample organization, to develop a new way to improve the quality of our surrounding environment. The purpose of this
study has been to examine what dimensions of Quality-of-work-life in university, can influence on employees organizational commitment and what is the role of Quality-of-work-life changes in this case. However, not all the hypotheses were confirmed, we found that, there is a significant positive correlation between organizational commitment and Quality-of-work-life of Mashhad universitys employees. In recent years, numerous studies in the field of Quality-of-work-life or organizational commitment have been carried out. However, relatively few studies have addressed the specific relationship between this two variable in university.

Literature review

Commitment and Organizational Commitment

Many factors influence employee’s commitment. These include commitment to the manager, occupation, profession, or career (Meyer & Allen, 1997). Organizational commitment focuses on employees’ commitment to the organization. In explaining the significance of organizational commitment, Meyer & Allen (1997) refer to Morrow & McElroy's (1993) statement that organizational commitment is the most maturely developed of all the work commitment constructs. As part of their research, Meyer & Allen (1991) developed a framework that was designed to measure three different types of organizational commitment: (a) Affective commitment refers to employees’ emotional attachment, identification with, and involvement in the organization. Employees with a strong affective commitment stay with the organization because they want to. (b) Continuance commitment refers to employees’ assessment of whether the costs of leaving the organization are greater than the costs of staying. Employees who perceive that the costs of leaving the organization are greater than the costs of staying remain because they need to. (c) Normative commitment refers to employees’ feelings of obligation to the organization. Employees with high levels of normative commitment stay with the organization because they feel they ought to. In arguing for their framework, Meyer & Allen (1991) contended that affective, continuance, and normative commitment were components rather than types because employees could have varying degrees of all three. “For example, one employee might feel both a strong attachment to an organization and a sense of obligation to remain. A second employee might enjoy working for the organization but also recognize that leaving would be very difficult from an economic standpoint. Finally, a third employee might experience a considerable degree of desire, need, and obligation to remain with the current employer” (Meyer & Allen, 1997, p. 13). Even though the authors present this argument, they do not imply that there is a rationale for summing all the scales to obtain an overall score for organizational commitment. Consequently, for this research, the different scales will be referred to as types rather than components. Studies have linked organizational commitment to measures of effectiveness that are similar to those found when investigating the outcomes of relations-oriented and task-oriented leadership behaviors. Loui (1995), for instance, found that commitment was significantly related to trust, job involvement, and job satisfaction. Angle & Perry (1981) uncovered a relationship between commitment and turnover. Wiener & Vardi (1980) reported positive correlations between commitment and job performance. Research has also linked organizational commitment to leadership behaviors that are relations-oriented and task-oriented. Jermier & Berkess (1979) discovered that employees who were allowed to participate in decision-making had higher levels of commitment to the organization. DeCotitis & Summers (1987) found that when employees were treated with consideration, they displayed greater levels of commitment. Bycio, Hackett, & Allen (1995) reported positive correlations between the leadership behaviors of charisma, intellectual stimulation, individualized consideration, and contingent reward and affective, continuance, and normative commitment.
Organizational commitment provides a broad measure of the effectiveness of leadership behaviors. This relationship offers a way to further explore the subject of leadership. In general, organizational commitment is considered a useful measure of organizational effectiveness (Steers, 1975). In particular, “organizational commitment is a “multidimensional construct” (Morrow, 1993) that has the potential to predict organizational outcomes such as performance, turnover, absenteeism, tenure, and organizational goals” (Meyer & Allen, 1997, p.12). For example, in a study involving 109 workers, Loui (1995) examined the relationship between the broad construct of organizational commitment and the outcome measures of supervisory trust, job involvement, and job satisfaction. In all three areas, Loui (1995) reported positive relationships with organizational commitment. More specifically, perceived trust in the supervisor, an ability to be involved with the job, and feelings of job satisfaction were major determinants of organizational commitment. Angle & Perry (1991) undertook a study to determine the effect that organizational commitment had on turnover. The participants included 1,244 bus drivers. Findings revealed a negative relationship between turnover and organizational commitment. In short, employees who intended to leave the job were not committed to the organization. Wiener & Vardi (1980) looked at the effect that organizational commitment had on commitment to the job and career commitment. Their participants included 56 insurance agents and 85 staff professionals. The researchers reported positive relationships between organizational commitment and the two other types of commitment. Jermier & Berkes (1979) collected data on organizational commitment from over 800 police officers. The researchers were investigating the relationship between job satisfaction and organizational commitment. Findings revealed that employees who were more satisfied with their job had higher levels of organizational commitment. DeCotiis & Summers (1987) undertook a study of 367 managers and their employees. The researchers examined the relationship between organizational commitment and the outcome measures of individual motivation, desire to leave, turnover, and job performance. Organizational commitment was found to be a strong predictor for each of these outcome areas.

Commitment can be defined as the identification and the attachment to an organization and implies three elements: a strong belief/acceptation of the organization’s objectives and values, the willingness to exert strong efforts for it and the firm intention to stay within the organization (Mowday and al, 1982). It is the process through which the organization’s goals and the individual’s goals get more and more integrated (Hall et al, 1970). Several researchers have studied the link existing between commitment and loyalty. According to Kanter (1968), for example, commitment refers to the individuals’ willingness to give their energy and loyalty to social systems. For Hirschman (1972), being loyal to an organization is necessary to express one’s dissatisfaction in a positive way and to help the institution to progress instead of leaving it. As a consequence, loyalty has a major influence on the individual’s choice between « voice » (expressing one’s grievance) and « exit » (resigning).

Applying Hirschman’s theory, Cannings (1989) states that only the attachment derived from « voice » leads to a superior performance; attachment derived from barriers to exit, like age or lack of qualifications, covers only the last dimension of Mowday et al’s definition (intention to stay). Organizational commitment has been at the centre of studies into individual and organizational performance for several decades. If Swailes (2002) criticizes the fact that researchers have ignored the new context of employee-organization linkages when they investigate the issue of commitment measurement, he argues for its continued importance to understand the new deals signed between employers and employees.

Social psychologists have situated organizational commitment downstream from motivation. According to them, it causes the mobilization of all the capacities of the employee to achieve the goals laid down by the company and prohibits any separation between employee and organization. Organizational commitment must be differentiated from job satisfaction: whereas
job satisfaction results from an individual relation to work, organizational commitment controls and guides the person in the organization (Estay, 2001). Workers can be autonomous and can have integrational facilities, but they can use these faculties outside or against their company. For instance, autonomy can lead employees to quit their enterprises to find better remuneration. Organizational commitment can reduce this kind of turnover. It can also lead people to think in the direction of company interest and make decisions to develop their organization. We know that an employee’s commitment increases when he takes responsibilities and when he is empowered because he has the feeling that his work belongs to him (Matejka and Liebowitz, 1989). More precisely, organizational commitment is influenced by three categories of factors: worker characteristics (Mottaz, 1988; Meyer et Allen, 1990; Michel, 1989), job task characteristics (Mowday and al., 1974; Meyer and Allen, 1990, Thevenet, 1992) and structural characteristics (Rhodes and Steers, 1981; Morris and Steers, 1980; Steers, 1977; Gaertner and Nollen, 1989). We will only develop the two last categories because we are looking for the structural characteristics – and not the individual ones – which might impact organizations commitment in an innovative context. Job task characteristics cover task autonomy, task significance, opportunity for social interaction in completing tasks and skill variety. They also concern job scope – the more the job represents a challenge, is important to the organization and receives feedback the more the employee commits himself, clarity of objectives, which is positively correlated to involvement, and work overload, which reinforces commitment if objectives are clear and challenging but which decrease in situations of conflict or stress.

The organizational characteristics which are positively correlated with involvement cover distributive justice, participation in decision making, degree of formalization and degree of decentralization, opportunities for internal mobility and training, and employment security. We should mention that involvement also depends on career development. Mowday and al. (1982) identify three periods in an individual’s career dynamic: the period before the hiring process (what are the factors that encouraged the individual to make this choice?), the very first months within the company and the following period, where factors of involvement are linked to the representation the individual has on the “investments” he has done within the company. Meyer and Allen (1984) suggested a three-dimensional measurement of organizational commitment showing that this attitude could be better understood as a multidimensional concept. They defined the three dimensions as:

– Affective commitment, e.g. “positive feelings of identification with, attachment to, and involvement in the work organization”.

– Continuance commitment, e.g. “the extent to which employees feel committed to their organizations by virtue of the costs that they feel are associated with leaving (investments or lack of attractive alternatives)”.

– Morale commitment, e.g. “the employees’ feelings of obligation to remain in the organization”. Evidence generally supports the theory that affective commitment is positively associated with certain desired outcomes while continuance commitment generally has negative associations. Only preliminary studies have been conducted in the area of morale commitment. This knowledge reinforced the importance of studying the affective commitment of core and contract employees. More precisely, researchers showed that organizational commitment enhances the individuals’ performance (Meyer et al., 1989) and reduces turnover (Siegel et Ruth, 1973) and absenteeism (Patchen, 1965). But it also facilitates the acceptance of changes in a new environment (Handy, 1989, Thevenet, 1992). To conclude this part, we would like to clarify the links existing between psychological contracts and organizational commitment. Latest research in social psychology has confirmed that aligned and healthy psychological contracts contribute to enhanced commitment (including affective commitment which is positively related to higher performance), job satisfaction (which is related to higher motivation, lower workplace stress and
more satisfied customers) and intention to stay with the organization (retention). Indeed, according to Coyle-Shapiro (2002), perceived employer obligations explains the three dimensions of what is called “citizenship behavior”: helping, advocacy and, more important for us, functional participation. More precisely, psychological contract fulfillment is more strongly related to citizenship behavior directed at the organization than to citizenship behavior directed at one’s colleagues (Turnley and al, 2003). Flood and al (2001), who developed a causal model of the causes and consequences of psychological contract in leading high-technology software companies, found support for the idea that psychological contracts have a direct effect on employee commitment and intention to remain with the organization.

**Quality of Work Life**

Quality of work life appears to be a promising concept in helping managers to recruit talented individuals and to secure their engagement. It also appears as a promising concept to help them foster a high involvement culture and high organizational performance. However, there are many barriers to overcome in order to achieve this. The experience of Teknika Group provides a good illustration of such difficulties. Quality of work life (QWL) is a multidimensional construct usually referring to overall satisfaction with working life and with work/life balance, a sense of belonging to a working group, a sense of becoming oneself, and a sense of being worthy and respectable. Programs of QWL usually deal with the work itself – its design and its requirements, the working environment, the decision-making processes and supervisory behavior, and the working conditions, including the work and non-work balance.

The managerial practices that are associated with QWL depart positively from those associated with lean management practices (Niepce et Molleman, 1998). Based on the socio-technical systems design (Trist, 1981), managers do consider employees as human beings who have interests and dreams, motivations and expectations, strengths and weaknesses. In QWL organizations, work is meaningful, self-regulated, and usually done in a team arrangement. Its accomplishment also requires the use of complex skills. Decision-making involves those who are affected by its implementation and those who have the knowledge, skills and experience. This generates a participative management culture which promotes cooperation and conflict management, employee commitment, self-efficacy and organizational effectiveness.

In these types of organization, managers are concerned with the meaning of work for the employees and their working conditions. Morin (2003) has defined six factors that give meaning to work: the purpose of work, its moral correctness, autonomy, pleasure at work, recognition and positive relationships. When employees perceive these characteristics in their job, they tend to experience psychological well-being and effective commitment to the organization. Indeed, it is difficult to best conceptualize the quality of work life elements. Walton proposed eight major conceptual categories relating to QWL as (1) adequate and fair compensation, (2) safe and healthy working conditions, (3) immediate opportunity to use and develop human capacities, (4) opportunity for continued growth and security, (5) social integration in the work organization, (6) constitutionalism in the work organization, (7) work and total life space and (8) social relevance of work life. Several published works have addressed the constructs that make up the QWL domain and key elements of QWL programs.

Others such as Pelsma et al. and Hart found that psychological distress and morale contributed equally to teachers’ QWL. They determined that in the work climate of an occupation, QWL can be assessed by combining the amount and the degree of stress and the degree of satisfaction experienced by the individual within his/her occupational role. Winter et al. viewed QWL for academicians as an attitudinal response to the prevailing work environment and posited five
Quality of Work Life (QWL) is a philosophy, a set of principles, which holds that people are the most important resource in the organization as they are trustworthy, responsible and capable of making valuable contribution and they should be treated with dignity and respect. The elements that are relevant to an individual’s quality of work life include the task, the physical work environment, social environment within the organization, administrative system and relationship between life on and off the job. QWL consists of opportunities for active involvement in group working arrangements or problem solving that are of mutual benefit to employees or employers, based on labor management cooperation. People also conceive of QWL as a set of methods, such as autonomous work groups, job enrichment, high-involvement aimed at boosting the satisfaction and productivity of workers.

It requires employee commitment to the organization and an environment in which this commitment can flourish. Thus, QWL is a comprehensive construct that includes an individual’s job related well-being and the extent to which work experiences are rewarding, fulfilling and devoid of stress and other negative personal consequences.

**Methodology**

In this research we used descriptive methods and examined the correlation between commitment and QWL with two variable correlation method.

**Data collection Method**

According to the aim of this survey the best way of gathering information was using questionnaire, in order to achieve to this purpose we used three questionnaires described below:

1. General information questionnaire: including personal information, precedences like age, education level, career, marriage condition and sex.
2. Organisational commitment questionnaire: this questionnaire was according to allen and Meyers organizational commitment model, with 24 questions in three dimensions, using the likert scale.
3. Quality of work life questionnaire: on the basis of Waltons QWL model including 16 questions in 8 dimensions. In this survey we added 2 questions about welfare services. We used the likert scale in this part.

**Examining the validity and reliability of the questionnaires**

Using this questionnaires by researchers shows it validity. To examining its reliability among different methods we chose the cronbachs alpha. For second questionnaire we achieved 0.886 and for the third one 0.854, showing the reliability of these questionnaires.

**Population and statistical sample**

Population of this survey includes all employees in Mashhad university. According to the statistics their number is 543 persons working in three departments. We used a judicative sampling and chose 178 persons as sample and after distributing 180 questionnaires we got 163 of them back.

After gathering the data in order to analyze we used descriptive statistics to adjust data and show several parameters to draw different diagrams. By the way we used correlation coefficient to analyze the hypothesis.
Findings of the survey

Hypothesis Test

In this study in order to test the hypothesis one to five about their meaningfulness or non-meaningfulness we used Pearson correlation coefficient.

**Hypothesis 1**: there is a significant relationship between QWL and organizational commitment. Results of this hypothesis are given in table 1, and shows that in confidence level of 99% there is a significant relationship between QWL and organizational commitment and it shows that with increase of QWL we will achieve to a higher level of organizational commitment in Mashhad University.

**Hypothesis 2**: there is a significant relationship between QWL and dimensions of organizational commitment. As shown in table 2 there is a significant relationship between QWL and dimensions of organizational commitment and among them the most significant dimension is between QWL and morale commitment. Now we decide to test the correlation between organizational commitment and dimensions of QWL, and in this way we presented the third hypothesis.

*:it is significant at 0.05 level

After we found that there is a significant relationship between organizational commitment and quality of work life, we decided to add two other hypotheses to our research in order to get a better result.

Discussion and Conclusion
Organizational communication, organizational commitment, job stress, and job performance have received substantial attention in past organization behavior research. These organizational behavior variables are significant to a company’s overall performance. For example, poor organizational communication has been found to lower organizational commitment (Kramer, 1999; Rodwell et al., 1998) resulting in the three basic components of organizational commitment, identification, involvement, and loyalty, being reduced. In addition, the level of organizational commitment has been found to positively influence job performance (Yousef, 2000) and negatively influence job stress (Sager, 1990). Although, the relationship between these variables has received attention in the USA, little is known about these relationships in non-western cultures (Honeycutt et al., 2001).
The purpose of this study has been to examine what dimensions of Quality-of-work-life in university, can influence on employees organizational commitment and what is the role of Quality-of-work-life changes in this case.

Results about organizational commitment in employees of educational departments in Mashhad with M=85.45 and SD=12.44 shows a high rate of commitment in this society. In this survey 7.6 percent of respondents are in low level of commitment and only 6.5 percent have a very high commitment level. In general this society has a good level of organizational commitment. As mentioned in Cuskelley, Graham & Boag Alistair's research organizational commitment is an important factor in preventing personnel's absence. Also Feldmann and Arnold in a survey about the relation between work values and organizational commitment in a multi national corporation in Singapore's electronic industry showed that variables such as job involvement and effort to achieve power had a greater positive correlation with organizational commitment rather than financial earnings of a job. According to this research's results 93.5 percent of this society with a mean value of 85.45 had a high and average organizational commitment and 91.3 of them with a mean value of 44.75 were in average and low level of work life level. We conclude that low and average level of work life quality results in average and high organizational commitment in this society. This survey shows that to achieve to a high level of organizational commitment policy makers should have organized programs and plans. We don't have to forget that there is a need to improve the quality of work life in this employees to gain a higher commitment. The results show that there is a negative and significant relationship between educational level and organizational commitment, and they vary in a reverse way. To solve this problem policy makers should use some motivations to motivate employees with higher educational level to achieve to a high organizational commitment.

Abstract
The present research was designed to study post-disaster stress in population affected by earthquake in Pakistan with their gender. A sample of N=90 adults residing in different villages of Mansehra District of NWFP, Pakistan was taken. It was hypothesized that the level of post-traumatic stress would be higher in females as compared with males. Impact of Event Scale by Horowitz et al (1979) was administered. The results verified the hypothesis and it was found that female sufferers of earthquake showed a higher level of post-traumatic stress when compared with affected male population. The research supports previous studies conducted in this regard by confirming that the element of gender is positively correlated with post-traumatic stress. The study further elaborated other factors as well which were involved in post-traumatic stress such as marital status, family loss, education and employment status.

Keywords: GENDER BASED; COMPARATIVE STUDY; POST TRAUMATIC STRESS; VICTIMS; EARTHQUAKE

Introduction
Stress is an inevitable part of life and some amount of stress is needed to live healthy and happy life. But if it exceeds the limit of the stress and goes beyond the tolerance level of an individual such as loss of loved ones, economic trauma, health related severe problems, etc. The most severe form of such stressors is the trauma that takes place in someone’s life that may be natural or man-made disasters which affect almost all the victim of disaster. Norris et al. (2002a) stated that in 94% of 49 studies which investigated the issue, female survivors of disaster were more seriously affected than were males. There are several possible explanations for this difference. For example low socioeconomic status is a risk factor for post-disaster psychopathology, and women more often live in poverty than men (Belle, 2003).

The gender difference may be in part explained by differences we often observe between the genders in the way psychological distress is expressed. In general, women are more likely than men to acknowledge psychological symptoms and to report them (Nolen-Hoeksema, 1990). After a disaster, males may suppress feelings of psychological distress because of the expectation that men must be strong and capable (Wolfe & Kimerling, 1997). The most commonly investigated post-disaster reactions are PTSD, depression, and other forms of anxiety. Substance abuse and other acting out behaviors, such as interpersonal violence, are seldom assessed. Men are more likely to express psychological distress through these kinds of behaviors, rather than reporting neurotic-type symptoms like depression and anxiety (Myers, Weissman, Tischler, et al., 1984).

Traditionally, women have been assigned the role of caregiver, a role that may lead to increased stress levels in the aftermath of a disaster. First, for women who are primary caretakers, the extra stress of caring for children and the home may fall disproportionately on them. Norris et al. (2002a) noted in their review of disaster studies that being a parent, especially a mother, was associated with higher disaster-related distress. In a study with...
survivors of the 1999 earthquake in Turkey, a higher percentage of women than men reported that their first thoughts were of their family (Yilmaz, 2004). Second, women may be more likely to provide care for others affected by disaster (Kaniasty & Norris, 1995; Solomon, Smith, Robins, and Fischbach, 1987). In a study with vicarious victims of the September 11th attacks, more than twice as many women than men reported engaging in collective helping behavior (Wayment, 2004). When women offer support to other people, not only can they be further exposed to the trauma through contact with others, but they also may be burdened by the stress of providing support in times of need (Solomon et al., 1987). A particularly devastating situation may be the one in which a woman provides support services to others in the aftermath of a disaster, but does not receive an equal amount of social support back.

METHOD

Sample
The sample consisted of N=90 (Mean=36.63, SD=12.757) adults residing in different villages of Mansehra District of NWFP, Pakistan. These included both females (n=52, Mean 36.08, SD=11.944) and males (n=38, Mean=37.39, SD=13.922) affected by the earthquake. Due to the non-availability or unwillingness from the population to respond to the questionnaire, purposive sampling technique was used and Impact of Event Scale was administered on individuals who willingly participated in the research process.

Instruments

Impact of Event Scale (IES) (Horowitz et al., 1979)
The IES was developed to measure subjective distress related to a specific event (Horowitz, Wilner, & Alvarez, 1979). The IES is a self-report measure designed to assess current subjective distress for any specific life event (Horowitz, et al 1979; Corcoran & Fischer, 1994). The IES scale consists of 15 items, 7 of which measure intrusive symptoms (intrusive thoughts, nightmares, intrusive feelings and imagery), 8 tap avoidance symptoms (numbing of responsiveness, avoidance of feelings, situations, ideas), and combined, provide a total subjective stress score. Items of the IES are anchored to a specific stressor (Horowitz, et al, 1979; Briere, 1997). Respondents are asked to rate the items on a 4-point scale according to how often each has occurred in the past 7 days. The 4 point on the scale are: 0 (not at all), 1 (rarely), 3 (sometimes), and 5 (often). IES can be interpreted according to the following dimensions i.e. 0 - 8 Subclinical range, 9 – 25 Mild range, 26 – 43 Moderate range and 44 + Severe range

Personal Information Schedule
It was designed to obtain demographic information including age, gender, marital status, educational level, employment status and number of family loss.

Procedure
The participants were individually approached by the researcher. They were residing in different Villages of Tehsil Balakot, District Mansehra of NWFP, Pakistan. Each respondent was interviewed individually to build a satisfactory level of rapport and to make him/her understand about the purpose of research. The Impact of Event Scale was administered to the respondents individually after collecting the demographic information. Since the instrument was in English that is why every subject was interviewed by a trained Psychologist in order to maintain uniformity of research. Both the subjects and the facilitators were thanked a lot for their cooperation.
Results

Table 1: Mean difference and t-value of Males and Females on Impact of Event Scale (N= 90)

</table>

The table-1 shows significant differences on Impact of Event Scale in males and females. The result shows that women are more prone to post-disaster trauma than males. The scores reveal that the mean score of males is 41.68 which indicates moderate symptoms of Post traumatic stress while women fall in highly vulnerable group as their mean score is 51.83 which means they are severely affected by the traumatic event. The results are highly significant at p< .0001 level.

Chi-Square Value= 15.692, df=2, p< .001

The table-2 shows the cross tab between the levels of severity of scores of males and females on the levels of severity of scores on Impact of Event Scale. The result shows that the higher number of female belonged to severely affected group as compared to males, as 43 females were severely affected by disaster where as only 19 males were severely affected by disaster. The frequency table is statistically significant at p<.001.

Table 3: Post-traumatic stress against “Marital Status” on Impact of Event Scale:

The table-4 shows the cross tab between the different levels of education of the subjects and the levels of severity of scored on Impact of Event Scale. The result shows that the slightly higher number of illiterate victims of disaster reported severely higher scores on Impact of Event scale whereas those who attended college or university are also found to be severely affected by trauma. But the number of illiterate subject is comparatively higher i.e. n=23 subjects report severe symptoms of Post traumatic stress. The overall results are not statistically significant at p > .05.

Chi square value = 5.414, df = 8, p > .05

The table-6 shows cross tab between number of family members lost during the disaster and the scores on severity of Impact of Event Scale. The result shows that higher number of earthquake victims who lost 1-3 family member report severe stress whereas 75% of those who lost 4-5 family members and those who lost six or more than six family members report 100% of severe stress. This frequency table is not significant at p > .05.

Discussion

Half of the population of Pakistan comprises of women. Women are responsible for bringing up children and taking care of the household activities and they are more sensitive about their families and family members. Studies have proved that women are more prone to mental health problems and there are higher rates of depression and most anxiety disorders among women than men (Myers et al., 1984), which enhances the probability of putting them at risk for disaster-related distress. Furthermore, there may be some experiences that women are more likely to have that may contribute to the development of PTSD post-disaster. The interaction of gender and various social/family factors highlights the interconnectedness of vulnerability factors. While men typically cope using individual and immediate decision-making, women use their social network to process and work through problems (Kawachi and Berkman, 2000; Taylor, Klein & Lewis, 2000). After a disaster, changes often occur in one’s social network (Kaniasty & Norris, 1997). In a study with victims of Hurricane Andrew, Norris, Perilla, Riad, Kaniasty & Lavizzo (1999) noted that nearly all of the events that were experienced in common by the sample were related to changes in the social environment. Women’s PTSD symptoms have been shown to increase as their available social supports decrease, a finding that was not true for men (Pulcino et al., 2003). Change in the social network, which may involve a decrease in available social support, may be more devastating for women than for men due to its negative effect on their coping ability.

The results of present research are also similar to the previously conducted studies and revealed higher level of post-traumatic stress in females than males. The study also elaborates some more relevant facts and shows that marital status, education, employment and family loss are not the factors that could create a significant difference among the level of post-traumatic
stress (tables 3 to 6). Single and married individuals were found almost the same on the levels of post-traumatic stress (table 3). Illiterate individuals were seemed to be more prone towards post-traumatic stress as compared with the educated ones; however the difference was not statistically significant (table 4). Employment (table 5) and family loss (table 6) were also not proven as significant factors in post-traumatic stress. Hence, the factor of gender showed highly significant difference and females were found more stressful than males.

Limitations and Suggestions
A few limitations were discovered while conducting the present study. The potential limitation of the study concerns the sample and generalizability of the findings. The sample size of 52 females and 38 males of earthquake victim may have been relatively small to allow the findings to be generalized to the population. Heterogeneity of the sample implies that results may be biased by wide variation in their professional and educational backgrounds. The study can be improved by including few more variables and investigating them thoroughly such as detailed psychosocial and health related complaints. It would be also worthwhile to also examine the relationship between the Post Traumatic Stress and Mental health problems.

Conclusion:
It is concluded from the present research that women have high vulnerability for developing symptoms of Post Traumatic Stress Disorder and they are more prone to be psychologically effected by the traumatic event in their lives. Vulnerability factors in individuals are inevitable such as age, gender, previous history of psychopathology and social support determines the level of psychological distress in victims.

META THEORETICAL ORIENTATION IN SOCIAL WORK PRACTICE:
THE RELEVANCE OF PSYCHODYNAMICS AND SOCIAL ECOLOGY
THEORIES TO SOCIAL WORK PRACTICE IN NIGERIA

Ernest Osas Ugiagbe
Department of Sociology & Anthropology,
University of Benin, Benin City, Nigeria

Department of Sociology
Ambrose Alli University, Ekpoma, Nigeria.

Abstract
This paper attempts to appraise the relevance of theoretical orientation to social work practice. Though it acknowledges the fact that there are other theories of social work profession, it lays emphasis on the psychodynamic and social ecology theories of social work practice in Nigeria. The paper appraise the tenents and principles of the psychodynamic and social ecology theories and posits that a combination of these two theories will positively enhance the profession of social work because while the social ecology theory emphasizes the importance of unique features and traits of the various ethnic groups, areas and cleavages in Nigeria, the psychodynamic theory emphasizes the importance of personality traits of individuals. The paper reviews the main currents and writers of these theories and concludes that the combination of these theories will enhance the social work profession and the output and skills of the social work professionals.

Keywords: Meta Theoretical; Orientation; Social work practice; Relevance Psychodynamics ; Social Ecology ; Theories ; Social work practice; Nigeria

INTRODUCTION

All disciplines that lay claims to being scientific usually have theories which are used as guide and tools for inquires into the nature, structure and impact of phenomena be they social or physical. Social works is a sub-discipline of the social sciences and hence there are social work theories which are useful tools for the practice.

A theory is an organized statement of ideas about the world phenomena (Malcolon Payne, 2005). A theory is a scientific statement which link two or more variables together in explaining a social phenomenon. Hare (1987) writes that we always have a theory that helps us decide why and how to choose between the alternatives even if we hide it from ourselves. Social work theories are ideas that try to explain why and how we should make decisions as social workers. This paper attempts to elucidate the theoretical orientation that can work in Nigeria context. Doing this, two theories will be examined and later, the applicability of these theories will be done and inference drawn there from.

PSYCHODYNAMIC THEORY

Psychodynamic theory is based on the interplay of opposing forces within a person as the basis for understanding human motivations (Goldenbery and Goldenbery.
Based on the Psychoanalytic model developed by Freud, wherein the therapist examines unresolved conflict from the past to understand and change the behaviours of the individual (Payne, 1991). This perspective is so infused in western culture that we are sometimes unaware that our thinking is influenced by it. The social work profession has also been significantly influenced by this meta theory which many saw as providing a scientific basis of social work practice (Greene and Ephoross 1991).

In his clinical observation, Freud found evidence for the mental mechanism of repression and resistance. He described repression as a device operating unconsciously to make the memory of painful or threatening events inaccessible to the conscious mind. Resistance is defined as the unconscious defense against awareness of repressed experiences in order to avoid the resulting anxiety. He traced the operation of unconscious processes, using the free association of the patients to guide him in the interpretation of dreams and slips of speech. Dream analysis led to his discoveries of infantile sexuality and of the so-called Oedipus complex which constitute the erotic attachment of the child to the opposite sex parents together with hostile feeling towards the other parents.

Psychoanalytic refers to a specific method of investigating unconscious mental processes and also a form of physiotherapy. The term as well refers to the systematic analysis of human behaviour based on the relations of conscious and unconscious psychological or mental processes. Sigmund Freud, a Vietnamese psychiatrist in the 1900s developed this theory. Freud work on the structure and functioning of both mind which have far reaching significance both practically and scientifically and it has continued to influence contemporary social thought and social work practice.

The first of Freud innovation was his reorganization of unconscious psychiatric processes that follow laws different from those that govern conscious experience. Under the influence of the unconscious, thought and feeling that belong together may be shifted or displaced out of context; images rather than expressed as absolute concepts and ordinary objects may be represented symbolically by image of other objects which may be far fetched. The law of logic does not apply to these modes of operation in the unconscious mental processes but makes it possible the understanding of such previously uncomprehensive psychological phenomenon like dreaming which according to Freud serves to protect sleep against unpleasant impulses and repressed emotions and desires.

In other words, unacceptable impulse, thought and emotions called the latent dream content are transformed into manifest dreams in such activities like sports, acting, soldiering and music. It is the view of this theory that repressed dreams, fantasies, and desires driven into unconscious finds outlet in slip of tongue and other behavioural traits.

This theory views the individual behaviour as the manifestation or product of these three factors according to Igbinovia and Ugiagbe (2005):
1. The process of child development i.e the side effect (positive and negative) of the process of socialization of the child which Freud called Development model of analysis of personality.
2. The structure of the mind i.e the relationship between the Id, ego and super-ego and how such relationship affects behaviour which Freud called Drive model of analysis.
3. Defense mechanism arising there from frustrating anxiety and emotional trauma are part and parcel of human existence.
The main functions of the superego are:

1. To inhibit the impulse of the Id particularly those of a sexual or aggressive nature, since these are the impulses whose expression in most highly condemned by the society.
2. To persuade the ego to substitute moralistic goals for realistic ones and
3. To strive for perfection. That is the superego is inclined to oppose both the Id and the ego, and to make the world over into its own image.

The ego always attempts to exercise control over the instincts. Unlike the ego, the superego does not merely postpone instinctual gratification. It tries to block it permanently.

Anne Westhues et al (1999) writes that a number of social work model stem from psychodynamic theory which includes humanistic model which focused on the here and now i.e. the individual self-awareness will lead the individual to choose to change. In the object relation model, the individual needs of relationship in defined as object seeking. Goldenbery and Goldenberg (1985) also subscribes to these assertions that young children who experience the loss of a parent or interpret their parents behaviour as rejecting are thought to internalize that rejection and to attempt in later life to make the significant individual in their lives to fit those roles.

Also Turner (1986) posited that as a result of defective socialization which may result in ego unable to function properly, it may over-defend or under-defend against life’s trauma which may lead to maladaptation. Hence, ego development according to him is the key to attaining the individual full capacity, Gestalt developed by Fritz Peris is also an important model of psychodynamic model. Gestalt deals with the present which is in consonance with the therapist role of helping clients overcome barriers that block awareness and return clients to the state in which they can use their own problem solving skills.

Strean (1986) described psychodynamic theory as heuristic that is, there is an objective reality which are interpreted subjectively. The focus of the psychodynamic is the individual as a person with little or no regards in principle to others. This person focused assumptions amongst others is that human beings are biopsychosocial who constantly attempt to make sense of their world (Anne/Westheus, 1999).

SOCIAL ECOLOGY PERSPECTIVE

The second theory is the social systems and Ecological Perspectives. The term ecology was first used by Ernst Haukel in 1808 to refer to interdependence among organisms in the natural world. In conventional usage, ecology means the interdisciplinary scientific study of the living conditions of organism in interaction with each other and with the surrounding organic as well as inorganic (Nuess, 1989:6).

(A) Ecology as a form of general system theory: Ecologist have always been system thinkers concerned with the relations among living entities and between entities and other aspects of their environments. Ecological perspective is concerned with the growth, development and potentialities of human beings and with the properties of their environment that support or fail to support the expression of human potentials.
By classifying the structure of the environment and the nature of its adaptive influence, the perspective appears to be admirably suited to the task of developing concepts and practice principles for intervening in the environment (Germain, 1979).

This theory views man as a member and hence an appendage of a large system which are not only over bearing but also overwhelm the individual in all its ramifications. In other words, the system theory posits that the individual is a part of a large system and caught up in the web of interactions and hence the totality of his being are affected in one way or the other by the system which he/she can not separate himself from the process of the society.

This theory uses the biological analogy of Darwinism as popularized by Spencer. This analogy sees all organism as systems, composed of subsystems and in turn part of super system (Malcohn, 2005). Thus, organisms and environments are regarded as a unitary system with different parts which, can only be understood in relations to its interdependence with the other parts. Applying this analogy, the theory posits that human beings as part of a system are likened to cell that make up the atoms and hence, organs and system. Thus, man is part of the basic building block of the family, then extended family, groups and then societies just like biological system.

In subscribing to the view of Harson (1995), the ecosystem theory emphasizes the value of system, networking and integration and hence, deals with the whole or total system rather than with parts of human behaviour in isolations. This is one of the positive sides of this theory. As Anderson et al (1999) rightly emphasizes, the system theory integrates the atomistic holistic continuum i.e the social worker should think about the social and personal elements in any social situation in the context of the social settings and other elements interfering with one another in the web of interactional processes within the whole (system society). This processes may be in form of reciprocity and symbiotic relationships between the individual and the society and even parasitic and predatory.

There is a comfortable fit between the science of ecology and social work profession in which the habitat is expressed us purposeful fostering health and interdependent transactions between persons and their environments. The individual is a product of the society and still part of the societal processes. Hence, the individualistic approach of casework orientation of the twentieth country was challenged and changed in consonance with ecology theoretical orientations (Ramsey, 1994; Wakefield, 1996). The result of this orientation was the movement from casework to social work which led to the incorporation of the family, group, community and organizational approaches to interventions in clients situation(s) (Carol Mayers, 1983:12).

As will be explained later, this ecological approach in my opinion seems to be the best for social work practice in Nigeria because of the communalistic lifestyle of Nigerian people. The individual is closely knitted with the family, group and community and because of the reciprocity between the individual and family, group and society they both are intertwined in web of complex relationships and interactions and one can not be dealt with alone without affecting the other. The other understanding of social ecological theory as it relates to social work practice was succinctly elucidated by Heoprey Greif and Arthur Lynch (1983) when they write that social workers understanding of ecology is an analogy to biological theories that explain adaptations of organisms to their environment. According to them, this means that as a person enters each new situation,
he or she usually adapts to its demands and his or her presence changes the situation at least structurally. In other words, a person is constantly creating, restructuring and adapting to the environment even as the environment affects the person.

In other words, from the perspective of determinism, an ecological perspective view human as active goal-seeking, purposive beings who make decisions and choices and take actions guided by memory of past experiences and anticipation of future possibilities in the social milieu of his environment. This assertion further adds credence to the analysis above that in Nigeria, individuals fortune or otherwise is closely tied to the situation or circumstance surrounding his family, group and larger society.

The criticisms, levied against this theory stemmed from the fact that it ignores the power structure relationship between the clients and the change agent (social worker). Furthermore, the assumption that the family power structure benefits all its members which is not totally true.

Also modernist argued that the theory does not explain why things happen or why connection exists nor is ecological theory sufficiently prescriptive to inform practice directly. It is overly inclusive, giving us little guidance about what is important to include in a general scheme. Further, it does not criticize the entropy of systems that are not viable, leaving unquestioned the value of some system as they exist. Finally, it is overly generalized and the language is too complex. These objections suggest that ecosystems or ecological theory as originally developed, overstate the importance of the parts of a system, change and institution. These criticisms leveled at ecological theory making it appear that homeostasis (system stability) is preferable to conflict and change and institution as partly the result of a systems solipsism that has no capacity to deconstruct its own cultural embeddedness. Although, not a panacea capable of addressing all these questions, social and deep ecological response to a systems-based ecology does offer a better understanding of the context and power of the social workers in transaction with those with whom he or she works. Ecological theory or perspective is still more useful, intriguing and more in agreement with the mission of social work in Nigeria than the individualistic psychoanalytic model of intervention.

Bronfenbrenner (1979) proved similarly useful to social work which as a progression relies in part on psychological theory to inform practice especially developmental psychology which places little importance on assessing a child’s environments as a causal factor in psychopathology. According to him the ecology of human development involves the scientific study of the progressive. Mutual accommodation between an active growing human being and the changing properties of the immediate settings in which the developing person lives, as this process is affected by relations between these settings and by this larger contexts in which the setting are embedded”. Bronfebrenner notes that although all behaviourists acknowledge that people and their environments interact, little attention is actually being paid to the social determinants of the phenomena under study. Only the most rudimentary attention is given to a critical conceptualization of the environment, instead, behaviourist homogenized the environment into a set of distinct variables associated mostly with a person’s social address. This practice contrasted with the subtle nuances systematically investigated by these same researchers in their studies of the human psyche. Only recently has there been evidence that more intensive ecological inquiry is both possible and necessary. For example, there is now sufficient evidence to hypothesize that
ecological forces at play in the world beyond the family affect a child’s development as much or more than the child’s interaction with parents (Rich 1988).

Nigeria is not only complex but also multicultural and peculiar society. The individualistic approaches like psychoanalytic will definitely not yield the desired result when applied alone. The more appropriate model or approach for social work mission in Nigeria will be the ecological model. This is because ecological perspectives on ethnicity, race, and gender in practice situations promise a more critical understanding of the power implicit in transactional processes. These perspectives, however developed rather modestly, did not initially challenge or deconstruct dominant values.

THE APPLICABILITY OF PSYCHODYNAMIC AND SOCIO-ECOLOGY THEORIES TO THE NIGERIAN CONTEXT OF SOCIAL WORK PROFESSION

The applicability of the meta-theoretical tools in appreciating social work practice in Nigeria context cannot be over-emphasized. The two theories that have been analyzed (psychoanalytic and socio-ecological theories) are very relevant to social work practice in Nigeria. The combination of these two theories will definitely provide a more vibrant and an all-embracing theoretical orientations for practice and research. This is because the positive and near universally accepted tenents of psychoanalysis which have proven effective in most societies in the western world coupled with the laudable and applicable tenents of social-ecological theory will provide the needed tools, directives and qualitative data that social work practitioners will need in Nigeria. As aforesaid earlier, Nigeria society is a multi-cultural, religious and ethnic society. This complex society with diverse personalities, family affiliations, belief systems, norms, values, socio-political and economic backgrounds and orientations, social milieu amongst others usually presents complex and formidable problems that are either personalized or induced by the society/communities circumstances. Hence, the problem may not be solved with universal approach i.e the panacea to one problem in community A in southern Nigeria for example may not be applicable and useful or effective in solving the same problem in community B or C in the same southern Nigeria. This is because of the differences in biodata and social-psychological economic and political indices and circumstances prevalent in each community which may be very different in dimension, vis-à-vis other communities.

Social Ecology model for example is very handy and relevant in dealing with the problems associated with various ethnic cleavages in Nigeria. This is in consonance with the assertion of Murray Bookchin (1921 and 1922) who put it quite simply that.

“Ecology deals with the dynamic balance” of nature, with the interdependence of living and non-living things. Since nature also includes human beings, the science must include humanity’s role in the natural world. Specifically the character, form and structure of human relationship with other species and with the inorganic sub-strata of the biotic environment. From a critical purview, the vast disequilibrium that has emerged from humanity’s split with the natural world, one of nature’s very unique species, homosapiens, has slowly and painstakingly developed from
the natural world. One of nature’s very unique species, homosapiens, has slowly and painstakingly developed from the natural world into a unique social world of its own. As both world interact with each other through highly complex phases of evolution, it has become as important to speak of a social ecology as to speak of a natural ecology.

The practice principles of social ecology enumerated by Michael Ungar (2002) here under presented will help us to know the philosophy, tenents and directions of social ecology theoretical orientation in social work practice.

1. Each individual has intrinsic value apart from the meaning or usefulness of the individual to others in his or her community.
2. The diversity of culture and social organization offers the potentials for solution to emerge to shared human challenges.
3. Structured alliances between communities and the services that provide for them must act to increase the diversity of resources that are directly, available to individual and families to help them help themselves.
4. A service delivery system that is managed by community stakeholders not bureaucracies is the least likely to contribute to social disintegration.
5. Human services delivery system works best when it is kept small.
6. Public policy is needed that expand the capacity of communities and their members to function.
7. What is good for individual and their communities is the benchmark of enlightened social and economic development.

And those who believe in the above points have ethical obligations to achieve them for their working environment.

The tenents of social ecology enumerated above will look more when customized or localized approach/therapy/interventions in social work profession. This means that the social-cultural/political and economic reality of an individual or group will inform the types intervention rather than a generalized approach or intervening processes to certain social problems in the society. For example, because of the socio-cultural and belief systems of the northern part of Nigeria, the approach or model or panacea possible in predominantly Christian communities in southern Nigeria, socio-cultural differentiation and other political and economic determinants may not work in favour of complete holistic approach rather localized approach of the ecological model is ideal.

According to German (1979) an ecological view practice is chixed toward improving the transactions between people and environment for all who function within them to carry out the professional purpose, requires a set of environmental interventions and a sit of interventions into the transaction between people and environment to compliment the set of available options for intervention in coping patterns of people.

The combination of the tenents of the psychodynamic and social ecology will definitely make social work practice in Nigeria a success. This is because the qualities of psychodynamics therapy in issues relating to the individual as a person, his/her subjective realities, thought process, emotion, feelings, psyche order, attitudinal and behavioural dispositions, choices and others. These issues and other maladjustments as a result of
his/her daily routines have been handled in the past, by social worker using the psychodynamics approach.

Germain (1979) writes that personality theories tend to be culture-bound in some respect and universal in other respects, for example, identity formation, autonomy, competence and relatedness to others seem to be universal. They are useful loci in considering adaptive capacities and pattern in an ecologically oriented practice. Human attributes like competence, relatedness, identity etc when understood in the context of multi-cultural society like Nigeria, will help the social worker perform his/her duties more effectively. If relatedness for example is understood as both biological, psychological and social by the social workers, then the social worker will know that the human infant cannot survive without the loving care of adults and this must continue over a long period of time for integration to fully take place. Most problems of adaptation and trust are fixation of early livelihood, hence Erickson (1963) writes that an infant who is not loved and cuddled before, he/she is three years may never trust the world and find fulfillment in his association with others. Hence, identity not only arises out of human relatedness but influence the nature of relationship thereafter.

These authors subscribed to Germain (1979) assertions that environment is complex but a conceptualization of the environment for social work practice must take into account physical aspects, social aspects and the interplay between them and the culture. Both the physical and social environments are affected by the cultural values, norms, knowledge, cosmology and belief system that pattern social interaction and determine how they are used and how they respond to the physical environment.

THE WAY FORWARD FOR SOCIAL WORK IN NIGERIA

Germain succinctly elucidated the tasks of social worker profession when he writes that the professional purpose of social work arises from dual, simultaneous concerns for the adaptive potentials of people and the nutritive qualities of their environments. The way forward for social work practice in Nigeria is to imbibe the philosophical traits/tenents of both psychodynamics and social ecology theories which will be directed toward improving the transactions between people as unique individuals and the environment which are equally unique in order to enhance adaptive capacities and improve the environment for the people therein. Knowledge of the tenents, postulations and limitations of these two theoretical orientations will unravel the complexities of not only individuals but also the over 350 ethnic groups in Nigeria.

As Germain (1979) rightly puts it, a knowledge required to understand the complexities of people, environments and the nature of that transaction that draw upon evolutionary environmental psychology, ethology and organizational theory as well as disciplines more familiar to social workers. The objectives as beautifully analyzed by Germains viz, releasing, developing and strengthening people innate and acquired capacity for growth and creative adaptations and removing environmental blocks and obstacles to growth and adaptation and positively increasing the nutritive properties of the environment. If these principles and objectives are adhered to and manifested social work in Nigeria will grow faster than expected.
CONCLUSION

In conclusion, these authors submit that the psychodynamic and social ecology theories are the best combinations that will provide the antidote and panacea for the task ahead for social work practice in Nigeria. This does not mean that other theoretical orientations are not useful but the psychodynamic and social ecology are special. Psychodynamics for example is rich in because its in-dept analysis of personality traits and their manifestations while the social ecology theory is excellent because of the laudable and practicable tenents, philosophy and propositions about the environment and locality of issues, problem and panacea. When combined, these two theoretical orientations will provide the needed tools for effective social work practice in Nigeria.

Abstract
This study is an attempt to examine the empirical relationship between stock returns and trading volume in Pakistan. Trading volume captures the important information contained in the traders’ information signal and may be useful in interpreting information contained in prices. In this research, the empirical relationship between stock returns and trading volume in Pakistani market was studied and how both variables affect each other using correlogram, unit root (Augmented Dickey Fuller) test and Vector Auto Regression Model for the relationship and significance of the data. To fulfill the research, 5-year daily stock prices of KSE 100 index and 5-year daily data of trading volume was collected. All the data arranged in Microsoft Excel and measured with the help of Eviews software. Result shows that there was an overall positive relationship between the stock returns and trading volumes in the Pakistan.

Key words: Stock Returns, Trading Volume

1. Introduction
Many past studies and researches have been done in different countries about the relationship between stock returns and trading volumes. Stock market is an organized way for the people to buy and sell stocks and corporations to raise funds. Its role is very important in the operations of the country’s economics system (Ajayi, Richard & Mougue, 1996). Stock prices and returns normally change if there is change in trading volume. As with returns, trading volume mainly reflect the available set of relevant information to the market. It is evident form the past research that investor’s expectations always lead to an increase in trading volume, which therefore reflect the sum of investor’s reactions to news (Mediros & Doornik, 2002).

The study deals with the empirical relationships between stock returns and trading volumes in Pakistan. Blume, Easley, and O’Hara (1994) have highlighted that volume captures the important information contained in the quality of the trader’s information signals and be useful in interpreting information contained in prices.

The volume data indicates growth or decline of a particular contract. It can also measure shifts in the composition of future markets as can be illustrated by the enormous growth of financial futures compared. Together with the volume data, the price change is also a closely monitored statistics by market participants. The trading volume may be thought to carry information about the aggregate change in expectations about the assets. In addition, any relationship between returns and trading volumes may help devise profitable trading rules (Bhar & Harmori, 2001).

In Pakistan, not a great deal of analysis has been done on stock returns and trading volume. In this study, the empirical relationship between stocks returns and trading volumes is evaluated in Pakistani market by using sophisticated techniques such as Vector Auto Regression (VAR), Augmented Dickey Fuller (ADF test) for unit root test and correlogram test for data stationary.
1.1 Problem Statement

The study intends to investigate the empirical relationship between stock returns and trading volume in Pakistan.

1.2 Significance of study

This study will be of significant importance for investors, portfolio managers and analyst for investment decision making and analysis purposes respectively in the Pakistani stock market.

1.3 Rational of Study

Returns on stock and trading volume are two prime indicators of trading activity on a stock market. These factors jointly determined, by the same market dynamics and may contain valuable information about a security. The rational of this research is to facilitate Investors to understand that how stock returns and trading volume affects each other so that they can make the investment decisions accordingly.

2. Literature Review

Stock market is an organized way for the people to buy and sell stocks and corporations to raise funds. Its role is very important in the operations of the country’s economics system (Ajayi, Richard & Mougue, 1996). Many past studies and researches have been done in different countries about the relationship between stock returns and trading volumes.

Several theoretical models are proposed to explain this relation between two variables Osborne (1959), Westerfield (1977), and Rogalski (1978). These include mixture of distribution model for asymmetric information was proposed by Clark (1973), Epps and Epps (1976), Tauchen and Pitts (1983) and Harris (1986). Karpoff (1986) forwarded a theory that relates returns and volatility with volume traded, which resulted in a relationship between volume and price change. However, Karpof (1987) repeated the study empirically and found a weak evidence to support the relationship between volume and returns, and further suggested a model that relates trading volume, returns and volatility.

Trading volume and stock returns are studied by the large number of researchers and there is enough evidence to support their relationship like Ratner and Leal (2001) examined the Latin American and Asian financial markets and found a positive relation between returns and volumes in these countries except India. Similarly Lee and Rui (2002) used daily data of Shanghai and Shenzeh markets and found a consistently strong relationship between returns and volumes. As for the casual relation, they found little evidence of predictability of returns by volumes or vice versa either within the Chinese domestic market or in combination with the two overseas market considered. Hiemstra and Jones (1994) found a new result using VAR model. They found a significant positive relation going in both directions between stock returns and trading volumes. Basci et al. (1996), found strong evidence of relationship between the two variables. Granger, Godfrey (1963) and Morgenstern (1964) used daily data to examine the relation between returns and volumes and found the positive relationship between the two variables. Stock prices and returns normally change if there is change in trading volume. As with returns, trading volume mainly reflect the available set of relevant information to the market. It is evident form the past research that investor’s expectations always lead to an increase in trading volume, which therefore reflect the sum of investor’s reactions to news Mediros & Doornik, (2002). Harris (1987) brings the favorable results for NYSE stocks and Medeiros and Doornik (2002) significant relationship among the variables in Brazilian stock market.
However, Cornell (1981) and Bessembinder and Seguin (1992) extended the concept by providing evidence on positive relation between changes in volume and changes in prices in various futures market contracts. The volume data indicates growth or decline of a particular contract. It can also measure shifts in the composition of future markets as can be illustrated by the enormous growth of financial futures compared. Together with the volume data, the price change is also a closely monitored statistics by market participants. The trading volume may be thought to carry information about the aggregate change in expectations about the assets. In addition, any relationship between returns and trading volumes may help devise profitable trading rules (Bhar & Harmori, 2001).

This relationship is also studied within two important areas i.e. how far the returns volatility persists in market and does trading volume explain the information arrival to the market?. Huson Joher Ali Ahmed, Ali Hassan and Annuar M.D Nasir (2005) concluded that current volatility can be explained by past volatility that tends to persist over time. Saatcioglu and Starks (1998) used monthly data from six Latin American markets (Argentina, Brazil, Chile, Colombia, Mexico and Venezuela) to test the relation between price changes and volumes and found a positive price-volume relations and a causal relationship from volumes to stock price changes but not vice versa. Campbell, Grossman and Wang (1993) and Smirlock and Starks (1985) indicated that there is some link between stock returns and trading volumes and past trading volume might provide valuable information about a security. The empirical work on the stock price-volume relation focused on the study of relationship between stock returns and trading volumes. Vector auto regression model was used in the research for the analysis. Blume, Easley, and O’Hara (1994) have highlighted that volume captures the important information contained in the quality of the trader’s information signals and be useful in interpreting information contained in prices. Due to lack of information contained in prices, traders cannot obtain the full information signal from price and could use volume as an additional statistic to observe that signal. Market participants, therefore, condition their expectations about price movements on volume as well as price. Trading volume and stock returns both are tested and with each other in both ways but the significant number of researchers have supported that the trading volume could be used as an indicator for return calculations, Christos Floros and Dimitrios V. Vougas (2007).

As the relationship between the variables got enough evidence in its support researcher and analyst conduct the work on large sample size by involving multiple stock markets, Chen et al. (2001) conducted a comprehensive study examining casual relation between stock returns, trading volumes and volatility using daily data for nine major markets: New York, Tokyo, London, Paris, Toronto, Milan, Zurich, Amsterdam and Hong Kong, they documented strong evidence for the argument that return causes volume. However, they were able to uncover only limited evidence to suggest that volume causes return. Malabika Deo, K.Srinivasan and K. Devanadhen (2008) examines the interaction of stock market returns, trading volume and volatility for select Asia-Pacific Stock Market – India, Hong Kong, Indonesia, Malaysia, Korea, Tokyo and Taiwan. Their finding again supported the proposition and suggests that the returns are influenced by volume and volume is influenced by returns for most of the markets. Therefore, trading volume contributes some information to the return and volatility which after wards again hits the trading volumes. Gunduz and Hatemi-J (2005) investigated central and eastern Europe markets: Budapest, Istanbul, Moscow, Prague and Warsaw. They used weekly data on price indices, trading volumes. The authors reported link between price and volume in Hungary, Poland and some relationship in Russia and Turkey. However, no relationship was found between price and volume in Czech Republic. Pisesdtasalasi & Gunasekarage (2003)
investigates casual and dynamic relationship between stock returns and trading volumes for five South-East Asian markets. The finding indicates a significant causality running from stock returns to trading volumes for Indonesia, Malaysia, Singapore and Thailand and significant casual effect from trading volumes to stock returns was detected only for Singapore; for the rest of the markets, trading volumes did not add significant effect. Moosa & Al-loghani (1995) examined for Asian stock markets (Malaysia, Philippines and Singapore and Thailand) using monthly data for the eight-year period ending (1993). They found strong evidence running from volumes to price changes to volumes in all markets except Philippines.

Inspite of such a strong evidence in the favor of positive relationship in some cases the weak relationship is also observed between these two variables like Duffees (1992) found weak positive relationship between the both variables and Mestel, Gurgul & Majdosz (2003) in Australian stock market found only weak support for a dynamic relationship between stock returns and trading volumes, implying that forecasts of one of these variables cannot be improved by knowledge of the other. Gallant, Rossi & Tauches (1992) focused on the dynamic relationship between volumes and returns. They examined the dependencies between S&P 500 stock index returns and trading volumes on the New York Stock Exchange (NYSE). They found evidence for returns leading volumes and some relationship between them and N’dri Konan Léon (2007) proves with the help of data from Bourse Régionale des Valeurs Mobilières proves that volume has predictive power for stock returns volatility.

In the nutshell, the above literature shows that stock returns and the trading volumes have strong or weak positive relationship in most of the countries either moving from returns to volumes or from volumes to returns and in some cases in the both directions. The relationship and significance between the stock returns and trading volume has still many rooms for further studies in many countries especially like Pakistan.

3. Methodology

3.1 Development of Hypothesis

For the analysis of the relationship between stock returns and trading volume in Pakistan, two models are used; for testing the stationary of the data, using augmented dickey fuller test for unit root following hypothesis is formed:

\[ H_0 : \rho = 1 \]
\[ H_1 : \rho < 1 \]

If the data is stationary, alternate hypothesis will be accepted. Further VAR model will be applied on the data.

For testing the relationship and significance of the data using vector auto regression, following hypothesis is tested:

\[ H_0 : \beta = 0 \]
\[ H_1 : \beta \neq 0 \]

3.2 Theoretical Framework

Relationship between stock returns and trading volume

![Diagram](Stock returns --- Trading Volume)
3.3 Data Collection
To fulfill the requirements of the research, 5 year daily stock prices of KSE -100 index and 5 years daily data of trading volume of KSE -100 Index was collected. Data was collected for the period of January 01, 2002 to December 31, 2006.

3.4 Data Analysis
Microsoft excel sheet is used for arranging the data and calculating the returns of stock prices. For testing the stationarity of the data, correlogram and Augmented Dickey fuller models are used and by using vector auto regression model the relationship and significance is evaluated between stock returns and trading volumes.

- The first step was to calculate the stock returns and Microsoft excel was used to calculate all the daily returns of stock prices. And it was calculated through;
  \[ \ln\left(\frac{P_t}{P_{t-1}}\right) \]
  Where:
  \( P_t \) = current closing stock price
  \( P_{t-1} \) = previous closing stock price
  \( \ln \) = Natural Log

- In the second step, the data is required to be checked for stationarity before using vector auto regression model. For this purpose correlogram was used for stock returns, where as autocorrelation and unit root rest was used to check the stationary of trading volume.

- The third step was the application of VAR model for measuring the relationship and significance of stock returns with trading volumes.

4. Results & Discussion
- The result of the second step i.e. testing of stationarity of stock returns showed that data was stationary for stock returns. The data of trading volume showed the conflicting results in autocorrelation test as compared to stock returns. To check the results of autocorrelation the Augmented Dickey Fuller test was applied to reconfirm the results of the autocorrelation that showed the data was stationary. Hence, the second step it was concluded that data for stock returns was stationary which was proved with the help of autocorrelation and for trading volumes the auto correlation and unit root test were used to prove that data is stationary. Both stock returns and trading volumes are stationary there for we will accept the \( H_1: P< 1 \). Hence, all the data is then suitable for the VAR model.

- VAR model not only measured the relationship of both stock returns and trading volume but also with themselves. The R-squared for both variables are positive, and the F-statistics is high for trading volume and lower for stock returns but both are positive shown in table -1. According to the results for stock returns, t-statistics is greater than 2 in few lags and shows a positive relationship between stock returns and trading volumes. Results also show insignificant relationship in some lags because the t-statistics falls between -2 to 2 but show no negative relationship between the two variables. Similarly in case of trading volumes, the t-statistics again greater than 2 in few lags and shows a
positive relationship between stock returns and trading volumes with no negative relationship in any lag.

- The standard errors for stock returns and the trading volumes determine the volatility of the data; the greater the standard error, the greater would be the volatility, from the above results, there is a positive relationship between stock returns and the trading volumes, however it is not strongly positive but shows no negative relationships. The null hypothesis is rejected and alternative hypothesis is accepted i.e. $\beta \neq 0$

5. Conclusion

Based on the analysis it is concluded that there was an overall positive relationship between stock returns and trading volumes and vice versa. The vector auto-regression model shows positive relationship between stock returns and trading volume but not strong positive relationship. Insignificant relationship was also observed in some lags. However, there is no negative relationship in any lag and over all the relationship is positive between stock returns and trading volume. Evidence shows that movement of stock returns may affect the movements of trading volume and vice versa. The study proves that the stock returns and the trading volume may effect on the future prediction of each other and it is somehow significant for an investor to invest in Pakistan by relating the both variables and their information.

6. Recommendations

For recommendation, the future research on this issue could bring results that are more accurate of Pakistani stock market, if the data comprises of long period like a decade or more. More over the issue should apply with more powerful tools like ARCH i.e. autoregressive conditional heteroscedasticity and GARCH i.e. generalized conditional Heteroscedasticity.

Moderating effect of adaptability on the relationship between two forms of market orientation and performance

Fahri Apaydin
Yalova University, Turkey
Cumhuriyet Cad. Karizma İş Merkezi 4. Kat
Yalova, Turkey

Abstract

This empirical study examines moderating effect of adaptability of small and medium sized firms on the relationship between two forms of market orientation - responsive market orientation and proactive market orientation - and performance, using data from a sample of diverse businesses. Data was gathered from small and medium sized firms and regression analyses were carried out to test the hypotheses. In the literature review part it is indicated that for any business to increase business performance, responsive market orientation and a proactive market orientation are not sufficient. Firms should have adaptability to achieve better result from being market oriented. That adaptability has moderating effect on the relationship between these two forms of market orientation and firm performance is supported empirically in this study. The study is hoped to be bases for future researches to gain insight into the effects market orientation forms and their interaction with adaptability on firm performance in the small and medium sized context. More studies need to be done to search the relationships mentioned in this paper.

Keywords: Responsive Market Orientation, Proactive Market Orientation, Adaptability, Firm Performance

1. Introduction

The marketing concept suggests that “to achieve organizational goals firms should act more effectively and efficiently than competitors in the task of identifying and satisfying the needs of target markets” (Kotler, 2003). Kohli and Jaworski’s (1990) theory of “market orientation” is considered as an implementation of the marketing concept in the markets. Narver and Slater (1990) became the first to operationalize the measure of market orientation and they demonstrated a positive relationship between market orientation and business profitability.

The works of Kohli and Jaworski (1990) and Narver and Slater (1990) were attempts to to research that investigated the antecedents and outcomes of market orientation applied by business in the 1990s. They made a comprehensive definition of what market orientation is. Most of the researches suggest that being market oriented is closely related with higher performance in one or more of the performance indicators, for example market share, sales growth, new-product success, etc. (Atuahene-Gima, 1995; Deshpande, Farley, & Webster, 1993; Han, Kim, & Srivastava, 1998; Jaworski & Kohli, 1993; Li & Calantone, 1998; Pelham & Wilson, 1996; Slater & Narver, 1994).

However, some academicians, based on the empirical measurement of market orientation in their studies, have questioned about the outcomes of market orientation. For example, it is suggested that being market oriented may hinder innovativeness (Berthon, Hulbert, & Pitt, 1999), may cause “myopic research and development (R&D)” (Frosch, 1996), or may “distract business
processes” (Macdonald, 1995). Christensen and Bower (1996) articulated that “firms lose their position of industry leadership because they listen too carefully to their customers.” The common point among the criticisms is that there is a penalty if firms just respond to customers’ wishes, which may make them blind about the changes in the environment.

Narver, Slater, & MacLachlan (2004) made an attempt to explain the reason why there are contradicting results about the same construct. They believe that it is about understanding market orientation too narrowly, so they suggest that market orientation has two dimensions—responsive market orientation and proactive market orientation. In their studies, they researched the effects of these two forms of market orientation on the innovativeness of the company and found out that while proactive market orientation has positive effect, the former had negative.

Narver, Slater, and MacLachlan (2000) posited that researchers seem to have an insufficient understanding of what it means to be market oriented because they mainly tend “to ignore its proactive dimension—the discovery and satisfaction of future needs of customer” (Kohli & Jaworski, 1990). Slater and Narver (1995) also argued that market orientation is “inherently entrepreneurial” because a market oriented firm is able to anticipate and respond to “the latent and emerging needs of their customers” (Jaworski, Kohli, & Sahay, 2000; Slater & Narver, 1998). Narver et. al. (2004) accept the two-dimensional view of market orientation is not controversial. They believe that market orientation has a proactive dimension and this has been overseen by the scholars so far. They also support their categorization with Atuahene-Gima and Ko’s study (2001) in which “a combination of market and entrepreneurial orientation improved the performance of product development” was found out.

Market orientation is seen as cultural values of some of the businesses. These values probably have many facets and needs explanation. Narver et. al. (2004) suggested two dimensions of market orientation and categorized them as “responsive market orientation and proactive market orientation”. The distinction between these two types of market orientation is based on the two types of needs—expressed and latent. The first is “responsive” market orientation, referred to as “customer led” in Slater and Narver (1998) and “customer compelled” in Day (1999). A business having this type of cultural values attempts to discover, understand, and satisfy the “expressed needs” of customers. The second organizational value is “proactive” market orientation in which a business attempts to discover, understand, and satisfy “the latent needs” of customers. To date, the satisfaction of latent has been searched in some studies but (Kohli & Jaworski, 1990; Narver & Slater, 1990; Slater & Narver, 1995) more systematic empirical analyses needs to be done to comprehensively understand the nature of it. In the literature so many researches have been done to link market orientation with other constructs. However, responsive dimension of market orientation has been the main focus in these studies. Thus, their findings might have fallen short to reveal to explain the relationships between the constructs.

Past studies have suggested that relationship between market orientation forms and firm performance might be moderated by some environmental variables, such as market turbulence, competitive hostility and market growth (Atuahene-Gima, 1995; Slater & Narver, 1994; Baker & Sinkula, 2007; Ledwith & O’Dwyer, 2009). In their study Slater and Mohr (2006) analyzed the moderating effect of strategy on the relationship between market orientation types and performance. Thus, to date no empirical analysis of the market orientation–performance relationship of which Narver and Slater (1990) and Kohli, Jaworski, & Kumar (1993) have utilized adaptability as the moderating factor on the relationship between market orientation forms and firm performance. This research is an attempt to expand on the past studies by
including adaptability of organizations as a moderating variable in the relationship between two forms of market orientation and performance of the firms.

2. Literature review

Customers have needs to be satisfied by the firms and expressed and latent are two forms of needs in which both customer needs and solutions exist (Leonard-Barton, 1995). This distinction forms the basis of the categorization of market orientation (Narver et. al., 2004). Expressed needs and expressed solutions are defined as the needs and solutions of a consumer of which the consumer is aware and, thus, can express. Thus, for instance, an expressed need is “hunger” for which one expressed solution could be “hamburger.” A consumer usually can easily utter such expressed solutions for their expressed needs when asked. “Latent needs and latent solutions can be defined as needs and solutions of which the consumer is unaware” (Narver et. al., 2004). Although it is difficult to discover latent needs, they are as important as the expressed ones. For example, at the beginning of the development of computers, the need for the benefits of a personal computer was a latent need. Expressed needs can be easily observed by every organization, and thus organizations trying to satisfy them may not gain a competitive edge. However, as discovering the latent ones is difficult, many organizations might fail to identify them. Thus those organizations which have the ability to discover them might gain competitive advantage in the market place.

Responsive market orientation refers “to the generation, dissemination, and use of market information pertaining to the current customers and product domain and focuses on expressed customer needs” (Jaworski et. al., 2000; Slater & Narver, 1995). In fact, researchers defined responsive market orientation as “the business’s attempt to understand and to satisfy customers’ expressed needs” and a proactive market orientation as “the attempt to understand and to satisfy customers’ latent needs”. “Firms might develop either expressed or latent solutions to the expressed needs of customers” (Slater & Narver, 1998). Developing latent solutions requires resources in terms of many features of organizations, such as human resources, financial resources, and maybe the most important one related with R&D capacity. In essence, to develop proactive market orientation culture, in addition to being close to the customers, being creative and open to innovation is highly necessary. As a result, in some cases, one organization might sacrifice its current products for the sake of satisfying the latent needs of customers (Jaworski et. al., 2000; Narver et. al., 2000; Slater & Narver, 1998).

In most cases, in order to discover and to satisfy the latent needs of customers, organizations might have to persuade the customers with the solutions they develop for them. Because it is widely known that innovation faces resistance and especially solutions for latent needs might face even more resistance. Hence, Narver et. al. (2004) describe “market orientation that leads customers rather than merely responds to them and label them as proactive market orientation”. Based on their suggestions it can be inferred that satisfying expressed needs with even very innovative and distinct product does not indicate that that organization is holding proactive market orientation values.

Recent researches (Atuahene-Gima, Slater, & Olson, 2005; Narver et. al., 2004) have suggested that a proactive market-oriented culture plays a more important role in the performance of the organizations than a customer-led culture-responsive market orientation is considered as a customer-led culture. The reason for it needs to be explained and in the literature some studies are trying to bring up explanations. However, as the concepts are at their birth more and complicated and interrelated more studies needs to be done to uncover some possible reasons.
Furthermore, Govindarajan and Kopalle (2004) suggest that firms having proactive culture a researchers sayings. In their studies, they have found out that a customer orientation focused on main customer segments is shown to inhibit the development of innovations, which supports the results of Narver et. al. (2004). Narver et. al. (2004) claim that “these two dimensions of customer orientation are not on opposite ends of a continuum but are independent of each other, suggesting that firms can develop both orientations simultaneously”. However, it might be difficult for the same organization to be proactive while acting responsively because each cultural value might require different organizational behaviors.

Organizations can be responsive by taking action using the information they reach and have. This indicates that learning organizations are more apt to develop responsive market orientation. Kohli et. al. (1993) suggest that organizational responsiveness is directly related with performance and those organizations taking action based on the information they acquire are good at coordination well, which impacts the performance positively. These suggestions are consistent with the approach of Levitt and March (1988), “examining the mechanisms used by firms to acquire any kind of knowledge developed by a competitor”.

Atuahene-Gima et. al. (2005) argue that “responsive and proactive market orientations may require different organizational conditions to ensure positive influence on firm performance due to the potential costs and risks”. A well working coordination mechanism is needed develop such organizational culture. The coordination is needed to identify both the latent and expressed needs of customers. In addition, as it has been argued in previous researches, the applicability of market orientation varies according to the environmental context (Cadogan, Cui, & Li, 2003; Rose & Shoham, 2002). It is relevant to say that organizations ability to fit to the organizations to the changing environment also plays an important role in the application of two forms of marketing orientation. In the past studies environment was analyzed as a moderator on the relationship between market orientation forms and firm performance (Tsai, Christine, & Jyh-Huei, 2008). However, some firms might adapt to the changing environment and make use of new opportunities and take necessary precautions to avoid from the threats better than others. It was suggested in the literature that “some other organization related factors should also be moderating the relationship between market orientation forms and firm performance”. It will not be enough for firms to successfully apply market orientation and to perform satisfactorily if they don’t have adaptability.

A fundamental topic in the literature on organizational change has been the attempt to identify the factors forcing organizations to adapt to environmental change. The contingency and resource dependency theories (Thompson, 1967; Pfeffer & Salancik, 1978), the strategic change literature (Ginsberg, 1988), and the organizational learning and evolution literature (Levinthal & March, 1993; Nelson & Winter, 1982) all try to explain organizational adaptation. Organizational adaptation is also explained with population ecology (Hannan & Freeman, 1984), institutional theory (DiMaggio & Powell, 1983), and studies on strategic decision-making process (Child, 1972; Daft & Weick, 1984).

Organization theories deal with adaptation and how firms adapt to the environmental changes. Moreover, they discuss the conditions that need to appear in organizations to be adaptable (Lawrence & Lorsch, 1967; March, 1988). Valle (2002) and Chakravarthy (1982) sees adaptation as the main feature of strategy by which organizations cope with the environment for the long term survival and growth. They describe adaptive abilities of a firm as the organizational capacity, which is related with spare resources of the organization. However, their
definition of organizational adaptation falls short to find explain the effect of adaptability on market orientation types.

Most researchers (Jankowicz, 2000; Koberg, Chesley, & Heppard, 2000; McKee, Varadarajan, & Pride, 1989) “consider the concept of adaptability as a useful organizational counterpart to the changing marketing environment”. Thus, it can be inferred that adaptable firms more likely to fit to the changing environment. Koberg et. al. (2000) suggest that adaptation includes various changes, including changes in organization’s control systems, allocation of resources, technology, and structure to changes in a firm’s strategy.

Managers deal with ongoing changes in the environments by applying various “adaptive responses” (Koberg, 2000; Valle, 2002; Johnson, 1995). As Sorenson (2003) suggests one of these responses is formation of the organization structure which plays an important role in the adaptability of organizations. Loose organization structure in which less hierarchy exists provides organization flexibility, and thus they can easily change when necessary. Miles & Snow (1978) typologies of strategic orientation might help in understanding the adaptation process and organizational adaptation. Their typologies might be used to explain both market orientation types and adaptability of firms. Miles and Snow (1978) postulate that “competing firms within an industry show patterns of behavior representative of four competitive strategy types: prospectors, defenders, analyzers, and reactors”. The prospectors constantly search for new products and markets and are more eager to change because they continually try to develop products and enter into new markets. The defenders, whereas, have a narrow and stable product range and market area and they try to protect their position in the marketplace. Therefore, they seldom make “major adjustments in their technology, structure, or products”. Thus they try to gain efficiency by doing so. Managers of prospectors to be proactive “spend more time on scanning its external environment and evaluating changes in the marketplace”. Therefore, they might develop proactive market orientation which will help them to achieve their goals.

An adaptive organization is defined as the one that recognizes rising marketing trends, identifies the threats and opportunities within a market, and adjusts to new environment conditions (Ginsberg & Venkatraman, 1995; Ginsberg & Buchholtz, 1990). As McKee et. al. (1989) suggest these firms do “market scanning, monitoring customers, cultivating customer loyalty via appropriate marketing programs, engaging in product development, monitoring competitor’s pricing, building an extensive distribution network, developing promotional programs, screening and training personnel, and lobbying various levels of government for action favorable for the firm”. These activities all help the organizations observe the changes and make necessary adjustments. In fact, these are the main marketing activities a firm should carry out to adapt a market and achieve its goals (Brenan, Turnbull, & Wilson, 2003).

Fey and Denison (2003) define adaptability as “being able to translate the demands of the business environment into action”. They suggest being adaptable requires “customer-driven actions, taking risks, learning from their mistakes, and creating change”. Denison (1990) suggests that the main three features of adaptability which impacts organization's performance are as follows. First, as they develop distinct abilities, they can easily to perceive and respond to major changes within the external environment the nature of competition. It might be easily observed within the literature that successful organizations (which achieve their goals and mission) are focused on their customers’ needs and their competitors’ strategic steps. Second feature of adaptable firms is their ability to respond to members of the organizations which are also called internal customers. This feature is especially needed to be responsible to the environment because organizations learn and apply their learned knowledge through their
employees. Third is the capacity to change the established attitude and behaviors of members within the organization. This capacity will even increase the flexibility of the organization and increases effectiveness. Hrebinak & Joyce’s (1985) definition of effectiveness supports this suggestion. Therefore, it is posited in many studies that adaptability of organizations impacts organizational performance to a large extent (Fey & Denison, 2003; Oktemgil & Greenly, 1997).

Moderating role of adaptability

Day (1994) suggested that “although a firm may be market oriented, the implementation of its market orientation may be weak relative to other firms”. This suggests that some other factors should interact with these market orientation types to increase the performance of the organizations. One of these factors is believed to the adaptability of the organizations, which expediate the application and development of these cultural values. However, it is not clear which interaction of adaptability is more effective on the performance. Change is needed to respond and be proactive in the market place. Adaptability provides the firms adjusting ability to the changing environment, and thus it goes hand in hand with market orientation types. Marketing forms are explained as cultural values of a firm. However, they do not explain if firms are able to act in accordance with such cultural values. It is posited that adaptability has moderating effects in the relationship between responsive and proactive market orientations and performance.

Based on the literature review following hypothesis have been developed:

H1: Responsive market orientation affects firm performance negatively.
H2: Proactive market orientation affects firm performance positively.
H3: Adaptability affects firm performance positively.
H4: The effect of responsive market orientation on firm performance becomes positive when the firm has high adaptability.
H5: The effect of proactive market orientation on firm performance is stronger when the firm has high adaptability.
H6: Proactive market oriented firms perform better than reactive market oriented firms as the adaptability of firms increases.

The model depicting the relationships among the constructs is below.

![Figure 1. Research Model](image-url)
3. Methodology

3.1. Sample and data collection

The sample was drawn from small and medium sized firms which are members of İstanbul Chamber of Commerce. This is a nonrandom sample in which firms were selected to comprise a broad spectrum of industries. Small and medium sized firms were chosen for the reason that most of the firms in Turkey fall in this category and they have a significant role in the business life in Turkey. To be able to make generalization, firms were chosen from various industries including finance, retailing, wholesaling, manufacturing, etc. This is relevant because the researched subject is not restricted to any industry. The owners or the senior marketing managers who are believed to have enough knowledge about the marketing activities and strategies of the firms to answer the questionnaire and are the decision makers in the firm are chosen as the respondents. The answers were obtained with face to face interviews. 450 Firms were chosen but some of them either could not be reached or rejected to answer the questionnaire. After reviewing the answered questionnaires, 406 of them were decided to be used in the analysis. The response rate is 90%, which is high enough to carry out the analyses. To test non-response bias, independent t-test to compare early and late respondents was carried out and no significant difference was found.

3.2. Measures

The respondents were told that the survey (titled ‘‘Firm Practices Survey’’) is designed to study practices in firms. There is no mention of market orientation forms and adaptability in the survey. The questionnaire used a five-point Likert-like scale for respondents to indicate the extent (from ‘‘not at all’’ to ‘‘to a very substantial extent’’) to which they agreed with the statements in the questionnaire. The reliability of these measures was calculated using Cronbach’s alpha; a coefficient alpha of greater than 0.7 was required (Nunnally, 1978). Responsive market orientation and proactive market orientation were measured with the scale developed by Narver et. al. (2004). Responsive market orientation was measured with 8 items and the reliability was 0.90. Proactive market orientation was measured with 7 items and the reliability of scale was 0.88. Adaptability of the organizations was measured with the 15-item scale developed by Fey and Denison (2003) and the reliability of the scale was 0.91. The items were computed and the dependent and independent variables were formed to be used in the analyses. The dimensions of performance used were return on investment, increases in sales, and overall performance evaluation. These dimensions were used in the scales developed by Dess and Robinson (1984), Pelham and Lieh (2004), and Brouthers and Xu (2002) and the reliability of the scale was 0.85.

3.3. Results

Construct means, standard deviations, and interconstruct correlations are provided in Table 1. The hypotheses were tested with a three-step hierarchical moderated regression analysis (Table 2). An initial regression was run to test the effects of responsive and proactive market orientations on performance (model 1). Adaptability of firms, which was accepted as the moderator, was added to the model (model 2). The squared terms for both responsive and proactive market orientation were added in Model 3. To get rid of the effects of multicollinearity caused by the linear relationship among the explanatory variables, variance inflation factor was applied. The results in Table 2 (model 3) show that the addition of the interaction terms to the main effects model increases R square by 8 percent (F-statistics 11.21, p<0.001). With respect to
the effects of responsive market orientation, H1 was supported ($\beta =-1.025$, $p<0.03$). The coefficient for the squared term of responsive market orientation is positive and significant ($\beta =1.524$, $p<0.04$). Therefore, H4 was supported, too. H2 was not supported as the significance is below the acceptable level ($p= 0.87$). Hypothesis 5 was not supported either because the interaction of proactive market orientation and adaptability is not related to firm performance ($p=0.85$). The results show that adaptability does not have positive effect on performance, so H3 is not supported ($\beta =-0.631$, $p<0.001$). A contradictory result was obtained about the moderating effect of adaptability and H6 was rejected. In the literature review, it was mentioned that proactive market oriented firms perform better than responsive market oriented firms when the adaptability is high. However, responsive market oriented firms are found to perform better, as the interaction of adaptability of firms and being responsive market oriented has positive effect on performance.

3.4. Discussion

Most of the results support the findings in the literature. Responsive market orientation has negative effect on performance, which is in alignment with results of most researches. Listening too much to customers might hinder firms to make innovation, and so effects the performance negatively especially in the changing environment. However, it was not expected proactive market orientation to have negative impact on performance. This might be explained with the nature of the sample which consists of small and medium sized firms. Such firms fail to proactively satisfy the latent needs of customers, which is an interesting finding of this research. Adaptability alone influences firm performance negatively and this result is also parallel with some of the researches. In these researches, it was found that “adapting to market change is likely to be costly, as implementing adaptability requires resource utilization, and there may be some loss of internal efficiency as an outcome of adapting to markets” (McKee et al., 1989). In these researches, it was found out that firms trying to achieve adaptability spend so much resource that in the short run they obtain negative performance results. Nevertheless, the interaction of adaptability and responsive market orientation causes better performance results in small and medium sized firms. On the other hand, even if the small and medium sized firms have adaptability, proactive market orientation doesn’t provide them with higher performance results.

4. Conclusion

A business to maximize economic value it creates must be market oriented to find needs and fill them rather than just to make products and sell them. Therefore, a business must be market oriented to achieve its mission and goals and have competitive edge. The relationship between a market orientation and firm performance has been tested formally in several researches. In the last decade, market orientation has been explained with two dimensions: “responsive market orientation,” in which a business responds to the expressed needs of its target customers and, by contrast, “proactive market orientation” refers to a business attempting to discover and satisfy customers’ “latent needs,” or opportunities for satisfaction of which a customer is unaware. In the researches effects of each form on firm performance have been proven. In some of the researches, it has been suggested that some other variables should be moderating this effect. In this research, adaptability, which is defined as the capability of a firm to adjust to the changing environment, is examined as the moderator.

This article has presented a review of the conceptual case of both proactive and responsive market orientation behaviors and the condition to apply these behaviors, adaptability. Empirical evidence supports that a business needs to have the ability to apply these market orientation
forms, which are considered as cultural values. The objective was to examine the empirical relationships between market orientation, adaptability and their interaction with firm performance. It was expected in the present study that the strength of the proactive market orientation relationship to firm performance would be higher when adaptability of firms increases. However, the results did not support these expectations.

Over the past decade, the value of being market oriented has received widespread attention, and many businesses have invested heavily in efforts to become more market oriented. However, market-oriented behaviors will not be enough to be successful in the changing market environment. Therefore, for any business to create and to maintain sustainable competitive advantage continually, it must support its proactive market orientation culture with firm capabilities.

Limitations and suggestions for future research

Although this study is believed to have relevant and interesting results, it is important to see limitations it has. First, the sample consisted of just small and medium firms; big firms would further strengthen the findings. Second, it was conducted within Turkish context; extending it to other geographical regions would be facilitated. Several authors have already gathered data using similar measures and indeed have reached some similar results; extending the study geographically should therefore be possible. Finally, firms from a variety of sectors were included in this research project, which can be criticized as various industries may reveal different results. Similar studies might be carried out in the context of larger firms and separately in various industries to be able to do comparisons.

ABSTRACT
Scabies caused by sarcoptes scabiei is common itching dermatosis in Pakistani less developed communities. Its epidemic study was carried out in internally displaced persons camps (the immigrant camps) of District D.I.Khan, District Hangu and District Bannu (Khyberpukhthoonkhwa). A total of 2500 patients out of approximately 22000 were found suspected for scabies, out of which 1928 cases were confirmed with the skin scrapping method as positive. Out of these 1928 positive cases, the overall prevalence, according to age, in children, adults and aged was 48.8%, 10.7% and 40.6% respectively. The seasonal prevalence recorded was 67% in the month of November, December and 33% in April; May. Prevalence noted according to gender was 74.6% for females 25.4% for males. The total percentage of the disease outbreak was 8.7%.

Keywords: Epidemic, Immigrants, Skin scrapping, Prevalence, dermatosis, KPK.

INTRODUCTION:
Scabies the dermal skin disease caused by infestation of sarcoptic scabiei, has been a common disease for at least 3000 years and was known in China, India, and the Middle East, although usually confused with lice (Anon., 1948). The scabies mite was first described by Avenzoar and his Students in Spain in the 12th century (Arene, F.O. and Ukaulor, A.L., 1985; Abdel-Hafeez et al., 2003; Andrew, J.R.H., 1991).

Sarcoptic scabiei is 0.3–0.5 mm in length and adult females are at the limit of visibility (Srivastava et al., 1980; Stanton et al., 1987). Away from their hosts, mites are able to survive and remain capable of infestation for 24–36 h at 21°C and 40–80% relative humidity (Suleman M and Jabeen N., 1989; WHO PFS report., 2008). Lower temperatures and higher humidities lengthen its survival (Alexander, J.O., 1984); For example, at 10°C and 97% relative humidity, mites remain capable of infestation for about one week (Stanton et al., 1987; Suleman and Jabeen N., 1989). However, at temperatures below 20°C, they are unable to move and cannot
penetrate the skin (Abdel-Hafeez et al., 2003). At 34°C; mites survive for fewer than 24 h, irrespective of environmental humidity. The mites’ infectivity decreases, the longer they are off their host (Stanton et al., 1987; Suleman and Jabeen N., 1989).

Scabies, caused by the mite Sarcoptic scabiei is transmitted mainly by interpersonal contact (Arlian, L.G., 1989). The life cycle begins as the adult female lays its eggs while burrowing into the skin. The eggs hatch to release larvae, which moult into several instars. The six-legged larvae hatched after 3–4 days and escape from the burrow by cutting through the roof. The larvae then dig short burrows (moulting pockets) in which they transform into eight-legged adult males and females. Mating occurs after a male penetrates the moulting pouch of an adult female. Impregnated females extend their moulting pouches into burrows, laying eggs as they go. Developments from egg to adult takes about 10–15 days and less than 10% of the eggs laid grow into mature mites (Alexander, J.O., 1984).

Transmission is by person to person and fomites, such as bedding and clothing (Arlian, L.G., 1989). Mites are predominantly found between the fingers and on the wrists. Rashes may occur on the abdomen, axillae, pubic area, knees, ankles, buttocks, elbows, and between the shoulder blades (Mellanby, K., 1985; Orkin M and Maibach, H.I., 1985; Porter, M.J., 1980). Mites hold onto the skin using suckers attached to the two most anterior pairs of legs.

A severe manifestation of the disease i.e., crusted scabies can occur which may predispose to streptococcal Pyoderma and the subsequent development of acute post streptococcal glomerulonephritis, acute rheumatic fever and rheumatic heart disease (Arlian et al., 1984). Due to unhygienic conditions, individuals get infected with ecto-parasites (Arlian et al., 1989; Arzensek, J. and Mayer, V., 1977).

Scabies is a widespread disease in many countries including Pakistan, where environmental and unhygienic conditions and encourage its growth and transmission. The disease is most prevalent in cold wet weather and spreads slowly during the summer months. The impact of the scabies on humans is on their general health and growth, but in severe infestation especially in children and elders, the disease may terminate fatally. The ectoparasitosis is endemic in resource-poor urban and a rural community throughout the world (Bakos et al., 2007; Burgess, I., 1994). Itching is commonly present and, due to subsequent scratching, leads to secondary infection (Bakos et al., 2007; Currie et al., 1994; Currie et al., 1997). Acute glomerulonephritis caused by nephritogenic strains of streptococci is a known complication, particularly in the tropics (Currie, B.J. and J. Carapetis, 2000; Currie, B. and U. Hengge, 2006; Downs et al., 1999). The ectoparasitosis is more common in younger age groups and infests millions of school-age children (Green, M.S., 1989), for instance, 58% of school children in Bristol (U.K.) and 50% of school children in rural Brazil were found to be infested (White et al., 2001). In deprived communities the prevalence may reach 20–40% in the general population (WHO, Pakistan, HCB. 2010). Overcrowding and the continuous availability of new cohorts of susceptible young children may maintain the infection cycle in communities where scabies is endemic, whereas during war, the most likely reason for outbreaks is the crowding together of scabies in adult populations (Hoy et al., 1996).

In recent years, the prevalence of scabies, caused by infestation with the sarcoptes scabiei var hominis, has increased due to heavy migration of the peoples from the war inflicted areas from South Waziristan Agency, North Waziristan Agency and Aurakzai agency of tribal areas to D.I.Khan, Bannu and Hangu respectively.

Reliable data on the prevalence and morbidity of scabies given in the report by WHO is 5% and 10% in 2009 and 2010 respectively for internally displaced persons in different migrant as well as local communities (Heukalbach et al., 2005; Mellanby, k., 1941). However, the migrants of North Waziristan, South Waziristan and Aurakzai agency were neglected in that report. In the present study the residents of the mentioned three camps were assessed through direct intervention in the community as well. Additionally, seasonal variation of scabies outbreaks as
well as other ecto parasites was also noted two times in a year. Although the least study has been carried out to find the prevalence of scabies in different migrant camps in Khyber pukhthoonkhwa, Pakistan. To carry out such sort of studies would be helpful in planning efficient and effective health care delivery to the migrants as well as disasters in time to come.

OBJECTIVE:
The objective of the study was to assess the occurrence and pattern of scabies among different migrant populations.

MATERIALS AND METHODS.
Study areas

The study was performed in three areas in District D.I.Khan migrant’s camp, District Hangu and District Bannu migrant camps situated at Khyber pukhthoonkhwa in Pakistan. The poor and resource deficient migrants along with their livestock were studied at their camps. The camps were close to the inhabitants of poor communities. The camps established in the above three mentioned areas were facing troubles of lack of electricity, lack of proper washing rooms, lack of pure and hygienic drinking water as well as over congestion in the specified camps.

Many camps are made up by establishing of plastic materials as well as light cloth rooms and do not have proper floors. Roads and paths were not paved properly in the encircled area. There were no back yards and usually the inhabitants were confined to their camps only. Waste collection was performed besides the boundaries of the camps, and rubbish of all sorts was scattered throughout the area. The hygiene conditions were precarious due to no public sewage system. In these aspects, the study area is comparable with the many other boweries in Khyber pukhthoonkhwa established camps.

Study design

In November 2009, D.I.Khan camp was inhabited by 10000 individuals belonging to 2000 households. A survey was carried out in November, and all households were again visited in May of the year 2010. The Bannu camp and adjacent areas was inhabited by 800 families with a total population of 4000. A survey was performed there in November 2009 and repeated in April 2010. The Hangu camp was inhabited by 1600 families with a total population of 8000. A survey was performed there in December 2009 and repeated in May 2010.

During a preparatory phase contacts were made with the camps inhabitant leaders and meetings were held with the Health personnel concerned of each study areas in which the objectives of the study were explained. Data were collected by door-to-door surveys. If family members were absent, their houses were revisited on two further occasions. Missing individuals were also invited to come to the local health centre. To reduce inter-observer bias, in each study areas the clinical examinations were performed by the same investigator.

Examination of patient

We thoroughly examined the affected skin patients of each family member and those found suspected for scabies were subjected to skin scrapings for differentiation whether suffered for scabies or psoriasis or impetigo. Diagnosis was made through skin scrapping as well as clinically. Genitalia examinations looking for lesions were not performed. Scabies was diagnosed clinically by finding the tunnels in the skin, erythematous papular, vesicular, pustular or bullous lesions through magnifying glass associated with itching and a positive family history (i.e. at least one other family member with similar symptoms). Other pruritic skin diseases were excluded.

Lymphadenopathy and secondary bacterial infection was also considered under observation. Secondary infection was defined as the presence of pustules, suppuration or ulcers. Study participants with an ectoparasitosis were asked to grade itching semi quantitatively as: Z, absent; W, weak; M, moderate or S, severe. To minimize subjective judgments, the same pattern was used in which the different degrees of itching were visualized.
Epidemiology of scabies in Khyber Pukhtoonkhwa Migrant Camps:

Prior to the studies, meetings with community health workers and community leaders were held and the objectives were explained. Informed oral consent was obtained from all adult participants and from the parents or legal guardians of the households. All study participants with scabies and family members were treated at the end of the study with topical use of rape seed oil 50ml each for patient satisfaction as well as to get information about its efficacy. This treatment scheme has been shown to be highly effective against scabies in ethno practices.

Results

During both winter and spring survey in month of November for D.I.Khan camp 81% of the total population was examined i.e.10000 individuals belonging to 2000 households (each family comprised of an average five members). In the Bannu camp and the adjacent community 91% of the population was examined for the presence of scabies in November and in the Hangu camp 85% of the population was examined in December. The individuals in each study area were grouped according to gender and age, as shown in Table II and figure-II

![Figure- I: Prevalence of scabies according to gender](image1)

![Fig-II:- Scabies Prevalence according to Age (individuals aged of 13-80 years)](image2)
Fig. I shows the prevalence of scabies by gender in all of the three migrant camps collectively. 74.6% of the female population was found positive for scabies, while 25.4% of the male population was positive male. Figure-II shows age wise prevalence. Prevalence in children, adults and aged were 48.8%, 10.7% and 40.6% respectively. While Fig-III, comparing prevalence according to season, indicates 67% collectively for November and December and for April, May indicates 33% prevalence.

Statistical analyses were carried out on the survey data using a one tailed test t-test assuming equal variances. In all the camps residents, more females than males were infected with scabies (P < 0.05) [Table-VII], and more children than adults were infested (both P < 0.05) [Table-V]. Scabies incidence was also significantly in aged (aged 51-80) in comparison to adults (aged 13-50) (p<0.05) [Table-V]. However, it was not significantly higher in old age people than children as (p> 0.05) [Table-V]. Scabies was endemic in these camps as well as in the adjacent communities. The prevalence of scabies in the total population and stratified by sex is shown in Table –I.

Scabiosis was more prevalent in children, no sex differences were observed. Scabies was more common in the old aged and children than adults, (P < 0.05) and is shown in Table-II. Seasonal-specific prevalence patterns showed a considerable seasonal variation of prevalence (Fig. III) &Table-III/IV. Prevalence of scabies was higher in November to December than in April and May and the results were statistically significant both at one tail and two tail test assuming equal and unequal variance as (P<0.05).The multivariate analysis of factors predicting the presence of scabies showed that all three explanatory variables (female, young and aged living in the migrant camps) besides season contributed significantly to being predisposed for infection. In both age groups, the axially as well as webs were the body part most commonly affected. The numbers of topographical sites affected were independent of age and sex. Morbidity attributable scabies is summarized in Table-I, II, III, IV. Secondary infection was much more frequent in individuals infested with scabies (11–17%).
Discussion:

Many previous studies have shown the epidemiological prevalence of different ectoparasites according to age, sex, season and communities. However, less was known about scabies before the current study was conducted. Infestation levels in our study area were comparable to those reported for internally displaced persons of Khyber pukhtoonkhwa, WHO, report, 2010 (Five percent), Pakistan Flood Situation Report, 2008. (Ten percent), Pakistan hujaj 2009, (9.9%), Swat/ Khyber pukhtoonkhwa, WHO report (5%). The prevalence of scabies found in our study areas was lower than reported in the general population from Pakistan (37%), (Schmeller,W. and A. Dzikus., 2001) and Egypt (19%), (Reid et al.,1990). In contrast, there are many studies on the prevalence of scabies in school children from virtually all parts of the world. As the diagnosis of scabies in our study was done by visual inspection as well as superficial skin scrapings, some individuals with low infestations may have been missed. Thus, the prevalence in the population may be slightly higher than observed. Our data confirm that scabies is most common in children then in old aged, but showed that scabies also occurs to an important degree in adults. This is of practical importance, as control strategies usually focus on treatment of school children, neglecting the family contacts. As a consequence, rapid reinfection is to be expected. Previous reports of gender differences in scabies are contradictory: One study reported females being more affected than males, (Nair et al., 1977 and Green M S.,1989) whereas two other studies, respectively, showed male predominance and no gender differences (Sharma R S., 1984; Srivastava et al.,1980). We found significant gender difference in both populations studied. In temperate climates, seasonal variation of scabies has long been known, with a higher prevalence in the colder months (Tuzun Y et al., 1980). This is usually attributed to temperature differences causing people to stay indoors during winter, which would result in a higher host density as compared with summer. In war inflicted areas as there is untoward situation the migrants does not find suitable environment to survive, there is dampness’ as well as severe unhygienic condition. At least in developing countries, and particularly when there is war rampage, access to water is restricted, poorer personal hygiene and a lower frequency of washing and changing clothes during the cold season could be contributory factors.

In addition, mite survival on and off the host is prolonged in a cooler environment (Tuzun Y et al., 1980). These factors may explain why a clear seasonal variation of scabies prevalence has not been described in tropical countries. The increased number of cases identified at the school after November may reflect the seasonal variation in the incidence of the disease noted in previous epidemics: an increase in the fall and winter followed by a decrease in the spring and summer (Meloney k; 1976). Our study showing occurrences of seasonal variation confirms similar findings from Poland. (Shelly, F. et al., 2006).

It is possible that secondary infection of the skin is treated early after appearance in the common communities, but is left untreated while there is war like condition. In fact, disease perception and health-seeking behaviour with regard to parasitic skin diseases are different in the different weathers.

The topographical distribution of lesions observed in our populations was similar to those described previously, typical predilection sites being the trunk, arms and axillae (Mellanby K., 1941; Orkin M and Maibach H I., 1985; Porter M J., 1980). Infestation of the genitals seems to occur mainly in certain high-risk groups. As during the door-to-door survey privacy could not be guaranteed, the genitals were not examined. It has been noted that in infants and small children the distribution of lesions is often atypical, with infestations of the face, neck, scalp, post auricular area and soles (Mellanby K., 1941; Orkin M and Maibach H I., 1985; Porter M J., 1980). In our study, infants showed disproportionately more lesions on the claws, soles and axillae, whereas in older children and adults the axillae and the hands were affected almost twice as frequently.
In both populations, study participation was high. However, in the longitudinal study we cannot rule out a certain non-participation bias, especially in the November survey when only 81% of the target population was examined. As adult males, the subgroup with the lowest prevalence of scabies, were under-represented the true population prevalence might actually be lower than reported. Another bias which may have interfered with the data from the second survey is that infested individuals might have sought treatment scabies after they had been informed of the respective diagnoses. In this case the lower prevalence’s of scabies observed at the second survey would be the result of an indicator of changing environmental factors. However, a previous study in a similar setting has shown that parasitic skin diseases are neglected by the affected individuals and do not causes people to present for treatment at the primary health Care. Young, female and old aged living in camps were found to be independent determinants for scabies mites, indicating that demographic, behavioural and environmental factors contribute to secondarily bacterial infection in resource-poor settings.

In Khyber pukhthoonkhwa, scabies is commonly treated with topical benzyl benzoate or pyrethroid. Ivermectin is registered as an oral drug for both ecto and endoparasitic diseases. In resource poor settings, mass treatment with oral Ivermectin, which after millions of administered doses did not show significant adverse events, may be an approach to control parasitic skin diseases (Heukelbach. et al., 2005)

Acknowledgments.

This study was part of my PHD program sponsored by Pakistan Higher Education Commission, Islamabad. We are thankful to the residents of D.I.Khan, Bannu and Hangu as well as the Health personnel’s contacted and the immigrant’s cooperation.

THE ROLE OF WATCH – DOG INSTITUTIONS IN ENFORCING ETHICS AND ACCOUNTABILITY IN THE NIGERIA PUBLIC SERVICE

BENSON Kunle Sehinde
Phd. Department of Public Administration
Obafemi Awolowo University, Ile–Ife, Nigeria.

Abstract
The Nigerian Civil Service is saddled with the responsibility of implementing the policies and programmes of government. The calibre of the public officials and the quality of their ethical behaviours as well as their level of accountability have great implication on the socio-economic development of the nation. Successive administrations in Nigeria have made frantic efforts to deal with unethical practices within the Public Service through several anti-corruption crusades, as well as putting in place institutions to serve as watch dog. Such institutions include Code of Conduct Bureau, Code of Conduct Tribunal, the Ombudsman, Public Service rules, specialized and Adhoc Bodies and Public Account Committee. This paper, which examines the role of Watch Dog institutions in enforcing ethics and accountability in the Nigeria Public Service, traces the history of unethical behaviours in the country’s Public Service from 1960 when Nigeria became independent till the present time (2010). The Watch-Dog institutions have been playing remarkable role in the fight against unethical behaviour in the Public Service, but most measures put in place have failed because they were introduced in an overall political and policy environment that was not sufficiently conducive to enable the success of the measures. The paper shows that despite government’s efforts to bring sanity to the Public Service, unethical behaviours and corrupt practices still persist in the system. This paper concludes that the watch dog institutions have the potentials to bring sanity to the country’s Public Service if given the right political atmosphere and the needed institutional support as well as the involvement of all and sundry in the society to fight against corrupt practices.

Key words: Civil Services, Public Service, Ethics, Accountability, Corruption, Watch-Dog Institution.

1 Introduction
The Public Service is characterized by privileges and obligations basically essential in the conduct of public affairs. Membership of the Public Service arises from a voluntary choice of employment. By becoming a public servant, a person assumes these obligations, which include administering laws to which his duties pertain, rendering faithful service to affect the aims and objectives of the government, implementing lawful decisions, advising his political master and above all serving the public diligently and impartially.

Public officers have ethical obligations to observe which create and maintain standards which constitute the atmosphere in which public servants work and live. Against these backgrounds, the Public Service in Nigeria looks different. Public servants are not always objective, administration is often than not diffuse rather universalistic ascriptive rather than achievement focused. Rules are not always taken seriously. Sometimes, they are applied ad hoc and worse yet, discarded altogether according to convenience- all in the name of failing of ethics and morality of the Public Service.

Since Nigeria became independent in 1960, there have been so many reported cases of corruption, betrayal of public accountability and ethics against the Nigerian state. In the view of Osoba (2000) corruption is one of the legacies handed over to the Nigerians by the departing colonial officials as they collaborated with some citizens presided over a fraudulent and corrupt
accumulation system. The desire of Nigerians who took over from the departing colonial officials necessitated their throwing caution into the winds and jettisoning the principle of public accountability and ethics. The lack of accountability, unethical behavior and corrupt practices have become so pervasive and even institutionalized norms of behavior in Nigeria, to the extent that one may conveniently speak of a crisis of ethics in Nigeria Public Services.

The issue of ethics, accountability and its attendant corruption has been a vicious circle since colonial administration to the present date. The realization of the negative effect of poor level of accountability, ethics and corruption in the Nigerian Public Services and the consequent effect on the socio-economic development in Nigeria led to the government to put in place some anti-corruption policies and agencies to serve as watch-dog for upholding administrative sanctity.

It is not that corruption has not been recognized as the “enemy within” it is however, that the political will and the necessary institutional support to tackle this problem have been virtually absent except for the military regime of Muhammadu Buhari / Tunde Idiagbon (1983-1985) and the civilian administration of President Olusegun Obasanjo. Past futile interventions against corruption include the corrupt practices Decree of 1975. The public officer (Investigation of Assets) Decree No. 5 of 1976, supplemented by the Code of Conduct Bureau and Code of Conduct Tribunals as provided for in the 1979 constitution; Shehu Shagari’s Ethical Revolution (1979-83), with a minister of cabinet rank in charge of national guidance. “The war against indiscipline” (WAI) campaign under Buhari/Idiagbon regime in 1984-1985, which was to some extent the only serious intervention, and the national Committee on corruption and other Economic crimes under Ibrahim Babangida regime (1985-93). The Babangida regime also came up with the Corruption Practices and Economic crimes Decree of 1990. This Decree expanded the definition of corruption to encompass the private sector. It also avoided unnecessary technicalities and provided stiffer penalties. However, that government did not really take the issue of corruption seriously. It could actually be argued that corruption in Nigeria became institutionalized during this period. Even Sanni Abacha regime (1994-98) came up with its own anti-corruption Decree: the “indiscipline, corrupt practices and economic crime (prohibition) Decree 1994” which was largely a replica of the Babangida 1990 decree on Corrupt Practices And Economic Crimes.

In order to have an in-depth examination of the role of the watch-dog institutions in curbing corrupt practices in the Public Service, the paper focuses mainly on three institutions, these include the Code of Conduct Bureau (CCB). Independent corrupt Practices and other Related Offences Commission (ICPC) as well as Economic and Financial Crimes Commission (EFCC). For proper explication, the study proposes the following basic assumptions.

- Unethical behaviour in the Nigerian Public Service is certainly not a problem of psychological disposition, character deficiency, or even one of morality, but a problem of the character of the state and its relations with the society and conflicting legitimacies.
- In Nigeria, corruption has become more entrenched as politicians see politics as a business investment which must be recouped and yield profit for them at the expense of the welfare and development of the people.
- There is need to adequately empowered the various Commissions that are put in place to serve as watch-dog institutions for upholding administrative ethics in the Nigerian public offices.

The objectives of the study therefore, are to analyze the resurgence of interest on Nigerian government in preventing all forms of unethical practices in the public sector. It also assesses the performance of the institutions put in place by the government to eradicate corruption in the Public Service. The rest of the paper is divided into four sections. Section one examines the review of relevant literature. Section two deals with the analysis of watch-dog
institutions. Section three discusses why measures put in place by government to fight unethical behaviours seem unsuccessful; section four deals with the ways forward, and the final section is the concluding remarks.

II. Review of Relevant Literature

Civil Service: The word civil service commonly means belonging to the general public and not to the army. Literally, civil service connotes public or government service. It is a body of officials employed to serve the public in a civil capacity (Olagboye, 2005). All over the world, the civil service is a permanent body of officials employed to implement the plans and decisions of government. Adebayo (1986), is of the opinion that the civil service is the entire service of government which is divided into department and in which civil servants work.

The Nigerian civil service evolved from the colonial service which was established by the British authorities as the administrative machinery for governing Nigeria. The amalgamation of the then Northern and southern protectorates as Nigeria in 1914, under Lord Fredrick Lugard, led to the establishment for the first time, of what seemed like a unified service. The upper echelon of the colonial service was dominated by European on who were concentrated executive, judicial and legislative powers. Traditional rulers were also co-opted into the colonial power structure.

Following the creation of the three regions, North, East and West in 1954, were three regional civil services. A Public Service Commission was also established at the centre and in each of the three regions within the same period the federal and regional services, thereafter nurtured a career service within their respective domains. The creation of states to replace the regions, (12 in 1967, 36 plus FCT since 1996 to date), witnessed unprecedented growth to match the increasing responsibilities of the Federal and State civil services.

The Public Service is regarded as the pivot of the executive arm of the government responsible for the implementation of policies and projects enunciated by government (Olaopa 2008). The public office occupied by these public servants has its environment, its ecology, its culture, its language and its nuances.

Ethics for the Nigerian public servants includes some trait and attributes like discipline, good conduct, ideas, punctuality, loyalty, tidiness, kindness, good attitude to public fund, honesty, neutrality, politeness, courage, cooperation, courtesy, good dressing, tact, helpfulness, avoidance of delay etc.

The Nigerian Public Service is now plagued by indiscipline and poor work ethics including corruption, insensitive and lack of prompt response to demands of members of the public, flaunting of contract procedures and looting of the treasury, ghost name syndrome, false bills, export tax fraud, payment for letters of recommendation, nepotism favoritism, tribalism, inability to collect and account for government revenue, divided loyalty, rigging of election results, misuse and abuse of political office, conversion of public facilities for personal uses, wealth acquisitions through financial impropriety.

Administrative ethics can be conceived of as rules and regulations public officials are expected to conform to in the discharge of their official obligation (Grade 1995). It is often the breach of these sets of rules in the discharge of their official duties under public authority that constitutes corruption or unethical conduct in Public Service.

Ethics in any Public Service is expected to focus on what is considered the right and proper behavior of all public officials- civil servants as well as political officers. Among being just fair, ethics ought to provide the basis for accountability, while the concept and practice of accountability is expected to make public officials responsible for their actions and inactions. It is rather unfortunate that the essential ethical values have been eroded in the Nigeria Public Service in such a way that there is utter ethical decay.
Accountability

Accountability is the obligation to answer for a responsibility that has been conferred. According to Olowu (1993) public accountability is the requirement that those who hold public trust should account for the use of the trust to citizens or their representatives. He postulated further that public accountability signifies the superiority of the public will over private interests and tries to ensure that the former is supreme in every activity and conduct of a public official. While Ayo (1994) sees accountability as a faithful discharge of one's duties so that one is not found wanting.

The prevailing value system of the community therefore is the mirror of the expected behavior of its public employees. Therefore, the widespread corruption in the Public Service in Nigeria is a reflection of the decadence values or morality of our society.

Ekiyor (1994) further postulated that “the increase of materialistic way of life in Nigeria has resulted in declining social and moral standards”. The pursuit for wealth by public official and employees in the private sector has increased the desire to look for loopholes to cheat the government. Nigerians care less to probe into the source of individual wealth. The rich are much respected for being wealthy. Therefore cheating the government is considered a justifiable procedure. This act amongst others has resulted to corrupt practices among public officials.

Corruption

According to Nwabuzor (2003) corruption can be classified into two broad categories of materialistic and non-materialistic corruption. He argued further that non-materialistic corruption has to do with service or benefit unjustly received. According to Falana (2007) Corruption involves deviation from laws and formal procedures that may have been rational or even socially functional. Into this vacuum in the rule of law came a rapid divestment of state assert. Official corruption is theft form the nation. It robs the citizens of their potential aspiration for a brighter future, a better education, better health care, better access to housing, safety of life and properties, food, water and other subsistence needs.

The political bureau established in 1987 attributed the failure of the politics and governance in Nigeria basically to corruption. Also, the British department for international development (DFID) maintains in its Nigeria country strategy paper for the year 2000, that poverty persists in Nigeria because of the mismanagement of the resources and corruption found particularly but not exclusively in the public sector (Ayua 2000). In this regard, many public officials in Nigeria have not discharged their duties as expected. Some of them corruptly enrich themselves by undue inflation of contracts, and over-invoicing, flagrantly embezzling public money thereby betray the public trust in them.

III Analysis of Watchdog Institutions

This section examines and analyzes the selected watchdog institutions.

Code of Conduct Bureau

The Nigerian Constitutions of 1979, 1989 and 1999 made adequate provisions for the establishment of a body known as the “Code of Conduct Bureau”.

The body is to deal with complaints of corruption by public servants for the breaches of its provisions and ensuring that public office holders are made accountable in the discharge of their duties. So, also the body is to maintain a high standard of morality in the conduct of government business and to ensure that the actions and behavior of public officers conform to the highest standard of morality and accountability.

Functions

The bureau is expected to perform the following functions in line with part 1 of third schedule of the 1999 constitutions.

- receive asset declaration by public officer in accordance with the provisions of this act.
examine the asset and declaration ensure that they comply with the requirements of this act and of any law for the time being in force.

- take and retain custody of such asset declarations and
- receive complaints about non-compliance with or breach of this Act and when the bureau considers it necessary to do so, refer such Complaint to the code of Conduct Tribunal established by section 20 of this act in accordance with the provisions of sections 20 to 25 of this act. Provided that where the person concerned makes a written admission of such breach or non – compliance, no reference to the Tribunal shall be necessary.

According to part 1 of the fifth schedule of this constitution:

1. A public officer shall not put himself in a position where his personal interest conflicts with his duties and responsibilities.

2. Without prejudice to the generality of the foregoing paragraph, a public officer shall not:
   a. receive or be paid the emolument of any public office at the same time as he receives or is paid the emolument of any other public office or
   b. expect where he is not employed on full time basis, engage or participate in the management of any private business, profession or trade but nothing in this sub – paragraph shall prevent a public officer from engaging in farming (FRN 1999: 151 – 152)

Other highlights

i. That public office holders shall not ask or accept property or benefits on account of anything done or omitted to be done in the discharge of their work.

ii. Nobody should offer a public officer any property, gift or benefits of any kind as inducement or bribe, that public officer should not abuse their position.

iii. Every public officer should declare his asset and liabilities before and after occupying public office alongside those of his unmarried children under the age of eighteen years. Any public officer found contravening any aspect of the code is to face the Code of Conduct Tribunal that is equally established by the constitution.

The body is responsible for ensuring that public office holders are made accountable in the discharge of their duties. The Code of Conduct Bureau in principle seems adequate for curtailing corruption and sharp practices but in practice it seems inadequate. The assets and liabilities declaration of public officers has not been seriously enforced since its establishment. In some cases, public officers had declared assets far above what they owned as their declaration could not be sustained. A case of anticipatory declaration, some public officers did not declare some of their properties they acquired while in office, while the issue of ownership of foreign accounts and late declarations was treated with levity. It is doubtful if anybody declares his assets and liabilities while leaving the public office. The activities of the Code of Conduct Bureau also appears to be ineffective as it is widely belief that most public officers are living quite above their income and besides it tends to assume that corruption is entirely a public sector affair as it nearly leaves out completely any initiative on the private sector. So also, during the administration of President Olusegun Obasanjo, the code of conduct tribunal seems to be “joker” against the state governors adjudged to be corrupt, but mostly those who have strong sympathy for Vice President Atiku who alleges persecution by the president. Embattled vice president Atiku and many Governors were dragged before the code of conduct Tribunal to face charges of corruption during the Obasanjo civilian administration (Sowore, 2006).

Independent Corrupt Practices Commission (ICPC)

ICPC was established by President Olusegun Obasanjo led administration in July 1999 to prohibit and also punish bribery, corruption and other sharp practices by public office holders. The failure of almost all laws promulgated by successive government to fight corruption, uphold integrity and ensure accountability among Nigerians led to sponsoring of the bill for a law to prohibit and also punish bribery, corruption and other sharp practices by Public Officers by Olusegun Obasanjo. The bill was not passed by the national assembly until almost after a year.
because of their selfishness and security. The signing of the bill to law also generated reactions by some state governments. For example, Abia and Ondo state challenged its legality on the ground that the 1999 constitution does not make provisions for such and that ICPC Act negated the principles of Federalism, as its powers would encroach on the tiers of government other than the federal. However, the seven supreme court judges, including the Chief Justice of the federation who gave the lead judgment confirm the constitutionality and legality of the ICPC Act 200, except for two provision which they considered unconstitutional (The Guardian June 8, 2002)

The Supreme Court judges found sections 26(3) and 35 defective and they were declared null and void. Section 26(3) prescribed a time frame within which prosecution of criminal offences under the Act must be concluded. This section in the opinion of the Judges, infringed on the principle of separation of powers and it was accordingly voided. Section 35 of the Act empowered ICPC to arrest and detain any person who failed to obey summons until such a person complied with the summon. This section was struck out as contrary to the provision of the 199 constitution. The ICPC Act 2000 came into force in June 13, 2000 (ICPC2002:5).

Powers and duties of the Commission.

Section (6) of the act stipulates that

a. It shall be the duties of the Commission, where reasonable grounds exist for suspecting that any person has conspired to commit or has attempted to commit or committed offence under this act or any other law prohibiting corruption, to receive and investigate any report of the conspiracy to commit, attempt to commit or the Commission of such offence and in appropriate cases, to prosecute the offenders;

b. To examine the practice, system and procedures of public bodies and where in the opinion of the Commission, such practice, system or procedures and or facilitate fraud or corruption; to direct and supervise a review;

c. To instruct, advice and assist any officer, agency or parastatal on ways by which fraud or corruption may be eliminated or minimized by such officer, agency or parastatal;

d. To advice heads of public bodies of changes in practices, system or procedures compatible with the effective discharge of duties of the public bodied as the Commissions thinks fit to reduce the likelihood of incidences of bribery, corruption and related offences;

e. To educate the public on and against bribery, corruption and related offences; and

f. To enlist and foster public support in combating corruption (ICPC 2000:16).

The Commission has been exercising its functions as specified by the enabling Act. Many political office holders, like governors, senate president, ministers and others has been prosecuted by the ICPC. However, the constitutional immunity granted some political office holders against criminal prosecution during the period the person is performing the functions of the office seems to be one of the major problem of the Commission. These are those holding the office of the President, Vice-President, Governor and deputy governors. In most cases of allegation of corruption against some governors, such governors cannot be prosecuted or made to answer charges preferred against them. Offences and penalties under the Act seems not to be adequately enforced. There can be no justification as to the extent of serving as Watch-Dog institution in situation where some public officers are treated as sacred cow or as being special and seen as being above the laws of the land. There are cases of official moves to shield certain former political office holders from prosecution for corruption and related offences. Some of these former political office holders have obtained exparte orders to restrain the Commission from arresting, investigating and prosecuting them in any manner whatsoever and however. In addition to this, is the problem of funding which does not allow the Commission to have offices in all local government headquarters and state capitals of Nigeria for ease of operation. The situation of inadequate coverage does not give enough room for the Commission to effectively
act as watchdog institutions. So also, the activities of the Commission is difficult to separate from political interference.

**Economic and Financial Crimes Commission (EFCC)**

The Economic and Financial Crimes Commission was established by the Obasanjo administration probably as a result of ineffectiveness of the ICPC. In June 2004, the national assembly enacted the EFCC (establishment) Act. This Act repealed the Financial Crimes Commission (Establishment) Act 2002. EFCC is responsible for the enforcement of all economic and financial crime law (Tell June 13, 2005). This include the money laundering (prohibition Act) 2004, the Advance Fee Fraud and other related offences Act 1995, the failed banks (recovery of debts) and financial malpractices in Banks Act (as amended) the miscellaneous offences Act and even Laws such as the criminal and penal codes as they relate to economic and financial crimes.

The Commission achieved some degree of efficiency and effectiveness. This is due to the economics power and authority bestowed on it by the enabling Act. The powers and responsibility of the Commission are similar to that of Nigerian Police, in that it is empowered to investigate and arrest criminals. It also has the power to investigate the ownership of a property if in the opinion of the Commission the lifestyle of the owner is not justified by his income. It has power to enforce all relevant laws dealing with the finance sector of the economy, as well as power of independent prosecution without involving the office of the attorney – General. The structural organization of EFCC also assist it to perform effectively. The Commission is headed by an Executive Chairman Waziri Farida who took over from Nuru Ribadu atop board of twenty members comprising the heads of relevant and powerful government agencies like the central Bank of Nigeria (CBN), National Drug Law Enforcement Agency (NDLEA), State Security Service (SSS), National Deposit Insurance Corporation (NDIC),Nigerian Communication Commission (NCC) Ministries of Finance, Foreign Affairs, Justice and other. The composition of the Commission’s Board affords it unhindered access to records, facts and figures with which to support itself during prosecution. The former chairman of the Commission Ribadu corroborates this as he notes that;

> The composition is obviously not accidental. The composition of the board has aided the Commission in doing its jobs more efficiently. In dealing with cases in the different sectors of the economy, all Commission need to do is to solicits the helps of the relevant member of the board and the job is easily done. (Ribadu, 2005; 28)

The Commission has successfully investigated arrested, prosecuted and jailed people who were hitherto seen as too high and mighty to be arrested let alone prosecuted. The EFCC made some spirited attempts at continuing corruption especially in the public sector from 2000 when it began operations. It was able to secure some judicial convictions of some highly placed state officials, including a serving inspector general of Police. Even so, the efforts were paralyzed by their inversion by Obasanjo himself. His well publicized threat at an open campaign at Akure, Ondo State in February 2007 to send the EFFC after Dr. Olusegun Mimiko, erstwhile Minister for Housing and Urban development for the latter failure to heed his directive not to run for office as governor.

This particular motive does paralyzed the EFCC as a watch-dog for combating corruption in the society but rather as bulling and a tool of political vendetta. In a similar vein, the spirited attempts to rein in vice President, Atiku Abubakar on corruption charges an effort that was thwarted by the assistance of the Nigerian Judiciary. This also is a figmatization of attempt to see the EFCC as watch – dog institution in the process of combating corruption menace in
Nigeria. However, the EFCC has not been able to live above this image of partisanship ever since.

Another similar prominent example of the above, is the case of Chief. James Ibori, a former governor of Delta State who was alleged of money laundering. As a result of which a British Court frozen its accounts. The freezing order was however lifted on the strength of a letter written by the Honorable Attorney General of the Federation who insisted that he has not requested for the freezing of the ex-governor’s asset pursuant to his power Under the Agreement between Nigeria and the Northern Ireland concerning the investigation and prosecution of crime and the confiscation of proceeds of crime. The handling of the case by EFCC does not justify the institution as a watch-dog but a toothless one. However, the former governor Ibori is now again in the net of law as his arrest had been made possible by the British Metropolitan Police Interpol. (Tribune 21 may, 2010). Nigerians awaits the handling of his case by the EFCC.

Despite the outstanding performance of the EFCC, some Nigerians are of the opinion that the Commission was just a weapon in the hands of Obasanjo’s Administration to fight his perceived opponents, as they believe that the Commission was selective in its assignment.

IV Why have these measures been generally unsuccessful?

These measures in the first instance, have failed because they were introduced in an overall political and policy environment that was not sufficiently conducive to enable the success of the measures. When grand corruption is rampant at the top level of government and politics, the nature of governance has basically remained undemocratic, unaccountable and patrimonial, and where patronage systems have remained intact, one can hardly expect to enforce measures against unethical behaviour with any degree of seriously or that the enforcement systems and institutions will be left to function without interference. Thus, the nature of the state and governance and commitment at the highest political level are crucial prerequisites for any successful drive to curb and punish ethical violations.

The measures that have been introduced have been partial in nature, focusing mainly on sanctions. So also many of the institutions that were established to promote ethics and accountability often lacked the resources, public visibility, impartiality and public support that are critical for their success. It is also no secret that many corrupt ex-officials have the influence and resources to thwart the best efforts of the Commission to bring them to justice.

In addition, some of the delays in investigation and prosecution of cases are attributable to serious short falls in personnel for quick response to established complaints and clues. The state of affairs is further compounded by shocking delays in the trial of suspects. Is justice delayed the same as justice denied? Ironically, the tortoise pace system is aided and abetted by members of the Nigeria Bar Association, especially senior advocates, who manipulate their knowledge of the judicial process to stall the swift dispensation of justice.

The degree of the task to deal with corrupt practices and to promote ethics and accountability in the Nigerian Public Service is not to be underestimated. Despite set-backs experienced in this regard, it is still possible to score gains in a meaningful manner.

V The Way Forward

The various Commissions that are put in place to serve as Watch-Dog institutions for upholding Administrative sanity in the Nigerian Public offices should live up to expectation and up to its slogan that “nobody is above the law”. Moreover, appropriate sanctions should be imposed on those found to be engaged in various activities that could result to corruption to serve as deterrents to would – be criminals. Our leaders should live by example, there should be adequate provision for legal tools to prosecute offenders while the fight against unethical behaviour should be handled individual and collectively. There should be removal of the acute feeling of job insecurity among civil servants which creates the temptation to protect oneself when thrown out of a job quite often for reasons unrelated to one’s performance and conduct. There should be a programme of mass education with the purpose of increasing the awareness of
what the public could contribute in fighting these unethical practices. Such programme could be implemented through workshops, seminars and the news media including television.

There must be adequate salaries/compensation for public officials to discharge their basic family responsibilities while the press must be given free hand to report/expose cases of corruption. There must be “carrot” and “stick” approach to governance, that is reward for conformity and sanction for deviant behaviour. There is the need to foster and promote enabling condition to service to enhance professional and ethical standard. There must also be need for mass education campaigns on the extent and cost of corruption and unethical behaviour so also affirming and advancing sound policies on recruitment, training and public personal management as well as fostering popular participation to ensure the responsiveness and accountability of governance will go a long way to expose and fight corruption. In addition, there should be encouragement of Public Service associations to play a catalytic role in institutionalization professional values and defending occupational interest.

The political insecurity arising from the alienation of the state from society impels them to monopolize power often in a personal way. Once there is personal rule at the top, it bends the bureaucracy by all the means- which are antithetical to bureaucratic organization. For instance in the bid for General Babangida and Abacha to make themselves life president they made policies and change the rules ad hoc, commit the government on impulse to projects which have not been budgeted, re-write the national budget in speeches at whistle stops to the charging of officials. In most countries in Africa, the political class is still crystallizing. It is still prone to intense political competition in which politics is a zero-sum game, while the Public Service is merely the victor’s booty. One reflection of this is that politicians in power use administrative rules, public enterprises, the power of appointments, and promotion of senior public servants as their own political and economic resource and thus undermine the performance of the Public Service. It is not only the state that has to change but politics as well. Performance will not improve very much unless we can solve the problem of extreme scarcity, increase productivity, and the size of the economic surplus, and improve its distribution. That is not to say that if we can generate more economic growth, we will solve the problems of our Public Service. My contention is that economic growth is a necessity, though by no means a sufficient condition for solving the problems simply because there is no chance at all that the civic virtues and civic culture at issue will thrive amidst a rising tide of poverty.

Concluding Remarks

Countries in the world experience some degree of ethical behavior among public officers. But in Nigeria because of special circumstances the extent of unethical behavior, especially corruption, can best be described as a crisis and should be addressed as such with the sense of urgency which the problem demand.

The issue of ensuring adequate Ethics, Accountability, and eliminating corruption among public servant need a big push with a coordinated front operating on several fronts at once. These could be in form of massive move in form of a moral revolution. Every citizens of the country should join hand together to fight unethical behaviour leading to corruption and other social vices in the society. The fight should not be seen as that of the president, alone. Agencies like the Nigeria police, the army, customs department, private sector, the press, the educational system, churches, mosques as well as individual public servants, should not be left out to the fight.

Abstract

This study attempts to examine the relationship between student satisfaction and academic performance in the institutions of higher learning. A total of 309 undergraduate students are taken from one of the public universities in the southern regions of Malaysia with questionnaire being personally distributed to these respondents. Both the Assumption of Normality and the Discriminant Analysis are used to test the above relationship. Findings indicate that student satisfaction is normally distributed. The conceptual framework characterizing the two most important variables to current Internet namely student satisfaction and academic performance are found to be significant but rather weak in their relationship. These two factors also show the significant results in this study. One interesting finding demonstrates that students who feel more satisfied are more likely to obtain lower CGPA academic performance than those who are less satisfied.

Keywords; Student satisfaction, Academic performance, Discriminant analysis, Malaysia

Introduction

The academic performance is the level of knowledge and development of abilities and skills that an individual has achieved at a certain level of education [1]. In educational institutions, success in studies is measured by academic performance, or how well a student meets the standards set out by local government and the institution itself [2]. It has been argued that academic performance generally refers to how well a student fulfills his or her scholastic duties. According to [3], one of the factors that determine the level and quality of a student is academic performance. Grades are most often a tallying or average of assignment and test scores that can often be affected by such factors as attendance, presentation skills, and instructor opinion of the student.

Numerous researchers have focused on the effects of psychological factors on academic performance [4]. In this context, one of the most cited psychological factors reported in the literature is student satisfaction. The concept of student satisfaction is a vital consideration for many higher educational institutions today. The outcomes of students assessment in relation to their campus experiences may be understood by their post-study behaviors, such as their intentions of recommending the institutions they had attended as well as the level of their support as an alumni and practicing professional [5]. These factors could be among the determinants that affect academic performance.
Must higher educational institutions study the association between student satisfaction and academic performance in order to manage better its existing and new academic products and services? Undoubtedly, student satisfaction and academic performance are two inextricably related educational experiences. To the best of the authors’ knowledge, there are limited empirical data examining the relationship between student satisfaction and academic performance particularly in the Malaysian context. This study specifically highlights the higher education industry as research interest due to the mushrooming of new public and private universities in the country offering business and management programs. Competition among these providers is growing intensely.

LITERATURE REVIEW

Reference [6] conducted an empirical study that examines the relationship between achievement motivation and satisfaction among traditional and non-traditional students in colleges. They found that traditional and nontraditional students differ in the pattern of correlations between their satisfaction with the college experience and achievement motivation. Besides that, the relationships between individual dimensions of achievement motivation and that of college satisfaction were supported by correlational analysis. Similarly, another empirical study done by [7] on the relative academic performance in relation to facet and overall satisfaction with interactive telecourses found that students exhibiting the highest level of relative academic performance were those who were (1) most satisfied with the technological aspects of the courses, and (2) most satisfied with the promptness of material exchange with students enrolled in college-level telecourses. These findings will be predictive of the relative academic performance of those students.

Reference [8] suggest that that students who recorded higher scores on personal academic satisfaction and school importance rated their academic performance higher than students with lower scores on the foregoing variables. In this study, social and academic integration is defined as the quality of students' intellectual development, peer group and faculty interactions. On the contrary, an empirical study by [9] to investigate activities and academic achievement among first-year undergraduate students in Hong Kong reported a non-significant relationship between interaction with faculty and expected grade point average.

In [10]’s study, he found that the student/teacher relationship is of particular importance in ensuring academic success. According to him, some of the necessary quality conditions in the classroom such as teachers allowing their students to know them and, hopefully, like them, will lead to students working harder that will in turn result in academic success. Similarly, the findings of another study by [11] that investigates the relations among academic achievement, self-concept, and student-faculty interactions show that student-faculty interactions were predictive of students' academic performance and scholastic self-concept.

According to [12], curriculum and the curriculum experience that parallel the ‘development readiness’ concept make schooling a more satisfying experience for students. To take the concept a step further, if students have positive and satisfying experience, their academic self-concept and success will likely to be enhanced. Reference [13] conducted an empirical analysis to examine the characteristics of positive and negative one-to-one student-faculty interactions with non-traditional and traditional undergraduates. One of their findings show that students who had a positive one-to-one interaction with a professor felt that the interaction affected their student rating of instructors and their academic performance. However, in another empirical
study by [14] to assess undergraduate satisfaction with an academic department, he researchers found that student grades are not related to overall student satisfaction.

Reference [15] conclude that students with low academic performance are characterized by more of the use of surface learning, less of deep learning and less satisfaction with educational environment than students with high academic achievement. Another study conducted by [16] study indicates a significant relationship between grades and students' academic performance and retention. Reference [17]'s study, on the other hand, provides evidence for the positive association between educational experience and academic performance.

Reference [18] evaluated the academic experience and satisfaction of students enrolled in the dual PharmD/MBA degree program by the South Carolina College of Pharmacy and The Citadel's School of Business Administration. They found that students enrolled in the dual degree program did better academically than their counterparts and indicated an overall high level of satisfaction with the program. Reference [19] measured students' perceptions of their teachers' caring, concern and discipline. Their findings suggest that there are no significant differences between academic performance and intellectual ability, and self-report measures such as students' global self-worth, satisfaction about reading and behavior, and relations with teachers.

Methodology

Sample

A total of 350 questionnaires were personally administered to the students during their lectures in a business and management faculty in one of the public universities in the Southern region of Malaysia. Unfortunately, 41 out of these questionnaires (11.7%) could not be used because they were not answered or incompletely answered, or irrelevant (e.g., nationality, marital status, etc.). As a result, only 309 or 88.3% (309/350 * 100%) were usable for data analysis.

Table 1 shows that there were less male students compared to female graduates (26.9% versus 73.1%). The demographic profile also indicates that there is a greater representation of Malaysian students (95.68%). This is viewed as being reflective of the accessibility to respondents. As expected, most of the respondents were still unmarried (96.1%). Students who entered the university with A-level & equivalent were found to have largest percentage of respondents (56.6%), followed by diploma (26.2%), matriculation (13.3%) and others (3.9%). As for financial aid, approximately 78% of the students received financial aid compared with those who did not received financial aid (21.7%).

Profile of respondents

Measurements

The measure for student satisfaction was adapted from Lee et al.’s (2000) study with the modifications necessary to reflect local conditions. The instrument comprises of three items. The respondents were asked to rate the satisfaction level with the program, institution and services on a 5-point Likert scale (1 = “Strongly Disagree” to 5 = “Strongly Agree” for first item), (1 = “Very Dissatisfied” to 5 = “Very Satisfied” for second item), and (1 = “Very Bad” to 5 = “Very Good” for third item). The scale proved to be uni-dimensional with a Cronbach α reliability
value of .742 Subsequently the average score was used to aggregate these three items to indicate the level of student satisfaction. As for academic performance, three levels of cumulative grade point average (CGPA): (1) $3.00 > \text{CGPA} \geq 2.00$, (2) $3.67 > \text{CGPA} \geq 3.00$ and (3) $\text{CGPA} \geq 3.67$ were used to conceptualize students’ academic achievement.

### Statistical Method

Discriminate analysis was used to distinguish CGPA levels based on linear combinations of measures [20]. The dependent variable, which was also called group membership variable was the students’ CGPA. To meet the assumption associated with the significance test for discriminant analysis, the quantitative variable of this study: student satisfaction must be normally distributed. To achieve the normality assumption, student satisfaction must have skewness and kurtosis index should not be more than 2.5 times the standard error [21]. Skewness is used to determine if the curve is nonsymmetrical, whereas kurtosis helps to tell the shape of a curve (flat or peaked).

### FINDINGS

Table II shows that index of skewness and kurtosis for student satisfaction was found not more than 2.5 times of their standard error. Based on these results, we conclude that the variable of student satisfaction did not violate the assumption of normality.

a. First 1 canonical discriminant functions were used in the analysis

The discriminant analysis was performed to predict which of a number of categories or groups the respondent will belong to. In this study, academic performance was the dependent variable and student satisfaction as predictor variable. Table III indicates that student satisfaction was able to significantly discriminate among the three levels of students’ CGPA. Student satisfaction was also compared among these three CGPA levels using group means. The group mean of student satisfaction for students obtained 3.00>CGPA≥2.00 was higher than those who obtained 3.67>CGPA≥3.00 and CGPA≥3.67.

The canonical correlation was 0.199, when squared implied that this model could only explain 4% of the variance in the CGPA. The Eigenvalue was rather low, whereas the Wilk’s Lambda was moderate at 0.960. Univariate ANOVAs revealed that three categories of CGPA: 3.00>CGPA≥2.00, 3.67>CGPA≥3.00 and CGPA≥3.67 differed significantly on student satisfaction. A single discriminant function was calculated. The value of this function was significantly different for the three levels of CGPA (Chi-square=12.36, df=2, p<0.005). The group mean of student satisfaction for students obtained 3.00>CGPA≥2.00 was higher than those who obtained 3.67>CGPA≥3.00 and CGPA≥3.67, suggesting that students who were more satisfied were more likely to obtain lower CGPA than those who were less satisfied.

Discussion & Implication

This study is the few attempts to examine the effects of student satisfaction on students’ academic performance by using discriminant analysis approach in the Malaysian context. In line with several other studies conducted outside Malaysia [8], [10] & [11], the findings suggest a significant relationship between student satisfaction and academic performance. One interesting finding found was that students who were more satisfied were more likely to obtain lower CGPA than those who were less satisfied. In other words, this significant relationship suggests two variables moving in inverse or opposite directions. The lower the academic performance in terms of CGPA of a student, the higher the level of his/her satisfaction in the learning process. Such interesting research phenomenon could be due to several reasons.

Students with lower CGPA may be attributable to the behavioural aspect rather than the intelligent quality of their personality. They are more liberal in attitude towards their study ideology. Good tertiary education experience derives from more than academic performance. The extent to which a university student is satisfied depends not only on single dimension i.e.
CGPA but a combination of factors such as interaction among peers, relationship with academic and administrative staff, university policies, infrastructure and facilities as well as learning perception. The relationship between CGPA and students’ learning perception is more controversial than expected. Students with lower CGPA do not necessarily imply that they have actually learned lesser than those with higher CGPA. Thus, it is not surprising to understand why students with lower CGPA do not bother about their academic performance when displaying a high overall satisfaction during their studies in the university.

This study provides useful implications for policymakers and administrators in the higher education industry. Both classroom-based and examination-oriented education system is not the catalyst of student satisfaction. Government should initiate a more liberal higher education policy to prompt university administrators in promoting campus-based learning environment. This means students are encouraged to involve classroom and extra curriculum activities across faculties, branch campuses, and universities. In this regard, student’s academic performance in terms of CGPA is determined by more flexible and practical assessment methods such as case studies, role play presentation, internship, coaching, and mentoring. It is argued that this interactive teaching-learning system would be contributory to the improvement of student’s academic performance while further enhancing their personal satisfaction in the campus.

ABSTRACT

The study aimed at investigating the effects of computer technology on Pakistani children from the perspectives of their parent. Participants of the study were 110 parents of children studying in 11 schools of Rawalpindi and Islamabad. 10 parents from each school were approached for data collection. A questionnaire consisting of 17 items was used to collect the data. Semi-structured interviews were also conducted with eight parents. Pilot testing was done to ensure the reliability and validity of the tool. The degree of reliability was calculated and validity was ensured by expert opinion. Data was analyzed with the help of SPSS version 15.0. Descriptive statistics (Percentage) was used to draw conclusions from the collected data. The findings of the study revealed that majority of the parents didn’t fix the timings of their children for using computer at home. Majority of the children had free access to internet and use the computer for entertainment purposes such as playing games, listening music and watching movies. Most of the parents’ asserted that excessive use of computer make their children less social, aggressive and isolated. The study suggests that children should be taught to limit their computer use to reasonable lengths of time. They should be supervised appropriately while using computers in order to avoid access to inappropriate material and wrong practices.

Key Words: Parental Perspectives, Home, Games, Entertainment, Pakistani Students

INTRODUCTION

It is the era of scientific development and hallmark of information technology. All the inmates of the world are baffled and in the trap of gripping IT semantic and pragmatic web. Everyone regardless of age and sex particularly the children, studying at primary level, are more inclined to use computer. Undoubtedly, it’s a good omen that our young ones are getting acquainted with the latest advancements like computers which are enhancing their knowledge and inquisitive skill but as they say, Excess of everything is bad so parental care is direly needed to keep a watch and check on their children especially at such a tender age. Use of computer has useful as well as harmful impact on the mind of a child. Nobody can deny that computer usage have significant impact on the cognitive development and learning outcomes of the child. Clements (1999) have highlighted that the use of computer helps the students to solve their problems in real lives and enhance their mathematical skills and promote scientific attitude among them. Turow (1999) concluded that parents provide the home computer and internet facility to their children to assist their learning and to prepare them for the age of technology and information.
Subrahmanyam (2000) recommended that there is a dire need to assist the parents as well as policy makers to ensure the constructive use of computer by the children and to reduce the frequency of computer usage for unenthusiastic purposes to minimize the negative impact of it. Subrahmanyam et al. (2001) argued that if children spend moderate time on computer, it can enhance their social skills. Communication skills can be developed by spending time on net, such as surfing time on the use of e.mail service. Kraut et al. (1998) explored that the excessive use of internet makes the teens and adults less social. Greenfield (1996), Okagaki & Frensch (1994) and Subrahmanyam & Greenfield (1996) suggested that playing video games enhance the spatial skills among the children. Buchman & Funk (1996) argued that there are several types of video games available which are nonviolent in nature but majority of the children like to play violent games on computer. They have reported that 59% of girls studying in grade four and 73% of boys studying in grade four play violent games as their favorite games. Bushman & Anderson (2002), Subrahmanyam et al. (2000) and Gentile et al. (2003) concluded that playing violent games promotes aggressive and negative thoughts among children and express the most aggressive behavior whenever they come across a disagreement by any person around them. Gentile et al. (2004) wrote that the use of aggressive video games for extensive periods of time by the students leads towards low academic performance in schools. Gentile & Anderson (2003) claimed that frequently accruing atrocious acts in the video games on computers may increase antagonistic attitude among students. Walsh (2000) have conducted a research on the students studying in grade 8 to 12 and concluded that 90% parents have no check upon the children’s purchase of video games. Anderson & Dill (2000) expressed that video games help the children to identify and select their favorite personalities as the characters of the games. This role playing guides the children towards the imitation of their favorite characters in their real life. In other words this leads them towards the idealism. Subrahmanyam et al. (2000) wrote that conceptualization and replication of presented staff on computer makes the child hard to adjust in the real world and child can’t differentiate the real life from the word of imagination. Gentile et al. (2004) have explored the timings of playing video games on computer by the young girls and boys and have concluded that the young girls spend an average of 5 hours in a week on playing video games on computer whereas these timing increased up to an averaged of 13 hours in a week in case of young boys. Subrahmanyam et al. (2000) that spending amplified amount of time on Internet get raises the feelings of isolation and desperation among children.

The objective of the study was to examine the effects of computer technology on Pakistani children from the perspectives of their parent. Study was delimitated only to the private schools located in urban areas of Rawalpindi District, and capital Islamabad of Pakistan.

METHOD OF THE STUDY

The study was qualitative as well as quantitative in nature. The mixed method approach was followed because “to expand an understanding from one method to another, to converge or confirm findings from different data sources” (Creswell 2003).

All the parents of children studying in grade four in private schools of Rawalpindi and Islamabad were considered as the population of the study. Sample of the study was selected in two phases:

In the first phase, through random sampling technique, eleven private primary schools were chosen. In the second phase, through purposive sampling, from each school, ten students of grade four who had a computer at their home were selected. Finally parent of those students were approached for the purpose of data collection.

A self-developed questionnaire consisted of seventeen items was used to collect data from the parents. The questionnaire have two portions, one was developed on five point-Likert scaling system whereas the other was included the statements offering a number of options to the
respondent for giving the reply to the statement. Eight semi structured exclusive interviews were also conducted to highlight the issue more in lightning way.

Reliability of the tool was ensured by pilot testing. Twenty-five parents of the students studying in grade four were requested to fill the questionnaire in the process of pilot testing. Data were coded and internal consistency of the questionnaire was observed 0.84 with the help of Cronbach’s Alpha formula on SPSS version 15.0. For the purpose of tool validation, experts’ opinion was sort out by five experts in the area of education and research. Questionnaire was modified and amendments were made in the light of their suggestions to make it more valid and authenticated.

DATA ANALYSIS AND DISCUSSION

A brief description of the data analysis presented in tables 1-5. Table 1 shows the computer literacy by the parents. 7% parents have a very little knowledge about computer. 81% parents knows computer to some extent where as 12% parents claim that they have command over the functions of computer. This shows that majority of the parents have knowledge of computer functioning to some extent. It shows that majority of the parent knows the functioning of the computer to some extent. While Table 2 shows the time spend by the children on computer. The analysis shows that majority of the parents (56.4%) don’t fix the timings of children for computer usage during home hours. Majority of the children (52.7%) use computer for 2-3 hours during week days whereas 47.3% students use computer for 3-4 hours during weekend. In the light of above findings, it can be concluded that huge number of parents did not fix the timings of computer use for their children during home hours and children use the computer from 2-3 hours during week days as indicated in figure 1. Figure 1 show the hours of computer usage by the children during weekend.

Moreover, Table 3 shows the effect of computer usage on the development of children with their parents’ perspectives. 74.5% Parents’ disagree by the statement that computer makes their children social and 50.9% parents claims that due to the use of computer at home their children become isolated. 58.2% parents are of the view that computer usage make their children aggressive. 53.6% parents responded that computer usage help their children to improve their vocabulary.

In the light of above findings, it is concluded that majority of the parents claim that excessive use of computer make their children less social and isolated (Kraut et al. 1998, Subrahmanyam et al. (2000). Aggressive behavior is prevailing among children due to playing violent games (Buchman & Funk 1996, Bushman & Anderson, 2002, Subrahmanyam et al., 2000 and Gentile et al., 2003).

Table 4 shows the purpose of computer usage by the children at home. 58.2% children prefer computer games in home whereas 41.8% students prefer outdoor games during home stay. 70% students have free excess to internet. 57.3% students use computer mostly for games playing, 29.1% watch movies whereas 13.6% children listen music as shown in figure 2. Figure 2 shows that children prefer computer games more than outdoor games for playing at home with their parents’ perspective. While Figure 3 shows that children use computer mostly for entertainment purposes whereas some children use computer for learning purpose such (home work, assignments etc.). In Figure 4 it was indicated that majority of the children mostly use computer
for plays games, second preferable interest are the movies whereas some of the children prefer to listen music on computer.

Table 5 shows that majority of the parents (50%) are remained aware to some extend by the activities of their children on computer, 37.3% parents do not bother the activities of their children on computer and were able to mention the last task that their child done on computer. 61.8% parents have a little check on the purchase of games, movies etc by their children whereas 33.6% parents have no check on the purchase on their children. 57.3% parents guide their children about the constructive use of computer whereas 32.7% parents never guide their children about the constructive purposes.

CONCLUSION

No body can deny the benefits of computer usage on the development of a child but there are some shortcomings or disadvantages arouse with the excessive timings spend on playing computer games, free excess to internet, miner check on child’s purchase of CDs of games and movies, underprivileged observation during computer usage at home hours. There is a small line between the use and misuse of computer and internet that has to be kept in mind by the parents. All of these limitations refer to the role of parents to safeguard guide their children from the constructive usage misuse of computer. As this study revealed that parents did not care much about involvement of their kids in computer and internet. It was recommended that parents and have a sound check on the activities of their children during computer usage at home hours and the most important thing is that the parents should fix the timing of the children for computer use to minimize the level of excessive use of it. Parents should have computer literacy to have a clear vision about the benefits and limitations of computer usage on the development of the children as the majority of the children prefer computer games instead of participating in outdoor activities. When parents were asked that if they keep themselves aware by the activities of their children during computer usage at home, and if they have a proper check on the purchase of their children of computer CDs of games and movies and if they guide their children about the constructive use of computer? Majority of the parents answer “Some times” not “Always”.

ANXIETY LEVEL OF STUDENTS AT ENTRY LEVEL: A CASE STUDY FROM ALLAMA IQBAL OPEN UNIVERSITY PAKISTAN

Dr. Muhammad Javed Iqbal
Chairman, Distance, Non-Formal and Continuing Education Department
Allama Iqbal Open University, Islamabad, Pakistan.

Dr Fazalur Rahman
Lecturer, Early childhood & Elementary Teacher Education department, Allama Iqbal Open University, Islamabad. Pakistan

Dr Muhammad Ajmal
Lecturer, Distance & Non formal education department Allama Iqbal Open University Islamabad.

Abstract
Output of education largely depends on input made by the potential of learner. Environment of learning, aptitude of: learner, tutor, resource person, peer group have significant impact in determining anxiety level of the learner. This study investigated the anxiety level of M.Phil Education students of Allama Iqbal Open University Islamabad, Pakistan at entrance level in the program. Rating scale was used as a tool. Findings of the study revealed that on receiving study material, students’ interest increased motivated feeling of relationship. However, some symptoms of anxiety like impaired hearing, impaired vision and over eating were detected. The study recommended that an introductory positive orientation letter may be served to the students with mailing package; first session of workshop may be devoted to anxiety relaxation techniques. Further anxiety level of students may also be assessed after first semester so remedial treatment may be employed to the needy students.

Keywords: Anxiety, psychological symptom, Allama Iqbal Open University, distance education.

Introduction
Education is considered a process as well as a product and is supposed to prepare one for better life while teaching and learning process is concerned with the promotion of desirable behaviour. Development and reshaping of attitudes is an important aspect of learning. Thus education has to focus on the conditions that provide bases for learning.

Attitudes associated with programmes and subjects have impact on the student participation level and achievement. Researches examining the psychological effects found that a students’ self concept of his ability to perform in subject is positively correlated with the achievement " (American Psychiatric Association, 1994, p.56).

Anxiety is an unpleasant state which is associated with feelings of un-easiness and apprehension. Both anxiety and depression are weeds that grow from the fertile soil of insecurity. It is uneasiness over an anticipated situation or object that typically would produce discomfort in rational individuals (Kendall & Hammen, 2000; Clark & Wells’, 1995). Anxiety is usually considered to be highlighted physiological state which has cognitive semantic, emotional and behavioral components (Seligman, Walker & Rosenhan, 2001). All these components may combine to create feeling of uneasiness. The anxiety state usually carries heart palpitation, nausea, pain, and headache or digestion disorder. Every one of us may feel anxiety at one or other time in one’s life. Usually this is the result of stressful situation so anxiety is part of our life. Smith, et al. (2009) view anxiety as today’s way of warning hence it is adaptive.
prepares a person to face threat. When anxiety is prolonged, intense, distressing and unwanted, it turns into anxiety disorder. Anxiety disorder hinders oneself from normal life functioning.

**REVIEW OF RELATED LITERATURE**

What ‘anxiety’ actually refers to and how can we identify its types and causes are also important questions to understand the concepts and aspects of anxiety.

Anxiety is a psychological construct, commonly described by psychologists as a state of apprehension, a vague fear that is only indirectly associated with an object (Scovel, 1991). Psychologists make a distinction between three categories of anxiety: trait anxiety, state anxiety, and situation-specific anxiety. Trait anxiety is a relatively stable personality characteristic, ‘a more permanent predisposition to be anxious’ (Ellis, 1994) while state anxiety is a transient anxiety, a response to a particular anxiety-provoking stimulus such as an important test (Horwitz, 2001). The third category, situation-specific anxiety, refers to the persistent and multi-faceted nature of some anxieties (MacIntyre & Gardner, 2001). It is aroused by a specific type of situation or event such as public speaking, examinations, or class participation (Ellis, 1994). In simple anxiety is something we all experience from time to time. It is a normal response to situations that we see as threatening to us.

Types of anxiety include “signal anxiety, anxiety trait, anxiety state, free floating anxiety. Signal anxiety is anxiety to an anticipated event. A distance student who is normally relaxed before he receives bulk of study material first time, but after receipt of study material, he is anxious, this is signal anxiety while anxiety trait is “component of personality which means it is present over a time period. This can be measured by using observational techniques. An anxiety state occurs as a result of a stress situation in which a person loses his emotions. Free floating anxiety is that which is always present and accompanied by a feeling of dread. A person may exhibit ritualistic and avoidable behaviour. Severity of anxiety may be normal, acute, chronic and panic. Normal anxiety is of small degree and it motivates the student. Acute anxiety interferes with ones’ ability to think and creates extreme nervousness (Terry, 2007). It usually occurs suddenly but lasts over a small period. Chronic anxiety may sustain for months or years. Panic activity is severe form of anxiety which disintegrate the personality.

Hamilton (2001) and Buss (1999), by factor analyzing anxiety scores obtained from psychiatric patients, obtained two factors (‘psychic’ and ‘somatic anxiety’) which accounted for the major portions of the variance in anxiety questionnaire scores. Schalling, Cronholm & Asberg (1995), having extensively reviewed the literature, hypothesized that anxiety is made up of cognitive and somatic components.

**Symptom /Effects of Anxiety**

Anxiety can be evaluated in terms of several criteria (e.g., behavioral, physiological and psychometric measures). Psychological symptoms of anxiety include irritability, lack of concentration, strange thoughts, mood swings etc.

According to Joseph (2007), some of the possible symptoms of effects may be a rise in blood sugar, muscular tension, dry mouth, rapid heartbeat or palpitations, headaches, fatigue, impotence, colon spasms, diarrhea or constipation, insomnia, poor concentration and a general feeling of apprehension and dread. People with generalized anxiety disorder may also experience depression at some point. Excessive anxiety must have at least three of these symptoms:

- Restlessness
- Easily fatigued
- Muscle tension
- Sleep disturbance
Anxiety symptoms range from mild uneasiness to intense condition, a certain amount of anxiety may raise arousal level and might improve performance. Common complaints of anxiety include persistent tension, nervousness, heart palpitation, swelling, trembling, dizziness and concentration problems. McFarland and Wasli (1992) listed 16 factors which may cause anxiety. Symptoms of anxiety may range from state of euphoria to panic and are also grouped into five levels as given below:

- **Level 0:** Euphoria: an exaggerated feeling of which are not directly proportionate to a specific situation.
- **Level 1:** Mild Anxiety: positive experience with increase ability to learn, motivated feeling of restlessness, may not be able to relax.
- **Level 2:** Moderate anxiety: narrows down the perception, voice tremors, increased, physiological changes.
- **Level 3:** Severe anxiety: perception reduced, focus on small details inability to communicate clearly, decreased intellectual thought process, feeling of purposelessness.
- **Level 4:** Panic state: complete disruption of ability to perceive, disfiguration of personality and loss of control. Panic attacks may last over 15-30 minutes.

**Types of Anxiety**

Anxiety may be of many types. Paul Tillich and Freud see anxiety as Trauma of non being. Test anxiety is uneasiness, apprehensions or nervousness felt by students who have fear of test. Parker (2000) identifies that student may experience: association of grades with personal worth, embracement by a teacher, taking a class that is beyond their ability, feeling of alienation from parents or friends, time pressures, feeling a loss of control, dizziness, headaches, racing heartbeats, nausea, fidgeting and drumming on a desk. Terry (2007), explains anxiety related problems can range from chronic shyness and low self-esteem to disorders involving how we think, feel and act-shown in the five main types of classified disorders; generalized anxiety disorder (GAD), panic disorder, phobias, obsessive compulsive disorder and post traumatic stress disorder. Generalized anxiety disorder (GAD) is characterized by excessive exaggerated anxiety and worry about every day life events. People suffering from GAD remain worried about their health, business, education, family etc. Here worry is not pseudo rather disturbs daily life. Symptoms of GAD might include these “excessive, on going worry tension, unrealistic view of problems, restlessness or feeling of being “edgy”, irritability, muscle tension, headaches, sweating, difficulty in concentrating, nausea, frequent bathroom, tiredness, trouble in sleeping, teaming and easy started”( Clinger, Martin and Guze, 1981; Forgersen, 1988; Kendall and Hamnen, 2000).

Obsessive Compulsive Disorders (OCD) is that type of anxiety disorder which is characterized by unwanted thoughts or behaviours and this seems not to be stop or control i.e. recurring worry that I have forgotten to switch off lights, heater, washing hand over and over etc. Separation anxiety is normal part of child development, which occurs when a child is away from home or parents. Social anxiety or social phobia is anxiety when one has a feeling of humiliated in public, one might experience extreme shyness. Performance anxiety is most common type of social phobia.

**Causes and Risk Factors**

There are a number of causes which contribute to the anxiety disorders. Environment family structure, brain chemistry, genetics, financial problems, marital problems. But the important thing is that no single factor alone leads to anxiety disorder. Anxiety might have four theoretical perspectives, biological, psychodynamic, behavioral and cognitive. There are at present 700 identified phobias. Some psychologists measure state and trait anxiety through physical signs: heart rate, respiration skin conductance and bio chemistry.
Sometimes anxiety can go on and on, and become a lifelong problem. There can be a number of reasons for this: If someone has an anxious personality and is a worrier, then they will probably be in the habit of feeling anxious. Sometimes people have ongoing stresses over a number of years which means they develop the habit of being anxious. It is expressed in the following diagram:

![Diagram of Reasons of Anxiety]

Anxiety may be found in the students as they might not be well prepared of heavy study package, as anxious student and complex subject matter combine to create a difficult environment of learning. Such environment may create the following four problems:

1. Anxiety blocks the normal thought process.
2. Anxiety favours a passiveness to material rather than interaction with it.
3. Anxiety is associated with a general sense of incompetence.

Foreign Language Anxiety

Horwitz, & Cope (1986), considering language anxiety with relation to performance evaluation within academic and social contexts, drew parallels between it and three related performance anxieties: (1) communication apprehension (CA); (2) test anxiety; (3) fear of negative evaluation.

a) Communication Apprehension (CA)

Communication apprehension (CA) is “a type of shyness characterized by fear or anxiety about communicating with people” (Horwitz, & Cope, 1986). McCroskey’s (2006) conceptualizes this while describing CA as “an individual’s level of fear or anxiety associated with either real or anticipated”. Communication apprehension obviously plays a large role in second/foreign language anxiety. People who are apprehensive speaking in dyads or groups are likely to be even in more trouble when doing so in a second/foreign language class, where “in addition to feeling less in control of the communicative situation, they also may feel that their attempts at oral work are constantly being monitored” (Horwitz, & Cope (1986). This apprehension is explained in relation to the learner’s negative self-perceptions caused by the inability to understand others and make himself understood (MacIntyre & Gardner, 2005).

b) Test Anxiety

Test anxiety, as explained by Horwitz, & Cope (1986), “refers to a type of performance anxiety stemming from a fear of failure”. Test anxiety is quite pervasive in language classrooms because of its continuous performance evaluative nature. Unfortunately,
for highly anxious students, second/foreign languages, more than any other academic subject, require continual evaluation by the instructor – the only fluent speaker in the class (1986). It is also important to note that oral testing has the potential to provoke both test and oral communication anxiety simultaneously in susceptible students.

c) Fear of Negative Evaluation

Fear of negative evaluation is an extension of the second component (test anxiety) of second/foreign language anxiety because it is not limited to test-taking situations; rather, it may occur in any social, evaluative situation, such as interviewing for a job or speaking in second/foreign language class (Horwitz & Cope, 1986). It is also broader in the sense that it pertains not only to the teacher’s evaluation of the students but also to the perceived reaction of other students as well (Shams, 2006).

Horwitz & Cope (1986) believe that, although communication apprehension, test anxiety, and fear of negative evaluation provide useful conceptual building blocks for a description of second/foreign language anxiety, it is more than just the conglomeration of these three components: “we conceive foreign language anxiety as a distinct complex of self-perceptions, beliefs, feelings, and behaviors related to classroom language learning arising from the uniqueness of the language learning process”. What makes language learning a distinct and unique process is its interaction with the concept of ‘self’.

OBJECTIVES OF THE STUDY

Objectives of the study were to:
1. Identify different types of anxiety in the students.
2. Find out the anxiety level of students.
3. Identify possible reason of anxiety among students

POPULATION

Students enrolled in M.Phil Education programmes of Allama Iqbal Open University Islamabad in spring 2008 and 2009 i.e. 183.

SAMPLE

The participants of the study consisted of 138 students enrolled at Allama Iqbal Open University.

METHOD OF THE STUDY

The study was descriptive in its nature, after survey of related literature an anxiety, a scale on 4 points was designed and developed. The draft obtained was validated by five psychologist and five educators. After professional judgmental validation, face sheet was placed on the scale.

This scale was served to the students when they came to attend the orientation workshop of the program in 2008 and 2009. These workshops were conducted just after the receipt of the study package by the students. This study package consisted of books entitled Trends and Issues in Education 3701, Trends and Issues in Distance Education 3705, Trends and Issues in Special Education 3709, Trends and Issues in Teacher Education 3704, Trends and Issues in Educational Planning and Management 3702 Computer Applications in Education 3705 and Educational Statistics and Research 3706 along with two assignments of each course.

Analysis of Data

Out of 180, 138 students responded i.e. 77%. Data collected was tabulated and mean score was calculated. A summary of the data is presented in below table 1:
DISCUSSION

The item 26 increased interests have mean score of 3.42 the highest. Next mean score is of statement No.25 “motivated” with mean score 3.39. Next mean score is 3.13 of statement “relationship with university” i.e. item No.15. The lowest mean score is of statement 19 “impaired hearing” is 1.14 next higher mean score of item 20 “impaired vision”, is 1.29 while the next higher mean score of statement of 34 “over taxing” is 1.43. The all other statements lie between these extremes.

17 statements are at .05 above mean score 2.00. This reflects that most of the students are level 1 mild anxiety i.e. level 1: positive feeling; relationship with university, motivated while lower mean score reflects level 2 moderate anxiety state: narrows down the perception; impaired hearing and level 3, severe anxiety, abnormal pain while 22 responses were below mean score 2. This reflects that just after receiving the study material of first semester more than half of the students i.e. 57% were at moderate anxiety i.e. level 2. Probably this is due to different mode of transaction as most of the students enter this system for the first time of their educational career.

RECOMMENDATIONS

It was recommended that:

1. Before actual mailing of study material to the students, an introductory positive oriented letter may be mailed to the student to make them prepare to receive the study material.
2. Students might receive the study material just after the receipt of introductory “welcome” letter.
3. First session of workshop at main campus may be devoted to anxiety relaxation techniques so that moderate and severe anxiety may be overcome.
4. Anxiety level of students may also be assessed after the first semester examination so that difference of both levels may be judged.

Abstract:
Terrorist attacks around the world in the last few years, had elevated the worldwide consciousness of danger of terrorism and its multifaceted impacts on the financial markets. Besides the injuries and loss of life, terrorism also has some political and real economic cost. When there is a wave of uncertainty related to terrorism, traders and investors hold back or withdraw their investments affecting the stock market negatively. This paper sets out to examine the effects of terrorism on Lahore Stock Exchange (LSE). Using events study methodology we identified twenty (20) terrorist attacks that had taken place in Pakistan since 2003 to 2010. Findings reported here indicate negative correlation among terrorist attacks and stock market performance.

Key words:
Terrorism, Stock Market performance, Lahore Stock Exchange (LSE)

Introduction:
Terrorism refers to all those fierce acts which are projected to produce fear, committed for spiritual, political or dogmatic goals, and are carried out by non-governmental agencies to disrespect the wellbeing and security of civilian. Terrorism is often used to take advantage of coercive powers by weaker party in a conflict.

A stock market is a public unit, where shares and derivatives of companies are traded at settled price; it is mere a network of transactions and does not have any physical existence. The role of stock market in measuring economic growth is indispensable. Stock market stimulates allocation and utilization of savings, a decisive function, for economic growth. It is sensitize to terrorism activities and shows immediate changes. Enisan and Olufisayo(2008) developed stock market has a positive effect on economic growth in long run. Some international
terrorism attacks have an effect on stock markets all over the world. Jackson (2008) found that the already prevailing instability of U.S economy was escalated after 9/11 attack. Besides international brunt of terrorism, stock market reflects the changes caused by national terrorism attacks. When there is a wave of uncertainty, because of terrorism, the traders and investor hold back or withdraw their investments affecting the stock market negatively. Tribune Business News (2004) stated that stock market of Spain was affected by a terrorist attack, and went down by 130 points.

There are three stock exchanges currently operating in Pakistan. Lahore Stock Exchange is the first automated stock market of Pakistan. It was founded in Oct, 1970 and is considered to be the second largest stock exchange of Pakistan. It has 519 listed companies, covering 37 sectors. Pakistani stock markets are very responsive to terrorism activities. Mahmood/CentralAsiaOnline(2009), Stated that during 2008-2009, political precariousness and terrorism caused a loss of $19 billion to Pakistani stock market.

National as well as some international terrorism activities specifically suicide attacks, target killing etc, influence the trading behavior of investors.

This study aims at analyzing the brunt of terrorism activities occurred in last 9 year, on Lahore Stock Exchange. The main focus of the study is whether terrorism activities negatively affect the stock market or positively.

**Literature Review**

Johnston & Nedelescu (2005) analyzed the impact of terrorism on financial markets and found that liquid, sound and diversified financial markets are competent in absorbing the distress given by the terrorist attacks and they remain functional.

Liargovas & Repousis (2010) conducted an event study and analyzed the stock of Greek’ banks to see the impact of terrorism. They considered three major terrorist attacks (attack in New York 2001, Madrid train bombing 2004 and London train bombing 2005). He found that only one of these attacks affects Greek banks’ stock negatively and consequently bring significant negative return.

Christofis et al., (2010) analyzed the impact of Istanbul bombing on the Turkish stock markets. Findings indicated that the terrorist activities cause significant negative returns in the Turkish stock markets.

Schmeling (2009) found that markets with less reliability and countries where people have culture of overreaction are more open to sentiments.

Nikkinen & Vahamaa (2010) conducted a research on terrorism and sentiments of investors. They analyzed the behavior of FTSE 100 index in the wake of terrorist attacks. They found adverse impact of terrorism on the sentiments of investors. They concluded that terrorist attacks cause index level to go down and increase stock markets’ uncertainty.

Alexander (2007) said that terrorist attacks complicate business activities, resulting in exit of many businesses.

Melnick and Eldor(2010) stated that terrorist assaults cause economic damage and this damage escalates with media coverage.

Baumert (2007) studied the effect of New York attack, Madrid bombing and London bombing on global stock markets. He found that the reaction of financial markets to these types of incidents is negative because investors quickly perceive the economic impact of these type of attacks.

Drakos (2010) found that the day terrorist attack takes place; returns go down on that particular day.
Eldor and Melnick (2004) reported that suicide attacks affect both the stock exchange market and stock on an enduring basis because victims get affected permanently, on the other hand location is not that imperative in affecting the both.

Schmeling (2009) found that emotions play a negative role in predicting the stock markets’ return across countries. Emotions are negatively related to stock return.

Levy and Galili (2006) concluded that terror has profound negative brunt on trade activities because it provokes the sense of insecurity and as a result limits the risk-sharing behavior, associated with trade.

Zussmanand Zussman (2006) found that stock market sturdily respond to the assassination of high-ranked members of terrorist unions than low-ranked members.

Karolyi & Martell (2006) examined the impact of terrorist attacks on stock prices. They analyzed 75 attacks, took place during 1995 to 2002. He concluded that terrorism has significant negative impact on stock prices.

Drakos (2009) conducted a study on the reaction of stock markets to terrorism. He said that stock markets react negatively after terrorist events but their reactions depend upon the perceived risk, associated with terrorism in the country.

Sathye et al, (2009) analyzed the Australian stock market to observe the impact of terrorism. They studied seven events by using Garch procedures. They found that only one of these (9/11) has considerable negative impact on the stock market of Australia.

Drakos (2010) concluded that there is a direct relationship between unfavorable impact of terrorist deeds and psychological tensions.

**Methodology**

The purpose of this study is to examine the performance of stock index in relation to Terrorist activities. An event study was conducted to see the impact of terrorism on stock index. Time series analysis was used as methodological approach.

We gathered daily index (time series data) of Lahore Stock Exchange (LSE) for the period of 2003-2010. Stock market index is a statistical depiction of stock value typically a stock portfolio. It is a method designed to measure the stock market section. Daily index of stock market illustrates the changes in the prices of the stock. Index going upward demonstrates positive trend and downward movement demonstrates negative trend.

We focused on twenty (20) terrorist attacks, took place during 2003 to 2010. We collected incidents of terrorism from News Papers (The News, Business Recorder & Dawn), Reports and web sites. We selected these events on the basis of their severity in terms of total destruction and casualties. Following is the list of selected events.

- Oct. 7, 2005: Attack on Ahmadi mosque
- Nov. 8, 2006: Dargai bombing.
- Jan. 12, 2007: president Musharaf declared war against terror.
- Feb. 21, 2007: Women minister Zill-e-Huma was murdered.
- July 17, 2007: Suicide Bomber Targeted Lawyers Rally.
- Sep. 14, 2007: Taliban and Extremists at War against Pakistan
Findings

i. Quetta mosque bombing:

There was a bomb blast on the mosque of Shia in south western city of Pakistan, Queta 47 people were killed and almost 150 got serious injuries. The index before this event was 2078.65 but after this happening it went down. Investors perceived it as a bad sign as the index was 2068.79 on 4th July, 2003 and next day it continued to drop and reached 2054.07. The graph is showing this downward trend in the index.

ii. MultanBombing:

On 7th Oct, 2004 terrorist attacked the sunni’s rally in Multan. The rally was to commemorate the leader of sipah-e-shahba Maulana Azam Tariq who was assassinated. In this terrorist activity 40 people died and over 100 people got injured. This event affected the index negatively and index went down from 2741.62 to 2737.96. But the next day the index went up and reached 2766.63.

iii. Attack on Ahmadi Mosque:

Terrorists attacked the Ahmadi Mosque on 7th Oct, 2005. They shot eight people. This incident affected the index of Lahore Stock Exchange (LSE) negatively and it went down from 4232.78 to 4200.73. The graph is also showing the downward movement of index.
iv. Dargai Bombing:

In the Dargai (Northwestern town of Pakistan) a suicide bomber attacked Pakistan’s Army on 8th November, 2006. In this terrorist activity 42 people were killed and 20 injured. This event negatively affected the stock index as index went down from 4649.73 to 4633.27. The index continued to went down on the next day to 4504.75. The graph is showing this negative trend in index.

v. President Musharaf declared war against terror:

The declaration of the coalition with the governments already working against the terrorism by Pakistan government, greeted the market with positive response and the stock market index went up. The index increased in a single day by 35 points because investors perceived that declaration as a good sign. The graph shows the upward movement of the market index after this event.

vi. Women minister Zill-e-Huma was murdered:

The women minister Zill-e-Huma Usman was murdered by a mad civilian on 21st Feb 2007. But this incident did not influence the stock market negatively. The index level continued to rise from 4694.73 to 4703.26 within 2 days.

vii. Suicide Bomber Targeted Lawyers Rally:

Many people were killed and injured on 17th July, 2007 in a suicide bomb attack on lawyer’s rally. According to media, this attack targeted Chief justice Iftikhar Muhammad Chaudhry. This incident negatively affected the index level of LSE. The graph is showing the position of LSE index level. Before this incident Index level was increasing, but later on index went down from 4887.78 to 4754.83.
War against Extremist:

The biggest crisis in Pakistan is of increasing assault of Taliban which affected the Pakistan’s economy as well as its stock markets. on 14th September, 2007 Taliban and extremist war was declared in Pakistan which brought down LSE stock market from 4493.54 to 4447.01. This event negatively affected the stock index as shown in the graph but on the very next day index went up to 4459.65.

Suicide bomber attacked Bhutto’s Rally:

On 19th Oct, 2007, a suicide bomber attacked Benazir Bhutto’s rally. This political event effected index level drastically. The index level of LSE on 19th October was 5049.61 but after this incident the level was 4845.77 the index dropped by 203.84 points.

Former Pakistani Prime Minister Benazir Bhutto assassinated:

The Assassination of Benazir Bhutto was occurred on 27th December, 2007 in Rawalpindi. Benazir Bhutto was ex-Prime minister of Pakistan and also the leader of Pakistan People’s Party. She was shot after a political rally at Liaqat National Bagh. It was one of the biggest political events that happened in the history of Pakistan. It affected the whole economy, rigorously. The stock market of Pakistan was largely affected by this event as index level of LSE on 27th December was 4743.35 but after this incident the level was 4504.4 it was a decline of 238.95 points it was a very large variation which was recovered after a long time. The Graph is showing this position in a meaningful way.
xi. Blast at Marriot:

On September 22\textsuperscript{nd} 2008, there was a wave of insecurity after a suicide blast at Marriott hotel. The stock market was affected at a large scale. Because a large number of foreign investors withdrew their investments and index fell from 2865.1 to 2828.3.

xii. The Sri Lankan cricket team is attacked in the city of Lahore:

Heavily armed gunmen attacked Sri Lankan cricket team in Lahore on 3\textsuperscript{rd} March, 2009, six policemen were killed and seven players and officials got injured. This political event affected the Pakistan’s image in the whole world. The stock exchanges were also affected as investors lost their confidence. As shown in the graph the LSE index level went down from 1664.56 to 1631.98 on 3\textsuperscript{rd} March, 2009 (event day) but after the event it again went up and reached 1713.04.

xiii. A bomb attacked in the FATA:

On 27\textsuperscript{th} March, 2009 a bomb attack in the FATA kills at least 48. But this political events didn’t affect the LSE index as shown in the graph it continuously goes up from 1999.5 to 2146.05.

xiv. Bomb blast in Peshawar:

Amidst the various chaoses the country was facing, on 9\textsuperscript{th} October 2009 the situation went wild when the militants set a car bomb in main Peshawar’s busiest bazaar. This explosion resulted in, killing 48 people and badly disrupting the economy. The index level on 8\textsuperscript{th} Oct, 2009 closed at 2993.65 while on 9\textsuperscript{th} Oct, 2009 it
closed at 2995.69. So the index showed an increase of 2.04 points. But after this event index level went down to 2951.81. As shown in the graph this event negatively affected LSE index.

**xv. Suicidal bombing in Northwest of Pakistan:**

On 12\textsuperscript{th} October, there was a suicide attack in an area of North West Pakistan. 41 victims were killed and dozens got injured. The index on 9\textsuperscript{th} Oct 2009 was 2995.69 and it was 2951.81 on 12\textsuperscript{th} oct, so there was a decline of 43.88 points. This event affected index level for short time, afterwards it again went up.

**xvi. Bomb Blast at Shias Jaloos in Karachi:**

On December 29\textsuperscript{th}, 2009 there was a bomb blast at the jaloos of shias, in Karachi. In this event 43 people martyred and more than 60 got serious injuries. This incident gave very tough time to the government. To condemn this attack, political and religious leaders called a strike of one day. But the index level of LSE did not show any negative impact as it continued to rise from 2914.74 to 2952.93. The graph also depicts it.

**xvii. Lakki Marwat suicide bombing:**

On 1\textsuperscript{st} January 2010, a suicide bomber attacked the crowd, watching volley ball match, in Lakki Marwat. 105 people were killed in this terrorist activity. This event did not show any negative impact on the index of Lahore Stock Exchange (LSE) as index continued to rise from 2883.07 to 2924.82. The graph is showing this upward trend in stock index.

**xviii. Karachi Bombing:**

There were three bomb blasts in Karachi on 5\textsuperscript{th} February 2010, one in mini bus and the other two in Jinnah Hospital. 23 people were killed and 50 injured in this event. The index did not show negative impact as it rose from 3049.23 to 3064.23 but after one day index went down to 3048.8.
xix. Lahore Bombing:

On 12th March 2010, there were two suicide bomb blasts in Lahore. These blasts took place near RA bazaar, a busy shopping and residential area. This event resulted in death of 45 people. But this event did not affect the stock index negatively as Lahore Stock Exchange (LSE) index went up from 3122.01 to 3196.39.

Below are the graphs showing the overall index position before and after the occurrence of Terrorist Attacks:
Conclusion

1. Few terrorist events have negative significant effect on Lahore stock market index. The details are given here under
   - Dargai bombing caused the index to move down by 144.98 points.
   - The suicide bombing at lawyers rally has led the market to decrease by 86.66 points.
   - Similarly the suicide attack on bhutto’s rally caused stock market to respond negatively, and resulted in the fall of index by 245.51 points.
   - The assassination of Benazir bhuto met with rapid decline of index By 253.34 points.

   These finding are supported by Christofis et al., (2010), Nikkinen & Vahamaa (2010), Baumert (2007), Levy and Galili (2006) in the literature.

2. Some of the events affected the stock market negatively but not in a significant manner such as.
   - Bomb blast at Ahmadi mosque let the index to decrease from 2078.65 to 2054.07
   - Similarly blast on a mosque in Quetta, caused the index to go down by 32.05 points.
   - The index dropped down as result of blast at Marriott hotel by 36.8 points.
   - Blast in a bazaar of Peshawar affected the market slightly and index moved down from 2993.65 to 2951.81.
   - Bombing in Karachi caused the index to fall by 0.43 points.
   - Likewise suicide blast in North West Pakistan caused the index to decrease by 28.38 points.

3. Some events did not affect the stock market negatively. The details are below
   - Multan bombing increased the index from 2741.62 to 2766.63.
   - The declaration of war against terror took the index up by 74.6 points.
   - Blast on sha jaloos caused the market to go up by 38.19 points.
   - Bomb blast in FATA didn’t affect the index of Lahore Stock Exchange (LSE) negatively, and index increased by 146.55 points.
   - Bombing in Lahore was also not greeted with negative response. And index went up from 3122.01 to 3196.39.

4. It is also evident that movement of index depends on severity of incident in terms of importance of a person. As index moved up on the murder of women minister Zill-e-Huma, whereas it considerably dropped down on the assassination of Benazir Bhutto. It strengthens the view of Zussman and Zussman (2006) who stated that killing of high-ranked members of terrorist unions affect the stock market more severely, than low-ranked members

5. Terrorist attacks started in Pakistan in July 2003. The stock index used to come down significantly in the early years but when it became the routine, the investors started to take it a routine matter and there was no significant impact on the index of stock market. It is evident from the above diagram that after 2008, the terrorist activities started the market to go up.

Abstract
The main objective of this study was to investigate the nature of relationship between expenditure on education and economic growth for the period 1972 to 2008 for Pakistan. By employing recent advances in dynamic modeling, the findings of this study suggest there is a unidirectional causality running from GDP growth to educational expenditure in Pakistan. There is no evidence of causation running from educational expenditure to GDP growth, which is an indication, that education sector failed to contribute to the GDP because this sector was badly neglected in the past. The implication of this study is that for achieving sustainable economic growth, Government of Pakistan needs to allocate sufficient resources to education sector in future.

Key words: Education, Economic growth, Cointegration, Granger causality

I. Introduction
In recent years Human Capital (HC) has been regarded as one of the crucial determinants of sustainable economic growth. It has been observed that deficiency in human capital is a major hurdle in the way of rapid economic growth and poverty reduction. Furthermore, the process of economic development will be slower in that country which cannot utilize its human resources properly along with other resources. Endogenous growth theory provides the theoretical basis for the relationship between education and economic growth. The theory explains the role of human capital (stock of knowledge, skills, aptitudes, education and training) in enhancing the economic growth. It has also been observed that high level of human capital does not directly serve as one of the factors of production. It raises the output by raising efficiency of the labour force through innovations and inventories. In short, human capital directly or indirectly serves as one of the factors that affect economic growth.

The positive and significant contribution of Human Capital through educational development towards economic growth is being well recognized.\textsuperscript{56} Education enhances both the labour efficiency and productivity that leads towards more output and has more economic growth. Promotion of education especially higher education by promoting research activities is the main focus of every development strategy in recent years.\textsuperscript{57} This implies that productivity

\textsuperscript{57}For detail see stern (2001)
can be enhanced through new technologies and innovations and this comes by investing in human capital like education and health.

Education helps the working labour force to get the benefits through enhancing social skills, better working conditions, lower disability rates, longer job tenure, more occasion of job training, more promotion opportunities and rewards and awareness of political matters. In most of the developing countries, education sector was badly neglected in the past. Pakistan is not an exception. Government of Pakistan had allocated less than 3 percent of the GDP to education sector in the past.

Table 1 shows that public expenditure on education as a percentage of GDP is less than 3 which is an indication that this sector was badly neglected in the past and it needs due attention of the policy makers.

Furthermore, the educational system was not consistent with needs of the country in the past. The educational system followed in Pakistan was unable to bring about the desirable transformation. As a result the process of economic growth remained slower which caused high unemployment, poverty and low standard of living. Presently, every developing country of the world is struggling to achieve rapid pace of economic growth through the use of latest knowledge and skill. The relationship between education and economic growth has received a lot of attention of the researchers and policy makers in the past two decades. Although there exists no consensus about the direction and strength of relationship between education and economic growth but many researchers are agree that there is a positive linkage between the two variables of interest. This study is an attempt to examine the relationship between education expenditures and economic growth for Pakistan economy by employing recent advances in dynamic modeling.

The remainder of the study is set out as follows: Section II provides a review of precious studies. Section III presents the data description and research methodology. Section IV discusses and presents empirical results. Section V contains the concluding observations of the study.

II. Review of Previous Studies

Many researchers have tried to investigate the existence of relationship between education and economic growth. Their findings provide evidence of the positive relationship between education and economic growth for different countries of the world.

Pradhan (2009) tried to analyze the relationship between government expenditure on education and GDP of India for the period 1952-2002. He used cointegration test and error
correction modeling (ECM) technique. His results show that education and economic growth are cointegrated and exhibit the existence of long run equilibrium relationship between the variables.

Francis and Lyare (2006) used cointegration and VECM for analyzing the causal relationship between education and development in three Caribbean countries – Barbados, Jamaica, Trinidad and Tobago – using annual time series data for the period (1964-98). They conclude that GDP has impact on education in all the three countries. Bidirectional causality is found only in Jamaica.

Gylfason and Zoega (2001) discussed the linkages among education, social equality and economic growth. They used different measures of education such as gross secondary school enrollment, public expenditure on education relative to national income and expected year of schooling for girls, and examined their impact on Gini coefficient; a measure of distribution of income, and economic growth for 87 countries for the period 1965 to 1998. Their results show that economic growth varied inversely with different measure of education across countries.

Islam, Wadud and Islam (2007) investigated the nature of relationship between education and economic growth in Bangladesh for the period 1976 to 2003 using multivariate causality analysis. Their results show that there is a bi-directional causality between education and economic growth in Bangladesh.

Chaudhary, Iqbal and Gillani (2009) used Toda and Yamamoto (1995) and Johansen co-integration approaches in a vector auto regressive framework for examining the relationship between higher education and economic growth for the period of 1972 to 2005 for Pakistan economy. Their findings confirmed that all the four variables, education, labour, capital and RGDP have the long run relationship. They argued that higher education might cause economic growth after a specific time period.

Stengos and Aurangzeb (2008) examined the linkages between education and economic growth in case of Pakistan. Primary, secondary, tertiary and gender wise data of gross enrollment and total expenditure were used as the proxies of education. This study shows that primary enrollment of female have a causal but no robust effect on growth while the secondary tertiary have both the effect on economic growth.

Keeping in view the above mentioned review of literature, it can be concluded that education is considered to have a strong correlation with social and economic development. Education can help in overcoming the economic and social problems like poverty, unemployment, crimes and terrorism in Pakistan. This study is an attempt to analyze the causal relationship between education and economic growth.

III. Data and Research Methodology

For empirical investigation to be carried out for Pakistan economy, time series data have been used in this study for the period 1972-2008. The data have been collected from Pakistan Economic Survey, Provincial and Federal Budget Documents (various issues). The included variables in the analysis were GDP and government expenditure on education. In order to investigate the relationship between education expenditure and economic growth, the following model is specified:

\[ GDP_t = \gamma_0 + \gamma_1 EduExp_t + \varepsilon_t \]
Unit Root Tests

Most of the economic and financial time series in general are non-stationary. In Monte-Carlo experiment, Granger and Newbold (1974) found that when regression involves non-stationary variables, the OLS regression could be spurious. To determine the order of integration of the variables included in the model, beside other techniques available, Augmented Dickey-Fuller (ADF) and Philip-Perron (PP) tests are employed in this study. In order to conserve space and time we will not offer detailed explanation of unit root tests as they are well documented in the existing literature.

Johansen Cointegration\(^{58}\)

The innermost idea for cointegration test is relevant to the functional forms of model. This includes the long run relationship of one variable with other variables. In simple words, it is documented that cointegration describes the existence of long run stable relationship between the two variables. If the time series variables are non-stationary at I(0) then they can be integrated at I(1) order of integration, when their first differences are stationary. These variables can be cointegrated when they have one or more linear combinations among themselves that are stationary. Furthermore, when variables are being cointegrated then there exists a constant long-run linear relationship among these variables.

In this study, Johansen cointegration test is applied to examine the cointegration among variables. The main reason is that Johansen cointegration test is the most consistent one. It is better for small sample properties such as in this study. Another advantage of this approach is, one can estimate several cointegration relationships among the variables simultaneously. It is well known that the cointegration tests require lag length. The Akaike Information Criterion (AIC) and Schwarz Bayesian Criterion (SBC) have been used to select the number of lags on the basis of minimum values of both criterions.

IV. Results and Interpretation

Test Results for Unit Root

Before carrying out the cointegration analysis, it is imperative to determine the order of integration of the variables. For this purpose, Augmented Dickey-Fuller and Philip-Perron tests are employed. The implication of these tests is to determine whether the Vector Autoregressive (VAR) model should be estimated in level or first difference form. Both ADF and PP tests are performed on level as well as on first difference of the series. The results of the both tests are reported in Tables 2.

The results of both the tests show that both the variables included in the model are I(1). This means that first differencing of variables is sufficient for modeling the time series considered in this study.

Table 2: Unit Root Tests

</tr>
</tbody>
</table>

Test critical values (MacKinnon, 1996)

| 5% Level | –2.948 | –2.945 |

* implies that the coefficient is significant at 0.05 percent probability level

**Test Results for Cointegration**

Having established that both variables in the study are integrated of order one, *i.e.* I(1), the next step is to determine the long-run linear relationship among variables by applying Johansen maximum likelihood co integration technique. Prior to applying this technique, the lag length of the test VAR was specified using Akaike criterion and Schwartz criterion at different lag lengths. The results are reported in Table 3.

**Table 3: Results of VAR Model**

<table>
<thead>
<tr>
<th>Lag length</th>
<th>Akaike Criterion</th>
<th>Schwartz Criterion</th>
</tr>
</thead>
<tbody>
<tr>
<td>3</td>
<td>–4.94</td>
<td>–4.58</td>

<tr>
<td>2</td>
<td>–4.97</td>
<td>–4.70</td>
</tr>
<tr>
<td>1 (optimal lag)</td>
<td>–4.70</td>
<td>–4.88*</td>
</tr>
</tbody>
</table>

The results in Table 3 indicate that the optimal lag length is one because the value of Schwartz criterion at lag 1 is minimum. With this information, Johansen cointegration test was performed. The results are presented in Table 4.

**Table 4: Johansen Cointegration Test**

<table>
<thead>

</tr>
<tr>
<td></td>
</tr>
</tbody>
</table>

Note: * denotes rejection of the null hypothesis at the 0.05 level of significance

Results reveal that the null hypothesis of no cointegrating relationship can be rejected at five percent level which means there is one cointegrating vector. It implies that both the variables exhibit a long run linear relationship.
The normalized cointegrating equation is presented below.

\[ GDP_t = 2.6926 + 1.0135 \text{ Edu exp}_t \]

S.E. (0.04879)

t-statistic [20.77]

The above equation shows that in the long-run expenditure on education has positive and significant impact on economic growth.

**The Short-Run Dynamic Model of GDP: The Error Correction Approach**

Error correction model is used to determine the short run dynamics of the regression model. The ECM equation is presented below:

\[ \Delta GDP_t = \alpha_0 + \sum_{i=1}^{n} \alpha_i \Delta GDP_{i-1} + \sum_{i=1}^{n} \alpha_2 \Delta Edu \exp_{i-1} + \lambda EC_{i-1} + \varepsilon_t \]

Where

\( \Delta \) denotes the first difference operator

\( \varepsilon_t \) is a random error term

\( EC_{i-1} \) is lagged error correction term

The results of estimated error correction model are reported in Table 5.

**Table 5**

<table>
<thead>
<tr>
<th>Dependent Variable</th>
<th>Coefficient</th>
<th>t-Ratio</th>
</tr>
</thead>
<tbody>
<tr>
<td>Constant</td>
<td>0.05457</td>
<td>5.71277*</td>
</tr>
<tr>
<td>( \Delta GDP(-1) )</td>
<td>0.107488</td>
<td>0.73744</td>
</tr>
<tr>
<td>( \Delta Edu \exp(-1) )</td>
<td>0.0172</td>
<td>0.73744</td>
</tr>
<tr>
<td>( EC(-1) )</td>
<td>-0.2173</td>
<td>-3.60013*</td>
</tr>
</tbody>
</table>

R\(^2\) = 63%, Adjusted R\(^2\) = 60%, F-stat = 17.90

Note: *represents significance at 5% critical values.

The results suggested that none of the regressors is establishing short-term relationship with the GDP significantly. Moreover, Error Correction Coefficient shows the speed of adjustment of variables returning to equilibrium. A negative and statistically significant coefficient of error correction term is an indication of cointegration between the variables.\(^{59}\) The error correction coefficient carries negative expected sign, which is significant, indicating that in Pakistan GDP (economic growth) and expenditure on education are co-integrated. Furthermore, the estimated coefficient of error correction indicates that approximately 21 percent of the disequilibrium is corrected immediately, i.e. in the next year.

---

\(^{59}\)Kremer et al. (1992) have shown that the significant lagged error correction term is a more efficient way of establishing cointegration.
Test Results for Granger Causality

After estimating the long-run relationship between GDP growth rate and public sector educational expenditure, the next step is to examine the Granger-causal relationship among variables. In this study Granger Causality test has been employed to examine the causal relationship among the both variables.

The results of Granger causality test are reported in Table 6.

<table>
<thead>
<tr>
<th>Table 6: Granger Causality</th>
</tr>
</thead>
<tbody>
<tr>
<td>Null Hypothesis (H₀)</td>
</tr>
<tr>
<td></td>
</tr>
<tr>
<td></td>
</tr>
<tr>
<td>Education Exp → GDP</td>
</tr>
<tr>
<td>GDP → Education Exp</td>
</tr>
<tr>
<td></td>
</tr>
<tr>
<td></td>
</tr>
<tr>
<td>Education Exp → GDP</td>
</tr>
<tr>
<td>GDP → Education Exp</td>
</tr>
</tbody>
</table>

Note: → indicates that first variable does not Granger cause the second.
*indicates the rejection of null hypothesis.

Table 6 shows that a unidirectional causality running from GDP to educational expenditure exists and there is no evidence of causation running from educational expenditure to economic growth in the short-run and long-run.

In order to check the stability of the model CUSUM and CUSUMSQ are employed.

Figure 1 CUSUM Test Result
Plot of Cumulative Sum of Recursive Residuals
Figures 1 and 2 reveal that the stability of coefficient estimates is not supported because both the plots do not fall within the critical values. It indicates that the long-run relationship between education expenditure and economic growth is unstable in Pakistan.

V. Conclusion

The main objective of this study was to analyze the impact of education expenditure on economic growth for the period 1972 to 2008. Results of the study provide strong evidence of unidirectional causality from the GDP growth to educational expenditure. This means educational expenditures are dependent on economic growth in Pakistan.

Educational expenditures play an important role in the development process of economy like Pakistan. In Pakistan, the allocation of resources for education sector is insufficient to meet the current requirements of the sector. Pakistan needs to design policies and programs for improving the quality of education. These educational policies should attract highly qualified professionals from abroad. For this purpose, the role of Higher Education Commission (HEC) for improving the quality of higher education needs to be strengthened. The Government of Pakistan should pay adequate attention in discouraging brain drain through providing reasonable opportunities to the highly qualified professional within the country. There is a need that the government should initiate various policies which must be consistent with the country’s needs and can help the educated professionals in securing appropriate jobs within the country. Furthermore, educational expenditures especially for elementary, technical and scientific education need to be expanded.

A major limitation of the study is that it includes only one independent variable. It means our analysis of the relationship between education and economic growth seems to be not free from simultaneity bias. Analysis of this relationship calls for further research by including more regressors like capital, labour and openness, etc. in the model.

ANALYSIS OF ENGINEERING AND EDUCATION STUDENTS’ EXPERIENCES AND EXPECTATIONS ON POWERPOINT USAGE FOR INSTRUCTION

Shittu, Ahmed Tajudeen
Kamal Madarsa Basha
Tunku Badariah Tunku Ahmad
Mukhtar Alhaji Liman
International Islamic University, Malaysia

ABSTRACT

This study investigates students’ experiences and expectations in a PowerPoint lecture class. The participants of the study were education and engineering students. A total of 300 questionnaires were administered and 288 were found usable for the study. Frequency, mean, standard deviation and independent sample t-test was used for analyzing the data generated from the study. The findings of the study shows that there is no significant difference in the mean of male and female student experiences and expectations in a PowerPoint lecture class. Also, there is no significance difference in the mean of education and engineering student preferred mode of utilizing the tool for instruction purposes. Base on these findings, the study make suggestions and recommendations on how to improve the quality of instruction that is giving to the present digital native students. The paper also offers implication for education and engineering educators to be cognizance of how to leverage their teaching with technology in order to achieve a meaningful and desire results.

Keywords: PowerPoint slide, Instruction method, Student experiences, Student expectation

INTRODUCTION

The importance attached to classroom instruction cannot be underestimated. Because the quality of knowledge that is impacted to the students solely depend on the instructional strategy employed. These explains why researchers in education ceaselessly searching and researching into how best to improve instructional delivery at all levels of education. Over the years, several method of teaching has being adopted for the accomplishment of teaching function. As a result different technologies were drafted into our classrooms. The dominance medium of instructional delivery in the recent age is PowerPoint lecture method. Unlike in the recent past when teachers display some resistance to adoption and use of technology, the present age has witness a dramatic shift to total usage of technology at all levels of education. O’Dwyer (2008) posited that there is increase in the emphasis placed on adoption of electronic delivery of instruction to students in the recent age. According to this researcher, PowerPoint lecture method has attracted much attention than any other form of instructional delivery. Yet, there appear some criticism on the effectiveness of PowerPoint lecture method because of conflict findings on it use in teaching, which has created an aspersion on the effectiveness of the tool for classroom instruction. For instance, Szabo and Hasting (2000) as well as Susskind (2005) examined the use of PowerPoint for teaching at different setting and reported that there is no much change in student academic achievement when they were being taught through the medium. Similarly, Barlett and Strough (2003) conducted a study to see the impact of different types of instructional forms on student’s academic performance, with PowerPoint base lecture, the finding shows that the PowerPoint
usage does not provide any improvement to student in term of performance as compared to traditional classroom approach. Yet, teachers and faculty members are encouraged to leverage their teaching function with modern technology to the extent that some have already jettisoned the traditional method of instructional delivery. In furtherance to the understanding of PowerPoint use in classroom teaching, this study therefore, aims at analyzing student view base on their experiences when they were taught with the tool, as well as their comment on their expectation when their teacher employ it to teach them.

LITERATURE REVIEW

There are many divergent views on the effectiveness of PowerPoint for instructional activities at all levels of education. While some argued that students’ learning might be adversely affected by this mode of delivery, some said it is the most appropriate software package for instruction delivery. Cripsen (2004) opined that elaborate PowerPoint presentation most time lower students academic achievement. Murphy (2004) stated the following as what makes PowerPoint potentially inappropriate for education: it can foreshortening evidence and thought; low spatial resolution; a deeply hierarchical single path structure as the model for organizing every type of content. Breaking up narrative and data into slides and minimal fragment; rapid temporal sequencing of thin information rather than focused spatial analysis, conspicuous decoration that is irrelevant to the content.

Laurie (2007) opined that PowerPoint presentation can not be use to teach the highest level of domain of thinking as presented in bloom six levels of cognitive domain. The six levels start from the simple recall or recognition of fact, as the lowest level, through increasingly more complex and abstract mental level, to the highest order which is classified as evaluation levels. This educator sum up his observation that technology integration which many teachers define as the use of PowerPoint in instruction can only effect learning to take place at the lowest rug of thinking, which is understanding and knowledge levels. In a study conducted by Davies, T.L., Lavin, A.M., Korte, L (20009), on technology use for classroom instruction, the result suggested that technology use in the classroom has a positive impact. Albeit it may not necessarily be appropriate for all classroom situations and all subject matter. However, Loisel and Galen (2004) study of the use of PowerPoint in 314l classroom concluded that in their survey result they discovered that students enjoy PowerPoint presentation and that they belief it is effective. Though, majority opted for information to be presented in a different medium. Moreover, out of the three media option in this survey (lecture, Dreamweaver and PowerPoint), PowerPoint continued to be the most preferred. Davies et al (2009) asserted that technology was employ to enable the teachers to summarize important points and to make effective use of class time. The finding from Davies study about technology integration in the classroom revealed that students are more attentive in a classroom where technology is use as a medium of instruction; it improve the quality of their note taking: the study also revealed that the use of technology would enable the instructor to cover more material.

In a study on using IT in the undergraduate classroom: should we replace the blackboard with PowerPoint conducted by Szabo and Hasting (2000) in the study student opinion were sought after receiving all their lectures in one module in PowerPoint. Grades of one set of students were compared with the grade of another set of students that took their own one year earlier. No significant differences were found. In another study, students received a mock test one week with overhead lecture, second week with a power point lecture and third week with power point with lecture notes. There was no significant difference between the two power point lectures both of which resulted in higher grade than the lecture with overhead transparence. What this result potent is that the efficacy of PowerPoint may be case specific rather than universal. On the efficacy of PowerPoint in lecturing Harknet and Cobane (1997) provide some descriptive account of the benefit of it usage 80% of the participant in the study felt that PowerPoint lectures
assisted them greatly in their learning. Some of them felt that the visual emphasis in the PowerPoint helped them in recalling some of what they learn at the time of examination. However, apart from the students’ positive attitude toward this method of lecturing, no other significant benefits of PowerPoint were disclosed. The author suggests that PowerPoint slides are easy to update and that they can provide excellent opportunity for creating electronic handouts. However, the finding from the study cannot be generalized because it is not clear how many students were survey and how many PowerPoint lecture was presented to them. Nicholson (2002) study on student perspective on lecture deliver using MS PowerPoint reported that students were of the opinion that PowerPoint is used less in some discipline than the other. In conclusion of her study there was general agreement among students that PowerPoint presentations add clarity to the content of their lectures. The students also agreed that the use of image, color, animation and layering are particularly helpful. From the literature reviewed it is evidently clear that powerpoint on itself as a tool can not improve student learning, it is the way that instructor use it that can encourage student learning.

**STATEMENT OF THE PROBLEM**
Paradigm shift in teaching and learning function at all levels of education has greatly influence the way educators, and faculty members implement the actual practice of teaching. Microsoft PowerPoint lecture method has replaced all other form of teaching in the traditional classroom. Faculty members are on their toe to use this medium either it is appropriate or not for a particular instruction. A lot of argument are generated on the pros and con of it usage. Some argue that it can increase the effectiveness of classroom lectures; that it lends greater clarity to lecture and making it easier to follow (Sammons 1997, Rossen et al 1997, Nicholson, 2002). Some researchers also stated that it is teachers centered. This make it inappropriate tool in teaching especially when educators clamor for a method that should be student centered. This study therefore is aim at seeking to know students perspective on the use of PowerPoint in order to gain insight into how to improve on it usage.

**PURPOSE OF THE STUDY**
The primary purpose of this study is to understand student views in term of their experiences when they received lecture with PowerPoint slide and what and how they want the tool to be use by their instructors/teachers/faculties in the classroom. What they like and dislike in the way the technology is used.

**PARTICIPANT OF THE STUDY**
The participants of the study were engineering and education students in international Islamic university, Malaysia. A total of 300 questionnaires were distributed but 288 were found usable. Out of the total participants 159(56%) of them were male, while 129(44%) were female. 225(78%) were undergraduate, while 53(22%) were postgraduate students. The participants of the study were randomly selected for the study.

**RESEARCH QUESTIONS**
1. Is there a significant difference in the mean of education and engineering students’ experiences in a PowerPoint lecture class?
2. Is there a significant difference in the mean of education and engineering students’ expectations on how PowerPoint should be used for classroom instruction?

**ANALYSIS OF THE RESULT**
The findings in (table 1) revealed the following. Majority of the students 136 representing (47.2%) agree that they found PowerPoint lecture method to be an attention capturing tool. 78(27.1%) of the total respondent strongly agree with this position as well, while 14(4.4%) strongly disagree. The item has a mean of 3.85(SD=1.04). The finding also show that
PowerPoint can be used to emphasize important points better, with more than half of the respondent 164(56.9%) agreeing. 54(18.8%) choose to strongly agree, 43(14.9%) were unsure, while 15(5.2%) strongly disagree with the statement. The mean of this item is 3.79 (SD=.97). The finding also shows that PowerPoint are better structured and prepared in teaching, with majority of the respondents 128(44.4%) agree with the statement, 54(18.8%) strongly agree, 77(26.7%) indicated to be unsure and only 1(0.3%) respondent indicated to strongly disagree with the statement. The mean and standard deviation of the item is 3.72(SD=.893). On item that stated that I found my note more organized in PowerPoint lecture classroom, majority of the respondents 124(43.1%) agree with this statement, 48(16.7%) strongly agree, 58(20.1%) choose to be unsure, while 46(16.0%) disagree and 12(4.2%) strongly disagree with the statement. The item has a mean of 3.52(SD=1.08). On item that stated that PowerPoint enable me to maintain my focus in the classroom, majority of the respondents 118(41.0%) indicated to agree, 35(12.5%) choose to strongly agree, 92(31.9%) were unsure, 34(11.8%) disagree, 9(3.1%) indicated to strongly disagree with the statement. The mean and standard deviation of the item is 3.47(SD=.96). The finding on the statement that PowerPoint lecture method enable the teacher to use the class time effectively and balance lecture discussion shows that almost half of the respondent 146(50.7%) were in agreement with the statement. 31(10.8%) choose to strongly agree, 52(18.1%) indicated to disagree and 16(5.6%) choose to strongly disagree. The mean and standard deviation of the item is 3.46(SD=1.05). The item that states that PowerPoint are easier to follow revealed that 129(44.8%) of the respondents choose to agree, 45(15.6%) indicated to strongly agree, 52(18.1%) indicated to be unsure, 36(12.5%) choose to disagree and 26(9.0%) indicated to strongly disagree with the statement. The mean and standard deviation of the item is 3.45(SD=1.16). The item that state that I enjoyed class more whenever PowerPoint is used as a medium of instruction revealed that 116(40.3%) of the respondents choose to concur with the statement, 25(8.7%) indicated to strongly agree, 104(36.1%) indicated to disagree and 53(18.4%) choose to strongly disagree with the statement. The mean and standard deviation of the item is 3.39(SD=.91). The item that state that PowerPoint are visually less clear revealed that respondent 101(35.1%) indicated to disagree, 78(25.7%) indicated to be unsure, 52(18.8%) choose to agree and 13(4.5) strongly disagree with the statement. The item mean and its standard deviation is 2.59(SD=1.10).

### Results of the Survey

The finding in (table 2) revealed the following information. The item that stated that I generally find visual elements such as pictures/charts/graphs helpful in PowerPoint lecture has 139(48.3%) of the respondents indicated to agree to the statement. 104(36.1%) indicated to strongly agree, 22(7.6%) choose to be unsure, 21(7.3%) indicated to disagree and 2(0.7%) of the respondents indicated to strongly disagree with the statement. The mean and standard deviation of the item is 4.19(SD=.88). On item that stated that I would like our lecturer to upload the slide online is 3.79(SD=.99). On the item that stated that I generally find that power point based lectures mean that there is less motivation for me to attend the lecture, 51(17.7%) choose to be unsure, 71(24.7) indicated to disagree and 32(11.8%) choose to strongly disagree. The mean and standard deviation of the item is 3.81(SD=.91). On the item that stated that I like a paper copy of lecture notes is harder to prepare is 144(50.0%) of the respondents indicated to agree to the statement. 119(41.3%) of the respondents indicated to agree, 110(38.2%) indicated to strongly agree, 62(21.5%) choose to strongly agree, 74(25.7%) indicated to be unsure, 8(2.8%) indicated to disagree and 9(3.1%) choose to strongly disagree. The mean and standard deviation of the item is 3.84(SD=1.06).

On the item that stated that I would like the lecturer to give an outline of a lecture on PowerPoint slide because I would learn more in the lecturer explanation has 135(46.5%) respondents indicating to agree to this statement. 62(21.5%) choose to strongly agree, 74(25.7%) indicated to be unsure, 8(2.8%) indicated to disagree and 9(3.1%) choose to strongly disagree. The mean and standard deviation of the item is 3.81(SD=.91). On the item that stated that I like a paper copy of slide to be made available by the lecturer has 110(38.2%) respondents indicated to agree with the statement. 76(26.4%) choose to agree, 75(26.0%) indicated to be unsure, 19(6.6%) indicated to disagree and 8(2.5%) choose to strongly disagree. The mean and standard deviation of the item is 3.79(SD=.99). On the item that stated that I would like our lecturer to upload the slide online

SD=Strongly agree, D=Disagree, U=Unsure, A=Agree, SA=Strongly agree, M=Mean, SD=Standard deviation
I generally find visual elements such as pictures/charts/graphics helpful in the power point presentations

I prefer it when important definitions and terms are completely written out on the power point slides

I like to have a paper copy of a power point slide if it is made available by the lecturer

I like that the power point slides are available for viewing on WebCT

I prefer slide that provide the full text of the lecture material (i.e. everything that the lecturer want the student to know is completely written out on the slide)

I find it helpful for the lecturer to read the power point slides as they are presented

I would prefer if the information are revealed line by line on the slide, rather than if the total information is revealed all at once on the screen

I like if the lecturer uses electronic sounds that go along with the pictures or concepts that are being presented

To me I feel that the use of power point slides inhibits discussion in a lecture

I found it boring when the lecture says the same things the powerpoint slide revealed on the screen

I would like the lecturer to vary the size and shape of the text used in the powerpoint slides

I would like the lecturer to give an outline of the lecture on powerpoint slide, as I would learn more in the lecturer explanation if I had to write some of the material

I find it helpful if each slide is revealed all at once, even if it is ahead of the lecture

When I have a copy of the presentation, I may likely decide not to attend the lecture

**t-test for equal of mean of male and female experiences on lecture received via PowerPoint.**

An independent sample t-test was conducted to compare students experience at PowerPoint lectured method classroom among male and female. The finding shows that there was no significant difference in responses of male and female. The mean and standard deviation for male is M(60.44), SD(8.99) and the mean and standard deviation for female group is M(62.47), SD(8.33). The mean difference is -2.033, 95% Confidence interval: -4.06 to -0.03.

**t-test for equal of mean of education and engineering students expectation on how PowerPoint should be use in instruction.**
An independent sample t-test was conducted to compare the expectations of students on how PowerPoint lectured should be used in the classroom among education and engineering students. The finding shows that there was no significant difference in responses of education and engineering students. The mean and standard deviation for education student responses is $M(51.73)$, $SD(8.05)$ and the mean for engineering group is $M(53.01)$, $SD(7.54)$. The mean difference is $-1.278$, 95% Confidence interval: $-3.103$ to $-546$.

### $t$-test for equal of mean between education and engineering student experiences in a PowerPoint lecture class.

An independent sample $t$-test was conducted to compare students experience at PowerPoint lectured method classroom among education and engineering students. The finding shows that there was no significant difference in responses of the two groups. The mean and standard deviation for education is $M(62.63)$, $SD(7.98)$ and the mean and standard deviation for engineering group is $M(60.43)$, $SD(9.16)$. The mean difference is $2.198$, 95% Confidence interval: $.153$ to $4.243$.

### DISCUSSION

Based on the objective of this study which aims at analyzing the experiences and the expectation of students on the medium through which the instruction they received is delivered to them specifically PowerPoint lecture method, several questions related to the objective of the study were raised through the instrument use for the study. The students were also asked to make personal comments on why they like or dislike PowerPoint lecture class. Judging from their responses, it was observed that both education and engineering students indicated to believe that PowerPoint lecture method always sustain their attention and interest in the class, they also attest to the fact that the medium of instruction can be used to emphasize important points. The majority of the respondent indicated that they were able to organize their notes in a PowerPoint lecture class. The medium enable them to keep their focus during instruction activities. Aside the fact that the medium is easy to follow, they observe that it enable their instructors to organize and better use the period of instruction judiciously and it also enable their teacher to stay more focus on the lecture material. On the responses of the students on how they would like the
medium to be used in the class, majority of them indicated that PowerPoint embedded with visual element such as graphic, picture, chart shall be more appealing to them in the class, majority of them also indicated that PowerPoint that has example and oral explanation on key point of the subject matter will facilitate their learning of the topic of instruction. The students indicated that they preferred their instructors to write out all what they will like them to know on the slide, in other word they preferred slide that provide the full text of the lecture material. They also want their instructors to provide a printed copy of the slide to be made available to them. The students indicated that they would like their instructors to upload the PowerPoint slide to institution WebCT or their learning management system (LMS) for them to access.

THE IMPLICATION OF THE STUDY FOR EDUCATORS
This study is another contribution to the best practice in instructional delivery and technology integration in higher education classroom in Malaysia. It is a contribution to the body of knowledge on PowerPoint integration in teaching and learning process. The result of the study has address some disconnect between technology uses as experience by the students and how they would want the tool to be use in their classes. In the light of these findings, instructors are encourage to utilize PowerPoint in an innovative way, through student preferences so as to achieve the best practice in technology integration that can result to quantum improvement in students learning. Educator are therefore encourage to be strategic in implementing teaching function since the medium and the content of instruction are intertwine process that required adequate and equitable planning for the achievement of instructional goal. Lastly, educators are encouraged to vary their use of technology by accommodate students preference in their deployment of technology in the class so that all their effort will yield a desire result.

CONCLUSION
The finding of this study is in exhaustible. More importantly, when it come to what is to be done, to improve classroom instruction. The content of instruction is as important as medium that is use as a vehicle for its delivery. This account for why it is necessary to continue searching and researching, in order to report how classroom instruction can be effectively conducted amidst several tool in the teachers kit that can be employ for classroom instruction. The study is conducted with quantitative method; however a qualitative approach study is also required in order to have an empirical finding of the same study thereby providing various solutions to the problem of PowerPoint usage in traditional classroom.

Nicholson, T. D (2002) Lecture delivery using MS power point; staff and student perspective at MMU

Abstract
This study evaluates the implementation of Quality Management System-ISO 9001 (QMS) in a degree awarding institute (institute), which was established in 1999 with a single campus. With the passage of time the institute has established its satellite campuses in other cities of the country. This institute has a mixed centralization and decentralization administration style. Head Office is mainly responsible for policy making, expansion, R&D, curriculum development, institute level events organization, HRM and financial control, whereas campuses have their role of teaching-learning and campus level administration. With its rapid expansion, the institute faced administrative challenges and adopted various administration models, but the challenges kept on growing to an extent that the management of the institute had apprehensions regarding further expansion. HRM, training & development, financial controls, research & development, record keeping, building maintenance, curriculum revision & development, introduction of new programs, industry-academia partnership, research productivity, quality teaching-learning, etc were the challenges for the institute management. The management displayed a strong intention to address these challenges; after several top level consultative meetings it was determined that there is a need for a robust management system. Finally the management realized that the international standard of quality management system ISO 9001 has the ability to address these challenges effectively and has a potential for developing a robust management/governance system. With these hypotheses the management decided to implement the QMS in the institute. This study evaluates how QMS helped this institute to cope with the above highlighted challenges, and how it builds the overall structure of governance; how it assesses the role of standards or tools such as ISO 9001:2008 can help an educational institution towards developing and managing the organizational profile. This study also discusses the steps of QMS implementation at the institute. From very outset, the author was involved in the implementation of QMS in the institute.

Key words: Quality, HEC, Governance, ISO, QMS, Pakistan

1. Introduction
We live in the age of information, creativity and innovation, wherein new technological advancements, opportunities and challenges are being faced by us all the time. Organization are also facing these challenges and trying to be the best in their field. In this endeavor, standards are set and best practices are being mandated in businesses. But to have good governance in any organization, they have to develop strategies to bring their resources together to achieve their goals and objectives; to this end, they set benchmarks or standards against which the organizations can measure their standards, procedures and practices. Quality is important for a company in order to excel; this is what quality is all about. Quality does not only deal with the corporate sector but also has application in Higher Educational institutions for teaching, learning and management (Bollaert et al, 2007). Moreover, Higher Education Commission of Pakistan (HEC) is also making efforts toward quality.
Our institutions need a transformation in the strategies being used so far. To change our organizations into world class institutions, we need progression in the field of knowledge; nations that fail to bring quality in its institutions seldom make it to the forefront of world leaders. Quality has become the buzz-word, of the 21st century.

ISO (International Organization for Standardization), established in 1947, is the world's largest developer and publisher of International Standards; it is a network of the national standards institutes of 163 countries, one member per country, with a Central Secretariat in Geneva, Switzerland, that coordinates the system. ISO is a non-governmental organization that forms a bridge between the public and private sectors. On the one hand, many of its member institutes are part of the governmental structure of their countries, or are mandated by their governments; on the other hand, other members have their roots in the private sector, having been set up by national partnerships of industry associations (ISO, 2010).

ISO gives us the standards that are the tools to achieve goals; it provides guidance to develop a process and ways to implement it as a framework. ISO not only provides guidance on the role of a governing body, but also encourages organizations to use appropriate standards to underpin governance and quality assurance (Tufail and Lodi, 2006). The objective is to provide a framework of principles for management, good corporate governance, evaluating, directing and monitoring in an organization. Therefore, ISO enables a consensus to be reached on solutions that meet both the specific requirements of business and the broader needs of society as a whole.

Education is considered to be an industry which makes investments in people; however educational organizations are not usually a business / corporate organization or a profit making industry. As an educational institution, the objective is to deliver quality education and for that, an organization carries out all kinds of processes and structural strategies to achieve its goals. To this end, an educational organization must have a clearly defined mission statement. To achieve this mission, objectives are developed; and to achieve these objectives, some mechanism is developed e.g. an organization has a Governing Body, departments and a structure and these structures are designed to achieve the goals.

In Pakistan very few educational institutions have considered ISO important in academia, research, innovation and creativity, as there are no measurable, tangible or quantifiable criteria to assess knowledge; however the institute which is the subject of this case study is not one of them. This research case study evaluates the role of how the standards or tools such as ISO 9001:2008 can help an educational institution towards providing and managing the organizational profile and to build an overall structure of corporate governance. ISO framework provides that challenge to this institution which has now adopted the ISO framework as guidance for good governance. Although this organization is not amongst the corporate sector, but it has implemented ISO standards as a benchmark and evaluated what it has been doing in the past and what new should be introduced. It has implemented this tool by developing parameters / criteria (measurable and quantifiable parameters); they have been able to define them in education. Though, exact quantifiable measures are yet to be developed and implemented, but there is some improvement and progress in this regard.

1.1. Background:
This study is about the implementation of Quality Management System - ISO 9001 (QMS) in a degree awarding institute (institute), which was established in 1999 with a single campus. With the passage of time the institute has established its satellite campuses in other cities of the country. This institute has a mixed centralization and decentralization administrative style. The Head Office is mainly responsible for policy making, expansion, R&D, curriculum development, institute level events organization, HRM and financial control, whereas campuses have their role of teaching-learning and campus level administration.
The rapid expansion created a variety of problems; although the institute has tried to embed quality in academics as well as in administration by developing some basic rules and regulations, but with the passage of time it was realized that the developed systems were unable to deliver the desired quality in academics and administration. The challenges grew to an extent that the management had apprehensions regarding further expansion. The management displayed a strong intention to address these challenges; after several top level consultative meetings, it was determined that there is a need for a robust management system. The management determined that the international standard of quality management system, ISO 9001, has the ability to address these challenges effectively, and the potential for developing a robust management/governance system; it was agreed that QMS should be used as a tool to achieve the desired level of quality and good governance.

For this purpose the institute engaged a Consultancy Firm (firms) through a transparent process for the implementation of QMS. The institute was asked to appoint a Management Representative/Project Leader (MR) and to nominate a QMS Steering Committee (SC). The role of MR and SC was to review, verify and validate the developed procedure/systems. An implementation committee/task force (TF) was constituted, comprising representatives of all academic and non-academic departments/sections; the role of this task force was to develop procedures at the functional level. The firm conducted a number of training sessions for the MR, SC and TF on QMS implementation and their role. It is worth mentioning that the trainings sessions were chaired by the Rector himself, wherein he embodied the commitment of top management to this initiative, and desired that all concerned academic and non-academic officers should fully cooperate with the consultants in the implementation of QMS.

After these training sessions, the firm conducted a comprehensive gap analysis/organizational assessment, in which they evaluated the existing academic and management practices with an aim to identify the areas for improvement and to prioritize the critical processes which need urgent attention. A consultative approach was used for gap analysis in which a series of meetings were held with different tiers of management and a series of individual interviews were conducted with the concerned officials. Existing documents, policies, rules, regulations and statutes were reviewed to assess what changes/improvements were required. This study evaluates how QMS helped this institute to cope with the above highlighted challenges, and how it builds the overall structure of governance; it assesses how standards or tools such as ISO 9001:2008 can help an educational institution towards developing and managing its organizational profile. This study also discusses the steps of QMS implementation at the institute.

1.2. Objectives:
The objectives of this study are as follows:
- To evaluate the existing academic and management practices of the organization.
- To identify the areas for improvement and devise a roadmap by formulating a quality policy for administrative efficiency.
- Successful implementation of the quality system procedure, capacity building and continual improvement.
- To evaluate how QMS helped this institute to build the overall structure of governance.

2.0. Methodology:
In this research the tool used is the case study method in which a series of interviews, group discussions, question/answer sessions and interactive sessions were conducted as explained in (Saunders, Lewis and Thornhill, 2009; Kumar, 2005) with the top management, heads of academic and non-academic departments, faculty members and students. The author visited all departments; especially those newly developed, and reviewed the previous rules and regulations...
in practice and newly developed procedures and policies. Case study method, being a multi
perspective analysis and an empirical inquiry, has been increasingly used in many social
sciences, as it gives the holistic view and an opportunity for in-depth investigation. Yin
(1993:23) says that the case study research method is an empirical inquiry that investigates the
issues within real-life context in which multiple sources of evidence are used.

This approach provided an appropriate understanding of the issues and the context in which
the issues were operating; it was a single event which helped in looking at the sequence of
events in a systematic way. As the author was an integral part of this process throughout; it
helped in seeking effective outcomes. This study investigates the phenomena and enabled the
author to identify real life problems / issues of the institute and their solutions to develop a set of
robust procedures for the institution under discussion.

2.1. Results of Gap Analysis:
The major findings of the gap analysis study are:

- **On the academic side, teaching-learning environment, curriculum revision, industry-
  academia partnership, student feedback, effectiveness of quality enhancement cell, core
  skill development, department alumni and research productivity need serious attention.**

- **Administration needs to work on recruitment and performance appraisal, procurement
  policies, clarity of roles and responsibilities of staff, laboratory management, capacity
  building of administrative officials, internal client feedback mechanism, setting up and
  monitoring of smart goals and objectives, clarity in reporting structure, efficient flow of
  processes, effective record keeping, internal checks and balances, internal planned reviews
  and mechanism for continual improvement.**

3.0. Recommendations for System Improvement:
In the light of identified gaps an agreed action plan was developed as follows

3.1. Academic (Enhancing Teaching Efficiency)

- **Interactive Research Sessions (IRS) for Faculty Members:** To enhance the research
  productivity it is recommended that each and every academic department should hold
  interactive research sessions twice a month. IRS will help faculty members in producing
  research papers as they would be able to review a numbers of studies consistently.

- **Curriculum Revision:** Considering the rapid developments in technology, it was decided
  that the curriculum should be revised every three years. Curriculum revision should also
  include the feedback from industry and alumni, because of their expertise to identify new
  trends in market /industry and to identify gaps in the old system. Thus curriculum review
  and revision should be based on data obtained from a number of sources, including student
  evaluation feedback, faculty input, graduate follow-up evaluation data and practicing
  agency’s feedback. A well defined Standard Operating Procedure (SOP) would be devised
  in consultation with faculty members in this regard.

- **Industry-Academia Partnership:** The consultancy firm suggests that the ties between the
  departments of the institute and related industry should be strengthened. In this way the
  institute can contribute towards overall development of the related industry, and can add
  value in the processes and products of the related industry in both the public and private
  sectors. This shall facilitate the institute to fulfill its corporate social responsibility in
  addition to exploring earning opportunities. A two-tiered approach can be developed in this
  regard; the departments may offer their services to the related industry and, similarly,
  faculty members may also provide consultancies in their individual capacities. The
  strengthened ties between the departments and the industry would pave the way to identify
  industry needs, job opportunities for graduates and potential revisions in the curriculum. It
would also be a source of practical exposure for the students attached with the concerned faculty member.

- **Student Feedback**: The consultancy firm will hold consultative sessions with students and faculty members to deliberate on different aspects of student feedback. Apart from QEC initiatives of spreading student feedback questionnaires and getting feedback from them, there should be some formal meetings with the students, preferably by the HOD, to take recommendations from them regarding faculty and course layout. These recommendations should be discussed in faculty meetings of the departments in an institutional manner.

- **Departmental Alumni**: The consultancy firm has proposed that there should be an interface of the departmental alumni. Initially a group or face book interface may be established by each department and later a website of the alumni may also be developed. The graduates will use this to share job opportunities, research papers, inputs on industry needs and suggestions to improve academic curricula. The departments have also emphasized to manage this activity at department level rather than at a central alumni and placement office. It has been observed that some informal efforts are also in place by the Department of Management Sciences in this regard.

- **Laboratory Management**: There should be well defined standard operating procedures for key experiments, as well as manuals for equipment maintenance and handling, and health & safety. Calibration of sensitive equipment must be regularly checked and scaled.

- **Core Skill Development**: Special focus should be laid on building English language proficiency of the business students and others.

- **Capacity Development Regarding Examination Processes**: It has been pointed out by a number of faculty members that some form of capacity development initiative should be carried out for faculty members regarding test item development and evaluation processes. The organization should organize identified capacity building sessions for faculty members.

3.2. Non-Academic (Enhancing Administrative Efficiency):

The following areas were identified for enhancing administrative efficiency and to improve service delivery. It is pertinent to mention that representatives of all the staff in the principal seat unanimously agreed to initiate the proposed steps.

- **Job Descriptions**: It was observed during the diagnostic phase that the departments have a lot of work to do in this area. It was mutually agreed with all departments that there should be job descriptions for each official so that they are clear about their roles and responsibilities, and form the base for their accountability and performance management.

- **Development, Implementation and Accessibility of SOPs**: Most of the departments do not have SOPs for relevant functions. The consultancy firm will work with each department to develop their SOPs.

- **Capacity Building of Administrative Officials**: The Institute is a relatively large organization having a large number of teaching and non-teaching staff. During the gap analysis study, it has been observed that whereas different formal mechanisms are available for the professional development of teaching staff, there is no formal system for the professional development of non-teaching (administrative) staff. It is strongly recommended that there must be a formal mechanism for continuous professional development of non-teaching staff in the departments and administrative offices. Annually, each academic and administrative department should conduct a training need assessment (TNA) survey, and then prepare a professional development plan on the basis of the TNA.

- **Client Feedback Mechanism**: Client feedback plays a vital role in ensuring client satisfaction. To improve the service level of administrative departments, ISO 9001:2008 standards recommend that there must be a feedback mechanism in each department for
having unbiased feedback from stakeholders. Careful analysis of feedback will help departments to improve their efficiency and develop their departmental policies and workflow based on that feedback.

- **Recruitment and Performance Appraisal Policies**: There should be fair and effective recruitment procedure to ensure that staff appointed to posts has appropriate qualification and skills to meet the organizations current and future needs. Appraisals should be undertaken at least once a year and there should be comprehensive training program for managers involved in appraising staff in order to understand the appraisal system. This is a complex and technical area which requires a long term concerted and consistent effort to modernize the policies as per the changing needs. ISO 9001:2008 standards recommend that in each department there must be a comprehensive competence criteria matrix for all posts, which clearly establish the qualifications, experience and skill level required for a particular post; during the ISO certification process, it would be tried that, at the very least, these criteria should be in place.

- **Procurement Policies**: The mission of the Purchasing Office is to procure the highest possible quality of goods and services for the organization at the lowest possible cost. To accomplish this mission, certain guidelines and procedures need to be established. Although purchasing is made as per PPRA (a government agency) rules, there is still room for improvement. These procedures must be adhered to in order to ensure budgetary control over organization resources. There should be standard operating procedures for the purchase order preparation, authorization limits and approval process. Supplier evaluation is a mandatory parameter for ISO certification. The consultancy firm will assist the procurement office in this regard.

- **Mandatory Quality Management System Documents**: The concept of ISO Certification is not only to achieve an international certification, but also to provide a roadmap to improve the organizational strength and quality of services in all domains of deliverables with a laid down strategy and approved procedures for improvement and corrective measures and methods.

- **Formulation of Quality Policy**: Quality policy is a guiding principle. It shows the overall intentions and directions of the organization. It is the responsibility of the top management to sketch a comprehensive quality policy. The Consultant will provide guidelines and sample quality policies to the top management for the establishment of the quality policy.

- **Establishment of Quality Objectives and Plans**: ISO 9001:2008 requires that quality objectives shall be established at each relevant function and level within the organization, i.e. just about everywhere. The manner in which quality objectives are established and managed will have an enormous impact on the organization's performance. The quality objectives will drive strategic improvements throughout the organization, significantly elevating the importance of the quality management system. ISO 9001:2008 standards recommend that quality objectives must be established using the SMART principle. SMART stands for: S-Specific – objectives should specify what they want to achieve; M-Measurable – you should be able to measure whether you are meeting the objectives or not; A-Achievable - are the objectives you set, achievable and attainable?; R-Realistic – can you realistically achieve the objectives with the resources you have?; T-Time bound – When do you want to achieve the set objectives?

- **Development of Organizational Charts**: ISO 9001:2008 standards recommend that an organizational chart must be developed at the organization and departmental levels. These organizational charts must clearly indicate the departmentalization, chain of command, distribution of authority and span of control. An organizational chart must show how departments, divisions, and various levels of an organization interact with each other.
Development of Quality System Procedures:

- **Quality System Procedure for Document and Record Control**: A lot of documents have to be handled every day. ISO 9001:2008 standards recommend that every organization must have a documented procedure for documents and record control. This quality system procedure outlines the approval mechanism of a document, review / changes / updating process of documents, identification, storage, protection, retrieval and retention mechanism, distribution and recall of documents, identification and control of external origin documents and disposal method of records.

- **Quality System Procedure for Internal Quality Assurance Auditing**: Audit is an examination of performance to determine whether defined performance standards have been met; it is the measurement component of the quality system. It does this by using a systematic methodology for analyzing processes, procedures and activities with the goal of highlighting organizational problems and recommending solutions. The consultancy firm will provide internal auditing training to one representative from each academic and administrative department. The first internal audit will be facilitated by the consultants while six monthly internal audits will be carried out by them on their own.

- **Quality System Procedure for System Review**: To ensure continuing suitability, adequacy and effectiveness of management system and to assess the opportunities for improvement and the need for changes to quality policy, objective or QMS, it is recommended that top management shall meet on periodic basis to conduct a review of the system. This practice is already in place in the form of a number of established forums; so we would incorporate this existing initiative in the QMS framework.

- **Quality System Procedure for Continual Improvement**: To continuously improve the performance of the Institute there must be a well-defined mechanism for corrective and preventive actions. The basic purpose of implementation of QMS standards is the continual improvement of the performance of the organization. To measure the performance there are key performance indicators (KPIs), which are backed by quality objectives. During implementation of standards, measurable quality objectives are established at each relevant function and level within the organization i.e., just about everywhere. After a given time, objectives are measured using quantitative data to track the performance over time. Selection and management of result oriented objectives will move ISO 9001:2008 into a new territory of driving strategic performance improvements throughout the entire organization.

3.3. Action Plans for System Implementation:

To adopt a graduated approach and to ensure sustainability, it was planned that the system should be implemented in phases; accordingly a phased implementation plan was developed as follows:

**Phase-1 Sensitization and Awareness Development:**
- Awareness sessions for all tiers
- Formation of the steering committee (SC) and a Task Force (TF)
- Training of Task force officials

**Phase-2 Organizational Streamlining:**
- Development of the vision, mission and quality policy.
- Development of organograms (overall and at departmental level)
- Review of the functions of the departments.
- Development of roles and responsibilities of employees (job descriptions).
- Review of the existing policies and procedures.
• Identification of processes, determination of sequence and interaction of process (process mapping).
• Development of new Standard Operating Procedures (SOPs) for the effectiveness of operation and control.
• Development of Standard Analytical Procedures (SAPs) to ensure the effectiveness of process.

Phase-3 Implementation of Academic Performance, Improvement and Initiatives:
• Implement teaching-learning improvement programs.
• Development of curriculum revision mechanism.
• Development of Industry-academia partnership mechanism.
• Development of student feedback mechanism.
• Capacity building and strengthening of quality enhancement cell.
• Strengthening of faculty development cell.
• Implementation of interactive research session for enhancement research productivity.
• Strengthening and functioning of departmental alumni.
• Arrangements for core skill development for students.

Phase-4 Internal Monitoring & Analysis of Implementation and External Auditing:
• In progress; outcomes shall be evaluated on completion.

4.0. Implementation of Action Plan:
4.1. Phase-1: Sensitization and Awareness Development:
In this phase, a number of awareness sessions were conducted for all the staff (academic and non-academic) of the institute to sensitize them towards system implementation.

A Steering Committee (SC) was officially notified with the aim to oversee the implementation process, keep make it on track all the time, give technical inputs for implementation, resolve implementation issues, review the implementation progress and to analyze the effectiveness of the implementation. The SC comprised of 16 members representing all the departments (academic and non-academic).

For system implementation an operational level task force (TF) was established; it also had representation from all the departments. The TF has undergone a comprehensive capacity building program of QMS implementation, which included basic and advanced level training on QMS implementation. The purpose of this capacity building program was to fully equip the TF and to mentally prepare them for its implementation.

4.2. Phase-2: Organizational Streamlining:
After many consultative sessions, the vision, mission and quality policy statements were developed during this phase.

Keeping in view the vision statement, the functions of each department were reviewed and organograms were developed by the TF. After approval of organograms, roles and responsibilities (job descriptions) of the each employee were developed and communicated. JDs were developed after careful analysis of the important facts about a job, such as the individual tasks involved, the methods used to complete the tasks, the purpose and responsibilities of the job, the relationship of the job to other jobs, qualifications consistent with the training requirement. Duplication of tasks was clearly seen during development of Job Descriptions (JD); for clarification of roles and elimination of duplication, such cases were sent to the SC which then decided which task was allocated to which employee. Along with the clarification of the roles and responsibilities, another purpose of JDs development was to provide a sound base for employee accountability and performance management.
After development of JDs, the TF, in the light of the functions of a department, identified processes and their sequences, and accordingly developed process maps for the development of Standard Operating Procedures (SOP); these were developed for the effectiveness of operations, control and continual improvement. Procedures and policies already developed were reviewed and brought in line with the functions of the departments. For effective monitoring of the procedures, Standard Analytical Procedures (SAP) were also developed which also includes the internal quality assurance auditing procedures.

In view of the large number of administrative staff /non-teaching staff of the institute, a Professional Development Center (PDC) was established with the aim to conduct training need assessments on a continuous basis and to provide concomitant training. The PDC is now fully functional.

A high level committee was formed to obtain feedback from the clients; the committee developed a client feedback form, which has been sent to all the stakeholders and also uploaded on the institute’s website. The received responses are analyzed carefully, and approved modifications are then incorporated in the institutional policies on an annual basis.

A comprehensive HRM system has been introduced, and competency criteria have been developed for each post. According to the appraisal policy, performance evaluations are conducted annually on 360 degree performance based method; this has resulted in the induction of more qualified, skilled and experienced personnel.

To procure the highest possible quality goods and services, and to make the procurement process transparent and effective, procurement policy manual and SOPs have been developed by consultant experts, and approved by the top management.

4.3. Phase-3 Implementation of Academic Improvement Initiatives:

Academic departments have adopted the IRS system proposed by the firm, wherein fortnightly meetings are held at the faculty level, supervised by respective HODs, to enhance their research productivity; these sessions have had a tremendous impact in producing quality research papers. A curriculum revision wing has been established to periodically review the curriculum, in view of latest developments and feedback from industry, alumni and students; SOPs for the smooth functioning of the wing have also been developed in conjunction with the institute’s Quality Enhancement Cell.

For students, courses on core skills development have been introduced in departments; also, forms for student feedback have been developed and it has been made mandatory for students to give their feedback at the beginning and end of each semester.

A Career Development Center (CDC) has been established as an interface between alumni and the institute, which has strengthened the ties between academia (institute) and industry. Through the CDC the institute has been able to get real time feedback from the industry on different issues faced by them; the research and development department of the institute has worked on these issues and developed feasible, practical and cost-effective solutions, which have proved to be beneficial to industry.

5.0. Benefits of QMS Implementation:

The implementation of QMS made it mandatory for the Institute’s top level official bodies, including Board of governors, to meet every three months. These meeting were made the basis for wider interaction between all stakeholders.

The developed organizational charts provided support to the management of the institute for planning, budgeting and resource allocation. It also defined the leadership as well as responsibilities, dependencies and relationships throughout the institute. It facilitated the structures of teams with clear responsibilities, titles and lines of authority. It really helped in organizing, categorizing and delegating tasks to achieve specific goals.
Job descriptions were used to explain the roles and responsibilities, necessary skills, trainings and qualification needed by a potential employee. The development of JDs resulted in the elimination of task duplication and also helped in interviewing candidates. JDs were also utilized to orient new employees about the job and to track their performance.

Development of SOPs provided roadmaps to visibly transparent operations of the institute; transparency is an important aspect of good governance, and transparent decision making is critical for the private sector to make sound decisions and investments. Accountability and the rule of law require openness and easy access to information so higher levels of administration, external reviewers, and the general public can verify performance and compliance to law. The institute has achieved all these through the developed SOPs.

The phases implemented to date have shown a clear change in the governance structure of the institute, in the form of clearer work procedures, convenient handover of work, more attention from the manager on the administrative business flow and in promoting a positive working attitude among the staff.

It is expected that the approaches used after the gap analysis will lead to better evaluation and rectification of the issues. This step of ISO standards implementation will add value to the institution and other organizations as well.

Abstract
Muslim modernist thinkers have highlighted the different aspects of economic teachings of Islam. Economic problems of Muslim world, particularly unequal distribution of wealth and construction of a welfare state, are their topics of interest. With the aim to eliminate poverty from Muslim world, these modernists’ have a deep desire to build a Muslim welfare state. Unfortunately, they are failed to provide the concrete solutions for economic problems, and doesn’t take into consideration the ways & means through which their objectives can be achieved. Hence it can be said that, the economic approach of this school of thought has very week theoretical grounds, like many other Muslim economic thinkers.

Key words: Modernism, Economic thoughts, Distribution of wealth

1. Introduction:
Since Islamic modernism movement is basically a revolt from traditional thinking and approach and based on logic and reasoning and they have adopted the same point of view in solution of economic problems. In this context most of them have highlighted the issue of unequal distribution of wealth and Islamic teachings in this regard. The problem of poverty or unequal distribution of wealth is the oldest and the most crucial issue of any economy through out the history of human being.

Muhammad' Abdullah a prominent Muslim modernist thinker has the opinion in this regard that, elimination of poverty from any society is not possible. He wants to build a society in which wealth and poverty will exist simultaneously, but the elite class will not exploit the poor. On the other hand he expects from this class that it will support the lower income group of the society. It is the real spirit of Islam. He has advised the upper class of the society to spend their wealth on those heads which are mentioned in Qur’an. Poor has a right on the wealth of rich and they have to oblige it, whereas the poor class in concerned, he council’s them to bear all miseries with patience. Kenneth, Cragg & Ishaq, Mus’ad (1966).
2. Rationale and Discussion:

Shibli No’mani a colleague of Sir Syed Ahmed khan is in favor of more equitable distribution of wealth. It will be better for society if the difference between rich and poor is minimized. This is the basic difference between eastern and western countries. In kingship the entire resources of the economy are concentrated in the hands of few persons, whereas in western countries wealth moves from rich to poor Shibli No’mani (1906).

Dr. Allama M. Iqbal, the famous intellectual and thinker of east, wants a social democratic system in which equal opportunities are available for all persons. In his opinion Islam is the only system which can enable it, hence it will be possible only in an Islamic state (Siddiqui 1982).

In similar context Ubaid ullah Sindhi criticizes Sufism which has entirely disregarded the economic aspect of life, which has a significant impact on the moral of persons and society. Surfism normally starts from morals and it is assumed that, economic needs are related to the sub-human level. This is the reason that, this institution has never put any attention on economics (Siddiqui 1982).

As far as the Shah Waliyulla is concerned his ideas in this regard are very clear and he has specially emphasized on this aspect of life of nations. He thinks that fair and equitable distribution of wealth provides a base for the development of culture. Economic equilibrium is must for the survival of any nation. Each society has to develop a system which can provide at least basic necessities of life to its members. Man can put his attention on creative activities only when he satisfied from the basic needs. It is possible only in that case when economic system is quite healthy, in such conditions moral development becomes possible Mohammad Sarwar (1965).

On the other hand if society is divided in two groups i.e. rich and poor or in the other words which they have and which they do not have. In this situation spirit of collective efforts demised and capabilities of majority of the public are started to squander just to maintain their subsistence level. In this case rich class of the society involved in a meaningless race of showiness. Concept of nation and feelings of collectiveness are vaporized under these circumstances. In these conditions revolution becomes indispensable. Now if the society has any tincture of life, in the other words the whole society do not fall into the pit of destruction, then revolution come out from the society and completely ruined off the ruling class and it is replaced by any other class. This class put the foundation of a new culture. French revolution and some other revolutions are the examples of such revolutions. But if the society is so dead, that there is not any chance of revolution from inside the society in this case foreign invention do the same. In this case foreign invaders destroyed this whole dead culture, which has lost his entire utility and was not able to face the changing requirements of time. A new culture is then established which is the mixture of both cultures with that new patterns of trade and commerce are set up in the economy. According to him destruction Roman and Iranian empires are the examples of these types of revolutions. The fall of Mughal Empire in the India also fall in this category (Sarwar 1965).

In this context Khalifa Abdul Hakeem’s point of view is that, society should be developed in classless form. Concept of rich and poor, employer & employee, domination of male on female is unethical, it should be abolished. The reason is that, all man & woman are equal is the eyes of God. Khalifa Abdul Hakim (1955). He wants to develop a system which is democratic and free of exploitation, in which elimination of poverty is the responsibility of government. In this context order of Qur’an is very clear that, your economy should be developed in such a way that, wealth should not circulate in elite class only. There is no room for black marketing, hoarding or other such type of activities in Islam. On the other hand basic demand of Islam is that, all members of society should open their wealth in the way of God, which is beyond the requirements of them, so that collective welfare of the society will increase. In an Islamic society provision of basic needs of human being is the responsibility of state, which is not
possible in Liaises–Faire economy. Free economy can never produce good results; this is the reason that, he is in favour to restrict the right of private ownership. He thinks that, welfare state is necessary for the benefits of all segments of society Khalifa Abdul Hakim (1955).

He thinks that collection of Zakat is the responsibility of an Islamic state, it was a compulsory tax and state was responsible for its collection & equitable distribution in the public. The basic mistake of Muslim community was that, they had left this practice and the result was that movement of additional capital to public ex-checkers was stopped and Government was unable to complete many welfare schemes. Islamic economic system is centrally controlled system of production and distribution. Khalifa Abdul Hakim (1961). In his opinion nationalization of land is not against of teachings of Islam. Khalifa Abdul Hakim (1961).

According to Taha Hussain a prominent Arab scholar, it was the economic program of Prophet Muhammad which roused the Quraish. If he did not prohibited riba (Interest), left the Zakat System, did not equalize poor & rich, lord & slave and just gave the invitation of monotheism then it was quite possible that they accept it. The basic reason of their hostility was that Prophet Muhammad has given a unique economic system which was based on the equality of human being, and it was not acceptable to elite class of that time.

Another reason was that, Prophet had stopped the idolatry, but it was not so much important as compare to economic interests Taha Husayn (N.D). He had also given the examples of second caliph Ummer in which he has feed the poor people from Bait-ul-Mal and some other steps taken by him for the welfare state Taha Husayn(N.D.)

Muhammad Asad another Muslim modernist is in favor to provide equal opportunities to all members of state. It is the responsibility of the state to provide basic necessities of life because without it there is not any question of self respect and ego, neither real freedom and spiritual development is possible in its absence. It does not mean that government personally provides all these things to individual citizens, but it means the provision of equal opportunities to all citizens Mohammad Asad (1985). In this context he thinks that, it should be a constitutional responsibility of government Muhammad Asad (1985).

The name of G. A. Parwez in the list of Muslim modernist thinkers is unique in the sense that he has tried to present economic teachings of Islam in socialist style but failed to produce any Qur’anic and historical evidence in this regard, Farooq Aziz (2008).

The analysis of thoughts of these thinkers shows that at least in this context their approach is quite same as to orthodox school of thought. Both of them want to build a welfare state, but none of them did not feel the need to provide the answers of these basic questions, e.g.,

1. How this state will be build?
2. How the required resources for the welfare state will be generated?
3. How this state will work? etc.

Moreover the most crucial question is related to the elimination of feudalism, which is the root cause of all economic problems, none of them did not pay any attention for its elimination. Hence it can be said that Muslim modernist thinkers are also failed to produce any concrete solution of economic problems of Muslim Umma like orthodox thinkers.

Conclusion:

Muslim modernist thinker has tried to present the teachings of Islam in the light of reasoning, logic and present state of knowledge. Economic aspect is an important direction of their interest. They have highlighted the economic teachings of Islam. Most of them are agree that Islam wants to build a welfare state in which state will be responsible to provide basic necessities of life to its citizens but non of them provide the mechanism, resources and other details of this dream and did not provide the answer how this target will be achieved.

Abstract
This study was conducted to analyze poverty and income inequality in Khyber Pakhtunkhwa of Pakistan during the year 2009. The research is based on cross-sectional data collected from one hundred and fifty households through field survey. Stratified random sampling technique was used to collect the relevant information from sampled respondents. The binary choice model was used to analyze the determinants of poverty. The results of the study conclude that 41 percent of people were found below the poverty line. Poverty in urban was found 37% while in rural, 43% of people were below the poverty line. On the basis of Gini coefficient and Kuznet ratios, high income inequality was found in the study area. The degree of income inequality is higher in rural as compared to urban. The results of the econometric model reveal that education and age of household head are significant and negatively correlated with poverty. Dependency ratio, household size and unemployment are also significant and have positive correlation with poverty. The results of the study show that education is necessary for better employment opportunities. It is suggested that government should provide education facilities to the people. It is also recommended to open skill development centre in the area to impart training and skills in various needed profession. Public and private sectors should also provide more employment opportunities to the people.
Key words: poverty, income inequality, unemployment, dependency ratio, household Size, probit model, logit model, Pakistan.

INTRODUCTION
The inadequacy of income to meet basic needs, low quality of life, denial of opportunities and choices basic to human development are different aspects of poverty. World Bank calculated an international poverty line by reference to the average of the national poverty lines in 15 of the world’s poorest countries. The United Nation Development Program has reported in 2007 that a person with less than $2 per day is considered poor and this measure of $2 is still being used as an international poverty line (World Bank, 2007). To eradicate poverty in Pakistan we have to fight with the causes and factors of poverty. Similarly, poverty cannot come to an end unless we will spend much larger share of our Gross Domestic Product (GDP) to the education sector. We have to open more primary and secondary schools especially in villages (Siddiqui, 2005). The number of Pakistani is now living below the poverty line has crossed the 62 million mark, according to the official statistics. The State Bank of Pakistan in its latest annual report on the economy explored that the World Bank’s task force on food security has estimated that the Head Count Ratio (HCR) regarding poverty increased in Pakistan to 33.8 percent in FY08 (fiscal year 2007-08) and 36.1 percent in FY09, projecting that 62 million people in the country now live below the poverty line.
The incidence of poverty varies between rural and urban areas, and from one province to the other. Poverty is widely and evenly distributed in the many mountainous parts of the country where communities are small, scattered and isolated, and where there are few major urban
centers. The rugged land and fragile system make cultivation difficult. Lack of access to markets and services has contributed to chronic poverty in these areas (Chaudhry et al., 2009).

Between mid-2008 and April 2009, at least 550,000 people left their homes in Federally Administered Tribal Areas (FATA) and North West Frontier Province due to increased insecurity. Since first half of 2009, armed conflict further intensified, leading to the mass displacement of over three million people. The majority of these Internally Displaced Persons (IDPs) are residing with host communities, while less than 20 percent live in camps. There are still 155809 people living in camps under the UNHCR and provincial government supervision (UNHCR, 2009).

Government of Pakistan has taken some strong initiatives to combat poverty and poverty reduction is at forefront of the government. These efforts include Benazir Income Support Program (BISP), Conditional Cash Transfer Program (CCTP), Child Support Program (CSP), Pakistan bait-ul-Mall (PBM) and many more like Sasti-Roti, Zakat Fund, Punjab Food Support Scheme, Tractor Subsidy Scheme, Peoples Works Program Microfinance Scheme, Vocational Training Centers etc. Under the Benazir Income Support program Rs.70 million are earmarked for disbursement to the needy persons (Pakistan Economic Survey, 2009).

World Bank and International Monetary Fund reports that more than 50 million additional people will live in extreme poverty in 2009. The International Labor organization projects that more than 30 million people will be unemployed in 2009 (Pakistan Economic Survey, 2009).

In country like America whose economy is very strong and stable but despite of it, the unemployment rate crossed a record level of more than 10%. As concerned to Pakistan the situation is quit worst. The economic growth has slowed down considerably during the last three years and huge hikes in prices of the goods have been witnessed from last few years. Unemployment rate touches the record level. A sharp decline has been observed in Karachi Stock Exchange Index. Pakistani rupees depreciated against dollar as a result our imports became too much expensive for us. The foreign debt considerably increased in last two years and now touches the $54 billion figure (State Bank of Pakistan, 2009).

A number of the studies have been undertaken to identify the core determinants of rural urban poverty in Pakistan but this study is the first and the most recent comprehensive analysis of rural urban poverty in Khyber Pakhtunkhwa. In this study there is an extensive discussion about the different norms commonly chosen to describe and quantify the extent of poverty in the study area. In addition, the poverty profile for rural and urban is also presented, with some discussion on the socioeconomic characteristics of the urban and rural poor. This study has the advantage of having access to the most recent data collected through questionnaire conducted by the authors.

MATERIALS AND METHODS

The Data

According to the nature of the objectives it is clear that the primary data as well as the secondary data were used. The whole district was divided in rural and urban areas. Data was collected from two Tehsils of district Kohat---Tehsil Kohat and Tehsil Laachi. Data was collected from one hundred and fifty respondents through Stratified Random Sampling Technique (SRST) for this research study.

A comprehensive interview schedule was prepared, consisting of different parts. Initially the researchers collected data on large number of socio-economic variables including age of household head and family members, tenancy status, household size, sex, education, working status of household head and members, working time, expenditure on edible and nonedible items, credit and debt situation of the households, income from all sources including jobs, business, rental income, agriculture, livestock, poultry, transfer income. Transfer income includes zakat, pension, disable benefit, social security benefit, gifts and scholarship. To check the validity of the interview schedule it was pre-tested in the area and corrected accordingly.
Rural people were interviewed personally at their homes, hujras, farms or shops, while urban people were interviewed at park, homes, garages and shops.

**Analytical procedure**

In the regression models, the response variables are used as quantititative but in this study the dependent variable is qualitative in nature i.e. the respondent may be poor or not which is the case of binary choices.

The logit model is a univariate binary model. That is, the dependent variable \( P_i \) takes the value of one or zero. In the present study the dependent variable \( P_i = 1 \) if respondent is poor and \( P_i = 0 \) if respondent is not poor. The independent variables \( x_i \) are household size, education of household head, age of household head, dependency ratio and unemployment. In this model the dependent variable is the log of the odds ratios, which is the linear function of regressors. For estimation we write as follows:

\[
\log(p_i) = \ln\left(\frac{p_i}{1-p_i}\right)
\]

(1)

\[
= \beta_0 + \beta_1 x_1 + \beta_2 x_2 + \ldots + \beta_m x_m + u_i
\]

(2)

\[
P = \frac{1}{\sqrt{\pi}} + \sum_{i=1}^{m} \beta_i x_i + u_i
\]

(3)

Where \( \left(\frac{p_i}{1-p_i}\right) \) is simply the odds ratio in favor of a happening.

The probability function that underlies the logit model is the logistic distribution. The probability of \( Y = 1 \) can be computed at any level of \( X \), that increases with \( X \) but not linearly as in case of Linear Probability Model (LPM). If the data is available in the group form, we can use OLS for estimation, taking into account explicitly the heteroscedastic nature of error term. Otherwise, non-linear in the parameter estimating procedures are called for.

In statistics and econometrics, the probit model is a popular specification for a binary response model which employs a probit link function. This model is most often estimated using standard maximum likelihood procedure. Such estimation is called probit regression. Probit model was introduced by Chester Bliss in 1935, and a fast method for computing maximum likelihood estimates. Suppose response variable \( Y \) is binary, that is it can have only two possible outcomes which we will be denoted as 1 and 0. For example \( Y \) may represent presence/absence of a certain condition, success/failure of some device, answer yes/no on a survey, etc. We also have a vector of regressors \( X \), which are assumed to influence the outcome \( Y \). Specifically, we assume that the model takes form

\[
\Pr(Y = 1 | X) = \Phi(X'\beta)
\]

(4)

Where \( \Pr \) denotes probability and \( \Phi \) is the cumulative distributed function CDF of the standard normal distribution. The parameters \( \beta \) are typically estimated by maximum likelihood. It is also possible to motivate the probit model as a latent variable model. Suppose there exists an auxiliary random variable

\[
Y^* = X'\beta + \epsilon
\]

(5)

Where \( \epsilon \sim N(0, 1) \). Then \( Y \) can be viewed as an indicator for whether this latent variable is positive:

\[
Y = 1_{(y^*>0)} = \{1 \text{ if } Y^* > 0 \text{ i.e. } -\epsilon < X'\beta \}
\]

0 otherwise
The Empirical Model

In order to analyze the determinants of poverty, the binary choice model was used. The model is as under:

\[ \log(p_i) = \ln\left( \frac{p_i}{1 - p_i} \right) \] (6)

Where, \( p_i \) takes the value of zero or one. In the present study \( P = 1 \) if a household is poor, otherwise = 0.

And \( \frac{p_i}{1 - p_i} \) is the odds ratio in favor of happening. In case of binary choice model without log of odds ratios coefficient of the explanatory variables can’t be interpreted directly. By taking the log of odds ratios the coefficient of explanatory variable can be directly interpreted. Equation 6 can be written as:

\[ p_i = \beta_0 + \beta_1 HS_i + \beta_2 AHH_i + \beta_3 UE_i + \beta_4 DR_i + \beta_5 EHH_i + \varepsilon_i \] (7)

Where;

HS stands for household size,
AHH is the age of household head,
UE is the number of unemployed persons in a household,
DR is the dependency ratio and EHH is education of the household head.
\( \varepsilon_i \) is the error term which shows the variation in dependent variable due to other variables.

RESULTS AND DISCUSSIONS

Socio-economic Characteristics of the Sampled Respondents

This section provides different socio-economic characteristics of sampled respondents. This includes age of the household head, education of the household head, household size, unemployment and dependency ratio. First of all socio-economic characteristics are discussed for the whole district and then it is analyzed for rural and urban areas. According to economic theory as the household size increases the vulnerability to poverty rises. In district Kohat as a whole, the maximum members in a household was recorded as 28 ranging from 2 to 9.13. The average household size are 9.12 with 4.38 of standard deviation. Generally as the age of a household head increases the household will be less vulnerable to be poor. In this study it is calculated that the average age of a household head in district Kohat is 46.7 years with 14.83 of standard deviation. The maximum age of a household head in whole district is 90 years and the minimum is recorded as 16 years. The unemployment is directly related to poverty according to economic theory as it decreases per capita income and increases dependency burden. As a result the household will be more vulnerable to be poor (Shareef, 2006).

The average unemployment is 0.55 with 1.02 of standard deviation in 150 samples which can be interpreted such that one person is unemployed per two households with 1.02 of standard deviation in 150 samples. According to this result the maximum number of unemployed persons in a household is 7 and the minimum is 0 in the study area. Commonly in Pakistan and particularly in NWFP there is joint and even in some areas extended family system. One person earns and rest of the family enjoys. According to the study the average of the dependency ratio is 4.62 with 2.33 of standard deviation. The maximum dependent members in a household are recorded 13 and minimum is 1 member. As we know that education plays a very crucial role in the economic and social development of a territory. More the years of education of a household head the less will be the incident of poverty as economic theory reveals. This result shows that the mean of education of household head is 6.28 years with 5.89 of standard deviation. In district Kohat the maximum years of education of a household is observed 21 years and minimum is 0 in 150 samples of the study.
In urban areas of district Kohat the average household size is 8.3 with 3.68 of standard deviation. The maximum number in a household is 20 and the minimum is 2 in urban area of district Kohat. The average age of household head is recorded 44.5 years with 14.7 of standard deviation. The maximum age of a household head is observed 70 years while the minimum age is 16 years. The unemployment mean is calculated 0.42 with 0.86 of standard deviation. The result of the urban areas of this study shows that the maximum unemployed persons in a household are 4 while the minimum is 0 in 54 observations. The mean dependency ratio in urban areas of Kohat is 4.38 with standard deviation of 2. The maximum and minimum dependent persons are 12 and 1 members in household respectively. The mean of education of household head is higher in urban areas as compare to rural areas of the selected district that is 9.6 with 5.41 of the standard deviation in urban and in rural areas it is 4.39. In urban areas the maximum years of education is recorded as 21 years while the minimum is 0.

In the rural areas of district Kohat the situation is quite different. The average household size in rural areas is higher than urban areas. The mean of household size is 9.58 with 4.68 of standard deviation. The maximum members in a household are recorded 28 while the minimum are 2 in total 96 respondents from rural region of the district. The average age of household head is observed higher in rural areas than in urban areas. According to the results the average age of household head is calculated 47.98 years with 14.49 of standard deviation. In the rural areas the maximum age of a household is recorded 90 years while minimum is 18 year. Generally it is seen that the unemployment rate is greater in rural areas than in urban areas. In this study it is calculated that the mean of unemployment in rural is 0.625 which is greater than urban areas according to this study. In a household the maximum unemployed members are recorded 7. The average of dependency ratio in rural area of Kohat district is 4.74 with 2.46 of standard deviation which is closer to average of urban dependency ratio. The maximum dependent members in a household are 13 which are greater than the urban dependency ratio while the minimum dependent members are recorded 1 in a household of rural area. In the rural areas of Pakistan there is less opportunities of education definitely there will be less literacy rate. As this study observed that the mean of education of household head is 4.39 with 5.31 of standard deviation. The maximum years of education is calculated 16 years in urban areas of study district.

</table>

Results of the probit and logit models are shown in Table 5.4. Logit model has eight iterations and probit model has seven iterations to produce the maximum likelihood estimates. The value of McFadden’s R², which is commonly used for the measuring of goodness-of-fit for binary choice models, is 0.48 for logit and 0.50 is for Probit models. McFadden’s R² in the range of 0.2 to 0.5 is classical for such model.

***, **, * show significant at 1%, 5% and 15% level respectively.

The estimated results of the logit and probit models are given in above Table 5.5. Five variables were regressed using logit and probit models; of which all variables are significant in case of both probit model and logit model. The results of both logit and probit models are almost similar to each other.

**Age of Household Head**

Age of household head has negative relationship with poverty. As the age of household head increases, poverty decreases both in the logit and probit models. According to first hypothesis age of household head and poverty has negative correlation with each other. Osinubi (2003) also found the negative relationship between the age of household head and poverty. According to economic theory, as the age of household head increase he gets experience and more chances of getting good job. As a result income increases and leads to resistant against poverty. But up to a specific limit as the age of household head increase he will get retired and will not be able to do a job and to raise income to defend poverty.

**Dependency Ratio**

Dependency ratio has the result according to our second hypothesis that is dependency ratio and poverty has positive correlation. As the dependent members in a household increase, the burden of feeding more persons increases with a limited income. Yusuf et al. (2008) found that larger the dependency ratio of a household, the more likely that the household will be poor. In dependency ratio we include child under the age of 14 years, old people above 64 years and female under the age of 14 years to 64 years at home but not working.

**Education of Household Head**

Education of household head has also a strong impact on poverty. From the third hypothesis it was hypothesized that education of household head affects poverty negatively. There is more jobs opportunities for more educated and a high qualified person and vice versa. Because higher the level or number of years of schooling, the better-exposed one is and also more enlightened. Hence one is adequately informed to devote a sizeable amount of the household income to basic need to maintain a particular standard of living suitable to his level of educational standard. Secondly, income and educational status tends to move together in the same direction. Therefore, with improvement in the level of education, one is better placed in terms of income generation and therefore purchasing power of the person well increased and thereby improving his standard of living and defends against poverty. This is also justified by the research conducted in Uganda (2002) that Households with heads who were better educated were less poor than those having less education.
Household Size
Household size has also a strong impact on poverty. As the size of a family increases, the family needs also increases and it is required high income to satisfy their wants and necessities. It is the voice of the mass “Chota khandan zandagi asan”. From the research it is justified that the household size has a negative impact on poverty. As the household size increases poverty also increases. The study of the Okurut et al. (2002) also found that large household size can impact poverty positively.

Unemployment
In the results unemployment has a very strong effect on poverty and is according to our fifth hypothesis it is positive correlated with poverty. Unemployment is a key factor of poverty to boost it. In our study area most of the people has no standard education and skill due to which it is difficult to find a formal or permanent job. Like the fifth hypothesis that unemployment correlation with poverty is negative, study conducted by Crandall and Weber (2005) also confirms that Local employment growth does appear to trickle down to the poor. One of the reasons of unemployment in our study area is that people have not access to job available outside of their area.

Income Inequality and Poverty
It is a situation where less people have more resources and more people has fewer resources in a society. Inequality can be calculated not only for income but also for land, assets and other resources. The present study focuses on income inequality which is positively correlated to poverty.
This section through light on income inequality between the rural and urban areas of district Kohat. According of Todaro income inequality has indirect positive impact on poverty. The direct impact of income inequality on poverty is ambiguous. Inequality has impact on economic growth, income per capita, accessibility, inefficient allocation of resources and saving. These entire variables have some impact on poverty. First, in equality is calculated through Income Distribution Tables, Lorenze Curve, Kuznet Ratio and Gini coefficient and then the impact of income inequality on poverty through economic growth, income per capita, accessibility, inefficient allocation of resources and saving is shown. Table III to Table IV are concerned with income distribution of whole district Kohat, urban Kohat as well as Rural Kohat calculated from household survey of district Kohat in 2009.

There is high income inequality in Kohat district as the share of lowest 16.67 percent household in total income of district Kohat is only 2.36 percent and the share of next lowest 16.67 percent household is only 5.06 percent. Collectively the two lowest groups (33.33 percent lowest household) possess only 7.36 percent share in total income.
The share of middle 16.67 percent household in total income of district Kohat is only 7.53 percent and the share of next middle 16.67 percent household is only 10.41 percent. Collectively
the two middle groups (33.33 percent middle household) possess only 17.94 percent share in total income.

The share of highest 16.67 percent household in total income of district Kohat is 15.44 percent and the share of next highest 16.67 percent household is 59.17 percent. Collectively the two highest groups (33.33 percent highest household) possess 74.61 percent share in total income. The table clarified that only highest 16.67 percent household possesses over half of the total income.

A common measure to analyze inequality graphically is known as Lorenz curve. The 45 degree line shows that the total income is equally distributed among the households. The bended curve is known as Lorenz curve and shows unequal distribution of income. Greater the difference between the 45 degree line and Lorenz, greater well be the inequality.

The numbers of households are plotted on the horizontal axes and income of these households on the vertical axes, not in absolute form but in cumulative form. For example the first point at the horizontal axes represents 16.66 percent of the bottom households. The next point shows 33.33 percent of the bottom households and the sixth point represents the 100 percent of the households which are 150. Similarly first point on the vertical axes represents 16.66 percent of the total income, second point shows 33.33 percent of the total income and the last point shows 100 percent or total income.

Kohat urban is also characterized by high income inequality as the share of lowest 16.67 percent household in total income of Kohat urban is only 2.96 percent and the share of next lowest 16.67 percent household is only 6.14 percent. Collectively the two lowest groups (33.33 percent lowest household) possess only 9.1 percent share in total income. The share of middle 16.67 percent household in total income of Kohat urban is only 8.50 percent and the share of next middle 16.67 percent household is only 12.19 percent. Collectively the two middle groups (33.33 percent middle household) possess only 20.69 percent share in total income. The share of highest 16.67 percent household in total income of Kohat urban is 17.38 percent and the share of next highest 16.67 percent household is 52.82 percent. Collectively the two highest groups (33.33 percent highest household) possess 70.2 percent share in total income. The table clarified also that in Kohat urban only highest 16.67 percent household possesses over half of the total income.

Kohat rural is also characterized by high income inequality. In Kohat rural income inequality is high then in Koht urban. The share of lowest 16.67 percent household in total income of Kohat rural is only 2.06 percent and the share of next lowest 16.67 percent household is only 4.55 percent. Collectively the two lowest groups (33.33 percent lowest household) possess only 6.61 percent share in total income.
The share of middle 16.67 percent household in total income of Kohat rural is only 7.04 percent and the share of next middle 16.67 percent household is only 9.52 percent. Collectively the two middle groups (33.33 percent middle household) possess only 16.56 percent share in total income.

The share of highest 16.67 percent household in total income of Kohat rural is 14.18 percent and the share of next highest 16.67 percent household is 62.62 percent while in Kohat rural it is 52.82 percent. Collectively the two highest groups (33.33 percent highest household) possess 76.8 percent share in total income while in Kohat urban it is 70.2 percent.

**Figure III. Lorenz Curve, Showing Income Inequality for Kohat Rural.**

---

**Source:** Field Survey, 2009

**Gini Coefficient : The Measures of Income Inequality**

Mathematically inequality can be explained by Gini concentration ratio which takes the values between 0 and 1. It is also known as Gini coefficient, named after the Italian statistician who in 1912 first formulated it. If value of Gini co-efficient values is 1 it means complete inequality and in case of 0 mean complete equality. Further, greater the value of Gini coefficient greater will be inequality. The value of Gini coefficient is calculated as the area between 45 degree line and Lorenz curve divided by area of the triangle (area between 45 degree line and the horizontal axes).

**Table VI. Gini Coefficient for District Kohat**

</tr>
</tbody>
</table>

The value of Gini coefficient shows that the degree of income inequality in urban areas of Kohat is low then in the rural areas.
The Measure of Income Inequality (Kuznet Ratio)

A commonly used mathematical measure of income inequality is a Kuznets ratio. The Kuznets ratio is calculated as ratio of different bottom classes to the top one. This study calculated the ratio of bottom 16.66 percent, 33.33 percent, 50 percent, 66.66 percent and 83.34 percent. In each case greater value of Kuznets ratio represent high income inequality and small value represents low income inequality.

</tr>
</tbody>
</table>

In the given table Kuznets ratios shows that there is a huge income inequality in district Kohat and the income inequality in Kohat rural is higher then in Kohat urban as Kuznets ratio for Kohat rural is greater then for Kohat urban for all groups. The Kuznets ratio for bottom 16.66 percent households in Kohat urban is 17.84 which shows that the income of top 16.66 percent households is 17.84 times greater than that of the lowest 16.66 percent households while for Kohat rural Kuznets ratio for the lowest 16.66 percent household is 30.36, showing that the income of top 16.66 percent households is 30.36 times greater than that of the lowest 16.66 percent. In the whole district of Kohat the top 16.66 percent households receives 25 time’s greater income than those of the lowest 16.66 percent households. In all Reagan Kohat urban, Kohat rural and in the whole district of Kohat income of the top 16.66 percent households is 5.8 times, 9.46 times and 7.95 times of the lowest 33.33 percent households respectively. Collectively the bottom 50 percent household also receives less income than the top 16.66 percent households and the Kuznets ratio is 3 times, 4.58 times and 3.95 times for Kohat urban, Kohat rural and whole district respectively. The income of the top 16.66 percent households is also greater then the bottom 66.66 percent and 83.34 percent households in all Reagan and the Kuznets ratio for these groups can be explained in similar way as discussed above. To show the relationship between rural urban inequality and poverty, first, nested structure of poverty urban, rural as well as for whole district Kohat and then is linked to inequality.
Total surveyed households in district Kohat are 150 and total population in these households is 1369. These surveyed households are divided into two groups’ poor and non poor. The poor households are 62 or 42.33 percent and in population perspective out of 1369, 562 people or 41.05 percent are poor. Non poor households are 88 or 58.66 percent and in population perspective out of 1369, 807 or 58.95 people are non poor.

**Figure V. A NESTED STUCTURE OF POVERTY STATUS IN URBAN KOHAT**

Total Households = 54
Total Population = 456

Non Poor
- Total Households = 36
- Households Percent = 66.67
- Total Population = 287
- Population Percent = 63

Poor
- Total Households = 18
- Households Percent = 33.33
- Total Population = 169
- Population Percent = 37
In 150 households 54 are living in urban areas of which poor households are 18 or 33.33 percent and in population perspective out of 456, 169 people or 37 percent are poor. Non poor household are 36 or 66.66 percent and in population perspective out of 456, 287 or 63 people are non poor.

Figure VI.A NESTED STUCTURE OF POVERT

```
Total Households = 96
Total Population = 913

Non Poor
Total Households = 52
Households Percent = 54
Total Population = 520
Population Percent = 57

Poor
Total Households = 44
Households Percent = 46
Total Population = 393
Population Percent = 43
```

96 households out of 150 are living in rural areas of which poor households are 44 or 46 percent and in population perspective out of 913, 393 people or 43 percent are poor. Non poor household are 52 or 54 percent and in population perspective out of 913, 520 or 57 people are non poor. Keeping in view above information it is concluded that poverty is more in rural areas then in urban areas as poor households are.

As discussed previously that income inequality has indirect positive impact on poverty. The direct impact of inequality on poverty is ambiguous. Inequality has impact on economic growth, income per capita, accessibility, inefficient allocation of resources and saving. These entire variables have some impact on poverty.

**Income Inequality, Economic Growth, Income Per Capita and Poverty**

Todaro suggested that high income inequality and rapid economic growth does not necessarily worsen each other. South Korea and Taiwan achieved rapid economic growth rate and also improved the distribution of income while Panama and Mexico grew faster but income distribution in these economies is deteriorated. Low rate of economic growth in India, Peru and Philippines is accompanied by the deterioration of income distribution. And yet Sir Lanka, Colombia and Costa Rica with low rate of economic growth has improved the economic wellbeing of their low income population. So the correlation between income inequality and economic growth is ambiguous.

Economic growth and poverty are mutually conflictive objectives and the relationship between economic growth and poverty does not itself indicate causality. According to World Bank Report, 1990 rapid decline in poverty are consistent with sustained poverty. China achieved highest growth rate in the world over the last twenty years and experienced a dramatic reduction in poverty. Over the period of 1987 to 1998 the head count ratio in china has decrease from 303.4 million to 213.2 million. But this is not solely due to economic growth. China through the
help of World Bank adopted long term policies and provided at least minimal education and improved health facilities to its population. If an economy grows fast but inequality is not treated then poverty can not be reduced. The correlation between inequality and economic growth is itself ambiguous so the economic growth is dropped down from the present study.

Households with higher income per capita are more probable to be above the poverty line as high income per capita makes it possible of meet basic needs. The data on the following developing countries shows that correlation of the degree of inequality with income per capita is ambiguous as shown in the following table.

**Table VIII. Per Capita Income and Inequality in Developing Countries, 1990s**

<table>

</table>

Column 2 represents income per capita of the given ten developing countries, column 3 represents share of lowest 40% of households in the total income of the economy. The larger ratio in column 3 indicates that low degree of inequality. Column 4 represents how much income the highest 20% of households receive as compared to lowest 20% households. This ratio is known as Kuznets ratio and can be calculated for any bottom of households percent. In each case larger Kuznets ratio is the indication of high degree of inequality. The larger value of Gini coefficient in column 5 represents high degree of inequality. The income per capita of Brazil is six times greater then that of Sir Lanka and has high income inequality as clear from all the three measures of inequality. Share of 40% of households in the total income of the Sir Lankan economy is 22 percent and in Brazil it only 8.2 percent. Income of highest 20 percent of households in Sir Lanka is 44 times of the lowest 20% of households while in Brazil income of highest 20 percent of households is 25.7 times of the lowest 20% of households. The Gini coefficient for Brazilian economy is 0.60 and for Sir Lankan economy is 0.30 which indicates that Brazil has high degree of inequality. Similarly income per capita of Paraguay is seven times greater then that of Bangladesh but has high inequality then Bangladesh. Conversely income per capita of Malaysia is 65% greater then that of Costa Rica but the inequality measure for both countries are not much differ showing same inequality. Therefore income inequality and level of income per capita are not strongly correlated and thus income inequality does not affect poverty through level of income per capita.

In the present study income inequality is negatively correlated to level of income per capita and thus increase the incidence, severity and depth of poverty both in urban and rural areas of Kohat as shown in the following table.

**Table IX. Monthly Per Capita Income and Inequality in District Kohat, 2009**

<table>
<thead>
<tr>
<th>Region</th>

<td>7.53</td>
<td>25</td>
<td>0.5</td>
</tr>
</tbody>
</table>
Per capita income in Kohat urban is greater than in Kohat rural but all the measure of inequality shows that the degree of income inequality in Kohat urban is low than in Kohat rural as the share income of lowest 50% of households in Kohat urban is greater than in Kohat rural. Ratio of highest 16.66 percent of households to lowest 16.665 percent in Kohat urban is less than in Kohat rural showing low degree of inequality. The Gini coefficient for Kohat urban is less than for Kohat rural showing low level of inequality. So income inequality has strong positive impact on poverty, through its negative impact on income per capita in case of district Kohat.

Income Inequality, Accessibility and Poverty
In case of high income inequality smaller portion of population will have access to loan and other sources and the low income households will be less educated and will be unable to educate their children, qualify for loan to start or expand business. Moreover, rich well have strong political power in the situation of high inequality which will be used to generate outcomes favorable to them and the poor population will be ignored. In this situation poor will become poorer and rich well become richer and the circle of inequality well be more accelerated and poverty will further increase (Todaro and Smith, 2004). In the case study of district Kohat, the impact of inequality on poverty through accessibility is viewed same as discussed above. This conclusion is derived not quantitatively but from the opinion of surveyed households through questionnaire.

Income Inequality, Inefficient Allocation of Resources, Saving and Poverty
Inequality is related to inefficient allocation of resources as high inequality lead to an overemphasis on higher education at the cost of universal primary education which leads to further inequality in income. Further, years of education is subjected to diminishing return means that if a person gets more and more education his income will increase but the every successive increase will be less then the increase in income with previous increase in year of education. With reallocation of resources whole population will be able to get a standard and equal education and the return on education in this case will be high then in case of inequality which will helps to reduce poverty. Saving is a source to invest, generate employment and expand production to alleviate poverty. Moreover the greater the income inequality smaller will be the saving rate in the economy because rich households saves small fraction of their income as rich household spent large portion of there income on gold, tourism, imported luxury goods and expensive houses etc, which results in inefficient allocation of resources. Besides landlords, politicians, tycoon and other rich classes save abroad for safety in the form of capital flight. Such saving neither generates employment nor expands production in the economy. Saving fraction among middle class is highest but in case of high income inequality the portion of middle class in the economy is small.

</tbody>
</table>

Kohat urban with low degree of income inequality has high saving and low poverty while Kohat rural with high degree of income inequality has low saving and high poverty which also shows that resources with high degree of inequality are inefficiently utilized. Thus it concluded that inequality has indirect positive impact on poverty through inefficient allocation of resources and low saving rate.
CONCLUSIONS AND RECOMMENDATIONS
The study has examined the nature and causes of poverty and inequality in district Kohat. In the rural areas average level of poverty was 43% while in urban areas it was 37%. 16% of population holds above 50% wealth. Poverty is more in rural areas than in urban areas of district Kohat. Age and education of household head has negative significant impact on poverty as both age and education increases experience, productivity and thus employment opportunities and income. Households with heads who were better educated were less poor as compared to non-educated. Household size, dependency ratio and unemployment are also major determinants of poverty. Poverty is positively correlated to household size as it increases the dependency burden of the households. Dependent and unemployed persons are unproductive and generate no income and thus increase poverty. The impact of all these on poverty is significant and is same to Shareef, Choudry et al, Gemberdlin and Ghozouni. It is clear that poverty cannot be eliminated altogether. It can only be controlled and brought to reasonable level. The degree of income inequality is high in rural areas than in urban areas. Inequality has indirect positive impact on poverty both in urban and rural areas of district Kohat. Inequality results in inefficient allocation of resources, low saving rate, low income per capita, worsens accessibility situation and thus increase poverty.

RECOMMENDATIONS
On the basis of research findings, the following recommendations are forwarded to reduce rural-urban poverty and inequality in general and particularly in the study area:

i. The education system of the rural areas be improved and be make easy and cheap to come to the access of the poor families. This can provide a permanent source of income and increase the chances of getting jobs.

ii. Health consume major portion of the income. Government should provide a suitable and a cost free health facility. As this portion of income become saved and play a role in reducing poverty.

iii. Unemployed is a major cause of poverty, Government should provide a job opportunities by starting a small scale industries and business enterprises to give a suitable likelihood to these unemployment person of the family.

iv. Allocation of resources should be improved, especially in rural and urban areas. Like in Karak gas project poor people should be given a quota.

v. Social welfare programmed like Benazir Income Support Programmed (BISP) be making efficient and increase its benefits so, as to reduce the incidence of poverty.

vi. We have manpower and we have talent it is recommended to set up skill development centers in rural areas to provide training and skills to the needed professions.

vii. Small firm farmers needed cash, micro financing as a vital tool of poverty alleviation and employment. It is recommended to be intensified in the rural areas to needy people.

Abstract
The pain pleasure theory of motivation is based upon the assumption that human nature seeks pleasure and avoids pain. One is never comfortable in painful situation and in order to get rid of that painful situation, the individual puts efforts to come out and seeks pleasure. Level of efforts put to avoid pain indicates motivation level. In order to support the assumption, a scale indicating 5 different stages i.e. 20, 40, 60, 80, & 100 was developed. These stages indicate pleasure level of an individual. According to the theory, if an individual reaches the stage of 20 and gets stuck at this stage, either he will show his satisfaction or dissatisfaction. In case of satisfaction, he will not put anymore effort to reach next stage, he will be happy whatever he has got. In case of dissatisfaction, he is going to face two situations; he will put more efforts to reach next stage and may manage to reach the target stage; otherwise, his dissatisfaction would lead towards anxiety and depression. This psychological state would further lead towards two behavior patterns; either he will go to seek medical help or his psychological disorders will get intensified which will finally lead towards abnormal behavior patterns.
Keywords: Pain ; Pleasure Theory of Motivation

Introduction
One of the best possible foundations of every business is motivated enthusiastic and motivated work force. Without motivated workers, a business may survive but can not do extraordinarily well. Much of the manual work has been taken over by computers but despite such developments, we need motivated employees to operate and control these machines & robots. Motivation being evergreen topic in management sciences, is still studied and researched with the same zeal and devotion as used to decades and centuries ago.
The word “Motivation” derived from a Latin word “Movere” to move, has been defined in the following way:

- Arousal of needs
- Intensity of that aroused behavior
- Direction of that aroused behavior
- Maintenance of that aroused behavior

It refers to arousal, intensity, direction and persistence of efforts directed towards job tasks over a period of time (Futrell 1998, P.461). There is always motivation behind every achievement. People strive through out their lives to get comforts and pleasures. But to get pleasure, one has to go through pains because it is better to be in pain for a short while than to remain in pain for a long time.

Motivation can therefore be thought of as the degree to which an individual wants and chooses to engage in certain behaviors. So it may be stated that individual behavior is at the heart of human motivation.

The basic motivation process is based upon the following model (Luthans, 2002, P. 249):

Need__________Drives__________Incentives

Need is created whenever there is a physiological and psychological imbalance.

Drives are set up to alleviate needs, needs for water and food are translated into thirst and hunger drives. Need for friends becomes drive for affiliation.

Incentives restore physiological and psychological balance, following the above example, water, food and friends become incentives.

Since every individual has a set of needs and a different set of goals, individuals behave in a way as to satisfy their needs and to fulfill their goals. Therefore, individuals behave differently. So the reason why do we need to develop another theory of motivation is to know the extent to which the factors affecting an individual’s life differ as we move on to different stages of life.

The Pain- Pleasure Theory of Motivation is based upon the assumption that human nature seeks pleasure and tends to avoid pain. The theory provides us the basis and helps us to evaluate the importance of different factors involved in motivation phenomena. This theory may also help us to raise the standard of living as we see different scenarios at different stages. Pain and Pleasure are characteristics of a very distinct evaluation that is generally perceived with emotions, desires and bodily sensations, thus particular feelings are associated with the two states and this is not controversial rather the understanding of these emotions is controversial.

**Theory Elaboration**

The Pain - Pleasure Theory of Motivation is based on the assumption that “human nature seeks pleasure and avoids pain”. The level of effort put to avoid pain indicates his motivation level. The theory can be best explained with the help of following model.
At one extreme end we have pain and at the other extreme end we have pleasure. It is human nature that it tries to achieve pleasure by putting some effort. In order to reach high levels of pleasure stage it has to pass through different stages.
Stages:

We have divided these stages as follows:

1) Stage 20
2) Stage 40
3) Stage 60
4) Stage 80
5) Stage 100

If a person gets stuck at any of these stages then he faces two scenarios. Either he is contented at that stage and remains there. If he is dissatisfied and is too ambitious to reach the next state of pleasure but doesn't have the capacity to do so, he would develop anxiety. When a person has constant anxiety leading to depression that situation would lead to two types of situations: either he would go for psychiatry consultation / medical help or his psychological disorders will get intensified which will finally lead towards abnormal
behavior patterns. He may develop criminal inclinations starting from snatching and stealing to high level planned robberies.

It has generally been observed that the stage of committing crimes comes at either stage 20 or close to 40. As the individual moves up, the tendency of the person to commit crimes decreases.

Diagram shows that tendency to commit crime decreases as we move

On top.

Let us have a look at the factors affecting an individual’s life.
Assumptions

1. The individual is in pain without basic needs.
2. 100% pleasure is the absolute one and one can only dream about that.
3. Those who reach the stage of 20 (having basic needs fulfilled), will face either of the two situations: contentment or dissatisfaction. Those showing contentment would get stuck at this stage; those showing dissatisfaction would either develop depression / anxiety or they will put more efforts to jump at next stage.
4. The same explanation applies to stages 40, 60, and 80.
5. If they manage to jump at the next stage, they will have sense of achievement.
6. If they remain in anxiety / depression stage, that would lead to the development of two types of behavior patterns; either one would go for medical treatment to psychiatrist and would get himself treated or his psychological disorders will get intensified which will finally lead towards abnormal behavior patterns.

Graphic Elaboration of Different Stages
Stage 20

At this stage the maximum score has been given to Food, Shelter, and Family. Whereas Clothing, Health, and Friends constitute the rest of the points / marks. At this stage the person has no points for job, professional life, education and wealth. However in order to move to next stages, he puts more efforts and tries to reach the stage of 40.
Stage 40:

Stage 40 is the stage where the person has acquired all basic facilities and now wants to add luxuries to his life. Many people get stuck at this stage and few manage to reach the stage of 60. At this stage, the max score goes to Food, Shelter, and Family. Next to these we have ranked health followed by clothing, friends, education, job, wealth and professional life.

Stage 60:

Those who managed to reach the stage of 60, have raised their standard of living. Here the max score goes to Food, Shelter, and Family followed by health, education, clothing and friends, job and then finally comes to the factors wealth and professional life. Those who managed to reach this stage achieve a level of contentment. This stage is considered to be the most desirable stage.
Stage 80:

This stage is an ideal one. Very few people manage to reach this stage. At this stage the person is quite satisfied as when we look at the rankings the max score has been given to Food, Shelter, Family and health followed by clothing, wealth, and the remaining factors.

Stage 100:

This is the last and an ideal stage. One can only dream about it. At this stage all factors have been given max score of 10. It is a rare phenomena.
Conclusion

Behavior scientists at different times proposed different theories on motivation; almost all scientists believe that people are motivated towards their different goals by their internal urge to do something & that urge is “motivation”. All motivation theories have their strengths and flaws, but they do give us an insight into some of the factors and mechanisms which play an important role in motivation phenomena. The Pain-Pleasure Theory of Motivation describes the significance of efforts put by an individual to avoid pain. The level of efforts put to avoid pain indicates the motivation level of an individual. Because of the curious nature, human beings keep putting efforts to reach heights of pleasure. In case of failure, they become dissatisfied and their dissatisfaction leads to abnormal behavior patterns.

Abstract

The study was designed to examine the attitude of Kalash People (a primitive and orthodox community considered to be the offspring of The Alexander, The Great, residing in the remote valleys of the North-West of Pakistan) towards the formal education of their children. Following hypothesis was formulated; the more the frequency of interaction of Kalash people with non-Kalash, the more will be their favorable attitude towards the formal education of their children. Data was collected through a structured interview schedule (developed by the researcher for this specific research) from the heads of Kalash families residing in three Kalash valleys i.e. Bamburat, Rumbur and Birir. Chi-square test was applied to test the hypothesis. Empirical results indicated a strong favorable attitude of Kalash people towards the formal education of their children.

Key Words: Attitude, Kalash People, Pakistan, Formal Education, Kalash Children, Pakistan

1. Introduction

Pakistan is a country having diversified topography and climate as well as different ethnic groups with their respective sub-cultures. When the sub-cultures of different ethnic groups of Pakistan are discussed, the sub-culture of Kalash people cannot be ignored. Kalash people live in the group of three small valleys which are called Birir, Bumburet and Rumbur. Birir lies at the Southern most tip of Chitral at a distance 34 km. Bumburet, the largest valley of Kalash is 35 km from Chitral. Rumbur is 32 km from Chitral. These valleys have an alpine climate (T.D.C.P., 2008).

The people who live in three valleys of Kalash are primitive pagan tribes which are known as Kafir Kalash. There is a controversy about the origin of Kalash people. A legend says that soldiers from the Macedonion Conquerer, Alexander settled in Chitral and are the progenitors of Kalash (T.D.C.P., 2008).

The Kalash people speak Kalasha. The Kalash names for three valleys are “Rukmuh” for Rumbur, “Mummuret” for Bumburet and “Birir” for Birir. The inhabitants of these valleys are called as “Rukmula”, “Momola” and “Birila” (Loure and Lievre, 1988).
Kalash life is being effected by the socio-cultural climate of the surrounding areas. Change is occurring in many aspects of the life of Kalash people. Most of the Kafirs (especially of Bumburet and Rumbur) have started giving up some of the old traditions and customs. The Kafirs of Birir valley are more orthodox and follow their customs more religiously then the Kafirs of Bumburet and Rumbur (Wikipedia, 2008).

This situation may be due to the fact Bumburet and Rumbur valleys are the most picturesque than Birir valley. Most of the tourists like to stay in these two valleys. That is why, the frequency of interaction of the people of Rumbur and Bumburet is higher than the people of Birir. Consequently, “Rukmulas” and “Momolas” are not as rigid as “Birilas” to accept any change in their life.

Certain development projects have been started by the government in Kalash valleys. Hospitals have been established Kalash valleys but usually they are run by dispensers instead of qualified doctors. Schools have also being established in valleys. Staff has been appointed in these schools who are generally Muslim. Syllabus and educational policies for Kalash students have been made by provincial government of N.W.F.P. These policies and syllabus for Kalash students are same as for the students of other provincially administered schools of N.W.F.P.

Loude and Lievre (1988) have not described any formal arrangement of education of Kalash children by Kalash themselves before the establishment of schools in valleys by the government.

However, their different festivals marriage and death ceremonies and various religious practices had played and are still playing an important role in the informal education of their children. In Kalash valleys girls learn their roles from mothers and boys from their fathers. It is strictly prohibited for Kalash girls to do such pieces of work as are specified for boys, in the same way, boys are not allowed to do such types of work as are specified for girls.

In such a situation where attention in being paid by the government to the development of Kalash valleys, the education of Kalash people too can play an important role in their overall development.

1.1 Statement of the Problem
Presently Kalash are exposed to different influences from outside. Infrastructure is being improved by the government. Health and enhancement facilities are also increasing. There are efforts to provide education to Kalash children, but the Kalash people are indifferent to the formal education of their children. There has not been any scientific sociological study to examine the attitude of Kalash people towards the formal education of their children. The study is planned to find out the impact of the interaction of Kalash people with non-Kalash on the attitude of Kalash people towards the formal education of people.

1.2 Objective of the Study
1. To study the level of interaction of Kalash people with non-Kalash.
2. To examine the attitude of Kalash people towards the formal education of their children.
3. To find out a relationship, if any, between the interaction of Kalash people with non-Kalash and the attitude of Kalash people towards the formal education of their children.
Sociological Significance
Kalash people are still backward in this modern age. Government of Pakistan launched various development schemes to improve their life. Educational institutions have also been established in Kalash valleys; it seems that Kalash people are not interested in educating their children. The researcher takes this area and decides to conduct a research to study the attitude of Kalash people towards the formal education of their children.

The present study has applied aspects. The reports of this study may be submitted to the concerned authorities so that they may develop plans in its light for the education of Kalash children.

No scientific sociological study has been conducted in the area of education of Kalash people. That is why, the proposed study will be a contribution to the body of knowledge.

2. Theoretical Framework
The present study is being conducted within the conceptual framework of George Homans’ theory of interaction (1962). Social interaction is one of the important concepts of sociology. The scientific study of human groups is part of sociology and a group comes into being only when two or more individuals interact with one another. George Homans is one of the most prominent sociologists who has discussed the concept of interaction. Homans held that increased frequency of interaction between two or more person help them in having the sentiments of love and respect. He considers group as an organic whole made up of different independent parts. Homans says that if there is frequent interaction between two or more persons, there will be an increase in the sentiments of friendship and liking for one another. The increase in the sentiments of liking and friendship may lead to the similarities in their sentiments and activities.

When Kalash people interact with non-Kalash, they observe their way of living and importance of reading and writing in daily life. In addition Kalash people also get chances to interact with the official people in authority or those who are concerned with solving or reducing their sufferings and problems, i.e. administrative officers or doctors. The increased frequency of interaction between Kalash and non-Kalash provides Kalash people more chances to understand non-Kalash and also helps in having the high degree of the sentiments of liking and friendship. Increased frequency of the interaction of Kalash people with non-Kalash may lead to the similarities in their sentiments.

Keeping the assumptions of Homans’ Theory of Interaction, the following theoretical hypothesis is formulated:

*The more the interaction between two or more persons, the more will be the similarities in their sentiments.*

2.1 Research Hypothesis
*The more the frequency of Kalash people with non-Kalash, the more will be their favorable attitude towards the formal education of their children.*

In the above hypothesis, interaction of Kalash with non-Kalash has been taken as an independent variable and attitude of Kalash people towards the formal education of their children as a dependent variable. Social interaction is based on reciprocal communication. It is an inter-stimulation and a series of two way contacts between two or more individuals (Murphy and
others, 1998). Attitude is the most dynamic aspect of human personality. Multiple factors are held responsible for the change in attitude. It may be referred to a tendency to feel and act in a certain way (Robins, 2007).

3. Research Procedure
Following is the research procedure adopted for the present study.

3.1 The Universe
The universe for the present study consisted of Kalash heads of the houses, living in three Kalash valleys i.e. Birir, Bumburet and Rumbur.

3.2 Sampling Procedure
The sample for the present research was drawn on the basis of systematic random sampling. First of all a list of all Kalash houses situated in three Kalash valleys i.e. Birir, Bumburet and Rumbur, was prepared by the researcher. The total number of Kalash houses in each valley is given below:

<table>
<thead>
<tr>
<th>Valley</th>
<th>Total No. of Kalash Houses</th>
</tr>
</thead>
<tbody>
<tr>
<td>Bumburet</td>
<td>153</td>
</tr>
<tr>
<td>Rumbur</td>
<td>127</td>
</tr>
<tr>
<td>Birir</td>
<td>108</td>
</tr>
</tbody>
</table>

Head of the family of every 4th Kalash house was selected for interview. In this way the researcher selected respondents systematically from each valley: which came out to be 38 respondents from Bumburet, 31 respondents from Rumbur and 27 respondents from Birir. The total number of respondents from three Kalash valleys were 96.

3.3 Instrument for Data Collection - Interview Schedule
A partly structured and partly unstructured interview schedule was used by the researcher used for data collection. There were 25 questions in interview schedule. It was constructed in Urdu because the researcher had to use the interpreter and the interpreter could understand Urdu well.

3.4 Pretesting
Before actual data collection, the researchers interviewed 10 heads of the Kalash families from Bumburet valley. On the basis of the results of pretesting, some minor changes in the interview schedule were made.

3.5 Use of Interpreters
The majority of Kalash people could not understand Urdu. That is why the researcher used interpreters. The interpreters were three and two of them were matriculate and one was undermatric. Three of them were Kalash.

3.6 Application of Statistical Tool
Chi-square test was applied to test the research hypothesis.

3.7 Data Collection & Field Experience
The researcher spent 13 days in the universe. First of all the researcher went to the largest Kalash valley, Bumburet, for data collection. The researcher found the Kalash of Bumburet very co-operative and hospitable. The researcher spent 8 days among the Kalash of Bumburet. Next the researcher went to the valley of Birir, the road which led to Birir was very dangerous but the driver drove the jeep very skillfully. The researcher found the Kalash of Birir very friendly, co-operative and hospitable. In Birir valley, the researcher was entertained with fresh fruit by some
respondents. The researcher spent 3 days in Birir valley. In the end, the researcher went to the valley of Rumbur. The road which led to the valley was blocked on account of land sliding. So the researcher went to the valley of Rumbur on foot after passing the distance of 9 kilometers. The Kalash of Rumbur were also very friendly and hospitable. They also showed their full interest and co-operation during the course of data collection. The researcher spent 2 days in Rumbur valley.

The researcher also visited all the schools situated in three Kalash valleys. The staff of all the schools co-operated with researcher.

4. Findings of the Study

Silent findings of the study are given below:

- Majority (55.2%) of the respondents were less than 45 years.
- Literacy rate (6.24%) among the respondents was extremely low.
- Almost all (97.92%) of the respondents’ wives were illiterate.
- A heavy majority (87.6%) of the respondents were cultivators.
- Majority (63.5%) of the respondents used to have interaction by verbal conversation with the people of nearby areas.
- A heavy majority (84.4%) of the respondents had visited the outer cities/towns.
- An overwhelming majority (70.4%) of the respondents spent more than one month in outer cities/towns.
- An overwhelming majority (76.0%) of the respondents had friendship with non-Kalash.
- The heavy majority (86.3%) of the respondents or their non-Kalash friends often participated in the marriage or birth ceremonies of one another.
- An overwhelming majority (68.5%) of the respondents had or their non-Kalash friends often visited one another’s houses.
- Among the respondents (91.7%) who had sons, a very heavy majority (96.6%) considered education necessary for their sons.
- Among the respondents (83.3%) who had daughters, a very heavy majority (80.0%) considered education necessary for their daughters.
- Among the respondents (96.6%) who wanted to educate their sons, a substantial number (45.9%) aspired higher level of education (B.A. and above) for their sons.
- Among the respondents (80.0%) who wanted to educate their daughters, a very heavy majority (79.9%) aspired Matric level of education level for their daughters.
- Among the respondents (96.6%) who wanted to educate their sons, a very heavy majority (95.5%) were willing to send their sons to outer cities/towns for education.
- Among the respondents (80.0%) who wanted to educate their daughters, the majority (56.3%) was not fully willing to send their daughters to outer cities/towns for education.
- Majority (55.9%) of the respondents were not willing to donate a piece of land for building a school.
- Majority (54.2%) of the respondents were willing to settle down in any outer city/town (Semi-permanently) for providing educational facilities to their children.
- A heavy majority (79.2%) of the respondents were ready to take loan to meet the educational expenses of their children.
- Only a minority (38.5%) of the respondents were willing to sell their land to meet the educational expenses of their children.
The heavy majority (84.4%) of the respondents were willing to take part in a movement, if it was started in the valley to persuade the people to educate their children.

Majority (53.1%) of the respondents were not satisfied with the performance of the teachers in the school of Kalash valleys.

Majority (59.4%) of the respondents had high level of interaction with non-Kalash.

An overwhelming majority (80.2%) of the respondents had high level of favourable attitude towards the formal education of their children.

5. Testing Of Hypothesis
The research and null hypotheses were developed:

5.1 Research Hypothesis: The more the frequency of Kalash people with non-Kalash, the more will be their favorable attitude towards the formal education of their children.

5.2 Null Hypothesis: The more the frequency of Kalash people with non-Kalash, the more will be their favorable attitude towards the formal education of their children.

Chi-square test was applied to test the null hypothesis. The following two way contingency table was constructed to test the hypothesis:

<table>
<thead>
<tr>
<th>Level of Favourable Attitude Towards the Formal Education</th>
<th>Level of Interaction of Kalash People with Non-Kalash</th>
</tr>
</thead>
<tbody>
<tr>
<td>High</td>
<td>Low</td>
</tr>
<tr>
<td>Frequency % age</td>
<td>Frequency % age</td>
</tr>
<tr>
<td>High</td>
<td>49</td>
</tr>
<tr>
<td>Low</td>
<td>08</td>
</tr>
<tr>
<td>Total</td>
<td>57</td>
</tr>
</tbody>
</table>

\[X^2 = 2.96 \quad d.f. = 1 \quad p = 0.05\]

Table 01 shows that among those Kalash who were found in the category of high level of interaction with non-Kalash, 86.00 percent showed high level of favourable attitude towards the formal education of their children as compared to 71.80 percent of the respondents having low level of interaction and high level of favourable attitude towards the formal education of their children. On the other hand, 14.00 percent of the respondents having high level of interaction showed low level of favourable attitude towards the formal education of their children as compared with 28.20 percent of the respondents who had low level of interaction and low level of favourable attitude towards the formal education of their children.

The calculated value of chi-square was 2.96 which did not show association between the interaction Kalash people with non-Kalash and their favorable attitude towards the formal education of their children. On the basis of chi-square test, the researcher failed to reject the null hypothesis. The reason for the rejection of research hypothesis may be the following:

i. George Homan’s theory is interaction may not be applicable in Kalash setting.

ii. There are some other variables such as Exposure of Kalash people to outsiders or their stay in outer cities or towns, which can be held responsible for the change of attitude of Kalash people towards the formal education of their children.
6. Conclusions
Based on the analysis of data and findings of the study, the following conclusions have been drawn:
Generally, Kalash people have higher level of interaction with non-Kalash. In general the Kalash people have high level of favourable attitude towards the formal education of their children. Analysis of the data showed that there was no association between the interaction of Kalash people with non-Kalash and their favourable attitude towards the formal education of their children.

7. Suggestions
Since the Kalash people have strong favourable attitude towards the formal education of their children, therefore:

1. Government should establish more middle and high schools.
2. Government should give monthly stipend or books/stationary to the students of Kalash schools, so that their educational expenses may not become burden on their parents.
3. Provincial Government of N.W.F.P. should fix a quota in jobs for the educated people of Chitral and nearby areas.
4. The teachers who perform their duties in the school of remote areas like Kalash valley should be given special monthly allowance.
5. Concerned authorities should pay attention to the improvement of the conditions of the buildings of schools situated in Kalash valleys.

8. Suggestion For Further Research
1. Attitude change is a multifactor phenomena and is attributed to a number of variables. A single casual factor may not be declared responsible for attitude change. A multidimensional study may be conducted which encompasses all the possible factors which can be held responsible for the change of attitude of Kalash people towards the formal education of their children.
2. An anthropological study may be conducted to study the social organization of Kalash society.
3. Another study may be conducted to see the generation gap in Kalash people.

ORGANIZATIONAL LEARNING AND EMPLOYEE PERFORMANCE

Foundation University Institute of Engineering and Management Sciences

Abstract
This study explores complexities of the relationship between organizational learning and employee performance. This study starts with the general proposition that organizational learning promotes employee performance, and then describes several challenges for researchers and managers who wish to study or promote organization learning in support of employee performance improvement. It also reviews the cultural and interpersonal risks of learning behavior, suggest conditions under which exploratory learning and experimentation is most critical, and describe conditions and leader behaviors conducive to supporting this kind of learning in organizations. It illustrates our ideas with examples from field studies across numerous industry contexts and based the existing research to analyze the effect of organizational learning on the performance of employees. The findings concluded that there is a significant relationship between the two variables; organizational learning and employee performance.

Keywords: Organizational Learning ; Employee Performance

1. INTRODUCTION

Learning and performing are closely related forms of human activity that are conventionally thought to conflict with each other. Work practice is generally viewed as conservative and resistant to change; learning is generally viewed as distinct from working and problematic in the face of change; and performing is generally viewed as distinctive way, but necessary imposition of change on the other two between the working and learning. To see that learning and performing are interrelated, we bring together recent researches on learning and performing. The current paper attempts to indicate the nature and explores the significance of such a shift.

1.1 BACKGROUND

While most people agree that learning leads to improved performance, there are several ways in which learning and performance in organizations can be at odds. First, when organizations take on a new learning challenge, performance often suffers in the short term, because new behaviors or practices are not yet highly skilled. Second, by revealing and analyzing their failures and mistakes—a critical aspect of learning—individuals or work groups may appear to be performing less well than they would otherwise.

1.2 OBJECTIVE OF RESEARCH

In organizations, the costs of learning may at times be more visible than the benefits. Therefore, leaders must publicize this idea broadly, or else learning may not happen. Experimentation, by its nature, will inevitably result in failures; yet without these failures learning cannot occur. So we want to seek for a learning that can excel employees’ performance.
Aim of this study is to develop a model that will add to the body of knowledge and would also help in defining and explaining the major links that lead to the better results shown by the employees.

1.3 SIGNIFICANCE AND SCOPE OF THE STUDY

Since the research is based on secondary data, the results of this research will be pretested ones. To see the effect of organizational learning on employee performance, the outcomes of the research will be beneficial for the implementation in different firms.  

1.4 LIMITATIONS OF THE STUDY

The scope is limited to the development of a model and its elaboration. The only constraint that was faced was to find the major elements that had an effect on employee performance and how they are linked with organizational learning.

1.5 PROBLEM STATEMENT

“The organization learning and its influence on the performance of employees”

[Is this a regression analysis study? The problem statement needs some modification, i.e. in accordance with the results or findings of the study][It could be like: Identification and integration of various dimensions of organization learning, which affects performance of employees]

2. LITERATURE REVIEW

To be a learning organization and to promote procurement of knowledge and learning is very important in the present scenario. This research was conducted keeping this view in mind. The study that was used as a guidance tool for the development of this model was conducted in India- the second emerging economy in this region of South Asia after China.

The major reason for this upward trend and progression was the Indian economic liberalization in 1991. Since then the developed countries have been very interested in investment in India. This foreign investment led to an increase in the Foreign Direct Investment. So challenge for the Indian organizations was to develop their human resources to match the requirements of those developed countries.

The researchers wanted to find out whether organizational learning played a key role in organizational performance and development. The researchers were of the belief that no such research had been conducted in the India. They were of the view that many researchers have been conducted on organizational learning and individual performance or team performance but there was insufficient work that was done to see the impact of organizational learning on overall performance of employees. They used questionnaires as data collection tool and interviewed mangers of three companies. Their findings showed that all three were achieving high standards in their learning processes. Their study suggested that organizational learning is an important factor to achieve high organizational performance (Khandekar and Sharma, 2006).

Purpose for conducting this research was to find out that whether there is trust when there is an environment which encourages communication at all levels. Trust then influences the personalities, the attitudes of the employees. How they interact with their colleagues, cooperation all of these elements are affected. The link between trust and performance is that when there is open communication on and a supporting management automatically there will be new ideas and sharing of knowledge and skills which affects the performance in a positive sense. Trust is in the leadership, and if good will be the pr-requisite of elevated performance.
This research work seeks to examine the relationship the human resource practices, how the members of the firm are treated and what has the affects of these on performance. The findings constituted that if communication is there, there is trust in management and support from the high –ups then performance moves in the required direction. [These purposes should reflect in the ‘OBJECTIVES OF THE STUDY’].

2.1 ORGANIZATIONAL LEARNING
Technological advancements, dynamic customer demands, increasing globalization, the blurring organizational boundaries, and increasing competition are all combining to produce organizational environments ‘more turbulent and volatile than ever before’ (Parry and Proctor-Thompson, 2003). It is more important for organizations to follow their survival instincts and learn. The change in the behavior of people in early twentieth century was viewed as a contribution of the individual’s exchange with the environment (Sync Sunysb, 2010).

Human beings are most prone to changes in their external and internal environment. They have different capabilities, capacities, and behaviors. To survive in this ever changing world they need to have the adaptability and should be able to interact with their fellow human beings; share knowledge and information and learn from different perspectives. This learning is also helped when they receive feedback and have an environment that is supporting (Sync Sunysb, 2010).

2.2 WHY PEOPLE LEARN?

Argyris (1976) developed the same idea after observing 100 managers’ behaviors in a case study:

“They (managers) become increasingly frustrated, angry, and tense as evidence accumulates on their inability to help themselves or others to gain the competence they seek, and such feelings are a necessary part of the learning process.”

Ackoff (1999) used an analogy to demonstrate the importance of pain in learning and stated:

“The worse the weather and the road, the heavier the traffic (hence the more unpredictable the driving of others), the more we have to concentrate on our driving and the more frequently we have to change our direction and speed.”

[TRY TO REPHRASE THEIR STATEMENTS INSTEAD OF VERBATIM REPRODUCTION]
People learn different skills and gain knowledge through observations, experiences, books, training, intuition, knowledge and facts accumulation etc.

2.3 ORGANIZATIONAL LEARNING

Organizational learning is an area of knowledge within organizational theory that studies models and theories about the way an organization learns and adapts. In Organizational development (OD), learning is a characteristic of an adaptive organization, i.e., an organization that is able to sense changes and signals from its environment (internal and external) and adapt accordingly, (Parry, 2003).

According to Finger and Brand (1999) there is a large difference between organizational learning and a learning organization. The learning organization has learning as an ongoing process, rather than a simple intervention to solve an extant problem.

Learning as mentioned earlier is part and parcel of every individual’s life. Even if an individual is lacking some capabilities and capacities; he goes through the learning process. Training, work place and culture, motivation and many other elements also contribute towards learning.
Individuals observe their surroundings when they are growing up, everything that belongs to them and everyone that has an influence over him/her, they learn. Individual learning is characterized by the social surroundings (parents, relatives, peers), economic conditions of the society in which he lives, social status, religious beliefs and then his/her own values, attitudes and dispositions. A learning organization does not rely on passive or ad hoc process in the hope that organizational learning will take place through serendipity or as a by-product of normal work. A learning organization actively promotes, facilitates, and rewards collective learning (Parry, 2003).

World, due to massive changes in technology and rapid growth in the use of internet, has shrunken, which has contributed to better global knowledge. The world is a dynamic place and is changing every second. To pace up with the rapid changes in the world, individuals need to understand these changes and be a part of it which ultimately helps organizations.

Capturing individual learning is the first step in making it useful to an organization. There are many methods for capturing knowledge and experience, such as publications, activity reports, lessons learned, interviews, and presentations. Capturing includes organizing knowledge in ways that people can find it; multiple structures facilitate searches regardless of the user’s perspective (e.g., who, what, when, where, why, and how). Capturing also includes storage in repositories, databases, or libraries to ensure that the knowledge will be available when and as needed (Parry, 2003).

2.4 TRAINING

Employees are the greatest asset of the company so it is crucial to let them have chances to constantly improve themselves. Employee development is thus significant for the growth and prosperity of the company. These individuals; by working for the organization in a better way help determine its success, as the more capable an employee is more will be the success and profits and better performance (Kaiser, 2000).

The capabilities and capacity of the individuals can be further polished if organization’s management provides relevant training programs to the employees. Training not only polishes the rough edges of the individual but also helps get an acute knowledge of their skills required at his/her job. Employees become more satisfied and motivated, when they get participated in the training programs and their skills are enhanced. Training also helps them recognize their own weak areas and add to personal growth of employees. These evidences are sufficient for the claim of importance of the training towards betterment of the organizational performance.

2.5 MOTIVATING CULTURE

Motivation is the most important factor in any area and it is very critical to have a learning culture. It identifies the organizations should make sure that their organization’s culture is supporting and motivating. Motivation not only shows that how much an employee is involved in his/her work but also that they are gathering knowledge and thus playing their part in organization’s growth.

People react differently according to how they think about the experiences and things; thanks to the perception theory. Organizations need to have different motivation techniques for different people as work force diversity is now in vogue. Some of the material/jobs that are needed to be
performed may not be that attractive so organizations need to have different plans to motivate. These might be praises, promotions, recognitions or rewards. Letting them know what they are going to learn is helpful in their future.

2.6 MAINTAINING CURIOSITY

Use a variety of interesting presentation modes. Motivation to learn is enhanced by the use of interesting materials, as well as by the way the material is presented. However, management should also remember that they don’t lose the main focus of these presentations i.e. to make them learn.

Help them set their own goals. People will work harder for goals that they have set for themselves, than if they were set by others and also provide them clear feedback (Psychology Campus, 2010).

2.7 KNOWLEDGE MANAGEMENT

Knowledge is the full utilization of information and data, coupled with the potential of people's skills, competencies, ideas, intuitions, commitments and motivations. In today's economy, knowledge is people, money, leverage, learning, flexibility, power, and competitive advantage. Knowledge is more relevant to sustained business than capital, labor or land. Nevertheless, it remains the most neglected asset. It is more than justified true belief and is essential for action, performance and adaption. Knowledge provides the ability to respond to novel situations. (KM-Forum, 2010).

Knowledge is everywhere, constantly around the individual so it is up to the person how he makes use of that knowledge. It should be constantly used in decision making, training, gaining new skills and ideas, in organizations processes, it products and services and in serving and satisfying customers. To have that much knowledge, there should be open culture to learning and sharing and supporting the employees if they have any new ideas.

2.7.1 Knowledge Management

Knowledge management is an audit of "intellectual assets" that highlights unique sources, critical functions and potential bottlenecks which hinder knowledge flows to the point of use. It protects intellectual assets from decay, seeks opportunities to enhance decisions, services and products through adding intelligence, increasing value and providing flexibility (KM-Forum, 2010).

Knowledge management complements and enhances other organizational initiatives such as total quality management (TQM), business process re-engineering (BPR) and organizational learning, providing a new and urgent focus to sustain competitive position. (KM-Forum, 2010)

2.7.3 Applying Knowledge Management

KM should be adopted to help gain an insight into how to serve customers more appropriately, how to increase profits and better train employees and reduce cycle times, empower employees, deliver high quality products, innovate and enhance flexibility and adaption, capture info and create knowledge and share and learn (Km-forum, 2010).
Mai (1996) suggested that every organization is to some degree a learning organization but are differentiated by the degree to which they learn better, faster, or more completely. In effect, organizational learning and innovation appear to reflect closely related processes and to be influenced by many of the same variables including culture, climate, leadership, management practices, information acquisition, retrieval, and sharing, and organizational structures, systems and environment (Kaiser, 2000). The convergence on common outcomes together with the similarity in influencing variables has been interpreted as suggesting that innovation may be a close relative of organizational learning (Kiernan, 1993).

Innovation all in all is the creativity that is required to think of and produce new products, processes are indispensable. It gives organizations the edge that they require and helps them to carry on for a longer duration. Innovation can be a part of an organization only if the culture is open to change and new ideas and learning. Learning is induced by constant exposure to maybe the community the organization is working in, learning new skills due to globalization, training; whatever the reason, it results in people having new thoughts. And when people are having new thoughts there should be systems in an organization to utilize them more effectively and this can be done if they have procedures for knowledge management.

2.9 HIGHER EFFICIENCY
Efficiency is basically to do tasks that are assigned within a minimum time frame and that make it less expensive for the organization and more revenues. So in order to have higher efficiency, management needs to have their employees’ motivated and satisfied and only then will they be able to perform well.

2.10 FEEDBACK
Feedback, the most essential element in order to keep the employees satisfied and motivated, is an incentive. Disappointment and dissatisfaction can change the whole relationship between the management and the employee. This can be also due to lack of communication and invisible barriers between the two. So it is very important that there is good communication as this helps in effective feedback. Feedback should be given in such a manner that it helps the employees in future; in form of suggestions.

2.17 REWARDS
Rewards are the outcomes of an individual’s work in the organization; the benefits that are provided to him as a result of his performance. So these compensations and benefits definitely contribute towards motivating an employee. And we try to find out the relation between employee performance and rewards. These last three elements can be gained when learning is prevalent in the organization because only when they understand these three by gaining knowledge and information about them and also on how to deal with employees and what should be done to maximize the profits they will automatically turn to these. These will gradually result in increased performance and thus revenues.

2.18 EMPLOYEE PERFORMANCE
Employee performance, the way an individual behaves, in how much time does he/she achieves the targets set, what are their attitudes towards higher management, how they socialize with their colleagues, how groomed are they, personal growth, absenteeism. These are some of the
elements that help in measuring employee performance. But the three elements that I have explained i.e. rewards, higher efficiency and feedback help in achieving higher performance within the organization and the three themselves can be achieved when the organization itself is a learning organization and encourages learning.

3. RECOMMENDATIONS

We want application of the conceptual model in Pakistan and recommend it to the telecom sector. The main reasons for selecting Telecom industry are:

- It has flourished within a few years
- We want to see that how supportive and encouraging culture do these organizations have
- What are their views on the variables of organizational learning
- Are they of the opinion that whether employee performance is affected by learning or not.

Leaders must publicize the idea broadly, or else learning may not happen.

4. CONCLUSION

From all the above literature and discussion and the figures, we can figure it out very easily that there is a definite connection between the two variables; organizational learning and employee performance. All the variables that contribute towards learning and also gain something in return when there is learning culture are very important for any organization. This helps them maintain themselves, survive in dynamic environment. Learning helps employees gain an insight into themselves, to better understand the world around them and the organization they are working for and thus increasing employee performance.

ABSTRACT
The problem under study was “A Comparative study of teaching styles of different qualification teachers as perceived by their students”. Main objective of the study was to find out the difference between the teaching styles of teacher on the basis of qualification. Through this study we become able to find that up to how much extent teacher is responsible for education standards. This study was also helpful to improve the teaching styles of the teacher. The study was delimited to only Gomal University level. A sample of 100 students from 10 different departments of the Gomal University was taken. A research hypothesis that there is no significance difference among teaching styles of teachers having Ph. D, M. Phil and Master Degrees was tested. A questionnaire was used for data collection. Percentage (%) statistic was used for data analysis.

Keywords: Comparative study; Teaching styles; Qualification; Teachers; students

INTRODUCTION
Teaching is a fun. Effective teaching is always based upon the academic qualification, experience and fun of teaching of the teacher. According to Ryburn, higher education is of utmost importance development of any country. The resources utilized for higher education are much more than other forms of education. Hence there has been an effort for efficient utilization of resources.

Higher education teachers learn through experiences. However a few have inborn capabilities of effective teaching but for all types of teachers, knowledge of higher education systems and teaching techniques may be helpful in skills development.

In recent years, the emphasis on teaching has shifted from formal recitation to social participation of students in the educative process. Modern Psychology has brought out the importance of the organism nature of learning process and as such both learning and teaching are being recognized as social activities. New techniques have been evolved and are being practiced in progressive schools, colleges and universities.

University in the education field is a big and competent institution. In university, teachers
are highly qualified in different fields. At the university level there are different criteria for the appointments of the teachers. Some teachers are Mster degree holders; some are M.Phil qualified and others as Ph. D degree holders. Ph.D degree is becoming the important component of the survival of the teachers in the university. Academic achievement of the students depends upon the qualification of the teachers.

This study is an attempt to see what the students say comparatively about the teaching of the Mster, M.Phil and Ph.D teachers.

STATEMENT OF THE PROBLEM
The problem under study was “ A comparative study of teaching styles of different qualification teachers as perceived by their students”.

OBJECTIVES OF THE STUDY
The objectives of the study were:

1. To know about the teaching styles of Gomal University Teachers as perceived by their students.
2. To find out the difference between the teaching styles of university teacher on the basis of qualification.

SIGNIFICANCE OF THE STUDY
1. This study will clearly explore that whether professional qualification of teachers can increase the effectiveness of teacher in the classrooms.
2. This study tells us that up to what extent teacher is responsible for education standard.
3. This study is helpful to improve the teaching styles of the university teacher as per need of the day. Through the results of the study the teachers can improve their teaching behavior.

HYPOTHESIS
H0: There is no significance difference among teaching styles of teachers having Master, M.Phil and Ph.D, degrees.

LIMITATION
The study will have following limitation.
1. Due to non availability of standardize instrument, researchers self developed questionnaire was used for collection of data.
2. Because of limited resources and storage of time, study was conducted on a small sample.

DELIMITATION
Following were the delimitation of the study.
1. The study was de limited to only Gomal University Dera Ismail Khan.
2. Only 10 departments of Gomal University Dera Ismail Khan.
4. Only 10 students from each selected department was selected on random basis.

REVIEW OF RELATED LITERATURE
Teacher qualification may be defi ned as all the formal and informal activities and experiences that help to qualify a person to assume the responsibilities of member of educational profession.

In national educational conferences, policies and commissions the emphasis was given on free and compulsory education and on the formal training programmes. In the policy of 1972-78 there was stress on the aims and objectives of the teacher’s education. In the policy of 1979 the emphasis was given to mould the character of a teacher as a Muslim and Pakistani. The stress was given on the quality of teachers. The suggestions were also made to train the teachers in science subjects. It was suggested that in service training should be introduced for the teachers at all levels at least once during the period for 5 years.
The first recorded study of teacher’s effectiveness was that of Kartz (1896), which is one of the earliest pieces of educational research of any kind to appear, set a design precedent that was to be followed by many years.

Ryan (1960) and his colleague conducted a programme of observational studies to identify factors associated with effective teaching. (Peter R.S., 1975) Studies have found that pupil of indirect teachers learn more and have better studies towards learning than pupils of direct teacher, but Flender (1970) suggests that both direct and indirect behaviors are necessary in good teaching.

There are common teaching practices of successful teachers, such as teaching in small steps, practicing after each step, guiding students during initial practice, and providing all students with opportunities for success. (Yamamoto)

Englert pointed out that successful teachers use lesson strategies to provide students both instrument and the opportunities for practice, more time on actively engaged educator spends the more positive students behavior and achievement will be better (Peters. R.S. 1975)

Smith. B.O. (1969) has suggested that a teacher should be prepared in four areas of knowledge i.e. (i) Command of the critical knowledge about learning and human behavior. (ii) Display of attitude that faster learning. (iii) Common knowledge in the subject matter to be taught. (vi) Control of technical skills of teaching.

**METHODOLOGY**

**POPULATION**

All the students and teachers forms the population for this research study.

**SAMPLE**

A sample of 100 students and their teachers was selected on random basis. Ten students were selected each from 10 department of the Gomal University Dera ismail Khan.

**INSTRUMENT**

A research questionnaire was used to collect relevant data. The students were asked to give their response to the items regarding the teaching style of their teachers.

**PROCEDURE**

A questionnaire regarding teaching styles of three types of teachers that is Master. M.Phil and Ph.D was distributed among the students of the selected departments and after recollecting the questionnaires data was arranged in the form of tables. Percentage statistic was used for the analysis of data.
PRESENTATION AND ANALYSIS OF DATA

Table No. 1 Showing easy way of teaching of the teachers

<table>
<thead>
<tr>
<th>Category</th>
<th>Ph.D</th>
<th>M.Phil</th>
<th>Master</th>
</tr>
</thead>
<tbody>
<tr>
<td>No.</td>
<td>34</td>
<td>30</td>
<td>37</td>
</tr>
<tr>
<td>%</td>
<td>34%</td>
<td>30%</td>
<td>37%</td>
</tr>
</tbody>
</table>

Table shows, according to 37% respondents, teachers having master degree teach with an easy way of teaching, while 34% and 30% favored teachers having Ph.D and M.Phil degree respectively.

Table 2 showing a clear concept of the teacher about the subject they teach

<table>
<thead>
<tr>
<th>Category</th>
<th>Ph.D</th>
<th>M.Phil</th>
<th>Master</th>
</tr>
</thead>
<tbody>
<tr>
<td>No.</td>
<td>43</td>
<td>31</td>
<td>26</td>
</tr>
<tr>
<td>%</td>
<td>43%</td>
<td>31%</td>
<td>26%</td>
</tr>
</tbody>
</table>

Table indicates that according to 43% respondents the teachers with Ph.D degrees have a clearer concept about the subject they teach. While according to 31% and 26% respondents the concept of the M.Phil and Master Degree teacher respectively is clearer.

Table 3 Showing use A.V. Aids frequently during teaching

<table>
<thead>
<tr>
<th>Category</th>
<th>Ph.D</th>
<th>M.Phil</th>
<th>Master</th>
</tr>
</thead>
<tbody>
<tr>
<td>No.</td>
<td>23</td>
<td>45</td>
<td>32</td>
</tr>
<tr>
<td>%</td>
<td>23%</td>
<td>45%</td>
<td>32%</td>
</tr>
</tbody>
</table>

According to 45% students the use of A.V. Aids is practical better by the teachers having M.Phil degree teachers. However 23% and 32% favored Ph.D & master degree teacher respectively.
Table 4 Showing interaction of the teacher with the students

<table>
<thead>
<tr>
<th>Category</th>
<th>Ph.D</th>
<th>M.Phil</th>
<th>Master</th>
</tr>
</thead>
<tbody>
<tr>
<td>No.</td>
<td>32</td>
<td>30</td>
<td>38</td>
</tr>
<tr>
<td>%</td>
<td>32%</td>
<td>30%</td>
<td>38%</td>
</tr>
</tbody>
</table>

According to 38% respondents feel that the teachers having Master degree make interaction with students while opinion of 32% and 30% is in favor of Ph.D and M.Phil teachers respectively in this regard.

Table 5 Showing Democratic Style of Class management

<table>
<thead>
<tr>
<th>Category</th>
<th>Ph.D</th>
<th>M.Phil</th>
<th>Master</th>
</tr>
</thead>
<tbody>
<tr>
<td>No.</td>
<td>32</td>
<td>34</td>
<td>33</td>
</tr>
<tr>
<td>%</td>
<td>32%</td>
<td>34%</td>
<td>33%</td>
</tr>
</tbody>
</table>

The respondents are almost equally divided regarding practicing of more democratic classroom management it is 32% 34% and 33% by Ph.D, M.Phil and master degree teachers respective.

Table 6 Regarding asking of question by the Teacher from the students

<table>
<thead>
<tr>
<th>Category</th>
<th>Ph.D</th>
<th>M.Phil</th>
<th>Master</th>
</tr>
</thead>
<tbody>
<tr>
<td>No.</td>
<td>23</td>
<td>37</td>
<td>40</td>
</tr>
<tr>
<td>%</td>
<td>23%</td>
<td>37%</td>
<td>40%</td>
</tr>
</tbody>
</table>

According to 40% respondents teachers having master degree ask question from the student more frequently, while according to 37% and 23% respondent’s questions are asked more frequently by M.Phil and Ph.D teachers respectively.

Table 7 Showing use of Demonstration method frequently

<table>
<thead>
<tr>
<th>Category</th>
<th>Ph.D</th>
<th>M.Phil</th>
<th>Master</th>
</tr>
</thead>
<tbody>
<tr>
<td>No.</td>
<td>22</td>
<td>51</td>
<td>27</td>
</tr>
<tr>
<td>%</td>
<td>22%</td>
<td>51%</td>
<td>27%</td>
</tr>
</tbody>
</table>

The table shows that M.Phil teachers use demonstration method, most frequently favored by 51% respondents while feeling of students in this regard is 27% and 26% in favor of Ph.D and master degree teachers respectively.
Table 8 Showing the positive and satisfactory response to the students questions

<table>
<thead>
<tr>
<th>Category</th>
<th>Ph.D</th>
<th>M.Phil</th>
<th>Master</th>
</tr>
</thead>
<tbody>
<tr>
<td>No.</td>
<td>39</td>
<td>34</td>
<td>27</td>
</tr>
<tr>
<td>%</td>
<td>39%</td>
<td>347%</td>
<td>27%</td>
</tr>
</tbody>
</table>

Table shows that Ph.D degree holder teachers are more generous in providing positive and satisfactory response to the questions asked by the students. This is supported by 39% as compared to 39% and 27% support for M.Phil and Master Degree holders respectively.

Table 9 Showing the preparation of the teacher for class teaching

<table>
<thead>
<tr>
<th>Category</th>
<th>Ph.D</th>
<th>M.Phil</th>
<th>Master</th>
</tr>
</thead>
<tbody>
<tr>
<td>No.</td>
<td>32</td>
<td>40</td>
<td>28</td>
</tr>
<tr>
<td>%</td>
<td>32%</td>
<td>40%</td>
<td>28%</td>
</tr>
</tbody>
</table>

Table represent that according to 40% respondents teacher having M.Phil degree are well prepared for class teaching as compared to Ph.D and master degree holder which are supported by 32% and 28% responded respectively.

Table 10 Regarding guidance in subject content by the teachers to the students

<table>
<thead>
<tr>
<th>Category</th>
<th>Ph.D</th>
<th>M.Phil</th>
<th>Master</th>
</tr>
</thead>
<tbody>
<tr>
<td>No.</td>
<td>31</td>
<td>37</td>
<td>35</td>
</tr>
<tr>
<td>%</td>
<td>31%</td>
<td>37%</td>
<td>35%</td>
</tr>
</tbody>
</table>

According to almost equal number i.e. 37% and 35% respondents think that M.Phil and Master Teachers respectively provide better guidance in subject contact while opinion of 31% is in favor of Ph.D degree holders.

Table 11 Showing motivation of the students towards learning

<table>
<thead>
<tr>
<th>Category</th>
<th>Ph.D</th>
<th>M.Phil</th>
<th>Master</th>
</tr>
</thead>
<tbody>
<tr>
<td>No.</td>
<td>26</td>
<td>42</td>
<td>32</td>
</tr>
<tr>
<td>%</td>
<td>26%</td>
<td>42%</td>
<td>32%</td>
</tr>
</tbody>
</table>

42% respondents think that teachers having M.Phil degree motivate the student for learning in a better way as compared to Ph.D and Master Degree holders, supported by 26% and 32% respectively.
Table 12 Showing creation of conductive environment in the Class

<table>
<thead>
<tr>
<th>Category</th>
<th>Ph.D</th>
<th>M.Phil</th>
<th>Master</th>
</tr>
</thead>
<tbody>
<tr>
<td>No.</td>
<td>32</td>
<td>37</td>
<td>31</td>
</tr>
<tr>
<td>%</td>
<td>32%</td>
<td>37%</td>
<td>31%</td>
</tr>
</tbody>
</table>

According to 37% respondents teach with Ph.D degree create conducive environment in the class 32% favor Ph.D and 31% favor master degree holders teachers.

Table 13 Showing boring teaching in the class

<table>
<thead>
<tr>
<th>Category</th>
<th>Ph.D</th>
<th>M.Phil</th>
<th>Master</th>
</tr>
</thead>
<tbody>
<tr>
<td>No.</td>
<td>41</td>
<td>28</td>
<td>31</td>
</tr>
<tr>
<td>%</td>
<td>41%</td>
<td>28%</td>
<td>31%</td>
</tr>
</tbody>
</table>

According to 41% respondents they feel bore during teaching of teachers with Ph.D degree while 28% and 31% respondents feel bore during teaching of teachers with M. Phil and Master Degree holder teachers.

Table 14 Showing that have no clear concepts about their subjects

<table>
<thead>
<tr>
<th>Category</th>
<th>Ph.D</th>
<th>M.Phil</th>
<th>Master</th>
</tr>
</thead>
<tbody>
<tr>
<td>No.</td>
<td>28</td>
<td>23</td>
<td>49</td>
</tr>
<tr>
<td>%</td>
<td>28%</td>
<td>23%</td>
<td>49%</td>
</tr>
</tbody>
</table>

According to 49% respondent, they feel that master teachers have very less clear concept about their subjects while the percentage in favor of Ph.D and M.Phil in this regard is 28% and 23% respectively.

Table 15 Showing provision of helping material by teachers during teaching

<table>
<thead>
<tr>
<th>Category</th>
<th>Ph.D</th>
<th>M.Phil</th>
<th>Master</th>
</tr>
</thead>
<tbody>
<tr>
<td>No.</td>
<td>30</td>
<td>36</td>
<td>34</td>
</tr>
<tr>
<td>%</td>
<td>30%</td>
<td>36%</td>
<td>34%</td>
</tr>
</tbody>
</table>

According to 36% respondents, M.Phil teacher provide more helping material during teaching process while, in favor of Ph.D and Master in this regard are 30% and 34% respectively.
Table 16 Showing the ignorance of individual differences by teachers

<table>
<thead>
<tr>
<th>Category</th>
<th>Ph.D</th>
<th>M.Phil</th>
<th>Master</th>
</tr>
</thead>
<tbody>
<tr>
<td>No.</td>
<td>29</td>
<td>33</td>
<td>38</td>
</tr>
<tr>
<td>%</td>
<td>29%</td>
<td>33%</td>
<td>38%</td>
</tr>
</tbody>
</table>

According to 29% respondents, Ph.D degree holders take no care for individual differences in classroom, while according 33% M.Phil and 38% Master degree holders ignore individual differences.

Table 17 Showing lack of interest of teachers in students problems in classroom

<table>
<thead>
<tr>
<th>Category</th>
<th>Ph.D</th>
<th>M.Phil</th>
<th>Master</th>
</tr>
</thead>
<tbody>
<tr>
<td>No.</td>
<td>35</td>
<td>34</td>
<td>31</td>
</tr>
<tr>
<td>%</td>
<td>35%</td>
<td>34%</td>
<td>31%</td>
</tr>
</tbody>
</table>

According to 31% respondents, that Master teachers show less interest in students problem in classroom while the percentage in favor of Ph.D and M.Phil is 35% and 34% respectively.

Table 18 Showing does not motivate the students for giving presentation

<table>
<thead>
<tr>
<th>Category</th>
<th>Ph.D</th>
<th>M.Phil</th>
<th>Master</th>
</tr>
</thead>
<tbody>
<tr>
<td>No.</td>
<td>36</td>
<td>35</td>
<td>29</td>
</tr>
<tr>
<td>%</td>
<td>36%</td>
<td>35%</td>
<td>29%</td>
</tr>
</tbody>
</table>

Table shows that 29% respondents give remarks about master teachers that they do less motivation to students for giving presentation while favor 36% for Ph.D and 35% for M.Phil in this regard.

Table 19 Showing more attention of teachers to research work of the students

<table>
<thead>
<tr>
<th>Category</th>
<th>Ph.D</th>
<th>M.Phil</th>
<th>Master</th>
</tr>
</thead>
<tbody>
<tr>
<td>No.</td>
<td>30</td>
<td>30</td>
<td>40</td>
</tr>
<tr>
<td>%</td>
<td>30%</td>
<td>30%</td>
<td>40%</td>
</tr>
</tbody>
</table>

Table shows that respondents almost give equally response toward Ph.D and M.Phil teachers that give more attention to research work of students while favor of 40% Master teachers involve in this degree.
Table 20 Showing low administrative abilities

<table>
<thead>
<tr>
<th>Category</th>
<th>Ph.D</th>
<th>M.Phil</th>
<th>Master</th>
</tr>
</thead>
<tbody>
<tr>
<td>No.</td>
<td>42</td>
<td>31</td>
<td>27</td>
</tr>
<tr>
<td>%</td>
<td>42%</td>
<td>31%</td>
<td>27%</td>
</tr>
</tbody>
</table>

According to 27% respondents that Master degree holder teachers have low administrative abilities as compared to favor of Ph.D and M.Phil teachers by 42% and 31% students in this regard.

Table 21 Showing less interest of teachers in the co-curriculum activities

<table>
<thead>
<tr>
<th>Category</th>
<th>Ph.D</th>
<th>M.Phil</th>
<th>Master</th>
</tr>
</thead>
<tbody>
<tr>
<td>No.</td>
<td>48</td>
<td>30</td>
<td>22</td>
</tr>
<tr>
<td>%</td>
<td>48%</td>
<td>30%</td>
<td>22%</td>
</tr>
</tbody>
</table>

A table shows the percentage in favor of teachers having Ph.D, M.Phil and Master degree holder in regard of less interest in co-curricular activities is 48%, 30% and 22% respectively.

Table 22 Showing the completion of course or syllabus in time by teachers

<table>
<thead>
<tr>
<th>Category</th>
<th>Ph.D</th>
<th>M.Phil</th>
<th>Master</th>
</tr>
</thead>
<tbody>
<tr>
<td>No.</td>
<td>48</td>
<td>30</td>
<td>22</td>
</tr>
<tr>
<td>%</td>
<td>48%</td>
<td>30%</td>
<td>22%</td>
</tr>
</tbody>
</table>

According to 48% respondents that Ph.D degree holder teachers take more time in completion of course or syllabus while 30% and 22% in favor for M.Phil and Master teachers respectively.

Table 23 Showing the percentage of teachers not regular in taking classes

<table>
<thead>
<tr>
<th>Category</th>
<th>Ph.D</th>
<th>M.Phil</th>
<th>Master</th>
</tr>
</thead>
<tbody>
<tr>
<td>No.</td>
<td>29</td>
<td>29</td>
<td>42</td>
</tr>
<tr>
<td>%</td>
<td>292%</td>
<td>29%</td>
<td>42%</td>
</tr>
</tbody>
</table>

According to 42% respondents that master teachers are not regular in taking classes while Ph.D and M.Phil have same percentage 29% in this regard by the respondents.
Table 24 Showing extra time of teacher to teaching if needed

<table>
<thead>
<tr>
<th>Category</th>
<th>Ph.D</th>
<th>M.Phil</th>
<th>Master</th>
</tr>
</thead>
<tbody>
<tr>
<td>No.</td>
<td>33</td>
<td>40</td>
<td>27</td>
</tr>
<tr>
<td>%</td>
<td>33</td>
<td>40</td>
<td>27%</td>
</tr>
</tbody>
</table>

According to 40% students that M.Phil teacher gives more time to teaching process when needed.

Table 25 Showing less use of writing board while teaching to the class

<table>
<thead>
<tr>
<th>Category</th>
<th>Ph.D</th>
<th>M.Phil</th>
<th>Master</th>
</tr>
</thead>
<tbody>
<tr>
<td>No.</td>
<td>37</td>
<td>34</td>
<td>29</td>
</tr>
<tr>
<td>%</td>
<td>37</td>
<td>34</td>
<td>29</td>
</tr>
</tbody>
</table>

Table shows that 29% students favor for master teachers in use of writing board very less while teaching to the class. While in favor of Ph.D and M.Phil in this regard is 37% and 34% respectively.

Table 26 Showing the provision of new ideas and new research area to the students

<table>
<thead>
<tr>
<th>Category</th>
<th>Ph.D</th>
<th>M.Phil</th>
<th>Master</th>
</tr>
</thead>
<tbody>
<tr>
<td>No.</td>
<td>49</td>
<td>31</td>
<td>20</td>
</tr>
<tr>
<td>%</td>
<td>49</td>
<td>31%</td>
<td>20</td>
</tr>
</tbody>
</table>

According to 49% respondents, Ph.D teacher provide more new ideas and new research area to the students, while favor of 31% for M.Phil & 20% for Master in this regard.

Table 27 Showing honesty of teachers in evaluation of student tests and assignment

<table>
<thead>
<tr>
<th>Category</th>
<th>Ph.D</th>
<th>M.Phil</th>
<th>Master</th>

</table>

Table reveals that, according to 38% respondents, M.Phil degree holder teachers do not link new lesson with previous knowledge 30% and 32% respondents have the same opinions about Ph.D and Master Degree holders teachers respectively.
FINDINGS

Following were the major findings of the study:

1. According to 37% respondents, teachers having Master degree teach with an easy way of teaching, while favor for Ph.D and M.Phil in this regard is 34% and 30% respectively.
2. 43% respondents favor the Ph.D teachers that they have a clearer concept about their subject while percentage in favor of master and M.Phil is 26% and 31% respectively.
3. The use of A.V. aids is practically better by M.Phil teachers as favored by 45% students while 23% and 32% favored Ph.D & Master teachers.
4. The maximum iteration of teachers with the students is master degree teachers as favor by 38% students while percentage in favor of Ph.D is 32% and M.Phil is 30%.
5. 32%, 34% and 33% students favor the Ph.D, M. Phil and Master degree teachers in regard of more democratic classroom management.
6. 40% respondents favor the master degree teachers in the regard that the ask questions from students more frequently as compared to M.Phil and Ph.D Teachers.
7. M.Phil teachers use demonstration method more frequently favored by 51% respondents. While Ph.D and Master teachers are favored by 22 and 27% respondents.
8. The quality of giving a positive and satisfactory response the students question is more to in Ph.D degree holder teachers as favor by 39% students while percentage in favor of M.Phil is 34% while Master teachers is 27%.
9. The teachers who are better prepared for class teaching are M.Phil as perceived by 40% students, while percentage of in response of students for Ph.D and M.Phil is 32% and 28% respectively.
10. The respondents shows almost equal response for provision of better guidance in subject content for M.Phil, Ph.D and Master teachers The percentage in favor of M.Phil, Ph.D & master teacher in 37%, 31% 35% respectively.
11. M.Phil teacher motivate the students more and in an effective way as perceived by 42% respondents while Ph.D and master teacher by 26% and 32% respondents.
12. The high percentage of students 37% whose are favor for M.Phil for creation of conducive for environment in the class while percentage in favor for Ph.D is 32% and for master is 31%.
13. 41% respondents feel bore in class of Ph.D teacher while 28% and 31% students feel bore in M.Phil and master teacher class.
14. Among the Ph.D, M.Phil and master teachers 49% students give response to master teacher in the regard that they have not a clear concept about their subject.
15. M.Phil teachers provide more helping material during class teaching as response by 36% students while 30% and 34% students favor for Ph.D and master respectively.
16. Master teachers do not care for individual differences as response by 38% respondents. While 29% and 33% response for Ph.D and M.Phil.
17. According to 31% respondents that master teacher do not take interest in student problem while percentage for Ph.D & M.Phil is 35 & 31% respectively.
18. Master teachers that they do less motivation to students for giving presentation is response by 29% respondents while percentage in favor of Ph.D and M.Phil is 36% and 35%
respectively.

19. The 30% respondents give equal response both for Ph.D and M.Phil in regards of more attention of teachers to research work of students while test of respondents favor for master teachers.

20. Master teachers have low administrative abilities by as response by 27% students while in favor of Ph.D and M.Phil is 42% and 31% respectively.

21. Ph.D Teachers take less interest 48% while respondents in favor M.Phil and Master teacher are 30% and 22% respectively.

22. Ph.D teachers complete their courses in time as perceived by 48% respondent while in favor of M.Phil and master is 30% and 22% respectively.

23. 20% respondents, response equally for, Ph.D and M.Phil teachers, not taking regular classes while 42% respondent favor for master teachers.

24. 40% students favor Ph.D M.Phil teachrs in the regard that they five maximum time to class teaching while percentage in favor for Ph.D and master 33% 27%

25. Ph.D teachers use less writing board during teaching as perceived by 37% students while master teacher use more writing board during teaching.

26. More new ideas and new research area to the students by Ph.D teacher as perceived by 49% students. While percentage for M.Phil and master teachers is 31% and 20%.

27. 38%, 30%, 32% respondents show response for honestly of teachers in evaluation of students test assignment for Ph.D, M.Phil and Master teachers.

28. Ph.D teachers give more examples during their class as response by 38%b respondent while percentage in favor for M.Phil and master 37% and 25%

29. The master teachers does not come to the class with proper preparation of their lesson as perceived by 29% while 36% response for M.Phil and 35% response for Ph.D teachers.

30. According to 36% respondents, Ph.D not takes interest in equal percentage of respondent’s response of for M.Phil and Master in this regard.

31. According to 38% student that M.Phil teachers link the previous knowledge with new lesson while favor for Ph.D and master teachers in this regard by 30.% and 32% students.

CONCLUSIONS
In the light of findings of the study it can be concluded that null hypothesis that there is no difference in the teaching styles of the three types of teachers is here by rejected and the following difference were found in the study.

1. Teachers having Ph.D degree have relatively clearer concept about their subject. The give positive and satisfactory response to questions raised by the students. They complete their course work in time. Ph.D teachers provide new ideas to the students and they are honest in evaluation of student’s performance. They also have priority over M.Phil and master degree holder teachers, in elaborating their lesson with
suitable examples they have better administrative qualities.

2. Ph.D degree holder teachers have comparatively boring style of teaching. They take less interest in students problems in the class and do not attempt to motivate the students by giving presentation. They do not use writing board frequently and provide no guidance for practical work.

3. Teachers with M.Phil degree come to the class well prepared. They take extra time for teaching, provide helping material during teaching and provide conducive classroom environment. M.Phil teachers prepare planning for lesson and motivate the students in the class for further learning. They show relatively more democratic style and provide demonstration frequently. They use A.V.aids frequently.

4. Teachers with M.Phil degree have no easy way of teaching as compared to others teachers and their concept about content is not as clearer as those of Ph.D teachers. As compared to in having interaction with the students and do not also question frequently.

5. Master degree holders ignore individual differences. Their concept of their subject is not so clear and they are not regular in taking classes.

RECOMMENDATIONS

In the light of findings and conclusions of the study it is recommended that.

1. In the area where Ph.D degrees holder teachers are showing good performance, they should be asked to provide on job training to other teachers.

2. The findings of this study may be circulated among all the teaching staff to make them aware of their strengths, weakness and expectations of students from them it will enable them to try for remedy of their weaknesses.

3. More attention should be given by all the teachers towards students in teaching learning process.

4. Ph.D degree holders need to give attention particularly in motivation of students and proper use of writing board.

5. M.Phil degree holder teacher may try to make their teaching easier and to get feed back to the students.

6. Master degree holder teachers may try to address individual difference properly, make proper preparation for their teaching and to be regular in taking their classes.

Abstract
The problem under study was the educational problems faced by females in rural areas. The major objectives of the study were to find out the sufficient information about the development of female education in rural areas and to find out the educational problems in rural areas. The study was significant as it provides sufficient information about the development of female education in rural areas both private and government female schools. The study enlightens in raising the literacy rate of female in the rural areas. The research hypothesis that there were no significant problems faced by female in rural areas was tested. The study was delimited to only three districts i.e. DIKhan, Lakki Marwat, and Tank. All the female students studying in rural areas institutions of these three districts form the population of the study. A sample of 200 female students was selected on random basis from all the Gils schools (i.e., Primary, middle and high) of the three districts. Questionnaire was used for data collection and percentage (%) statistic was used for the analysis of data.

Keywords: Investigation ; Educational ; Problems ; Females ; Rural areas

INTRODUCTION
The development of the country depends upon the education of the residents. In our country there are more than 50% females. For the development of the country female education should be stressed. Teaching a male is teaching a female and teaching a female is the education of the whole family. Female education is one of the dilemmas of our country.
Knowledge has great importance in forming the character and shaping the personality in a positive way, so gaining knowledge has been the duty of men and women as per verses of the holy Quran and saying of the prophet (SAWW). Islam also stresses upon provision of equal chances of education to the entire citizen.

As the females left the home of the parents therefore they are not considered as the earning hand for the future of the family. Literacy rate of females also remained less than the male. According to (Shadid.S.M, 2005) the literacy rate of male and female in 1972 was 11.6% and 4.7%. Where as in 1978 policy the literacy rate of male and female as stated in census 1981 were 35.05 and 15.99 which shows a dramatic less rate of females than the males. In the developed countries like America, according to Garvue. R. J (1969) education purpose is defined in terms of well being of individual and society. Therefore the literacy and achievement of male and female is both high in
those countries. According to Shah. L. H (2011), the ratio of intelligence of male and female is 100: 110. Therefore this may be one of the reasons of males showing high achievement rate.

Primary grades are already segregated except in large cities. In fact, only a small minority of primary school-age girls attends school, much less then for boys. Many parents of remote areas do not see the need of education for girls.

Education is considered to be the essential instrument of emancipation and self-fulfillment for women but most of them never got a chance to become educated. In some of the counties the problem of female education has been solved up to a great extent with the help of co-education; however there are lots of problems related to female education in developing countries like Pakistan, especially in the rural areas. This study is an attempt to uncover some of such problems which needs to be highlighted so that these could be solved.

STATEMENT OF THE PROBLEM

The main purpose of this study was, ” Investigation of Educational problems faced by Females in rural areas“.

OBJECTIVES OF THE STUDY

The major objectives of the study were as under;

1. To find out the sufficient information about the development of female education in rural areas.
2. To find out the educational problems in rural areas.

SIGNIFICANCE OF THE STUDY

The study was significant in the following aspects;

1) This study provides sufficient information about the development of female education in rural areas.
2) This study was significant for both private and government female schools in rural areas.
3) By this study the literacy rate of female can be increased in the rural areas of three districts.

HYPOTHESIS

H0: It was hypothesized that there was no significant problem faced by female in rural areas.

LIMITATION AND DELIMITATIONS.

This study was limited to the following aspects.

1) Response of female students could not be stated authentic as they may be influenced by the administrators of the respective schools to secure the good name of their institutions.
2) The problem include was selected from domestic, social, economical and transportation areas of problem.
3) There was no built in questionnaire as a tool of research. So the researcher made questionnaire was used for the data collection.
4) This study was delimited to only three districts i.e. DIK, Lakki and Tank.
5) Study was delimited to only female schools.
Female Education in Pakistan

Literacy rate is the first indicator of development in education in any society. Educational statistics indicate wide differences in male/female literacy rates in all areas of Pakistan, both among urban and rural population, literacy figures of urban are also not encouraging but the most deprived segment of the population in this respect, remains the rural female. A good society is the one which is cleared from all social evil. For this purpose education is must. Therefore we cannot think about a good and balanced society without female education.

In Pakistan, the status of women is not like that of men in any walk of life. The literacy rate of Pakistan in 1982-83 was 23.5% while that of male was 32%. In rural areas the literacy rates of female 4.7%. The literacy rate in 1992 has been estimated as 32%. In this %age only 13.7% women are educated which is very low rate of literacy. The literacy rate in rural area was 14.8%, out of which the rate of female literacy was 5.5%. The literacy situation is not satisfactory in Pakistan, especially in the N.W.F.P.

The conclusion of a book entitled with the education and advancement of women by Jacqueline Chabaud (1974) reveals that the forty-seven countries, which have chosen co-education, proves, on the contrary, that co-education increases educational opportunity for girls both qualitatively. A study of Qaisar Shaheen (1992) shows some crucial problems faced by female students in co-educational institutes including, most of the females have insecurity problems in co-operative environment.

METHODOLOGY

Population

All the female students studying in rural areas institutions form the population of the study.

Sample

200 female students were selected on random basis from all the Gils schools (i.e., Primary, middle and high) of District DIK, Lakki Marwat and Tank.

Instrument

A twenty item questionnaire consisting of questions based on expected problems faced by female students of rural area was used for data collection.

Procedure

As it is clear that the study was a survey type and was based on the finding availed on the basis of self-made questionnaire. Hence the researcher after developing the questionnaire tried to make it valid and authentic in the expert’s opinion of Institute of Education and Research and other departments and faculties of Gomal University, D.I.Khan. The questionnaires were distributed among the 200 students of primary, middle, and high schools of the three Districts. After recollecting the questionnaires the researcher marked each and every question according to his own scoring criteria. The availed data ware analyzed and interpreted later on. Percentage was used as a statistical method for data analysis.

FINDINGS
As result of analysis of data the following main findings were drawn:

1. Distance of the school is a problem for 40% females. High rents are also a problem for 50% females. Observing parda is not a problem. Transportation is a problem for 60% females of rural areas.
2. Attitude of parents is not positive towards education. 70% females observe attitude of parents problem, 60% females face local attitude problem. Where as the attitude of class fellows and teacher is a problem for only 20% females.
3. A domestic responsibility is a problem for 70% females. Overcrowd ness at home is 60% problem. Financial difficulties are problems for 90% and fee and funds are problems for 80% females of rural areas.
4. Availability of schools is a problem for only 30%. Lack of facilities at school for 50% Lack of availability of teachers is a problem for 60% and uninteresting atmosphere is a problem for only 20% females.
5. Life security is a problem for 80% females. Bad culture for females is a problem for 70%. Terrorism is problem for 90% and kidnapping is a problem for only 20% females of rural areas.

CONCLUSIONS
Following conclusions are drawn on the basis of findings. 
1. Distance of the school, and observing parda are not the problems of majority females but rent of transportation and availability of transport are the problems for majority of the females.
2. Attitude of parent and locality are not positive towards female education. Where as the attitude of teachers and class fellows is very positive with the females of rural areas.
3. Domestic responsibilities, over crowd ness at home, and financial difficulties are the problems for majority of the females of rural areas.
4. Lack of facilities at school and lack of availability of teachers are the problems for majority of the students.
5. Life security, bad culture and terrorism are the problems faced by majority of the students of the rural areas.

RECOMMENDATIONS
On the basis of the findings of the study it is recommended that:
The following recommendations are made on the basis of findings and conclusions:
1. Transportation should be made available for the for off places and the transportation rent should me made minimum for the students, especially for the rural areas. In this regard the suggestions of the 1972-80 policy regarding half students rents should be implemented.
2. Attitude of the parent and the local people is not positive towards female education. So the attitude changing seminars, and workshops should be arranged. Because female education is the need of the day.

3. Domestic responsibilities of the students should be decreased through proper teachings, and providing guidelines to the parents through workshops, seminars, and radio and television programs.

4. Facilities at schools should be provided and the attendance of the teachers should be made compulsory. This study is a type of report for the concerned institutions and officers in this regard.

5. Life security and terrorism is not only the problem of female but it is the problem of whole Pakistani society, specially the province of KPK. This is the responsibility of the government to provide security at any cost.

**Abstract**
This article investigates the presence or absence of symmetric relationship between oil prices and economic activity. Crude oil price and the industrial production of Pakistan for the period 1991 to 2008 are used for this purpose. Two sets of VAR models, the VAR model with linear oil price specifications and with non-linear oil price specifications are estimated. The non-linear VAR specification is estimated to investigate the nature relationship between the oil price and industrial production (symmetric or asymmetric). This relationship in case of Pakistan is found to be symmetric. The forecasting evaluation criteria showed that the VAR model forecasts are close to the actual observations of the industrial production as compared to the ARIMA forecasts. It also concludes that the oil price, among other factors, is an important factor in influencing the Pakistan industrial sector.

**Keywords:** Asymmetric and Symmetric Relationship, Index of Industrial Production (IIP), Oil Prices, Vector Autoregressive (VAR), Variance Decomposition, Impulse Response Function.

**1. Introduction**

As economic theory suggests that booms are the result of beneficial productivity shocks and the recessions are the results of adverse productivity shocks. That is, there is a linear relationship between the oil prices and the output fluctuations. A rise in the oil price, an adverse productivity shock, should cause the output to decline and so the fall in oil price, a positive productivity shock, must cause a boom. Once linear relationship between oil price and the economic activities becomes non-linear and the increase in oil price does not have the same effect on the economy as that of the decrease in oil price, the relationship does not remain symmetric.

This article scrutinizes the existence or absence of symmetric relationship between oil prices and economic activity. The study uses crude oil price and the industrial production of Pakistan for the period 1991 to 2008. Two sets of VAR models, the VAR model with linear oil price specifications and with non-linear oil price specifications, suggested by Mork (1989) are estimated. The non-linear VAR specification is estimated to investigate whether the relationship between the oil price and industrial production is symmetric or asymmetric.
2. Previous Literature

A number of empirical researches are available on the relationship between oil price and macroeconomic relationship. For example Hamilton (1983), Burbridge and Harrison (1984), Gisser and Goodwin (1986), Hooker (1996), Rotemberg and Woodford (1996) found a linear relationship between the oil price and macroeconomic activities. These studies, however, concluded that oil price changes have different impacts on the economies over time. The linear relationship, however, become weekend during the eighties, because of the smaller energy intensities, more flexible labor market and improvement in the monetary policies. Blanchard and Gali (2007).

However with the advent of time the once symmetric linear relationship between oil price and macroeconomic activities becomes asymmetric. To deal with the phenomena many time series models have been included the nonlinear oil price specification. For example Mork (1989), Hamilton (1996), Lee et al (1995), Jimenez-Rodriguez and Sanchez (2005), Lardic and Mignon (2008) concluded that increase in oil price seems to retard the economic activities by more than the fall in oil price stimulate it.

Mork (1989) hypothesized that oil price decrease has less impact on the economy than the oil price increase effects. Defining the oil price increase and decrease by his own way his results confirmed the asymmetry between oil price and economic activities. Mork defines the increase in oil price as the positive difference between the current and lag oil price. If the difference is negative, the positive price will be considered as zero. Similarly, the decrease in oil price is the negative difference between the current oil price and the one period lag oil price. If the difference is positive, it will be considered as zero.

Hamilton (1996) forms another asymmetric transformation of oil prices. He stated that most oil price increases are the correction of earlier decline in oil prices. Thus it seems more appropriate to compare the current oil price with that during the previous year rather than the previous month or the previous quarter alone. Hamilton proposed that if oil price in time $t$ is lower than the previous year, than the increase in oil price is zero and no positive oil shock have been occurred. Similarly, if the oil price in time $t$ is greater than the previous year, than the decrease in oil price is zero and no negative oil shock has been occurred.

3. Hypotheses:

This article empirically tests the following:

$H_{1A}$: The relationship between the changing oil price and industrial production in Pakistan is symmetric.

$H_{2A}$: The fluctuations in oil prices help improving the forecast of industrial production.

4. Research Methods

4.1 Variables and Data

Monthly data on GDP is not available for Pakistan, therefore the Index of Industrial production will be used as a proxy for the GDP. (For instance, Kumar (2005), Komain (2006), Abosedra & Gosh (2007) and Robalo & Salvado (2008) used the Index of Industrial production as a proxy for the GDP).

Oil price shocks are used as an explanatory variable. The oil shocks are usually defined in terms of price fluctuations, which may be caused either by the demand or the supply side forces. In practice it is unlikely for demand to grow rapidly enough to cause a price shock unless it is motivated by fears of supply shortages. Historically the supply side has been primarily responsible for the observed oil price shocks. The price shocks may be positive (a rise) or negative (a fall) (Wakeford, 2006). We shall use the monthly Brent crude oil price as our variable for the oil prices.
4.2 Vector Autoregressive (VAR) Model

The VAR in real is an econometric model which is used to find out the interdependencies among the multiple time series and it is in fact the generalization of the univariate AR models. If we have only two variable $Y_t$ and $X_t$ and their VAR model can be written as follows.

\[
y_t = b_{10} - b_{12}x_t + \gamma_{11} y_{t-1} + \gamma_{12} x_{t-1} + \varepsilon_{yt}
\]

(equation 1)

\[
x_t = b_{20} - b_{21}y_t + \gamma_{21} y_{t-1} + \gamma_{22} x_{t-1} + \varepsilon_{xt}
\]

(equation 2)

Where it is assumed that $y_t$ and $x_t$ are stationary and also the $\varepsilon_{yt}$ and $\varepsilon_{xt}$ are uncorrelated white noise error terms. The problem of endogeniety leads to a serious problem of inefficient OLS estimates. VAR model may be changed to its reduced form to cope with problem of endogeniety. The equation 1 and 2 can be written in matrix format as follows:

\[
\begin{pmatrix}
1 \\
b_{21}
\end{pmatrix}
\begin{pmatrix}
y_t \\
x_t
\end{pmatrix}
= 
\begin{pmatrix}
b_{12} \\
b_{11}
\end{pmatrix}
\begin{pmatrix}
y_{t-1} \\
x_{t-1}
\end{pmatrix}
+ 
\begin{pmatrix}
\gamma_{12} \\
\gamma_{11}
\end{pmatrix}
\begin{pmatrix}
y_t \\
x_t
\end{pmatrix}
+ 
\varepsilon_{yt}
\]

(equation 3)

This can be written as

\[
BZ_t = \Pi_0 + \Pi Z_{t-1} + \varepsilon_t
\]

Where

\[
B = \begin{pmatrix}
1 \\
b_{21}
\end{pmatrix}, 
\Pi_0 = \begin{pmatrix}
b_{12} \\
b_{11}
\end{pmatrix}, 
\Pi_1 = \begin{pmatrix}
\gamma_{12} \\
\gamma_{11}
\end{pmatrix}
\text{ and } \varepsilon_t = \begin{pmatrix}
\varepsilon_{yt} \\
\varepsilon_{xt}
\end{pmatrix}
\]

Pre-multiplying equation 4 by $B^{-1}$ allows us to write the VAR model in the following format.

\[
Z_t = A_0 + A_1Z_{t-1} + e_t
\]

(equation 5)

The equation 5 is a first order VAR model in a standard form where,

\[
A_0 = B^{-1}\Pi_0, \quad A_1 = B^{-1}\Pi_1 \quad \text{and} \quad e_t = B^{-1}\varepsilon_t
\]

For notational purpose, we can define $a_{i0}$ as the element $i$ of the vector $A_0, \quad a_{ij}$ as the element in row $i$ and column $j$ of matrix $A_1$ and $e_{it}$ as the element $i$ of the vector $e_t$.

Thus the VAR (1) of equation 5 can be written with the new notation as follows:

\[
y_t = a_{10} + a_{11} y_{t-1} + a_{12} x_{t-1} + e_{1t}
\]

(equation 6)

\[
x_t = a_{20} + a_{21} y_{t-1} + a_{22} x_{t-1} + e_{2t}
\]

(equation 7)

$e_{1t}$ and $e_{2t}$ in equations 6 and 7 are the white noise because these are the combinations of $\varepsilon_{yt}$ and $\varepsilon_{xt}$, which are stationary by assumptions. The difference between the VAR model of equation 1 and 2 and the VAR model of equation 6 and 7 is that the first model is a structural or the primitive VAR while the second is called the VAR in standard format. The conventional Ordinary Least Square technique can be applied to VAR in standard form in order to obtain efficient estimates.

4.3 Forecasting Criteria

To evaluate forecasts generated by a certain model, method or technique many identifiers are available.

*Bias* is the average of residuals:

\[
B = \frac{1}{n}\sum e_t
\]

This is a systematic error in forecasts that appears due to drift of forecast from the actual observation.

*Mean Absolute Error (MAE)* is the average of the absolute errors.

\[
MAE = \frac{\sum Abs(e_t)}{n}
\]

*Mean Absolute Percentage Error (MAPE)* is the average of the ratio of the absolute errors and the actual observations.

\[
MAPE = \frac{\sum \left(\frac{Abs(e_t)}{Y_t}\right)}{n}
\]

the value may be written in percentage by multiplying with 100. The MAPE should be the lowest for a better forecast.
Mean Square Error (MSE) is the average of the squares of errors. It is computed as follows:

$$MSE = \frac{1}{n} \sum e_i^2$$

the value is interpreted as the variance which gives more weight to the large residuals or errors.

Root Mean Square Error (RMSE) is simply the square root of the mean square error.

$$RMSE = \sqrt{MSE} = \sqrt{\frac{1}{n} \sum e_i^2}$$

For the interpretation purpose this value which is considered like the standard deviation is preferred over the MSE.

5. Empirical Findings
5.1 Symmetric or Asymmetric Relationship
To investigate whether the relationship between the oil price and industrial production is symmetric or asymmetric and to forecast the industrial production using oil price the Vector Autoregression (VAR) is estimated. The VAR model is estimated with both linear and non-linear oil price specifications.

5.2 Linear VAR Specification
The linear oil price VAR specification consists of two variables that is the index of industrial production and the crude oil prices. On the basis of lag selection criteria of AIC, LR, FPE the lag order of the VAR model with linear oil price specification should be 15, which is not a surprise in case of monthly based data. Thus the VAR model with 15 months lag period is estimated. A summary of the results of VAR (15) is given in table 1. The table shows that for the first equation where the industrial production is dependent variable, the F-statistics 9.58 is greater than 4 which is significant and shows that the lags of industrial production and oil price significantly affect the current values of industrial production. The adjusted R-square is also greater which shows that 60 percent of the variations in the industrial production are explained by the lags of oil price and industrial production.

This shows a better fit. In the second equation where the oil price is dependent variable, the F-statistics is less than 4, which shows that the lags of industrial production have no significant effect on the current value of oil price. Besides this the Adjusted R-square is very low for the equation. So the results of VAR (15) show that a unidirectional causality runs from the oil price to the industrial production. Now in order look for the dynamic structure of the VAR model an idea about the Impulse Response Function (IRF) and the Variance Decomposition (VDC) for the VAR (15) model is needed.

5.2.1 Impulse Response Function
The impulse response function shows the dynamic response of macroeconomic variables to one standard deviation shock to other variable in the model. According to Runkle (1987) reporting the Impulse Response Function without the standard error bar is tantamount to reporting the regression coefficients without t-statistics. Thus as an indication of significance the 90 percent confidence interval is estimated. The figure for the IRF consists of three lines. The middle line shows the response of the macroeconomic variable to one standard deviation shock to error of other variable in VAR system.

The other two lines show the confidence bands. If the horizontal line falls between the confidence bands then the non-rejection of null hypothesis is evident. Farzanegan and Markwards (2009). The null in this case is that the oil shocks do not affect the industrial
production. Thus to investigate the response of industrial production in Pakistan to the changing oil prices the crude oil price have been utilized as shock variable.

The figure 1 shows the 12 period response of the industrial production to the shock in the crude oil price. The figure of IRF measures Standard deviation on the Y-axis and the periods after the initial shock at the X-axis. After the initial shocks to the oil price the industrial production decreases for the first 3 months reaching its minimum level in the second period after the shock. At the forth period of the shock the industrial production increases and from fifth period to the eighth period again it responds negatively. Thus making some oscillations the response of the industrial production to oil shocks converges to the initial level after 36 months period. The response of the industrial production to the oil shocks is significant because the horizontal line is touched by the confidence bands. The Impulse response Function shows a damp time path i.e. it converges through oscillations, which shows the stability of our VAR model and the stationarity of the time series.

5.2.2 Variance Decomposition

The Variance Decomposition shows the relative importance of each random shock to the variable in the model. The table 2 shows the VD (Variance Decomposition) for the forecast error of the industrial production for 12 months periods. For the first period the variance in the industrial production share by its own lags is 100 percent however for the coming periods this figure decline to around 92 percent in the 7th period and at end of 12th period it shows that almost 84 percent variations is explained by its own shocks. The share of oil price in the fluctuation of industrial production is zero for the first period and for the later periods it increases to around 7 percent in the 7th and at the end of 12th period almost 16 percent of the variations in industrial production is due to the oil shocks.

5.3 Non-linear VAR Specifications

The VAR model for the nonlinear oil price specification is estimated. The Mork (1989) definition of asymmetric oil price relationship is incorporated in the VAR model. He has defined his own increased and decreased in the oil prices. The formula for the positive oil price and negative oil price given by Mork (1989) is given below:

\[ \text{LoilP}_t^+ = \max (0, (\text{LoilP}_t - \text{LoilP}_{t-1}) \]
\[ \text{LoilP}_t^- = \min (0, (\text{LoilP}_t - \text{LoilP}_{t-1}) \]

Thus using the above formulae for positive and negative oil price the positive and negative oil price shocks has been calculated. A graphical summary of the negative and positive oil shocks is given in figure 2 below.

The estimated output of the VAR (13) with nonlinear oil price specification, based on the lag selection criteria of AIC, LR and FPE is estimated and the summary of the results is given in table 3. In the table 3 for the equation where the industrial production is dependent variable the F-statistics is greater than 4, which shows that the lags of negative and positive oil price have joint significant effect on the industrial production. Again the adjusted R-square is greater than 0.6, which shows a good fit. For the other two equations where the negative and positive oil price is
the dependent variables, the F-statistics is very low and also the adjusted R-square is close to zero. So, again it is proved, the unidirectional causality runs from the positive and negative oil price to the industrial production and the reverse case is insignificant.

5.3.1 Impulse Response Function
The figure 3 shows the responses of industrial production to the negative and positive oil price shocks. The first part shows the response to the positive oil price shocks. For the first two periods after the initial positive oil shock the industrial production decreases with the increase in oil price and then it increases till the third period after the shock. After the third period it again declines and reaches its minimum in the fifth period. In the sixth and seventh period the response is a bit increase and then decreased again. Thus going through a number of oscillations the industrial production converges to its initial level at almost 39th period after the shock. Again the impulse response function time path is damped. Since the horizontal line is not touched by the confidence bands therefore we conclude that the response of industrial production to the positive oil shock is insignificant.

In the second part of the figure the response of industrial production to the negative oil shocks is shown. After the initial negative oil shock the industrial production increases for the first two periods and then decreases for the third period. From third to eighth period after the negative shock the industrial production increases with the decrease in oil price. Then after some oscillations it converges to the initial level at 32nd period. Because the horizontal line is not touched by the confidence bands therefore we conclude that the response of industrial production to the negative oil price shock is insignificant. Since the response of the industrial production to both the negative and positive oil price is insignificant, therefore it is concluded that the relationship between the oil price and industrial production is linear or symmetric.

[Insert Figure 3 about here.]

5.3.2 Variance Decomposition
The Impulse Response Function gives us a qualitative response of the industrial production to the shocks in the oil prices. Thus the forecast error variance decomposition is examined to determine the share of proportion of movements in the series of industrial production that are due to the shocks in their own series as oppose to the negative and positive shocks in oil prices. The table 4 shows the forecast error variance decomposition of the industrial production for 12 months periods. Table shows that at the initial period the share of industrial production explained by its own lag is 100 percent but at later periods it decreases and reaches to 91 percent and at the end of 12th period the share of its own shocks in the variation of industrial production becomes almost 82 percent. However at the end of the 12th period almost 9 percent shares in the industrial production are explained by positive oil shocks and 8 percent is explained by the negative oil shocks. Since the difference in share of industrial production variations by the positive and negative oil price shocks are not much, therefore we conclude that the relationship between the oil price and industrial production is linear and symmetric.

5.4 Forecasting and Forecast Evaluation
The forecast are made using the selected ARIMA and VAR models from Dec 2006 to Sep 2008. Table 5 shows the actual growth rate of index of industrial production and the forecast made by ARIMA and VAR models. To assess the forecasting ability of a model we 20 observations at the end of the sample period are retained and are not used to estimate the models. The sample range from July 1991 to Sep 2008, but the ARIMA and VAR models are estimated for the period July
1991 to Nov 2006 and then the most efficient models are used to forecast the remaining observation of the sample and compared it with the actual observations.

Table 5 reports the various forecasting measures of the forecast error, namely the RMSE (Root Mean Square Error), MAE (Mean Absolute Error), MAPE (Mean Absolute Percentage Error) and the Theil’s statistics. The first two forecast error measures depend on the scale of dependent variable. These are used as relative measures to compare the forecast for the same series across different models. The smaller the error the better is the forecasting ability of that model accordingly. The Thiel statistics calculates the ratio of RMSE of the chosen model to the RMSE of the naive (i.e. assuming the value in the next period is the same as the value in this period and no change in the dependent variable).

Thus a value of one for the Theil’s statistics indicates that, on the average the RMSE of the chosen model is the same as that of the naive model. A Theil’s statistics in excess of one will lead to a reconsideration of the model as the simple naive model performs well. A Theil’s statistics less than one does not lead to an automatic acceptance of the model, but it does indicate that on the average the chosen model performs better than the naive model. The Theil’s coefficient always lies between zero and one, where zero indicates a perfect fit. The Thiel’s statistics are further decomposed into bias proportion, variance proportion and the covariance proportion. The bias proportion indicates how far the mean of the forecast series is from the mean of the actual series. The variance proportion tells us how far the variance in the forecasts series varies from the variance in the actual series. The covariance proportion measures the remaining unsystematic forecasting errors. The sum of the bias, variance and covariance proportion is equal to one. For a better forecast the bias and variance proportion should be as small as possible and all the bias should concentrate to the covariance proportion.

6. Conclusion
Since the response of the industrial production to both the negative and positive oil price is insignificant, therefore it is concluded that the relationship between the oil price and industrial production is linear or symmetric. Moreover, the forecasting evaluation criteria of Root Mean Square Error (RMSE) and the Mean Absolute Error (MAE) showed that the VAR model forecasts are close to the actual observations of the industrial production as compared to the ARIMA forecasts. Thus it is concluded that the oil price, among other factors, is an important factor in fluctuating the Pakistan industrial sector. Government should rationalize the taxes on the petroleum products. This will lead to stabilization of prices and the reduction of unbalanced consumption pattern, which in turn will lead to predictable government revenue and the reduction of those products for which reliance on imports is major.

Abstract
This study attempts to investigate relationship between corporate governance and default risk for the corporate sector of Pakistan. Firstly, it develops the Corporate Governance Index (CGI) and then ranks companies in terms of different indicators to evaluate the quality of corporate governance by analyzing different forms of disclosures available in the annual report as a proxy for the corporate governance. The evidence suggests that corporate governance is significantly related with the default risk/credit rating of corporate working in the corporate sector of Pakistan. The study also decomposes the corporate governance index into its various components in order to determine which of the components are more liable for default risk. It finds independence, ownership structure of the company, financial transparency and board of director’s quality are more significant components of corporate governance as compared to others forms of disclosure.

Key Words: Default Risk, Corporate Governance, Corporate Disclosure, Credit Rating

1. Introduction
The corporate rating reflects corporate creditworthiness of a firm and its default risk (Standard & Poor’s 2002). That is why that rating agencies are more concerned with better corporate governance in today’s world, because poor corporate governance does not only destroy the financial position of the firm but also results in the losses to its major stakeholders i.e. owners and creditors of the companies (Fitch Ratings, 2004). Corporate Governance is important for firms because separate ownership and control brings conflict of interest among the owners, creditors and Management of the company (Jensen & Meckling, 1976).

2. Previous Literature
A number of studies have been conducted to investigate the relationship between corporate governance and cost of debt (for instance, Bhojraj & Sengupta 2003, Collins & LaFond 2006). Similarly some studies have found that there is a negative association between firm likelihood of bankruptcy and corporate governance (for instance, Daily & Dalton 1994). The recent research has brought into focus the impact of corporate governance on of credit rating which in most is observed to be positive in terms of sustainability, board of director’s size, board of director independence and CEO duality (Overhue & Cotter, 2010).
Most of the previous studies confined their analysis to the restricted variables on governance, like the board size, board independence, audit committee independence, audit committee size and meeting frequency (Anderson et al, 2004). While (Bhojraj and Sengupta, 2003) considered the board independence and institutional ownership as a variable of governance. This study attempts to develop wide-ranging corporate governance index centered on the comprehensive corporate governance attributes on compliance, board of director’s quality, independence, ownership structure, external audit, procedures and financial transparency in case of Pakistan’s large manufacturing sector. It has been observed how all these attributes of corporate governance collectively and individually affect the default risk faced by a firm. The study makes use of the information from the annual reports in order to get the information about all the above stated attributes of corporate governance.

The study has been explained by the detailed conceptual framework given on next page. This conceptual framework illustrates how different attributes of corporate governance i.e. board of director quality, external audit, ownership structure, procedures, compliance and financial transparency are combined together to bring better governance in corporate and then how this governance proceeds further and effect the liquidity position of concern, level of leverage, size, growth, information asymmetry and reputation which ultimately results in bringing or not bringing the default risk to the firm in the form of better and poor credit ratings by rating agencies.

3. Hypothesis
Using an index of corporate governance, the quality of corporate governance is assessed and following hypothesis is empirically tested:

\( H_1: \) There is a positive relationship between default risk of a firm and corporate governance.
4. METHODOLOGY

4.1 Model to be Estimated
In order to find the validity of the proposed hypothesis and observe which of the components of corporate governance drives the result or contribute towards the default risk/credit rating following equations have been used.

\[
DR_{t+1} = \alpha + \beta_1 \text{CGSCORE}_i + \beta_2 \text{SIZE}_i + \beta_3 \text{LEV}_i + \beta_4 \text{GROW}_i + \beta_5 \text{REPU}_i + \beta_6 \text{IASY}_i + \beta_7 \text{LIQ}_i + \beta_8 \text{PER}_i
\]

4.2 Construction of Corporate Governance
In order to calculate the corporate governance score, a corporate governance index based on annual report disclosures has been designed to mark each company’s corporate governance quality. Construction of the index is based on the corporate governance indicators suggested by prior research like Cotter and Overheu (2010) and S&P (2002). The previous studies of Cotter & Overheu (2010), Nelson (2003), Weber (2006), Daily & Dalton (1994), Bhojraj & Sengupta (2003), Elloumi & Jean (2001) on corporate governance were limited to BOD, independence, CEO characteristics, CEO a same person as a chairperson, BOD composition, Audit Committee size etc.

The exception of this study is that it has used all the indicators collectively to see their joint effect on the firm default risk. Thus this study seems to be an addition in the existing literature available on the corporate governance and default risk in general and particular for Pakistan.

Moreover, the index used in our study also carry the marks for financial transparency information disclosure which was missing in the previous study Cotter and Overheu (2010), Nelson (2003), Weber (2006), Daily & Dalton (1994), Bhojraj & Sengupta (2003) and Elloumi & Jean (2001). Table 1 provides the summary of corporate governance index. The maximum possible score is 64 (4 general disclosures, 14 BOD, 4 ownership, 26 independence, 3 external audit, 2 procedures, 11 financial transparency). Details of the index development are given in appendix [Insert Table 1 about here.]

4.2.1 General Disclosures
The first component of the corporate governance index is general disclosures and it has been used as a proxy for the quality of compliance maintained by the management for the rules and regulations set by regulatory body (SECP) in Pakistan.

In order to check the quality of compliance the presence of corporate governance statement made by the company and in addition to it reference made in this statement to the code of corporate governance has been observed. In index each disclosure on corporate governance statement and code of corporate governance carry one score. While in index detailed disclosure on corporate governance statement and code of corporate governance contains 2 point.

4.2.2 BOD
Since corporate governance is a process by which director can control and direct the management of the company to maximize the interests of owners of the company Wong and Yeung (2000). Therefore, the director plays an important role in shaping the effectiveness of corporate governance.

In the previous studies of (Yermack, 1996, Eisenberg et al 1998) used the board size and board composition as a mechanism of board effectiveness and found at the end the firm with the smaller BOD and non executives has more market value and high profitability. On the contrary studies are Barnhart and Rosenstein (1998). However, most of the studies missed out such as personal attributes of BOD to determine their effectiveness. So, we considered the more personal attributes of BOD on; qualification and experience, which were missed out or limited to the education only in the previous study of Chan and Lau (2003).
To judge the quality of BOD the index includes each point for disclosures of board member’s qualification, experience, board committee, list of board of directors, remuneration, attendance of board of directors, board size, jobs of board of directors and establishment of investment committee for future plane etc. while index includes two points for detailed description on board members qualification, remuneration and board size.

4.2.3 Ownership
The purpose of considering the ownership disclosure is to observe, whether the ownership is in the hands of management or not. Because, those firms which are controlled by the management perform better than those firms which are controlled by the dispersed owners. Hence firm’s performance in one period can affect the structure of ownership control in subsequent years. Moreover, the concentrated ownership results in the reduction of agency cost (Short, 1994). The index includes each point if number of shares held by board members are disclosed and owned more than 30 percent of shares by board members. While for disclosing top five shareholders firm was given two points.

4.2.4 Independence
To observe the strength of the oversight role performed by the board, we made the assessment of the independence of BOD and relevant committees like in Asbaugh-Skaife et al (2006) and Anderson et al (2004). Board of director independence is one of the compulsory requirements given in the code of corporate governance issued by SECP on May 28th, 2002. A board which is independent and free from the conflict of interest can formulate the policies in the best interest of the company and other stakeholders (McCabe and Nowak, 2006).

In order to find the independence of board members two measures have been used. In first measure it is just find the director is non Executive Director or not (Clarkson et al. 2006). And in other measure, rules and regulations set in the code of corporate governance issued by SECP on May 28, 2002 have been followed. According to these rules a director would be considered an independent director if:

a. His interest in the total paid up capital is less than 5%.
b. He did not remain at the executive position in the company for last three years.
c. He/ She or his/her relative did not have any fiduciary relationship and pecuniary interest in the Contractual obligations other than the directorship and had no obvious relationship with the executive director like son and father and husband and wife.
d. He did not serve the company as a director for the period of more than ten years.
e. He did not have the relationship with the directors, executives of associated companies and related parties.

It has been assessed from the information available in annual report on details about BOD, Shareholding pattern and related party transaction like James & Overhue (2010). Along with the independence of the audit committee, independence of compensation committee and nomination committee like James and Cotter (2007). The presence of these committees may ensure the monitoring of the management, integrity of the financial statements prepared by the management and effectiveness of the internal control employed by the management in the company (Smith Report, 2003).

Moreover, in case of absence of audit committee, nomination committee and compensation committee. We considered the other committees available in annual report on human resource and environment. The information on independence on board members and relevant committees was observed from the disclosures available in 2008 annual report of firm. The index also includes the point for independence of board members and relevant committees on the basis of size of committees and number of meetings of committees held in 2008.
4.2.5 External Audit

As from the statutory point of view the board is liable for the appointment of external auditor. So, the quality of external audit implied by the management is normally considered as a part of corporate governance. In order to assess the quality of external audit being implied by the company, index includes each point for the company disclosed the name of its auditing firm. Moreover, one point also awarded if the firm was one of the four big audit firms. Similarly index includes each point if audit expenditures are 50 percent higher than the minimum audit fee set by ICAP. As previous study of James & Overhue (2007) indicates that higher fee paid to the auditor reduce his conflict of interest and he will be more independent and less inclined to the interest of management.

4.2.6 Procedures

In index points were also awarded for procedures. One point was awarded if jobs of board members were clearly disclosed. An additional point was awarded if the company disclosed that it had code of conduct in its annual report.

4.2.7 Financial Transparency

Because the managers are the custodian of public resources, which also includes the financial resources, due to which all the stakeholders especially creditors are interested in the financial disclosures of the company (Dewan, 2006). To check the transparency in the usage of financial resources the study has followed, the different indicators suggested by OECD available in the annual reports of the companies as a proxy for the financial transparency after the financial meltdown of 1997 (Dewan, 2006).

Similarly to find the level of financial transparency, the corporate has been marked in the corporate governance index on the basis of quality of the Financial Transparency Information Disclosures as follow, if the company has provided an overview of the trend in its industry, company provided the detail of its product, company provided the detail of its market share, company provided the details of Related Party Transactions (RPTs) company reported its earning forecast for upcoming years, company reported its output in the annual report in physical terms, company reported the efficiency indicators in the annual report like (Return on Assets and Return on Equity etc.), company provided the investment plan in the coming years in its annual report. Company provided the comparison of its performance with rest of the companies operating in the same industry has been given 1 score otherwise 0.

4.3 Data Sources

Unlike the previous studies James & Cotter (2007), James & Overheu (2010) and Skaife et al. (2006) default risk of company is captured by getting unpublished data of firm’s individual credit rating. For the detailed analysis of the proposed hypothesis initially 67 companies was considered, but then to keep the homogeneity in data and to get the satisfied results, sample of 36 companies has been used, and thus removed 31 companies because of difference in operations and non availability of data on the variables have been used in this study. Thus, at the end, the final sample consisted of 36 companies which met the criteria of being non finance/insurance/banking and which held PACRA credit rating in 2009 and filed an annual report in stock exchange in 2008. The information for constructing corporate governance index and for control variables was obtained from annual report of 2008. While daily stock prices data was obtained from Karachi stock exchange.

5. Results and Discussion

5.1 Descriptive Statistics

Table 2 shows the descriptive statistics of our corporate governance index, its important components and other control variables. The highest CGSCORE is 54 which is 83% (54/63) of total CGSCORE. While the lowest CGSCORE is 16 which is 25 percent (16/64) of total CGSCORE. The median and mean score of CGSCORE are 33.125 and 30.5 which are 52
percent and 48 percent of total CGSCOREt respectively, with a range of 10.27. The highest score obtained by the company on BODi is 13, while the minimum score obtained by a company on BODi is 05, which is 36 percent (5/14) of total BODi score. Similarly, mean and median score of BODi are 8 and 7 with a wide range of 2.42. The highest score obtained by a company for INDPi is 17. While the lowest score obtained by a company for INDPi is 1. The mean and median score of INDPi are 8 and 7 respectively. The highest score obtained by a company for COMPi is 04, which is the 100 percent (4/4) of the total COMPi score. While the lowest score obtained by a company on COMPi are 02, which is 50 percent (2/4) of total COMPi score. The median and mean score of COMPi is 4 and 3.5 respectively. The highest score obtained by a company on External Audit EXAUDITi is 03 and lowest score obtained by a company on EXAUDITi is 01. Similarly the descriptive statistics of FITi shows the highest score achieved by a company on the financial transparency is 11. Moreover, the lowest score obtained by a companies in the FITi is 3, which is 27 percent (3/11) of the total FITi score. The mean and median score obtained by companies are 8 and 8.5 for FITi respectively with a wide range of 2.5. The descriptive statistics on OWNi shows the highest score obtained by a company is 4. While the minimum score obtained by companies on OWNi is 01 with a range of 0.76.

According to table (2) maximum score obtained by the companies on PROi is 02. While the minimum score obtained by company is 1 with a range of 0.439155.

[Insert Table 2 about here.]

6.2 Model Estimation

In first equation CGSCOREt has been regressed against the default risk. Result of first equation in table (1) shows that the CGSCOREt is significant and positively related with the Default risk for which the Credit rating has been used as a proxy. Which indicates the firm with the good corporate governance has better corporate rating and low default risk and vice versa. These results are inconsistent with James & Overhue (2010) and consistent with Asbaugh-Skaife, Collins & La Fond (2006). Moreover, these results reveal in Pakistan, the corporate governance plays a vital role in determining its default risk. The other significant variable includes the performance of the firm and Leverage, due to which default risk occurs and credit ratings get affected. The regression results in table (1) shows performance is positively related with the Default risk/corporate rating as it was expected. Which means those firms whose performance is better they have the higher credit rating and hence the lower default risk. Similarly the regression results in table (1) about leverage indicates it is negatively associated with the Default risk/credit rating which means those firms which use more debt they have to pay more interest cost which increases their default risk by decreasing the credit rating. The previous literature on corporate governance also verifies it, the high performing firms have the higher credit rating risk and expected to have lower default risk while more levered firms have more expected default risk and lower credit ratings. (Sengupta, 1998; Bhojraj & Sengupta, 2003; Anderson et. al, 2004; James & Cotter, 2007).

In equation 1 our insignificant variables includes Size and Growth. Though the size is insignificant, but it is insignificant in right direction. While growth is surprisingly insignificant in opposite direction. Which might be indicating that it is easy to govern less growing businesses as compare to the enlarge and fast growing firms.

In order to determine which component of corporate governance from corporate governance index drives the result more, we decomposed the CGSCOREt into its components as per Index. In the equation (2) the CGSCOREt has been substituted with its component BODDISCt and regressed against the DRi+1/credit rating. BODDISCt is the marks of disclosure of BOD from the corporate governance index and shows the marks obtained by the company, for the quality of board members out of total BOD disclosure score (x/14).
Moreover, ISAY\textsubscript{i} has been introduced among the control variables and dropped LIQ\textsubscript{i} and PER\textsubscript{i} for parsimonious purpose. The result of equation (2) in above table (2) shows BOD\textsubscript{i} is significantly and positively related with default risk/credit rating. And thus reflects the firms which have more qualified and experienced board of directors, they are properly governed due to which their credit rating is high and expected default risk is low. Among the other control variables result in table (2) indicate again the significant variables are: Reputation and leverage with exactly the same sign as they were expected. Even though, among the insignificant variables size and Information asymmetry is the variable which is insignificant, but both are insignificant in right direction which is inconsistent with James & Cotter, 2007; Mahajan & Sharma, 1985) and consistent with the (Gilson, 1990, Daily & Dalton, 1994)

Like the equation (2) of study, In order to determine which component of corporate governance from corporate governance index producing the better result, we decomposed the CGSCORE\textsubscript{t} in to its components as per Index.

INDP\textsubscript{i} is the marks of Independence of BOD from the corporate governance index and shows the marks obtained by the company for the independence of its management and relevant committees; out of total score of INDP\textsubscript{i} score (x/26).

In the equation (3) the CGSCORE\textsubscript{t} has been substituted with its component INDP\textsubscript{i} and regressed against the DR_{t+1}/Credit rating. Moreover, in equation (3) to get, the robust results LIQ\textsubscript{i} and ISAY\textsubscript{i} has been dropped for parsimony purpose. The regression result in table (3) Indicates INDP\textsubscript{i} is significantly and positively related with the DR_{t+1}/Credit rating like BOD\textsubscript{i} and CGSCORE\textsubscript{t}. Which means an independent board and relevant committees can perform their oversight, monitoring and decisional role effectively, to mitigate the Default risk by improving the credit rating of company. Among the other control variables again the significant variables in equation (3) are: performance and leverage with exactly the same sign as they were expected, although Reputation is insignificant in this equation but it is insignificant in right direction. Moreover, from the result of equation (3) it could be concluded, like the CGSCORE\textsubscript{t}, within the Corporate Governance Score the component of INDP\textsubscript{i} is also significant, which is inconsistent with previous studies (Cotter and Overheu, 2010). Moreover, these results are consistent with Beasley et al. (2006), Abbot et al. (2003), Daily & Dalton (1994a) and Asbaugh-Skaife et al (2006).

In order to see whether the board members are complying with the rules and regulations set by the regulatory bodies which is an indication of stakeholder protection and proper governance of corporate. And to find, whether the compliance level of corporate is contributing towards default risk/CREDIT rating, in equation (4) the CGSCORE\textsubscript{t} has been substituted with COMPDIS\textsubscript{i}. Moreover, to get the robust result, LIQ\textsubscript{i} has been dropped. The result in above table (3) shows COMP\textsubscript{i} is not significantly related with the expected DR_{t+1}/Credit rating of companies operating in the Pakistan framework of corporate governance.

Similarly, among the control variables although the size is insignificant, but surprisingly it is insignificant in opposite direction, which is an indication, that, it is easy for the director of smaller company to comply with the rules and regulations than the company with the larger size. Even though Reputation is also insignificant, but it is insignificant in right direction. Moreover, table (3) shows among the other significant variables of the study is performance and leverage. These results are inconsistent with James and Cotter (2007).

Similarly in order to observe, whether, the external audit plays an important role in the DR_{t+1}/Credit rating of corporate working in the corporate frame work of Pakistan. In equation (5) CGSCORE\textsubscript{t} has been substituted with EXAUDIT\textsubscript{i} and regressed against the DR_{t+1}. The regression result in above table (3) indicates that EXAUDIT\textsubscript{i} is not significantly related with the default risk/credit rating. Among the other control variable like the previous equations PER\textsubscript{i} and LEV\textsubscript{i} is significantly related with DR_{t+1}/Credit rating. The coefficient sign of performance indicates as performance of the firm increases its creditworthiness in terms of credit rating
increase which ultimate reflect, reduction in expected default risk of the corporate. The level of leverage of the firm indicates, the more debt is used to run the business, results in lower credit rating and higher default risk. The sign of the coefficient indicates \( \text{LEV}_i \) is negatively related with the default risk as it was expected. Moreover, to get the robust result, \( \text{LIQ}_i \) has been dropped and \( \text{REPU}_i \) has been introduced among the control variables. These results are consistent with Rezaee, Olibe & Mnimier (2000).

Similarly to observe, whether, the financial transparency constitutes default risk. In equation (6) the \( \text{CGSCORE}_i \) has been decomposed into its various components and \( \text{FIT}_i \) has been regressed against default risk. The regression results in above table (3) reveals, financial disclosures, which have been used as a proxy for the financial transparency is almost significantly related with the \( \text{DR}_{t+1} \) at ten percent. Which indicates the lower credit rating and more default is because of the financial transparency. Among the other control variables, to get the robust results, the \( \text{REPU}_i \) has been dropped and \( \text{LIQ}_i \) has been introduced in equation (6). Moreover, table (6) shows among the control variable liquidity is positively and significantly related with the default risk, as it was expected. The positive sign of the coefficient of liquidity indicates the firm with more liquidity has the more creditworthiness in term of credit rating and thus enjoys the lower default risk.

Similarly the size is also significantly and positively related with the default risk, as it was expected, which shows the firm with more size has more ability to use its assets properly, which result in increased creditworthiness. These results are consistent with Parker et al. (2002) and inconsistent with James & Overhue (2010).

Like the previous equations to see the effect of \( \text{OWN}_i \) on \( \text{DR}_{t+1} \)/Credit rating of the corporate, working in the corporate Governance framework of Pakistan. In equation (7) \( \text{CGSCORE}_i \) has been substituted by \( \text{OWN}_i \), which is used as a proxy of concentrated ownership structure of corporate. To see concentrated ownership structure contributes towards \( \text{DR}_{t+1} \) or not, \( \text{OWN}_i \) has been regressed in equation (7) against the default risk.

Moreover, the results in above table (1) suggests \( \text{OWN}_i \) are significantly related with the default risk/credit rating of corporate working in the corporate governance framework of Pakistan. And shows those firms having more concentrated ownership their expected default risk decreases, which is inconsistent with Claessans et al. (2000) and Shleifer & Vishny (1997) and consistent with Short (1994). Among the other control variables like the previous equations, significant variable includes, leverage and performance. Even though \( \text{REPU}_i \) is insignificant, but it is insignificant in right direction.

In order to observe, whether, procedure drives the \( \text{DR}_{t+1} \) or not. In equation (8) the \( \text{CGSCORE}_i \) has been substituted with \( \text{PRO}_i \) (procedures), and regressed against the \( \text{DR}_{t+1} \). The regression results in above table (8) suggest the procedures are not significantly related with the default risk/credit rating of corporate working in the corporate governance framework of Pakistan. Moreover, among the control variables significant variables are, \( \text{LEV}_i \) and \( \text{PER}_i \) which is consistent with Elloumi & Goyaie (2001) and James & Overhue (2010). Although, \( \text{REPU}_i \) is insignificant but it is insignificant in right direction. Similarly, size is also insignificant, but surprisingly it is insignificant in opposite direction. Which may be an indication of the governance of the small firms is an easy, due to which its credit rating improves and default risk get lowers.

To check Muti-collinearity problem in data the variance inflation factor has been used. Variance Inflation Factor (VIF) and tolerance are both generally used measures of degree of multi-collinearity of the \( i \)th independent variable with the other independent variables in a regression model. Fortunately or unfortunately most commonly used rule of thumb by the practitioner associated with the VIF is rule of 10. The result in table (04) shows the value of VIF ranges from 1.01 to 13.0 and so only one value which is slightly higher than 10, which means there is not so much multi-collinearity among the independent variables.

3.2 Explanation of Results of Diagnostic Tests

In order to ensure that the estimated models are consistent with the OLS assumption, several diagnostic tests have been applied. The result of Jarque-Bera normality test are insignificant in regression 1, 2, 3, 6, 7, 8, so we can not reject the normality test hypothesis of residuals even at 10 percent level of significance. The results of Breusch-Godfrey serial correlation LM Test suggests, we can not reject the null hypothesis of no serial correlation. The result of ARCH test suggest that squared residuals are homoscedastic. Similarly Ramsey’s test result suggests that specification of all the models is appropriate and the parameters of the models are stable.

7. Conclusions and Future Directions

Our results show that default risk/credit rating is significantly related with the corporate governance, a finding consistent with previous literature. While within the corporate governance board of director’s disclosure, independence, financial information and transparency disclosure, and ownership disclosure which are used as a proxy of board of director quality, independence of board of directors and committees, financial transparency and concentrated ownership structure showed the significant relationship with the default risk/credit rating. On the other hand, external audit, procedures, and compliance disclosures which are used as a proxy for the quality of
management in terms of monitoring, smooth functioning of employees and compliance to the rules and regulations set by the regulatory bodies showed the insignificant relationship with the default risk, which means our corporate are well governed on the matters of monitoring, functioning of employees and compliance to the rules and regulations set by the regulatory bodies. Amongst the control variables, liquidity, leverage and performance are significantly related with the credit rating/expected default risk. One surprising finding of this study is that that size of the firm is insignificant in wrong direction, while the growth of the firm is also insignificant, but it is insignificant in right direction which shows that size of the corporate does not matter in default risk.

This study has covered only the limited attributes of corporate and seen their impact on default risk. Our review of literature has explained the several aspects considered in the construction of corporate governance index. Undoubtedly, in the ownership structure of corporate in the modern era the institutional owner and institutional creditor have the important stake in the corporate which must be considered while finding the relationship between corporate governance and default risk.

Similarly default risk may be because of other many other factors which are afar from the boundary of corporate governance. It is valuable in the future to do more detailed study that involves many of these factors important in bringing the default for a corporate. We assert that using the same measure of default risk on larger sample of firms for an extended period will show more clearly how corporate governance affect the default risk over the years.

A view is that default risk of a firm could be observed from the stock prices of that particular company as these prices are outlook of the inner of the company. But unfortunately because of some political disturbances and domestic violence in the Pakistan statistically insignificant result obtained at the end. Now in future in more normal circumstances this relationship will be observed which is expected to be statistically significant.

8. Recommendations

On the basis of results of the study it could be recommended to the policy makers and SECP to check the ownership structure of the company. As our results and literature reviewed indicates that the concentrated ownership decreases the default risk of the company by improving the credit ratings.

Similarly financial transparency in the use of financial resource is a question mark on the corporate, due to which the level of transparency needed to be improved by improving the disclosure quality and providing the detailed information on the financial affairs of the company rather than just focusing the compulsory financial statements. This extra detail on the financial affairs of company will enhance confidence of the investors, lenders and thus decreases the default risk by increasing the credit-worthiness of the company. On the basis of results obtained it is recommended that the SECP must introduce the new rules and regulations for controlling the board of director and convince the corporate for disclosing the detail information on board of directors and improving their profile spreading from their personal attributes to job related experience. So, that they can perform their oversight, monitoring and decisional role effectively.

Moreover, to reduce the conflict of interest among the board members and improve the monitoring role performed by the different committee, it is required to introduce the more outsiders and increase the size of these committees so that they can play their role of monitoring effectively.

#### Endnotes

1. The disclosures used as a proxy for financial transparency in this study have been suggested by S&P 2002.
3. Information on big four audit firms was obtained from ICAP.
4. ICAP issued a circular on 13th August 2008 in which they set the minimum audit fee on the basis of account receivable turnover rate for the firm. See [www.icap.org.pk](http://www.icap.org.pk)
ABSTRACT
This study examined principal’s personal traits as determinants of leadership effectiveness as perceived by teachers. Four hundred senior most teachers of higher secondary schools in Punjab selected through simple random sampling technique participated in the study. The researcher developed a questionnaire for the teachers to evaluate their principal’s personal traits (emotional maturity, self confidence, sense of humor). The multiple regression, analysis of variance (ANOVA) and t-test were used as statistical tool for data analysis. Findings from the study revealed that a positive correlation exists between three predictive variables and leadership effectiveness. It was recommended that principal’s personal traits should be one of the factors in appointing teachers to administrative posts.

Key words: Principal, Personal traits, Leadership effectiveness,

INTRODUCTION
Leading is one of the key management functions which have attracted the attention of many researchers worldwide. Leadership is a process by which an individual (principal) influences and coordinates the activities of others (subordinates) for the achievements of school goals (Ibukun, 1997). In the same direction (Oredein, 2004) submitted that the major function of a principal in a system is to stimulate teachers and to provide consultation and administrative services to the teachers needed. (Fafunwa, 1980) was of the opinion that the principal is an administrative head, a manager, a supervisor, an instructional leader, a curriculum innovator and a catalyst towards planned revolution. The principal of a higher secondary school is expected to demonstrate leadership effectiveness enriched with desired personal traits.

A principal’s leadership effectiveness is the quality of his personal traits and leadership behavior perceived by school population in general and faculty members in particular. The focus of the leadership studies in a school system was to identify and describe the characteristics of an effective school leadership (De Bevoise,1998,Sweeney,1998,Tukl,1998,Boyer,1997,Lightfoot’,2005). The assumption of the researchers is that the high school principal as a leader is enriched with desired personal traits and acceptable leadership behavior(Cohen,1997,Serqiovanni,1995).
Apparently, the personal traits of a principal co-determine his effectiveness. The list of personal factors associated with effective leadership is quite long. For educational leadership, emotional maturity, self confidence and sense of humor are particularly important. (Witten, 1974) found certain personal traits are predictors of principal’s leadership effectiveness. (Martine, 1988) tried to explore personality factors and behavioral characteristics of the principals as determinant of leadership effectiveness. Rachel L.(2006) explored sense of humor in his doctoral dissertation, "the effects of principal’s humor orientation and communication competence on principal’s leadership effectiveness as perceived by teachers”

STATEMENT OF PROBLEM

The success or failure of the school is often attributed to the roles and functions of the principal. The irony of the situation is that teachers are appointed into positions of principals without considering the required personality traits of the teachers which strongly influence their administrative effectiveness. Therefore, the study investigated certain personal traits as determinants of principal’s leadership effectiveness.

RESEARCH HYPOTHESIS

It was hypothesized that

H01: There is no significant contribution of selected personal traits on principal’s leadership effectiveness.

H02: There is no significant contribution of each of the independent variables (emotional maturity, self confidence and sense of humor) on dependent variable (leadership effectiveness)

METHODOLOGY

Population and Sample

This study was a descriptive research of the survey type. The population of the study consisted of all the senior teachers (subject specialists, senior subject specialists) working in government boys higher secondary schools in Punjab. Working on daily basis with their concerned principals, gives them a unique insight into the factors influencing principal’s leadership effectiveness. A sample of four hundred teachers participated in the study.

Instrumentation

The researcher developed a questionnaire to measure certain personal traits of the principals as determinant of perceived leadership effectiveness. The teachers were personally contacted at their duty post during school hours for the administration of the instrument. After collation of the scores, the multiple Regression, ANOVA and t-test were used to analyze the data. The hypotheses were tested at 0.05 level of significance.
RESULTS

Table 1: Multiple regression table of independent variables emotional maturity, self confidence and sense of humor on leadership effectiveness

<tr>
<td>Total</td>
<td>85700.792</td>
<td>400</td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Results indicated that emotional maturity, self confidence and sense of humor taken together account for 30.2% of the variable in leadership effectiveness. \( R^2 = 0.302 \)

This is reflected in F-ratio F at \( F(3, 397) = 5.214 \) which implies that these three independent variables are important predictors of leadership effectiveness.

Table 2: Summary of individual contribution of the predictors and criterion variable

<table>
<thead>
<tr>
<th>Model</th>
<th>Unstandardized coefficient</th>
<th>Standardized coefficient</th>

</tr>
<tr>
<td>Emotional maturity</td>
<td>1.611</td>
<td>.0681</td>
<td>0.812</td>
<td>2.682</td>
</tr>
<tr>
<td>Self confidence</td>
<td>2.321</td>
<td>.0812</td>
<td>0.763</td>
<td>2.051</td>
</tr>
<tr>
<td>Sense of humor</td>
<td>.453</td>
<td>.0883</td>
<td>0.175</td>
<td>1.892</td>
</tr>
</tbody>
</table>

Data analysis revealed that the three independent variables on leadership effectiveness are significant except sense of humor. Therefore emotional maturity, self confidence, sense of humor contributes significantly to leadership effectiveness. However, emotional maturity contributed most with a t-value of 2.682, followed by self confidence with t-value of 2.051 and lastly by sense of humor with t-value of 1.892.

DISCUSSION

The first hypothesis which states that there is no significant contribution of emotional maturity, self confidence and sense of humor on principal’s leadership effectiveness was rejected. This means that there are significant contributions of these variables on leadership effectiveness.

The findings revealed that a combination of emotional maturity, self confidence, sense of humor when taken together could be effective in determining leadership effectiveness.

CONCLUSIONS

Results indicated that emotional maturity, self confidence and sense of humor taken together account for 30.2% of the variable in leadership effectiveness. \( R^2 = 0.302 \)
This is reflected in F-ratio F at \{F 3.397\} = 5.214 which implies that these three independent variables are important predictors of leadership effectiveness.

It has been empirically established in this study that personal traits (emotional maturity, self confidence, sense of humor) when combined together have a positive correlation and relationship with principal’s leadership effectiveness.

Data analysis revealed that the three independent variables on leadership effectiveness are significant except sense of humor. Therefore emotional maturity, self confidence, sense of humor contributes significantly to leadership effectiveness. However, emotional maturity contributed most with a t-value of 2.682, followed by self confidence with t-value of 2.051 and lastly by sense of humor with t-value of 1.892.

It is so necessary for a high school principal to be enriched with desired personal traits to be more effective.

**RECOMMENDATIONS**

The following recommendations are made:

1. Personal traits are the strongest determinants of principal’s leadership effectiveness.

2. The teachers selected to administrative posts should necessarily possess personality traits and charismatic looks.

3. If a principal is naturally having such traits, it is so encouraging otherwise he should try to develop in himself such personality traits so the teachers may feel at ease in his presence and work with due interest and pleasure.

ABSTRACT
The problem under study was The Perceptions of Teachers and Students, towards failure in subject of English at secondary level. The main objective of the study was to know about the viewpoints of teachers and students about the failure in English. The study may be helpful in facilitating the learning of English by controlling the causes of failure in this subject. All the male and female secondary schools comprised population of the study. District Bakhar was selected for the Research purpose. A sample of 10 schools (5 male + 5 female) was selected from Bakhar on random basis. Five (5) students and Five (5) teachers from each of the 10 schools were selected on random basis. A questionnaire was used for data collection. A percentage statistic was used for the analysis of data.

Keywords: Perceptions; Teachers and Students; Failure; Subject; English; Secondary level

INTRODUCTION
No nation on the globe can make progress in all fields of life, without having proficiency and good command on English. It is great wonder that quality of instruction in English and results of exams: in the subject of English are lowest of the other entire subject. This is situation from primary to degree level. It is an admitted fact that of the time and energy is consumed in learning and teaching English. In spite of this our students are weak in English. In the light of above discussion we can easily concluded that English language is very significant and valuable medium for seeking knowledge and skills. Realizing the importance and need of English government has made it compulsory from very fist year of schooling. In spite of the Government efforts we have to find out the cause of high failure rate and low proficiency of our school and colleges in this subject. After locating responsible factors of poor standard of English in our country we have to take proper and appropriate steps and means to improve the poor situation in this regard. Essay writing is one of the most important elements of English language. The present situation is that our students are incapable to express themselves in verbal and written form. They feel reluctant in writing, reading and speaking English.

In the subject of English we teach our students composition, translation, pronunciation, dialogue, drama, essay writing and comprehension. But teaching of composition is an important aspect process of teaching learning. The goals and objectives teaching English and entire composition of teaching as foreign language are involved in composition. In composition we can easily test, the spelling, tenses, punctuation, sequence of sentence.
For teaching English teachers generally use translation method which is an old method of teaching, therefore our students cannot get command over English subject and one can examine that there are large numbers of students who are failed in English subject at secondary level.

Keeping in to view the failure in the subject of English this study in designed to know the causes of this evil practice and to suggest some remedies.

**STATEMENT OF THE PROBLEM**

The problem under study was to investigate “The Perceptions of Teachers and Students, towards failure in the subject of English at secondary level “.

**OBJECTIVES OF THE STUDY**

Following were the main objectives of the study:
1. To identify main areas which lead student towards failure in English
2. To investigate the causes of students failure in the subject of English.

**SIGNIFICANCE OF THE STUDY**

1. The study may be helpful in judging the causes of failure in English.
2. The study may be helpful for the teachers in teaching of English as to make this subject more interesting.
3. The study may be helpful in facilitating the learning of English by controlling the causes of failure in this subject.
4. Another importance of this study may be to discord the complexities in the way of English teaching.
5. The foremost significance of this study may be to search whether we can control the causes, which are leading towards failure in English, or not. The research findings will contribute to the effectiveness of English teaching and finally it will make students to get commend over this subject.

**LIMITATION AND DELIMITATIONS**

Researcher developed instrument was used for conducting research. There was no built in questionnaire for the purpose of data collection. The study was delimited to only male and female Government High Schools. Only ten (10) Government High Schools were randomly selected for the study.

**REVIEW OF RELATED LITERATURE**

English is widely spoken in the world. According to Aysah Mueen (1992). “English meets the tests of practical value. It is the language of the world in all fields of the arts, hard sciences, humanities and social sciences in international trade, commerce and diplomacy are conducted in English” Pakistan is no exception. There English is taught and learnt as an important language second only to the National language i.e. Urdu. Aysha Mueen (1992) further says that English is used as an official language Pakistan as 80 % correspondence is carried out in English and it needs to be fostered as a means of education, communication and a practical tool. Pakistan and other non English speaking countries throughout the world are realizing that if English language teaching is neglected, there will be decline in the field of science, technology and commerce. Keeping in view the importance of English in Pakistan, the achievement of the students in the subject is not up to the mark. Khamisani, Amena (1983) has analyzed the situation in Pakistan and noticed that there is a rapid and marked decline not only in the students, knowledge of English literature and their response to it, but chiefly in the proper use of English syntax.

According to Haycraft (1993) the Asian people are facing problem in teaching and learning of English while those problem include lack of expert knowledge, lack of spoken, English and facilities which are making English effective. Robisson, H Allam (1985) has also discussed same type of problems within classrooms of teaching English. Done Byrne (1979) writes about the nature of the writing skill follow” When we write, we use graphic symbols; that is, letters or
combination of letter which relates to the sounds we make when we speak. According to Bryne (1979), writing involves the encoding of a message of some kind that is we translate out thoughts into language.

Gatherer (1980) States: “Writing is least studied of all forms of communication, it is surprising that the basic skills of communication on paper should have been a so little researched. What scholarship does exist on writing is mainly concerned with the classification of composed texts. Gatherer (1980) further States: "The psychology of writing is still largely undiscovered: the description I have given is probably much too primitive. There are many other features to be taken into account.

According to Jereme Resner (1975) "When a child first starts to write, he draws pattern. He is not printing letters until he things of them as symbols. Then, as he learns the individual letter names and their pattern as he chunks individual elements into larger unites-writes or prints letters, but he has to think about them and how to make his hand perform the necessary movement. As he just practice, he acquire facility". Just as the new drivers, becomes the experienced drivers and able to stop thinking about what separate section, he is to perform, so, too does the new writer become the experienced writer and stop thinking about how to control his hand.

Handedness Rasner (1975) states. "The child should use always the same hand, and it should be what even he writes best with. It you are un-certain about which one that is, test him. You do not need a formal test. Have him print with one hand then the other and compare the two. Almost invariably, one will be better than the other. That is the hand he should write with.

S.P. Corder quoted by Valerie Kinsella (1988) tracing the history of research on foreign language states. "In the course of learning a second language learners regularly produce utterances in speech and writing which judged by the rules of the second language are erroneous- or ill formed.

According to John Bright (1976), Learning to write is a matter of (a) establishing mechanical habits of fluent movement and (b) understanding which differences in the way letters are formed, significant and which do not matter. There are not many movements to lean because the same basic ones are used in a number of different letters. For example, the basic strokes of i, t, and l are the same down and round. The basic strokes of h, n, m, p, are the same, down up and over. The basic of all the following letters in an anti clock wise movement c, e, o, o.a.d. g, q.

Nazir, Ahmed (1982) says “the translation method aims at teaching English by giving word-for-word, phase for phase, or sentence for sentence equivalents in the mother tongue for English word, phase or sentences and vice versa”. The mother tongue his the natural medium over which we have full control.

METHOD OF RESEARCH

Population
All the male and female secondary schools comprised population of the study.

Sample
District Bakhar was selected for the Research purpose. A sample of 10 schools (5 male + 5 female) was selected from Bakhar on random basis. Five (5) students and Five (5) teachers from each of the 10 schools were selected on random basis.

Development of Instrument
Researcher himself identified various areas of problems in teaching of English with the help of experts and on the basis of these areas questionnaire was developed. Before giving final touch to questionnaire it was discussed with different experts from the different departments of the Gomal University, DIKhan.
Procedure

Researcher himself visited every school included in the sample and administered questionnaire to the teachers and to the students.

Analysis of Data

The collected data were tabulated and analyzed by the researcher and percentage statistic was used for the analysis of data.

**FINDINGS**

Following findings were drawn from the statistical results:

1. 60% teachers and 55% students considered that due to lack of interest in the subject of English there was failure in the subject of English. While 55% parents, 40% teachers and 45% students, did not consider it as a cause of failure in English.
2. 40% teachers and 65% students considered that teaching of English by untrained teacher was cause of failure in this subject. While 45% parents, 60% teachers and 35% students did not consider it as a cause of failure in English.
3. 100% teachers and 100% students considered that due to lack of practice in speaking English language there was failure in the same subject.
4. 72% teachers and 70% students considered that due to use of traditional method in teaching of English there was failure. While 38% parents, 28% teacher and 30% students did not consider this as a cause of failure.
5. 67% teachers and 65% students considered that due to over loaded students there was failure in the subject of English. While 15% parents, 33% teachers and 35% students did not consider this as a cause of failure.
6. 74% teachers and 71% students considered that crowded classroom was the cause of failure in the subject of English. While 36% parents, 26% teachers and 29% students did not consider it as a cause of failure.

7. 90% teachers and 85% students considered that due to out of date examination system there was failure in the subject of English. While 20% parents, 10% teachers and 15% students did not consider it as a cause of failure.

8. 30% teachers and 40% students considered that culture of Pakistani society which to some extent against the teaching of English was the cause of failure. While 70% teachers and 60% students, did not consider it as a cause of failure.

9. Society which is to some extent against the teaching of English was the cause of failure in the subject of English. While 70% teachers and 60% students, did not consider it as a cause of failure. 76% teachers and 81% students considered that English was a difficult subject and this was the cause of failure. While 37 parents, 24% teachers and 19% students did not consider it as a cause of failure.

10. 47% teachers and 50% students considered that insufficient time given to English in timetable was the cause of failure. While 40% parents, 53% teachers and 50% students did not consider it as a cause of failure.

11. 47% teachers and 50% students considered that insufficient time given to English in timetable was the cause of failure. While 53% teachers and 50% students did not consider it as a cause of failure.

12. 50% teachers and 75% students considered that lack of trained teacher time cause of high failure in the English subject. While 50% teachers and 25% students did not consider it as a cause of failure in English.

13. 62% teachers and 60% students considered that due to lack of practice in speaking English language. While 38% teachers and 40% students did not consider it as a cause of failure in English.

14. 62% teachers and 65% students considered that due to use of traditional method in teaching of English there was failure lack. While 38% teachers and 35% students did not consider this as a cause of failure in English.

15. 80% teachers and 90% students considered that due to over loaded of tent there was failure in the subject of English. While 20% teachers and 10% students did not consider this as a cause of failure.

16. 70% teachers and 60% students considered that crowded classroom was the cause of failure in the subject of English. While 30% teachers and 40% students consider it as a cause of failure.

17. 70% teachers and 100% students considered that out of data examination system is the cause of failure in the English subject.

18. 50% teachers and 60% students considered that lack of high English teachers is the cause of high failure. While 50% teachers and 40% students is as the cause of failure.

19. 82% teachers and 72% students considered that lack of high English teachers are the cause of high failure. While 18% teachers and 28% students consider it as a cause of failure.

20. 90% teachers and 60% students considered that insufficient time given to English in time is the cause of high failure in English.

21. 100% teachers and 100% students considered that use of grammar translation method is the cause of high failure in English.

22. 90% teachers and 95% students considered that lack of English speaking environment is the cause of high failure in English. Subject while 10% teachers and 5% students it is as a cause of failure.

23. 70% teachers and 80% students considered that having no competent English teachers at school level is the cause of high failure in English. Subject while 30% teachers and 20% students it is as a cause of failure.

24. 40% teachers and 60% students considered that no use of A.V Aids is the cause of high
failure in English subject while 60% teachers and 40% students consider it is as a cause of high failure.

25. 45% teachers and 72% students considered that no use of group work activities at the English class room is the cause of high failure in English subject. While 55% teachers and 28% students consider it is as a cause of high failure

CONCLUSIONS

Following conclusions were drawn in the light of findings of the study:

1. Majority of the respondent considers that lack of interest in the subject of English is the cause of failure in the subject of English.
2. Majority of parents & students consider that untrained teachers are the cause of failure in this subject.
3. Hundred percent respondent considered that due to lack of practice in speaking English language there was failure in the same subject.
4. Majority of respondent considers that traditional method of teaching is a cause of failure.
5. Most of respondent consider that over loaded students are the cause of failure in the subject of English.
6. Majority of respondent consider that crowded classroom was the cause failure in the subject of English.
7. Most of respondent consider that out of date examination system is the cause of failure in the subject of English.
8. Most of parents & students consider that English is a difficult subject therefore students are failing.
9. Most parents were consider that insufficient time given to English in timetable is also the cause of failure was the cause of failure in English subject.
10. Most of the students were considering that lack of interest in English language is the high failure.
11. Most of the teachers were considering that in sufficient time given to English in time table is the cause of high failure in the subject.
12. Most of the respondent were considering that lack of trained English teacher the cause of high failure in English subject.
13. Most of the respondent were considering that the lack of practice in English speaking is the cause of high failure in English subject.
14. Majority of the respondent were considering that traditional method of teaching in the cause of high failure in the subject of English.
15. Most of the students were considering that over loaded of tent on the students the cause of failure in the English subject.
16. Majority of the respondent were considering that the crowdedness class room is the cause of high failure in English subject.
17. Most of the respondent were considering that out of date examination system is the cause of failure in the English subject.
18. Most of the students were considering that complication of English subject the cause of high failure.
19. Most of the respondent was considering that high English teachers are the cause of high failure in English subject.
20. Majority of the students were considering that insufficient time given to English in time is the cause of high failure in English subject.
21. Majority of the student were considering that use of grammar translation method is the cause of high failure in English subject.
22. Majority of the respondent were considering that lack of English speaking environment is the cause of high failure in English.
23. Majority of the respondent were considering that having no competent English teachers at school level is the cause of high failure.

24. Majority of the respondent were considering that no use of A.V Aids in the classes is the cause of high failure in English subject.

25. Majority of the respondent were considering that no use of group work activities at the English class room is the cause of high failure in English subject.

RECOMMENDATIONS

Following recommendations were made in the light of the findings and conclusions.

1. Modern techniques of leaching must be added in the teacher-training program.
2. The teachers should encourage the students for learning.
3. The government should provide trained English teaches to all the schools.
4. Proper measures may be taken to change the negative attitude of the teachers and students towards English.
5. Modern system of examination may be followed.
6. The findings of the study may be sent to higher authorities for the betterment of leaching English in Pakistan.
7. Individual attention may be given to every student.
8. The Government should provide the books of English to all the mediums or to each medium i.e. Urdu and English medium.
9. Practice in speaking English may be given due attention.
10. Sufficient time may be given to English in school timetable.

Professional Development of English Teachers: The Saudi Arabian Context

Dr Intakhab A. Khan
Asst. Professor and In-charge (Training)
King AbdulAziz University Community College, Jeddah- 21589, Saudi Arabia.

Abstract
Teaching in general and English language teaching (ELT) in particular is a challenging task. In order to be effective in the classroom most teachers need a background of training: pre-service or in-service. Professional development as a component of in-service training has been found very effective in educational sector as there is always a chance that a new incumbent doesn’t possess suitable qualification or experience. Teaching of English in Saudi Arabia requires great deal of expertise in the subject and enough exposure to the teaching scenario of the bilingual context. The aims and objectives of teaching of the target language often remains a dream, however, the governmental efforts are sincere. In this case, the professional development of the concerned English teachers may be proved to be helpful in the process of attainment of the conceived objectives.

The present paper tries to explore the need of professional development for English teachers in Saudi. It is generally found that most English teachers face problems in teaching the target language. Among the factors that are supposed to be responsible, the in-service training (continuous professional development) is very crucial. There are many aspects that can be directly or indirectly associated with the concept of professional development. The following are some of them: teacher’s background, their perception regarding the need of teacher development, effect of effective training on human resource development, attitude of teachers towards professional development, effectiveness of professional development, participation in such programs and utilization of the program input to the actual teaching/learning situation.

Keywords: ELT, training, professional development, strategies, learning theories.

1. Introduction

The concept of professional development can’t be ignored in any teaching situation. It has become almost a necessity in the modern time. There are many studies that reveal the poor results of educational practices related to the teaching of English in Saudi Arabia. But, most of the time, there exists a controversy over the factors that affect the results or outcomes of learning. The teachers always blame the attitude of the learners for failure of learning while the administration and families blame the teachers. Moreover, there is a fact that if there is no learning there is no teaching. This philosophy obviously emphasizes the role of the teachers, and holds the teachers accountable for failures in the process of learning the target language (English).

It is found that quite a lot of the professionals are not suitably trained in their areas of specialties such as ELT/EFL/ESOL. Thus, it is inevitable to ignore the relevance of professional
1. Need and Importance of Professional Development

Professional development is a broad term, encompassing a range of people, interests and approaches. Education is getting global and competitive day by day. Both the parents and the nation want a creative mind in children. The background of the target students in English in both the countries is supposed to be humble, and the learners are unable to practice the target language at homes, in the markets or society to the extent they should. So the teacher's role becomes greater. The teacher needs an effective teacher-training so as to be able to assimilate the educational values and ideas of one's own culture and of modern needs. The nation needs the services of millions of teachers who have trained minds and not stuffed brains so that the ultimate development of human resource can be targeted. The actual training requires the following aspects to be fulfilled: teacher’s attitude, philosophical change, technology oriented attitude, skill oriented teaching/learning, human resource development etc.

2. Research context of professional development

Recently many studies have been carried out in the area of professional development. However, the trend of investigations started long ago. In this connection, the studies that created the very base of professional development in education include: Griffin, 1983; Guskey, 1986; Joyce & Showers, 1988; Lieberman & Miller, 1979; Orlich, 1989; Wood & Thompson, 1980, 1993 etc. However, people are still found having doubts regarding the practical relevance of such researches. Since the goal of most modern professional development efforts is the ultimate improvement in the institutions, and the improvement is usually measured by the gradual performance of the academic staff, institutions that ultimately lead to the uplift of the target learners.

Some researchers suggest that professional development efforts designed to facilitate change must be beneficial for those who are very much in the field of practice: (McLaughlin, 1990; Weatherley & Lipsky, 1977; Jin, Y., & Yang, H. Z., 2006). Others indicate that an emphasis on individuals is detrimental to progress and more systemic or organizational approaches are necessary (Tye & Tye, 1984; Waugh & Punch, 1987). Many experts stress that reforms in professional development must be initiated and carried out by individual teachers and school-based personnel (Joyce, McNair, Diaz, & McKibbin, 1976; Lambert, 1988; Lawrence, 1974; Massarella, 1980). Others emphasize the most successful programs are those which are guided by a clear vision that sees beyond the walls of individual classrooms and schools, since teachers and school-based individuals generally lack the capacity to conceive and implement worthwhile improvements on their own (Barth, 1991; Clune, 1991; Mann, 1986; Wade, 1984).

Some reviewers argue the most effective professional development efforts approach change in a gradual and incremental fashion, not expecting too much at one time (Doyle & Ponder, 1977; Fullan, 1985; Mann, 1978; Sparks, 1983). Others insist on broadening the scope of professional development programs that are expected to yield better results if implemented well (Berman & McLaughlin, 1978; McLaughlin & Marsh, 1978).

The case of educational institutions in Saudi isn’t much different. The attempt to develop the teachers professionally has been emphasised for a long time. Many Saudi educational institutions
utilized the opportunities of having academic exchanges with the institutions of USA, Canada, UK etc. Yet, it is felt that a lot more can be achieved in near future in the area of teacher/professional development especially when we relate the two concepts: teacher development and pedagogy.

3. Professional Development and pedagogy
Teaching as an activity is always associated with philosophy, sociology and psychology. As an interdisciplinary subject, education/teaching derives many things from social psychology, consequently building a base for pedagogy. The attitude of teachers towards training or ongoing development should always be positive. Though pre-service training is always better, the role and importance of on the job training can never be underestimated. Motivation of on the job teachers towards their profession and their continuous professional development is another important area that needs to be studied in depth in order to make the process of professional development of the English teacher a great success. In this connection, the teachers should be directly involved in defining priorities about what are their real problems and able to select appropriate solutions (Tobin, 1988, Hewson and Hewson, 1988). It is also important to analyze the consequences of teachers' attitudes. Pre-service courses can benefit from that knowledge and guide the selection of courses and methodologies to insure a good foundation for the teachers. One possible way to permit a critical evaluation could be putting together the two groups (teachers and students). Pedagogy should be developed in relation to the current needs, and professional development should be focused on the pedagogical aspects including the learning needs.

3.1. Teacher development and Quality English Language Education

The teacher is the most important element in any educational programme. It is the teacher who is mainly responsible for implementation of the educational process at any stage. No amount of investment in education can improve quality of education unless there are well qualified English teachers to impart quality language education. In order to target quality education, the teacher should have quality training and expertise. It is expected that most trained and professional teachers should have the following traits in order to be effective and efficient.

Despite the availability of resources and increased emphasis on the use of technology, many teachers, whether pre service: Doering, A., Hughes, J. E., & Huffman, D. (2003), Zhao, Y., Pugh, K., & Sheldon, S. (2002), or experienced, currently feel ill prepared to use technological tools and resources for teaching of contents. The factors may be contributing to pre service, novice, and veteran teachers’ struggles with integrating technology into their teaching in innovative and effective ways. First, school leaders call for technology integration without actually defining their vision for integration (Perry & Aragaldo, 2001). Teacher factor is the most important of all in the educational setting. It is the teacher’s responsibility to afresh his knowledge, update his potential and equip himself with the advancement of the society and use of technology in general and educational environment in particular (Khan: 2005, p.197). There are many ways in which the teachers can develop themselves in their respective fields.

CPD (Continuous professional development is one of those means that has been suggested by almost all the modern pedagogues in this situation when the world has become a global village, and the education of all types can be pursued from anywhere and anyway.
4. Expectations from the English teacher in Saudi Arabia

Teaching is an art as well as a science. Without a proper development of teaching skills a teacher can’t prove himself to be an effective instructor in his classes. He has to justify his position by showing different traits and skills while teaching the target learners. Apart from some well known qualities of a teacher in general such as qualification, training and experiences, a teacher is always expected to display some modest but significant behavior patterns and characteristics in his day to day interaction with the learners. If a teacher lacks the following characteristics he is supposed to attend teacher development programs in order to modify his teaching potential, attitude and readiness to deliver in the best possible manner.

4.1. Characteristics of an English Teacher: Pedagogic perspective

On the basis of my educational background, teacher training, and relevant experience, an effective teacher’s qualities may be summed up as under:

A teacher of English is primarily a knowledgeable person not only in his subject but also in the foundations of education/teaching: psycholinguistic and sociolinguistic etc. He should also know what and why he is teaching a subject like English, and how can the subject be taught in the best possible manner. In order to be effective and learner centered, he is expected to prepare his lessons well before starting a new unit especially functional grammar. In order to be target oriented in his approach, the teacher should assess the performance of the students on individual basis as well as among colleagues. In this case, it is better that he keeps current records of the students and update the same from time to time. If a teacher is professional, he will always share his pedagogic experience with his colleagues as well as the administration. Being a facilitator, an effective teacher is required to motivate the learners as the learning of English as a foreign language usually becomes monotonous.

Education is a life-long process, and formal teaching continues until one is in his profession, therefore continuous development is also as natural as the practice of teaching. In order to grow further, a dedicated teacher should stay in touch with the latest advancement in the field of ELT such as integrated curriculum, integrated English, communicative approach to language teaching etc. This can facilitate him to discover the possibilities of innovations in teaching and exploitation of available resources such as technology and e-learning material. Above all, the teacher is expected to be able to diagnose the learning difficulties and accordingly evolve innovative teaching/learning strategies for better results.

4.2. Background of English teachers in Saudi Arabia: The practical Experience of

Teaching English in Saudi is quite thought provoking and knowledge oriented. There are many factors that contribute to the existing situation. Saudi Arabian educational context is different from many developing countries for two important reasons: controlled population, and government's specific policies and implementations. The Saudi government is able to invest the amount of money whatever is required. And, the Saudi population is not that much like India or China that the government can’t focus on each and
every student. On the other hand, in the over populated and economically stressed countries, education is usually neglected for its own locally adverse situation.

At the higher education level, ESL/EFL teachers in particular are more responsible for imparting education in general and the target language in particular to those students who don’t have favorable conditions for learning. In this case, the concerned teacher, apart from being well educated and sophisticatedly trained, should be well motivated, have clear vision, know teaching strategies, motivating techniques so that his teaching can be more interesting, and the learning yields results and outcomes.

In Saudi Arabia, in most technical/professional colleges, there are basically three kinds of English teachers: native speakers, bilinguals, and the teachers from India, Pakistan and other similar countries. Each type has specific characteristics, and faces specific teaching problems. The background and training doesn’t contribute a lot, however, a suitably equipped teacher may successfully minimise the learning difficulties. The training like CELTA, DELTA, TESOL, EFL, ESL, ESP, B.Ed., M. Ed etc are generally found less effective because these do not meet the need of the local teachers and specific classroom situations. Therefore, in order to abridge the gap between education/training and actual practice, there is an urgent need to develop the existing academic staff through professional programs so that the teachers may not face too many problems due to a substantial change in the educational set up and technology based teaching scenario.

5. The ultimate need of teacher development

It is good to have such a combination of native speakers, bilingual and unilingual teachers to have them as facilitators. But CPD (Continuous Professional Development) must go on in order to avoid waste of human resource. Training and professional development is always essential in this fast changing society. Thus, in order to be update, modern and sophisticated, one should attend in-service training or professional development programs. It is always appreciated if the teachers of English are research oriented, but ironically speaking, most teachers of Saudi are disinterested in any such program. They think that this is an academic embarrassment to take part in any training program. They innocently forget that every teacher is not a born teacher rather some are made.

6. Conclusion

Teaching is the noblest profession and the teacher is the role model. Everyone is a society is bound to respect a teacher because value system is always attached to them in particular. Teachers in general and English teachers in particular are always accountable for bringing certain desired changes in society in general and students in particular. English being the lingua franca holds very important position in the global scenario of sociolinguistic perspective. It is rightly considered as one of the major tools of socialization, instrument of technological and scientific changes. Saudi Arabia is no exception to such changes and developments. English as an international language and a means of instruction is Saudi Arabia is being duly emphasized
these days. Many researches are being undertaken in the area to diagnose problems and find out solutions if any. In spite of the fact that the government has taken many genuine and serious steps to impart knowledge and develop the level of English in the country, the students face a lot of problems during the courses of study. Apart from so many other factors, teacher remains the most crucial aspect of teaching-learning environment. It has been assumed if English teachers are properly trained/developed and appropriately educated in the branches like Educational philosophy, educational sociology, educational psychology and pedagogy, the chances of further waste can be minimized or even removed from the English education system of Saudi Arabia.

ABSTRACT
This research work was focused on the “effect of small class size on the academic achievement of students at secondary school level”. Class size is the number of students a teacher instructs in a classroom at a point in time. Class size produces significant effect on student academic achievement at secondary school level. In this research work researcher has analyzed that if class size is small then the academic achievement of students is high because they can easily participate in the each and every activities i.e. discussion, question answer, feedback etc. In this research work a sample of 400 students of 10th class was taken from four rural and four urban high schools. To analyze the data Chi Square ($\chi^2$) test was used. The results of this research work showed that small class size play a very essential role in increasing the academic achievement of students at secondary school level.

Key Words: Small class size, Academic Achievement, Secondary school

INTRODUCTION
Education is a very vast and ample subject. No doubt it has virtually unlimited range and scope and hence the same is the case with issues and problems in education which are not only innumerable but also multiplying with every coming day. It is here by intended to undertake one such issue out of excess of problems for research which concerns the number of students in a class and its alleged effects on the academic achievements of the students of that particular class. The purpose of the study is to bring into focus and spotlight the acute problem of overcrowded classes of schools and how these effect the overall achievement of the students at secondary school level. This problem has its roots in recent past and is closely related to the unrestricted and undisciplined growth of population, which is rightly termed as the explosion of population. As this growth of population is inconsistent and incompatible with our resources which are not increasing or not being utilized by us accordingly. That is why our resources cannot cope with the fast growing needs of the population and its sequel is the over crowded and over populated classes besides other impacts and consequences.

Now seen in this perspective it is not an easy task to handle this problem successfully and workout some permanent and long lasting solution for it. But at last we can grasp at the different aspects and facets of this problem and it’s for reaching and multifarious effects on the progress of individuals and also on society as a whole. Class size is considered a very important factor in decreasing or increasing the academic achievement of children. At
secondary school level students need maximum guidance, discussion, counseling and they want to share their ideas with their teachers and this is only and only possible when the numbers of students are limited in the class rooms, in crowded class rooms it is impossible. At secondary school level the courses are tough, lengthy, difficult, and some time vague they need continuous supervision and discussion for better learning, and this better learning is possible in the small classrooms.

STATEMENT OF THE PROBLEM
The problem under study was to determine the effect of small class size on the academic achievement of students at secondary school level.

OBJECTIVES OF STUDY
Following was the objective of the study: -
1. To explore the effect of small class size on the academic achievement of students at secondary school level.

SIGNIFICANCE OF THE STUDY
The results of the study would be useful for the following reasons:-
1. This proposed study is of immense value to the education in general and to our academic institutions in particular, as with the help of this study the effects can be adopted to reduce its alleged adverse effects on the achievements especially academic achievements of various students.
2. The upshot and expected outcomes and findings of this research work can be used by education departments at Provincial and National level for forming their future education polices keeping in view the possible results of this study.
3. The study provides information about the overcrowded classes and the effect of these classes on the academic performance of students at secondary school level.

HYPOTHESES
H₀: (Null Hypothesis) There is no significant effect of small class size on the academic achievement of students at secondary school level.

H₁: (Alternative Hypothesis) There is significant effect of small class size on the academic achievement of students at secondary school level.

EXPLANATION OF TERMS AND ABBREVIATIONS
Terms and abbreviations used in the study are as under: -
1. α Level of significance.
2. d.f Degree of freedom.
3. DIKhan Dera Ismail Khan

REVIEW OF RELATED LITERATURE
Krueger and Whitmore (2001) identified that small class size benefits for students. Researchers explain that how small class sizes narrow the achievement gap, reduce grade retention, decrease behavioral problems, reduce truancy, and increase graduation
rates. According to author class size increase the academic achievement of students and also develop self confidence which is very much lacking in the large class size.

Fletcher (2009) found that increased participation in high school sports, extracurricular activities, honors, and advanced placement courses among students who attended smaller class sizes. The researcher also found that the class size has indirect relationship with the student’s achievement.

On the bases of researchers discussion there is a long term effect of smaller class size on student academic achievement. Achilles (1993), Finn and Achilles (1999), Nye (2001b), Konstantopoulos and Chung (2009), Nye (2001a), and Nye (1999) claims that students in the smaller class sizes retained their advantage over other students who attended larger. Researchers also found that students who attended smaller classes continued to outperform those students who had attended larger classes in mathematics, language arts, and science tests through ninth grade. Moreover, these researchers claim that these advantages of smaller class size not only in the primary or elementary schools but continued generally throughout high school.

**California Class Size Reduction Program (CSRP)**

Stecher and Borhnstedt (2000) and Mitchell and Mitchell (1999) explains that the California CSRP used a quasi-experimental design to study the impact of smaller class sizes on student achievement using two nonrandomized comparison groups but no control group, on the bases of these groups the California CSRP claims that the smaller class size increases the academic attainments of students.

**Student–Teacher Ratio**

Rees & Johnson (2000) in schools, such ratios are indicative of possible staff changes. The school should engage some teachers if the student-teacher ratio is 50:1. If the ratio is very low i.e. 10:1 classes could be combined. The normal student-teacher ratio should be 20:1.

**Historically Development of Implications**

Word et al (1994). Historically there has been a steady decline in pupil-teacher ratio. In 1929-1930 the people teacher ration was 30, in 1939-40 it was 29.1, in 1949-50 it was 27.5 and by 1965-1966, it had dropped to 24.6. These figures represent average ratio for all enrolled public schools students. Elementary school ratio run some what higher and secondary school ratio run some what lower. For instance, the elementary school pupil-teacher ratio for 1955-5.6 was 29.6 and the secondary school ratio was 21.2. The US office of education has predicted that by 1975-80 the elementary ratio will drop to 25.1 and the secondary ratio will be reduced to 20.2. The projections indicate that during the same period the total number of elementary students and teachers will drop slightly and the number of secondary students and teachers will increase about 30 percent.

Rees & Johnson (2000) Classes with too many students are often disrupting to education. Academic performance of the students at school level affected by too many students in a class, so larger class decrease the academic performance and smaller class increase the academic performance of the students at school level.
Card & Alan (1996) explain that lower student to teacher ratios are better at teaching students difficult subjects just like physics, mathematics, biology and chemistry, than those with a higher ratio of students to teachers. The schools with lower student to teacher ratios are much better, have a higher attendance and have more confidence with in the different institutions. Children who attend schools with a smaller pupil-teacher ratio and a better educated teaching staff appear to earn higher wages as adults than children who attend poorer schools.

Molnar (1999) explain that on the bases of more popular studies on student-teacher ratio effects were those done in relation with Student Teacher Achievement Ratio (STAR) and Student Achievement Guarantee in Education (SAGE) Program. Researchers associated with all of these programs found significant benefits linked with smaller class size.

Class Size and Academic Achievement
Glass and Smith (1979) using meta-analytic techniques researchers reviewed approximately 80 class-size studies conducted between 1900 and 1978. On the bases of these researches the researchers concluded that reductions in class size resulted in increases in academic achievement. To obtain significant increase in educational attainment however required a dramatic reduction in class size. Decrease in the class size up to 15 results in significant increase in student’s achievement. Researchers pointed out that in 1980 many of the achievement gains were based on tutorials or extremely small classes.

METHODOLOGY OF THE RESEARCH STUDY

Population
Population of study consisted of all the 10th class male students of higher secondary schools in District Dera Ismail Khan, Pakistan.

Sample
For this research study four rural and four urban male high schools were selected randomly, so total eight male high schools were selected. Total 400 male students from small classes and large classes were selected randomly from these eight schools, 50 students from each high school. So a sample of 200 male students from rural areas and 200 male students from urban areas were randomly selected from these schools.

Instrument
Questionnaire as an instrument was used in this research study. The instrument was developed and validated to get the opinion of the students about the class sizes and the academic achievement. Researcher personally served the questionnaire to the students, the students were asked to give the exact response / figure to the items.

Procedure
In order to know the effect of small class size on the academic achievement of students a questionnaire was used. The questionnaire was developed, validated and improved in the light of feedback. Difficulties and ambiguities pointed out and removed in consultation with
the experts in the relevant field. Researcher himself visited the schools distribute questionnaire and collects the data.

What is a "Small Class"? Jackson (2005) Researchers have found that gains in achievement generally occur when class size is reduced to less than 20 students.

Rowntree (2008) the national average (which has been improving over recent years) is about 16:1 for secondary schools, but there is a wide variation.

**Best class size for maximizing student achievement**
The smaller class sizes in the Student-Teacher Achievement Ratio (STAR) project were 13 to 17 students while the larger class sizes were 22 to 25 students. While the Student Achievement Guarantee in Education (SAGE) project used smaller class sizes of 15 or less and a variety of larger ones, the California Class Size Reduction Program (CSRP) used class sizes of less than 20 as well as various class sizes of more than 20.

Keeping in view the above discussion the class size was classified into two categories “Small” and “Large”. The number of students in small classes was less than or equal to 20 and the number of students in large classes was more than 20. Academic achievement of the child was also classified into two categories “High achievement” and “Low achievement”, High achievement for 1st division students and low achievement for 2nd division and 3rd division students. First division from 60% to 100% Second Division from 45% to 59% and third division from 40% to 44%

**STATISTICAL ANALYSIS**
In order to know the effect of small class size on the academic achievement of students at secondary school level Chi-square ($\chi^2$) distribution was used. The effect of these variables was estimated at 0.05 level of significance.

Chaudhary (2000) The Chi-square distribution was first obtained in 1875 by F.R Helmert a German Physicist. Later on in 1900 Karl-Pearson showed that as n approaches infinity a discrete multinomial distribution may be transformed and made to approach a Chi-square distribution ($\chi^2$). The Chi-square ($\chi^2$) distribution contains only one parameter, called the number of degree of freedom. The formula for Chi-square distribution is as under:-

$$\chi^2 = \frac{n(ad - be)^2}{(a + b)(c + d)(a + c)(b + d)}$$

where $\nu = (r - 1)(c - 1)\text{d.f.}$, Where $2 \times 2$ Contingency table= $\frac{a}{c} \frac{b}{d}$

**FOR URBAN STUDENT**
Table: 1 Showing effect of small class on the academic achievement of students.

<table>
<thead>
<tr>
<th></th>
<th>Small Class</th>
<th>Large Class</th>
<th>Total</th>
</tr>
</thead>
<tbody>
<tr>
<td>High Achievement</td>
<td>87</td>
<td>21</td>
<td>108</td>
</tr>
<tr>
<td>Low Achievement</td>
<td>11</td>
<td>81</td>
<td>92</td>
</tr>
<tr>
<td>Total</td>
<td>110</td>
<td>90</td>
<td>200</td>
</tr>
</tbody>
</table>
To measure the effect of small class on the academic achievement of the students, Chi-square distribution was used. Calculated Chi-square value was found to be 94.46 which is greater than the table value of 3.84 at \( \alpha = 0.05 \) with one degree of freedom. \( \chi^2 = 94.46 > 3.84 \) So there is a significant relationship at 0.05 level of significance. Hence \( H_1 \) “There is significant effect of small class on the academic achievement of students at secondary school level” is accepted.

### Summary

The problem under study was to investigate the effect of small classes on the academic achievement of students at secondary school level. For the purpose of collection of data, a questionnaire was developed, validated and administered personally to the students. Data was analyzed with the help of Chi-square (\( \chi^2 \)) distribution as a statistical analysis technique. It has been found that small classes play a very crucial role in increasing the academic achievement of the students at secondary school level.

### Findings

**For urban school**

The calculated value of Chi-square is 94.46 while table value is 3.84.

**For rural school**

The calculated value of Chi-square is 78.35 while table value is 3.84.

### Conclusion

There is a significant effect of small classes on the academic achievement of 10th class students for rural and urban schools. It is concluded that for both the schools, there is an indirect relationship between the variable i.e., smaller the class greater will be the academic achievement and larger the class lower will be the achievement.

### Recommendations

There are following recommendations on the bases of the findings and conclusions:-

1. Parents may choose those schools in which the strength of students in the classes is small in order to increase the academic achievement of their children.
2. The same type of research can also be applied for the female schools.

COMPARATIVE STUDY OF HOME TUITION AND TUITION CENTERS REGARDING ACADEMIC ACHIEVEMENT OF STUDENTS AT SECONDARY SCHOOL LEVEL

1Malik Amer Atta, 2Dr. Asif Jamil, 3Muhammad Ayaz, 4Tahir Shah, 5Wajeehuddin Nouman

4DEC, Sarhad University DIKhan, 5AIR Gomal University DIKhan

ABSTRACT
This research work was focused on the “comparative study of home tuition and tuition centers regarding academic achievements of students at secondary school level”. In this comparison it was conducted that home tuition produces significant effect on student academic achievements as compared to tuition centers. In this research work on the bases of results researcher has analyzed that when students get home tuition then their academic achievements is high as compared to tuition centers. A sample of 80 students of 10th class from eight different high schools was taken. For analyzing the data we have used t-test.

Key Words: Home Tuition, Tuition centers, Academic, Achievements, Secondary school

INTRODUCTION
Generally there are two kinds of tuition system working in Pakistan i.e. home tuition and tuition centers. In home tuition private home tutor come to the student’s home at the preferred time set by the student. This saves a lot of traveling time for student and the parent. A good home tutor is not just familiar with the school syllabus but he or she is familiar with the children. Home tutor often gives real life examples of the concepts taught in the books to reinforce understanding for the purpose of clarification. In home tuition simple memorizing techniques, exam techniques, question answer technique and other study techniques are also imparted from the tutor to the student. In home tuition with the right tutors and lots of practice, a weak student can be coached to do well in future exams. From home tuition the main benefit is that the student will receive personal attention. This is something that students cannot get in their schools. It is often seen that many students may not get a chance to clarify their doubts in class. Some students may be too shy to ask their teachers. Therefore in home tuition the hundred percent focused one-to-one attentions during tuition will help the student to understand topics that he or she is weak in.

On the other hand for parents who do not like home tuition, or if the home tutors are not available near the home then the alternative is tuition centers. There are many tuition centers located all over Pakistan. The advantages include to the tuition centers are the lower tuition fees and the provided study material. The main disadvantage of the tuition centers is the absence of one-to-one attention. In tuition centers even in a small tuition class, there are minimum 5 students to 1 teacher, thus the teacher’s time is shared among all the students. Some time tuition centers are located at a high distance due to which the student spent more time in traveling. Moreover, at tuition centers the classes have fixed timings, and are not as flexible as home tuition.

Now a day in Pakistan any kind of tuition is considered a very important positive force in the academic achievements of children. At secondary school level students need maximum guidance to compete with their class fellows, to decrease their deficiencies, to increase their performance and to solve the each and every academic problem of school. For this purpose those students get tuition
facilities whose parents are not involved with their academic activities. At secondary school level the courses are tough, lengthy, difficult and some time vague; these courses need continuous attention, so in this way parental regular involvement or the tuition is the best way to solve the problem. In Pakistan the most parents provide tuition facilities to their children due to some reasons i.e. the parents are illiterate, they are too much busy in their jobs, they came late in their homes or they are too much busy in increasing their economic condition and to facilitate their children etc. So they want to increase the academic ability of their children for this purpose they arrange tuition for their children. If at home parents are not involved in the school academic activities of their children and can not provide any tuition facility to their children then their children feel difficulties in solving the school assignments as a result they take less interest in the academic activities and show poor performance.

In Pakistan there are different people who provide tuition facilities, some professional tutors provide tuition facilities they are already working in the schools or colleges, they are experienced and trained. Some students after completion of master degrees and due to non availability of jobs they become tutors and provide tuition facilities, for the purpose of earning. Some students get tuition from their elder brother, sister, uncle, neighbor or any non professional educated person freely. In all these ways of tuition the purpose is only and only to increase the academic achievement of their children. Time spent on tuition has an important effect on academic learning and academic achievement. Tuition facility engages the students for some time after the school time, in this engagement student learn something which is much better. In almost every place of the country there are so many tuition centers provide tuition facilities. They provide each and every type of coaching facilities for the academic enhancement of the students. Tuition centre have more students and more expensive as compared to home tuition. From the surface, yes, tuition centre appear to have more students. That's because tuition centre usually conduct classes in large groups while home tutors tend to teach students individually, and the lessons are often at home.

STATEMENT OF THE PROBLEM
The problem under study was to compare the performance of home tuition and tuition centers regarding academic achievements of students at secondary school level.

OBJECTIVES OF STUDY
Following was the objective of the study: -
ii. To compare the home tuition and tuition centers regarding academic achievements of students at secondary school level.

SIGNIFICANCE OF THE STUDY
The results of the study would be useful for the following reasons:-
1. This study provides information about the home tuition and tuition centers regarding academic achievements of children at secondary school level.
2. This study is significant for those parents who are not involved in the academic activities of their children.

HYPOTHESES
H0: (Null Hypothesis) There is no significant difference of home tuition and tuition centers regarding academic achievements of students at secondary school level.
H1: (Alternative Hypothesis) There is significant difference of home tuition and tuition centers regarding academic achievements of students at secondary school level.

EXPLANATION OF TERMS AND ABBREVIATIONS
Terms and abbreviations used in the study are as under:-

- a. $\alpha$ Level of significance.

- c. DIKhan Dera Ismail Khan

REVIEW OF RELATED LITERATURE
Jacqueline L (2010) being a subject specialist in the teaching learning process, I often asked a question by parents, “Is getting tuition on home or going to a tuition centre better?” I always receive the quick and different reply that tuition centers are better. Then I ask why? Because they have more students and the teachers will be qualified. Now I explain that why this answer is worrying. After the declaration of research reports that the home tuition is better, having cleared the air, what are the other alternatives? The most obvious competitor to tuition centers would be home tuition. Home tuition is better because is cheaper than the tuition centers and also the children get individual attention which is lacking in the tuition centers. In addition, it is more suitable, flexible and according to the parent’s behavior that tutors travel to your house and can adapt to your schedule. At home tuition tutors can remain under your analysis at all times if you want to ensure that they are working properly. Despite the benefits of home tuition, some parents are concerned over the fact that the tutors are students themselves. Yes, most tutors are students themselves who are offering tutoring services to earn some allowance but they are highly qualified. Although expensive tuition is not always the best, select reliable tutors at reasonable rates, or be prepared to pay a heavy price instead.

ROLE OF TUITION IN THE PERFORMANCE OF STUDENTS
Koch H L (1995) many parents consider that the best inheritance they can give to their children would be education. For this purpose parents encourage their children to do well in school, due to this best support, there children find difficult academic subjects a challenge, but these subjects are in the approach of their parents so the children feel difficulties and they need home tuition. Private home tuition can play an important role in the form of removal of difficulties of difficult science subjects. In difficult science subjects getting your child to practically take part in academics is a tough job.

Laosa G (1989) in schools student study so many subjects, some subjects are easy and some are difficult i.e. science subjects. So when teachers assign work in science subjects they feel difficulties and need regular guidance. Thus, regular forms of parent’s participation can do very well in solving the problems of their children, and if parents are illiterate then they need individual attention just like parents then home tuition is the best alternative to solve all the problems of the children as compared to the tuition centers.

Becker B S (2001) what is the most significant advantage of private home tuition? In home tuition individual attention is provided to the student which is very much lacking in the schools. In secondary school level students are curious about different type of things, so for this curiosity they want to ask some questions from their teachers but in school situation they cannot ask any question but with the help of private tuition they can remove their confusion, difficulties and can do best in the classroom.
SIGNIFICANCES OF HOME TUITION

Goh C (2010) it is the individual differences that each and every child is different and performs differently at home and in schools. Some children are very intelligent and some need extra attention. In order to meet this competency private home tuition has become necessary for the student; as a brilliant student has to compete with other while weak students have to struggle for getting good marks. There are various significances of private home tuition for both students and parents. Some significances of home tuition are given below:

1. In home tuition the students are in the special attention from their tutors which may be the lacking point in their traditional classrooms and in the tuition centers.

2. Since home tuition helps the students to build confidence and hence improve their learning process. Home tuition is very important for student to discover the most effective way for learning.

3. Sometimes the students are afraid of difficult type of subjects i.e. science subjects, but with the help of private home tuition, they are able to sole these difficulties. If tutor is regular, qualified and hard worker then they are able to improve their performance.

4. In private home tuition, the students are able to share the opinions, ideas and difficulties with their tutors and they feel no hesitation to tell them about their difficulties which may not be possible in the regular classroom sessions or in the tuition centers. Private home tuition open every communication channel for teachers and students in which they participate and remove difficulties.

5. In private home tuition, parents are able to get in touch with the teachers to see the progress of their children. The parents are well informed about each and every activity of their child.

Kay N C (2010) the popularity of private home tuition is increasing day by day as compared to tuition centers. Many parents still believe that private home tuition really not only benefits younger children but also beneficial for high school. Moreover, home tuition for high school students at this level develops sound independent study skills; focus on continuous learning on their own and improve confidence in the students. From home tuition students can get all the guidance and support you need by contacting a reputable and experienced.

Why Private Tuition? Will a tutor help?

Hughes K (2010) on the bases of findings as a parent you may choose a home tutor for private tuition to help your child who has not achieved the lecture of teacher. Private home tuition is too much near to your needs, because in home tuition individual attention is provided to the children’s. Private Home tuition can increase levels of school performance, increase the confidence of a child, enjoyment, motivation and readiness in a subject and develop study skills that can be applied on various subjects. Private home tuition is not just for children; adult can also improve their performance in this way.
Charles Cheow (2010) Since in a school there are so many subjects are offered to the students some subjects are easy and according to the mental level of the students but some subjects are difficult and confusing these subject demand consistent guidance and supervision, with the help of tuition centers these difficulties can be removed. If parent choose better tuition center then they can enhancing their knowledge will benefit them greatly when it comes time to take entrance exams. When a child brings home poor grades one of the first things that bring to mind is the thought of a tuition centre. If the child and their teacher are not able to work well together then this problem can be solved with the help of classroom teaching and if there is still an issue with the level of learning, decide for the suitable and well performed tuition centers. Since there are so many students in tuition centers so they can attached with each other so in this way they can solve their problems and remove their confusions. Since parents cannot solve all the problems of their children so children often respond well to outside influences. Tutors on the tuition centers are able to best teach a child the study skills and critical thinking skills necessary to further their education. Encouraging students individually is impossible in classes, but this difficulty can be solved in the tuition centers. A tuition center that focuses on a small student to teacher ratio will see their pupil success rates skyrocket.

METHODOLOGY OF THE STUDY

Population
Population of study consisted of all the 10th class male students of higher secondary schools in District Dera Ismail Khan, Pakistan.

Sample
Sample # 1: For this research study five rural male elementary schools were selected randomly, from these schools eight students from each school were selected in which four get home tuition and four go to tuition centers. Total 40 students are selected in which 20 get home tuition and 20 go to the tuition centers.

Sample # 2: For this research study five urban male elementary schools were selected randomly, from these schools eight students from each school were selected in which four get home tuition and four go to tuition centers. Total 40 students are selected in which 20 get home tuition and 20 go to the tuition centers.

Instrument
Instrument used in this research study was a questionnaire, developed and validated to get the data about the students who get home tuition and those students who go to the tuition centers and the data about the academic achievements of all these students. Researcher personally served the questionnaire to the students, the students were asked to give the exact response / figure to the items.

Procedure
In order to compare the home tuition and tuition centers regarding academic achievements of students a questionnaire was used. The questionnaire was developed, validated and improved in the light of feedback. Difficulties and ambiguities pointed out and removed in consultation with the experts in the relevant field. Researcher himself visited the schools distribute questionnaire and collects the data.
STATISTICAL ANALYSIS

ANALYSIS OF DATA
The data collected through Questionnaire and the scores of sample were calculated, summed and mean scores were calculated, “t” test and co-efficient of variation was used as statistical technique.

Chaudhary et al (1996), “The co-efficient of variation is also used to compare the performance of two candidates” (p.106).

Alam (2000), “Consistency or stability is used as terms opposite to variation (or dispersion). A data is considered more stable if it has less variation and likewise it is less stable if variation is more”. (p.151)

Chaudhary et al (1996), the applied formulae of test were as under:

\[ t = \frac{(\bar{x}_1 - \bar{x}_2) - (\mu_1 - \mu_2)}{\sigma_1 \sqrt{\frac{1}{n_1} + \frac{1}{n_2}}} \quad \text{With} \quad v = n_1 + n_2 - 2 \quad \text{d.f} \]

Where \( \bar{x}_1 = \frac{\sum f_1 x_1}{\sum f_1} \) and \( \bar{x}_2 = \frac{\sum f_2 x_2}{\sum f_2} \)

Pooled Estimation = \( S_p^2 = \frac{(n_1 - 1)S_1^2 + (n_2 - 1)S_2^2}{n_1 + n_2 - 2} \)

Where \( S_1^2 = \frac{1}{n_1 - 1} \sum (X_{1i} - \bar{X}_1)^2 \) and \( S_2^2 = \frac{1}{n_2 - 1} \sum (X_{2i} - \bar{X}_2)^2 \)

Co-efficient of Variation = \( C.V = \frac{S}{\bar{X}} \times 100 \)

Where \( S = \text{standard deviation} \) and \( \bar{X} = \text{Mean} \)

ANALYSIS AND INTERPRETATION OF DATA
The study aimed at comparing the home tuition and tuition centers regarding academic achievement of students at secondary school level.

Comparison of home tuition and tuition centers regarding academic achievement of students of rural areas.

</tbody>
</table>

The above table indicates that the mean of academic achievement of home tuition and tuition centers students were 29.17 and 22.02 respectively, SD in the scores of two samples was 2.37 and 3.51 respectively. The obtained t-Calculated value 7.37 is greater than then the t- tabulated 2.021 so we reject \( H_0 \) and accepts \( H_1 \) and concludes that there is significant difference of home tuition and tuition centers on the academic achievements of students at secondary school level. The difference was in the favor of those students who get home tuition facility. The Co-efficient of Variation (C.V) of home tuition students and tuition centers students is 8.12 and 15.94 respectively. Since C.V of those students who got home tuition is less than the tuition centers students so there is consistency in the academic achievement of home tuition students on the aspect of academic achievement.
Comparison of home tuition and tuition centers regarding academic achievement of students of urban areas.

</table>

The above table indicates that the mean of academic achievement of home tuition and tuition centers students were 26.15 and 19.65 respectively, SD in the scores of two samples was 4.03 and 4.31 respectively. The obtained t-Calculated value 4.804 is greater than then the t-tabulated 2.021 so we reject H0 and accepts H1 and concludes that there is significant difference of home tuition and tuition centers on the academic achievements of students at secondary school level. The difference was in the favor of those students who get home tuition facility. The Co-efficient of Variation (C.V) of home tuition students and tuition centers students is 15.41 and 21.93 respectively. Since C.V of those students who got home tuition is less than the tuition centers students so there is consistency in the academic achievement of home tuition students on the aspect of academic achievement.

SUMMARY
The problem under study was to compare the home tuition and tuition centers regarding academic achievements of students at secondary school level. A questionnaire was developed, validated and administered personally to the students. Data was analyzed with the help of t-distribution as a statistical analysis technique. It has been found that private home tuition plays a very crucial role in the academic achievements of the students at secondary school level as compared to the tuition centers, because at home tuition tutors pay full attention which is very much missing in the schools and in the tuition centers.

FINDINGS
For rural school
The calculated value of t-distribution is 7.37 while table value is 2.021.

For urban school
The calculated value of t-distribution is 4.804 while table value is 2.021.

CONCLUSION
There is a significant difference of home tuition on the academic achievements of 10th class students for rural and urban schools as compared to the tuition centers. The academic achievement of those students who get home tuition is better than those who went to the tuition centers.

RECOMMENDATIONS
There are following recommendations on the bases of the findings and conclusions:-
3. This study may indicate that home tuition is the best alternatives of the parental involvement.
4. This study may indicate that parents can play an important role in strengthening their children education if they provide home tuition service from the experienced and academically sound teachers.
5. The same type of research can also be applied for the female schools.

Surveying of innovation levels and Characteristics
Case study: East Azerbaijan Province SMEs

Abstract
Innovation is the embodiment, combination, or synthesis of knowledge in original, relevant, valued new products, processes, or services. The importance of innovation in organizations competitiveness is an undeniable fact. Innovations reflect a critical way in which organizations respond to either technological or market challenges. Small and Medium sized enterprises (SMEs) constitute 95 % of Iranian firms. According to Iran statistic website the value added of 95 % of Iranian firms is just about 10 % of the whole value added in country. This study assumes the lag of innovation is the reason of uncompetitive nature of East Azerbaijan Province SMEs. This paper reports on the results of a study that examined barriers to firms’ innovation among a sample of 86 managers of small and medium-sized enterprises (SMEs) in East Azerbaijan Province. Findings of the study show that the most significant barriers are associated with costs, whereas the least significant are associated with lag of information. The survey results show that East Azerbaijan Province SMFs are not collaborating with universities and higher education institutions; they do not see university as a main source of information. Then it is not a surprising point that 31% unemployment rate is reported in 2010 however 60 % of studied SMEs reported lack of skilled labour as a barrier to innovation.

Keywords: Organizations, Innovation, SMEs

Introduction
Rogers defined innovation as “an idea, practice, or object that is perceived as new by an individual or unit of adoption”. Innovations reflect a critical way in which organizations respond to either technological or market challenges (Brenner 1987, Comes-Casseres 1994, 1996, Smith et al, 1992, Hage, 1988). The survival and growth of business enterprises increasingly depends on their ability to respond to globalization and rapidly changing in market demands, technologies and consumer expectations. Emerging opportunities and threats forced companies to investigate and invest more on innovation to decrease risk of becoming uncompetitive. As Debdulal Dutt’a Roy(2008) noted” innovations may be directed to change the organizational structure (the degree of complexity, formalization, and centralization), technology (introduction of new equipment, tools or methods, automation, or computerization) and human resources (changing the attitudes and behavior of organizational members through processes of communication, decision making, and problem solving)”.

COPY RIGHT © 2011 Institute of Interdisciplinary Business Research
With increasing global competition and quickly spreading knowledge, the future of many businesses depends upon their ability to innovate. The ability of a company to not only keep up with its current business practices, but to exceed its own – and its competition's – expectations are critical to survival (http://www.realinnovation.com).

Due to the great contribution of the innovative activities to the firms’ competitiveness and success, it is of great interest to identify the barriers and obstacles that limit the development of innovative activities in firms. A number of studies show that firm differences in barriers to innovation were related to cost, institutional constraints, human resources, organizational culture, flow of information and government policy (Mohen and Roller 2005; Baldwin and Lin 2002). There are many good reasons for paying attention to small and medium sized enterprises (SMEs). They constitute the 94 percent of Iranian firms (amar.org), they are a main source of employment, and they are flexible. Iran defines SMEs as independent businesses that employ less than 250 people (Iranian Commission, 2003).

This paper reports the results of a study that examined barriers to innovation among a sample of 86 SMEs in the East Azerbaijan Province. East Azerbaijan Province economy has not been growing in terms of GDP in compare with other provinces in Iran during the period 2006-2008. Innovation contributes to sustained long-run economic growth through industry-wide spillover (Grossman and Helpman 1990; Romer 1986). The value added of 94 % of Iranian firms is just about 10 % of the whole value added in country (amar.org). John Cantwell (2003) defined Competitiveness as the possession of the capabilities needed for sustained economic growth in an internationally competitive environment. The importance of innovation in organizations’ competitiveness is an undeniable fact. This study assumes the lag of innovation is the reason of uncompetitive nature of Iranian SMEs. Finding the current innovation situation and primary obstacles to innovation in East Azerbaijan Province of Iran are the main goals of this study. In particular, by using empirical data, the paper sheds light on the issue: the characteristics and behaviors that distinguish innovator firms and non-innovator firms. The remaining sections of the paper are organized as follows: the second section presents previous research on innovation and barriers to innovation, the third section describes the methodology used in the analysis, which is discussed in the fourth section. The fifth section concludes the paper.

**Innovation and its importance for Enterprises**

"Innovation . . . is generally understood as the successful introduction of a new thing or method . . . Innovation is the embodiment, combination, or synthesis of knowledge in original, relevant, valued new products, processes, or services". (Luecke and Katz, 2003). Rogers defined innovation as “an idea, practice, or object that is perceived as new by an individual or unit of adoption”. (Swanson, 1994). To attain the business environmental policy goals, enterprises will either have to bring about modifies in the way people do something, or changes in technology. Innovation is one of the main processes by which those changes come about.

Innovation is not fully about the development of new product (services). Enterprises can also take advantages administrative innovation (improving internal control, coordination, and structure), and technical innovations (changes to technology or work processes). Davila et al (2006) organized reasons why enterprises undertake innovation in the following way:

1-Improved quality
2-Creation of new markets
Community innovation survey (2007) defined nine factors as motivation factors to innovation, increased range of goods or services, Entered new markets or increased market share, Improved quality of goods or services, Improved flexibility of production or service provision, Increased capacity for production or service provision, Reduced costs per unit produced or provided, reduced environmental impacts or improved health and safety, Met regulatory requirements, Increased value added. Organizations which generate and implement more good ideas about better, more efficient ways of working have a distinct advantage in a competitive environment. To achieve success over a long period of time, all organizations need to hold innovation (Andy Couchman et al, 2004). With The globalization phenomena, market expansion, and increased customers’ expectations and competition among firms, innovation has become more market-driven, more rapid and intense, more closely linked to scientific progress, more widely spread throughout the economy (OECD, 2000). Organizations may also facilitate innovation through project teams or R&D departments (Morton 1971, Zaltman, Duncan, and Holbek 1973). Services sector R&D, for example, rose from less than 5% of total business enterprise R&D for the OECD area as a whole in 1980 to more than 15% in 1995. In countries that measure services R&D well, such as Canada, it now amounts to about 30% of total business enterprise R&D (OECD, 2000). Steve Jobs defined Innovation has nothing to do with how many R&D dollars you have... It's not about money. It's about the people you have, how you're led, and how much you get it. He argued that there are no definitive metrics for innovation. Measures of innovative success vary by company and industry. He defined R&D and patent creation as the most common metrics of innovation:

- **R&D** – This metric assumes that the amount of money spent on research and development directly correlates to the amount of innovative products, processes and services that get to the public.
- **Patent creation** – Some companies create patent after patent and boast of their innovative capabilities. While this may be well and true for a few, if the numbers of patented products, processes, and services are now making it to the marketplace, then their relevance diminishes.

The propensity of countries to seek sources of innovation and knowledge wherever they are present has increased considerably in terms of patenting in the 1990s. The internationalization of patenting has not been equally rapid in all countries: the available evidence shows that US patents have a larger, and more rapidly growing, proportion of foreign co-inventors than those of Europe or Japan. An interesting point about innovation was found in Paul Windrum (2006) “Innovation begets further innovation”. He argued that Through organizational innovation, managers gain a more specific view of the different activities of the firm, and see the potential creative opportunities that arise through breaking
down ‘departmental silos’ and creating novel synergistic activities. Rogers argue that any innovations have characteristics which explain the rate of their adoption:

- **Relative advantage**: “the degree to which an innovation is perceived as better than the idea it supersedes”;
- **Compatibility**: “the degree to which an innovation is perceived as being consistent with existing values, past experiences, needs of potential adopters”
- **Complexity**: “the degree to which an innovation is perceived as difficult to understand and use”
- **Trial ability**: “the degree to which an innovation may be experimented with on a limited basis”
- **Observability**: “the degree to which the results of an innovation are visible to others.”

Innovations are considered as a major engine to enhance their performance and to strengthen their competitive position in the market by companies (Vareska van de Vrande, 2008).

**Barriers to innovation**

As many studies show, innovation has positive effects on the firm; it is interesting to find out why not all firms engaged in innovation activities. Laura Palmer-Noone discussed that Most of these leaders believed that their greatest challenges to innovation were to be found inside their institution. In her findings traditional institutional culture, or institutional inertia cited as a significant barrier to innovation. A number of studies show that firm differences in barriers to innovation were related to cost, institutional constraints, human resources, organizational culture, flow of information, and government policy (Mohen and Roller 2005; Baldwin and Lin 2002).

Support of employees for changes in their firms depends on the kind of innovation implemented. While changes in the organization of work that are introduced independently of investments in new machinery are encountered by resistance, investments in new machines, production sites, etc. are supported by employees (Thomas Zwick). It is not always a barrier against innovation but it may retard or change the innovation plans (Schaefer, 1998). Antonia Madrid-Guijarro ET. Al (2009) emphasized on a resource-based view of organizations. They introduced financial resources, human resources and external resources as barriers to innovation.

Cost has been mentioned as one of the most important barriers to innovation. High innovation costs have a negative and significant effect on the innovation propensity (Lim et al, 2007 and Silva et. al, 2007). Arguments can arise between the need to invest in innovation and the risk aversion common among managers/owners (Hausman 2005; Frenkel 2003), with small firms being especially subject to such conflicts because of their limited financial resources. A study in Canada reveals that set up costs, rather than the running costs, are of greater concern for those that intend to engage in innovation activities (CSLS, 2005). Understanding of economic risks associated with innovation activities would have a low degree of association with firms' experience in innovation activities (Lim et al, 2007). The most financial theories such as transaction cost theory and agency theory linked risk and financial exposure, in the way that with higher risk being associated with higher financial exposure and lower risk with lower financial exposure (Brigham and Ehrhardtii, 2005). Transaction cost theory analyzes the fact that the intangibility and specificity combined with investment in technology, by increasing transaction costs, may decrease the firms’ propensity
to financing innovation with debt. Agency theory argues that the high risk of innovative activities and the existence of information asymmetries can increase problems with debt financing. An increase in debt may lead to an increase in conflicts between lenders and the firm. Several previous studies point to the negative influence of debt on innovation activity (Giudici and Paleari 2000). But Dr Xavier L. Comtesse et al (2002) argued that financial issues were not considered to be major barriers to innovation in Switzerland. C.C. Colton viewed the company culture and leadership as two prominent barriers to innovation. He argued that if the company's culture isn't set up to accept new ideas and creative contributions from its staff then inventions will be unable to break through to the marketplace. Employee commitment and effort is required in adoption of innovation (Acemoglu and Pishke, 1999). Resistance to change which results from poor employee skills and inadequate training is viewed as an important organizational challenge by many researchers. It also argued that small business managers often lack the types of education and training that have been linked with a successful innovation strategy (Hausman, 2005). Shanteau and Rohrbaugh (2000) argued that Weak management support is another innovation choke point because innovation can disrupt established routines and schedules. Barriers to innovation also included organizational inertia and structured routines that may limit the ability of incumbent firms to identify new opportunities and adapt to environmental changes (Nelson and Winter (1982); Hannan and Freeman (1984)). Obstacles that were external to the firm are clearly more important than internal ones, perhaps because most internal issues can be resolved by a firm that is committed to its innovation activity (Lim et al, 2007). Global competition, government policy, and economic uncertainty require that firms effectively communicate to managers the importance of innovation as a core firm strategy that will help maintain market competitiveness (Antonia Madrid-Guijarro et al, 2009). Because of high competitive pressures, firms are forced to adopt new technologies so as to gain a competitive advantage (Porter, 1985). Many researchers suggested that firms in more turbulent external environments have higher potential for innovation, because turbulent environments trigger firms to incorporate innovation into their business strategy in order to remain competitive and, ultimately, survive (Antonia Madrid-Guijarro et al, 2009). Lack of information about market opportunities, changes in technology, and government policy _which impact managers' adoption of innovation as a strategy to better meet customer needs and to help make the firm more competitive_ is viewed as other barriers to innovation. Lack of market information related to the potential requirement and preferences of the end-user may lead to a firm producing products that are not meeting the users’ needs, and hence may lead to lack of customer responsiveness towards firms’ innovative products. In other words, recognition of the requirement of potential customers is important to ensure the success of firms’ innovation process (Lim et al, 2007). Lack of government assistance was defined as the third most important barrier to innovation in European countries by Piatier (1984) research.

Maria José Silva (2007) defined nine barriers to innovation as the base of his research.

- The high economic risk
- The high cost of innovation
- The lack of financing
- The organizational rigidities
- The lack of skilled personnel
- The lack of information about technology

Maria José Silva (2007) defined nine barriers to innovation as the base of his research.
The lack of information on market
The lack of customers' responsiveness
The government regulations

The high cost of innovation
The lack of financing
The lack of skilled personnel
The high economic risk
The organisational rigidities
The Government regulations
The lack of customers' responsiveness
The lack of information on technology
The lack of information on market

Figure 1: Barriers to innovation in Portuguese firms (Silva, Maria, Leitão, João and Raposo, Mário 2007)

In what concerns the significance of each restraining factor of innovation, four significant variables are detected. The high economic risk and high cost of innovation are defined as economic factors that prevent innovation in Portuguese firms. The first important point is that the firm can't innovate and grow unless you're willing to take risks. However, in the current regulatory and tort environment, companies are more focused on risk reduction than ever before. The lack of financing sources has a negative and significant effect on the innovation propensity. For its turn, the lack of qualified personnel restrains the propensity of the firm for innovating and also for developing the innovation process. The lack of customers’ responsiveness to new products has also a negative and significant impact on the propensity for innovating. The study of Lim et al (2007) investigates empirically the obstacles to innovation faced by manufacturing firms in Malaysia based on data from the Third National Survey of Innovation (NSI-3). NSI_3 defined nine obstacles to innovation same as the Portuguese research (cost of innovation, economic risks, lack of sources of finance, lack of information on markets, lack of information on technology, lack of skilled personnel, lack of customers’ response, legislation and regulation and organizational rigidities).
The results provide insights that high innovation costs have a negative and significant effect on the innovation propensity. The same is detected for the barrier associated with excessive perceived economic risks. For its turn, the lack of information on the market restrains the propensity of the firm for innovating and also for developing the innovation process. The lack of appropriate sources of finance has also a negative and significant impact on the propensity for innovating.

### Research Methodology

The data for this study was gathered from questionnaires surveyed to a sample of 86 SMEs of the East Azerbaijan Province. The questionnaires were distributed among the managers because previous studies reported that managers' attitude significantly impacted innovation climate (Storey 2000; Lefebvre, Mason, and Lefebvre 1997; West and Anderson 1996). The questionnaire which is used is the same as the UK innovation survey questionnaire 2007. Some changes is made in questions such as Geographical locations. In order to increase confidence in the validity of the measures, the questionnaire was distributed to five managers for the purpose of pilot testing and led to modifications in some part of questions. Reliability of the inequity scale was \( \alpha = 0.9 \). Construct reliability hence appear adequate.

### Description of Sampling

From the 86 distributed questionnaires, 50 were completed and returned for the response rate 58.13 %.

Level of innovation activities among SMEs

According to the result of questions four and eight, from 50 respondents, 64% were innovators and the 36% rest were non-innovators. Innovation takes place through a wide variety of business practices, and a range of indicators can be used to measure its level within the enterprise or in the economy as a whole. These include the levels of effort employed (measured through resources allocated to innovation) and of achievement (the introduction of new or improved products and processes). This section reports on the types and levels of innovation activity over the three-year period 2006 to 2008. Innovation activity is defined here as where enterprises were engaged in any of the following:
- Introduction of a new or significantly improved product (goods or service) or process
- Engagement in innovation projects not yet complete or abandoned
- Expenditure in areas such as internal research and development, training, acquisition of external knowledge, or machinery and equipment linked to innovation activities.

| Table 3: Innovation-active enterprises: by type of activity, 2006 to 2008 |
|-------------------------------------------------|------|
| Innovation -activities                         | 64   |
| Product(good/service) innovator                | 50   |
| Process innovator                              | 64   |
| Abandoned activities                            | 17.6 |

Around 17.6% of SMEs report abandoned projects. The proportion of enterprises having participated in some innovation-related activity (64 per cent) shows that SMEs recognize the need to assign resources to innovation. The most commonly reported activities were in marketing research, followed by a considerable investment in all form of design.

Figure 2: Breakdown of innovation activities
Area of activities
The businesses surveyed were asked which markets they operated in. Figure 3 show that 80 \% of East Azerbaijan Province enterprises operate at a regional level, about 44 \% at Iran level and 0 \% worldwide. Just under a quarter (20 per cent) of businesses reported any exports for the years 2006–2008.

Barrier to innovation
Successful and evidence-based policy interventions require an understanding of the barriers to business innovation. These barriers can be internal obstacles that the enterprise encounters while carrying out innovation activities as well as external factors preventing innovation. The survey asked about a range of constraining factors and their effect on the ability to innovate. Table 4.3 shows the mean and standard deviation of each category of constraints.

</tr>
</tbody>
</table>

The results provide insights that high excessive perceived economic risk have a negative and significant effect on the innovation propensity. The same is detected for the barrier associated with the lack of financing sources. For its turn, uncertain demand restrains the propensity of the SMEs for innovating and also for developing the innovation process. The high innovation cost has also a negative and significant impact on the propensity for innovating. Few enterprises felt constrained by a lack of information on market, while a lack of qualified personnel was viewed as one of the most important constraining factor by half of the SMEs.
Why enterprises did not innovate
The survey also attempts to gain an appreciation of the possible reasons why businesses were not involved in innovation activity during the period 2006 to 2008.

As the figure 5 shows by 55.8 % of factors constraining innovation is cited as the main reason why enterprises did not innovate. No need due to market conditions is reported as important factor by 29.4 of SMEs.

Driving forces of innovation
On this occasion, the survey sought information about motivation factors for innovation. Respondents were asked to rank a number of drivers for innovating on a scale from no impact, through low, medium or high.
According to Table 4, from the respondents view there is a significant mean difference among driving factors of innovation. Improved quality of goods or services is reported as the main motivational factor of innovation. Entered new markets or increased market share, Met regulatory requirements and Increased value added were wildly reported.

Methods to protect the value of innovation
The survey collected data on business perceptions of the relative importance of different means of protecting intellectual property, reported in table 5. These included formal intellectual property rights as well as strategic mechanisms such as being first to market. The data show that Trademarks are the most important factors and it is followed by Patents and Registration of design.

Information Sources of innovation
Respondents were asked to rank a number of potential information sources on a scale from ‘no relationship’ to ‘high importance’. The mean and standard deviation of each category (information source) is shown in Table 4.7
These sources are:
- Internal – from within the enterprise itself or other enterprises within the enterprise group
- Market – from suppliers, customers, clients, consultants, competitors, commercial laboratories or research and development enterprises
- Institutional – from the public sector such as government research organizations and universities or private research institutes, and
- Other – from conferences, trade fairs and exhibitions; scientific journals, trade/technical publications; professional and industry associations; technical industry or service standards.

</table>

The results show that client or customers were cited as the most important source of information by East Azerbaijan Province SMEs and it is followed by suppliers of equipments. Universities and other higher education institutes were seen as the least important source of information.

Co-operation agreements (Attitudes of SMEs respect to types of partners)
As it is displayed in the table below (Table 7), the smaller and greater means are for Universities or other higher education institutions and Suppliers of equipment, materials, services, or software respectively. From the information provided by table 7, this can be suggested that SMEs have fewer propensities about co-operation with universities or other higher education institutions while the most frequent partners for co-operation were suppliers of equipment.

Wider forms of innovation

Innovation is not wholly about the development or use of technology or other forms of product (goods and services) and process change. Enterprises can also change their behavior or business strategies to make themselves more competitive, often in conjunction with product or process innovation, but also as independent means of improving competitiveness. Enterprises were asked whether they had made major changes to their business structure and practices in the three-year period 2004 to 2006. The findings are summarized in Table 8.

</table>

The results were initially summarized using statistics (means and frequencies percentages) to provide a better understanding of the respondents and characteristics of the responding companies.

From the 86 distributed questionnaires, 50 were completed and returned for the response rate 58.13%.

80% of East Azerbaijan Province SMEs operate at a regional level, about 44% at Iran level and 0% worldwide. Just under a quarter (20 per cent) of businesses reported any exports for the years 2006-2008 (see figure 3).

Innovation takes place through a wide variety of business practices, and a range of indicators can be used to measure its level within the enterprise or in the economy as a whole. These include Internal R & D, External R & D, Acquisition of machinery equipment and software and hardware, Acquisition of external knowledge, Training, All forms of design, Changes to product or service design, Market research, Changes to marketing methods, launch advertising.

According to Table 3, overall, 64% of enterprises were classed as being innovation-active during 2006-2008. The proportion of enterprises having participated in some innovation-related activity (64%) shows that firms recognize the need to assign resources to innovation. The most commonly reported activities were in market research, followed by a considerable investment all forms of design. The internationalization of R&D seems to be a useful instrument to mitigate the effects of barriers to innovation often faced by SMEs (Tiwari and Buse 2007). During 2006-2009, about 45% of enterprises participated in Internal and External R & D. Summing up; these early results seem to suggest that a larger share of enterprises is participating in just one mode of innovation behavior but the innovation which was occurred in East Azerbaijan Province SMEs was new to the SME not to the national market.

In accordance with the total of the sample SMEs and the analysis of the Figure 4, we observe that the main barriers to innovation are economic factors namely, excessive economic risk, lack of financing, cost of financing and high cost to innovation. In what concerns the internal
factors the lack of skilled personnel should be stressed. The factors associated with the lack of information on markets and governmental regulations are less restraining to innovation. Among all obstacles, ‘Excessive perceived economic risks’ seems to be the foremost important obstacle faced by all SMEs. The Excessive perceived economic risk was cited being of ‘high’ importance by 75 per cent of the SMEs. On the other hand, only about 4.2 per cent of SMEs perceived this obstacle as ‘not relevant’ to their innovation activities.

‘Lack of appropriate sources of finance’ was cited as being of high importance by about 66.7 per cent of the SMEs and not relevant by about 4.2 per cent of them. These findings are consistent with the findings of Baldwin and Lin (2001) who in their study of impediments to advance technology adoption found cost-related problems being the most frequently reported by the Canadian manufacturing firms.

As recently as 2003 a report from the prestigious Gartner Research and Consulting Group suggested that 25 per cent of IT projects were not producing a realistic return on investment. In the same year, the UK Ministry of Defence was criticized for wasting £120m on a failed inventory project. For this reason Iranian SMEs are not interested in investment in costly projects (such as IT/IS) as the survey shows it. Worsening financial position of the firm suggests that when companies increase debt and reduce liquidity, then innovation activities decrease. This result is consistent with those of Freel (2000) and Chiao (2002). Additionally, because of higher risk exposure, firms may opt against using debt to finance innovation. Lenders who are risk averse may also be averse to funding risky innovation initiatives. As a result, SMEs might pursue relatively safe and non-innovative projects through use of internal capital (Galende and De la Fuente, 2003).

The lack of financial resources hinders many SMEs from initiating or – even worse – completing their innovative ideas. As reported in Table 3, 17.6 % of SMEs had abounded innovation activities. SMEs have problems to acquire loans because financial institutions are often reluctant to (co-)finance risky innovation projects. Another financial constraint refers to the problem of getting access to public funding for innovative ideas and bureaucratic application procedures associated with them. Further, it was pointed out that innovation projects must be delayed owing to regulatory reasons until the application has been approved. However due to limited resources SMEs, in contrast to larger ones, rarely have the chance to establish the relationships needed.

‘Innovation costs too high’ was cited as being of ‘high’ importance by about 58.3 per cent of the SMEs and ‘not relevant’ by about 4.2 per cent of them.

Shifting from an inward to a more outward orientation was raised because the costs and risks of innovation have increased and firms have become more specialized. The role played by research in firms’ commercial strategies has also changed. As the range of technologies necessitated for innovation has spread out and technologies have become more complex, companies can no longer cover all relevant disciplines. Many key developments draw on a wide range of scientific and commercial knowledge, so that the need for co-operation among participants in different fields of expertise has become greater in order to reduce uncertainty, share costs and knowledge and bring innovative products and services to the market (OECD, 2000). According to table 7, The results of the survey on East Azerbaijan Province province of Iran shows that in Iranian SMEs the most frequent partners for co-operation were suppliers (76 per cent of enterprises with co-operation were suppliers) and other business in their enterprise (72 per cent). Around 44 per cent of collaborators included universities amongst their partners.
SMEs that perceive “lack of customer’s responsiveness to new products” show fewer propensities to innovate. This result is in accordance with the interactive model of innovation, with the market-pull approach and the Porter model. These approaches demonstrate that the satisfaction of the market requires the incorporation of innovations. Therefore, if the SMEs believe the market is not accepting the new products, it has no incentive to innovate, and then this consciousness ends up creating a barrier to innovation.

The business Dominated by established enterprise was cited as being of high importance by about 58% of the SMEs.

In many cases, ICT significantly reduced the costs of outsourcing and co-operation with entities outside the firm. It has helped go down the natural monopoly character of services such as telecommunications; it is a key technology for speeding up the innovation process and reducing cycle times. It has played an important role in making science more efficient and linking it more closely to business. When 58% of the SMEs see the monopoly as a barrier to innovation, it shows that in the area of study, SMEs do not use ICT as much as they should.

The lack of qualified personnel was viewed as one of the most important constraining factor by about half of the SMEs. The study of Hoffman et al. (1998) supports these results, when defending the thesis that lack of qualified staff can be a serious constraint to the development of the innovation process.

The study of Tiwari and Buse October (2007) indicated two reasons for scarcity of skilled labour:

a) Demographic developments (“aging population”) (Reinberg & Hummel, 2004)

b) Lack of student interest in engineering and natural sciences (IWD (2007))

But the condition is different in East Azerbaijan Province. Unemployment rate was reported 13.8% in Spring 2009 and unemployment rate of people between 15-24 years old was reported 29.0% in Spring 2009 (see www.amar.org.ir).

Lack of information on market, governmental and international regulations were reported as the least important obstacles to innovation.

The survey sought information about motivation factors for innovation (table 4). Respondents were asked to rank a number of drivers for innovating on a scale from no impact, through low, medium or high. Improved quality of products or services was cited as the main motivation factor by 64% of SMEs and Improved flexibility of production or service provision and Reduced environmental impacts or improved health and safety are seen as important by almost 30% of SMEs. The objectives of Reduced costs per unit produced or provided (61%) and meeting regulatory requirements (by 59%) were also widely reported.

Successful innovations often generate intellectual property that businesses will try to protect. The survey collected data on business perceptions of the relative importance of different means of protecting intellectual property such as registration of design, trademark, patent, copyright, secrecy, and complexity of design. Registration of design is cited as the most important way of protecting innovation by 71.4% of East Azerbaijan Province SMEs. Patent and Trademark are viewed as high important by 68.2 and 66.7% of SMEs (see table 5).

Table 6 can show the overall status of each of Information resources more clearly. By a quick look at the table, it becomes obvious that the main Information source for East Azerbaijan Province SMEs is clients or customers and followed by suppliers of equipment.

In the United States, the Bayh-Dole Act (1980) helped to strengthen the role of science in the innovation process and facilitate industry-university collaboration. But there is evidence that
Universities and other higher education and conferences, trade fairs, exhibitions are cited as important information resources to just about 20% of studied SMEs. Also, as it is cited before East Azerbaijan Province SMEs have the least partnership with universities.

Innovation is not wholly about the development or use of technology or other forms of product (goods and services) and process change. Enterprises can also change their organizational structure, marketing strategy, corporate strategy, and advanced management techniques to make themselves more competitive. As reported in Table 8, 63.6% of Iranian SMEs made changes to their management strategy during 2006-2008. As would be expected, a great proportion of SMEs engaged in one or more of these changes. Advanced management techniques were most commonly reported, with the introduction implementing new organizational structures being least frequent.

**Conclusion**

Innovation affects firms' ability to compete successfully in an increasingly global market. This paper examines forces to innovation, and product, process, and management innovation activities and barriers to innovation among a sample of 88 East Azerbaijan Province manufacturing SMEs located in the East Azerbaijan Province of Iran. The East Azerbaijan Province economic situation is interesting due to the need to increase the investment in innovation by manufacturing SMEs. This need is because recent regional GDP has not been growth in the past three years.

In the selected case (East Azerbaijan Province SMEs), an in-depth study of eleven barriers to innovation was done through distributing questionnaires. The research results revealed that the economic factors such as excessive economic risk, lack of financial resources, lack of availability of finance, and high cost of innovation have determined the propensity of SMEs about innovation. However, Lack of customer responsiveness and lack of qualified personnel were viewed as other important constraints to innovation.

The survey results indicate that innovation is also becoming increasingly popular among SMEs. After all, small SMEs often lack resources to develop and commercialize new product in house and as a result are more often inclined to collaborate with other enterprises in their own business. There is growing evidence that innovation in areas such as ICT or biotechnology draws increasingly and more directly on scientific progress. The idea of facilitating industry-university collaboration strengthens. The survey results show that Iranian SMEs are not collaborating with universities and higher education institutions nevertheless we expected based on the literature. Van de Ven (1986) argues that as individuals have access to more information about available innovations and are more globally informed about the implications of innovative ideas, they are better able to relate the "parts to the whole." In general, individuals with a broader awareness of the consequences and implications of innovative ideas facilitate the process of organizational innovation.

The survey results indicate that East Azerbaijan Province SMEs prefer to engage more in market research, followed by a considerable investment in changes all forms of design. According to Morton (1971), Zaltman, Duncan, and Holbek (1973) Organizations facilitate innovation through project teams or R & D departments. But there is evidence that East Azerbaijan Province SMEs do not concentrate on R & D investment as one of the main innovation activities.
Enterprises reported market and internal sources as most important for information on innovation. This suggests that enterprises tend to rely on their own experience and knowledge coupled with information from customers and clients, suppliers.

The survey discovered that improved quality of goods/services increase the propensity of SMEs to innovate. And Also in the field of protection of innovation, Registration of design and Trademark were viewed as important ways of protecting innovation in East Azerbaijan Province SMEs.

The results of the study may be useful for both government and SMEs. The finding can be used in the development of public policy aimed at supporting and encouraging innovation among SMEs in East Azerbaijan Province.

When conducting a research, occurrences of some obstacle are inevitable and in fact it is difficult to find a research that has been carried out easily without facing any problem. This study is not an exception and some problems came up as well. The expectation about the response rate was not met. And also, there were financial questions about the amount of investment in innovation activities but none of the SMEs answered these kinds of questions. It took more time than the estimated time (3 week), for the respondents to return the questionnaires. This alone resulted in change in the plans and the study fell a few days behind the schedule. The size of the sample is such that it is difficult to generate the finding of this study to the whole population of SMEs in Iran.

For further research it would be interesting to examine why Lack of unskilled labour is cited as an important barrier to innovation by 50 % of SMEs; however the unemployment of educated people is reported 29.0 % in Spring 2009. It would be also helpful to conduct researches which examine and compare barriers to innovation between SMEs in other countries and Iranian SMEs.

Management Department of Islamic Azad University Kaleybar Branch, East Azerbaijan, Iran

Abstract
Porpuse - The Porpuse of this study is surveying and applying managerial grid model in iranian prosperous organization, according to Robert Blake and Jane Mouton dominant patterns of behavior to understanding the dominant leadership style and consequently studying its effects on organizational performance. Methodology/Analysis - this research employs the two dimensions of the leadership grid in the organization and by utilizing the administration of questionnaire, defines the ranking of each dimension. The resulting scores are then intermixed and placed on a two-dimensional grid. Findings - the research provides an opportunity for managers to critically assess their own performance and consequently recognize their strengths and weaknesses in order to improve their general leadership skills. The Finding of study shows that , all companies are roughly close to the middle-of-the-road management area (5, 5 score) in the leadership grid.

Keywords: Leadership style, Successful organization, The Managerial Grid Model

Introduction
The activity of leading a group of people or an organization, or the ability to do this is leadership. Over the years, leadership has been studied immensely in various tenors and theoretical foundations [6]. Much effort has been made to apprehend better leadership in organizations during the last fifty years [17]. Moreover, there are plenty of momentous reasons for the popularity of the topic and continuation of researches, of which the leading and prominent one is resolutely changing the business environment. Thereupon, organizations are faced with changes like never before, calling for greater leadership skills at every level of the organization in order to deal with enhancing challenging problems and hardships [17].

Moreover, the long-term health of an organization will be driven by the strength of its leadership—not just at the top, but also in every division or department and at each level of the organization [16]. In the long run, the essence of effective leadership is what makes each and every business prosperous. The reason is that exploiting effective leadership through choosing and employing a proper style provides the opportunity of fully utilizing and taking advantage of the skills and abilities of staff at any organizational level for the purpose of accomplishing and fulfilling organizational goals. A cardinal point is that this is not just a foremost problem for larger businesses. However, even if you exclusively hire one or two
people as your employees, it is still indispensable to be assured that you make the utmost of their skills, abilities, and aptitudes. Consequently, people without a clear sense of where they are supposed to go will be unproductive or underproductive, wasting the organization’s time and money [16] and as a result the organization moves too slowly and may be deviated from its right direction which imposes a direct impact on the company’s future survival.

Accordingly, there is a wide range of methodologies and models for studying leadership styles. Pursuant to the main purpose of this research which includes defining the dominant leadership style and consequently studying its effect on organizational performance, the one we are getting help from is called the Leadership Grid or the Managerial Grid Model. The model was developed by Robert Blake and Jane Mouton in 1964, 1978, and 1985 and the research was accomplished at the Universities of Michigan and Ohio State for the first time [11]. Furthermore, regarding Marturano and Gosling “this grid appears to be the most well-known model of managerial behavior and is still being used in leadership development and consulting practices around the world” [11]. This model originally identified five different leadership styles based on two dimensions of ‘concern for people’ and ‘concern for production’ in the organization - on a scale from 1 (minimum concern) to 9 (maximum concern), two additional patterns of behavior have been identified by Blake and McCanse in 1991 [11].

This research is based on survey and employs quantitative research methodology. By utilizing the administration of questionnaire, we try to define the ranking of each dimension. Afterwards, the resulting scores are intermixed and placed on a two-dimensional grid. This way allowed us to determine the dominant and more employed leadership style among the Iranian successful organizations in separation of their managers, employees, and altogether and consequently comparing the perceptions of employees in regard to the employed style by their managers. Totally, leadership is one of the several assets a successful manager must have within her/his organization since this can be considered as a core competency for the organization. For this purpose, we are going to conduct a survey in order to find out about one of the most important secrets of successful organizations.

Literature Review

Based on the study of Jogulu and Wood, preliminary research which was accomplished by Burns in 1978 inferred that “leadership is one of the most observed and least understood phenomena on earth”. The inquiry to augment and expand our apprehending of leadership has issued to a vast body of research and literature which has spanned centuries [5]. Furthermore the business environment is tremendously changing; greater “competitive pressures facing organizations today, business has become more complex, and the increasing globalization and internationalization of business” are considered as the leading and prominent factors calling for grander leadership competences and proficiencies at every levels of an organization as well as enhancing the requests for leaders to be capable to work across distances, cultures and countries [17].

Generally, there are many different definitions for leadership but more recently, the GLOBE Study of 62 societies has precised on the definition of “leadership” by describing it as “the ability of an individual to influence, motivate, and enable others to contribute toward the effectiveness and success of the organizations of which they are members. Hence, the focus spans over influence to comprise stimulation, incitation, and enabling of others to assist accomplish the goals of the organization”. Likewise, the competency to monitor others is given no eminence in this late definition of leadership [5]. Consequently, definitions of
leadership tend to focus on the interpersonal relationships that exist between the leader and the follower, or the group of followers [20]. A common plot amongst various definitions of leadership is that leadership is considered as interpersonal processes between individuals in a group working toward a goal which is held in common. Ergo, existing relevancy between leaders and followers are leveling and integral to the apprehending of leadership [11].

Leadership involves the head and the heart. It is both analytical and interpersonal. Having the range and repertoire to be cold-blooded, rational, and decisive at times, and at other times warm-blooded, nurturing, and participative, and knowing when to be which, is a huge personal challenge [19]. Thereupon, it is proposed that tomorrow’s leaders may require to hold visions, values, assumptions and paradigms that are in accordance with having a team-oriented, empowered workforce in order to be most successful. As a result they are required to “think and act differently, using innovation and personal values to help guide their actions, instead of following textbook solutions” [6]. The successful leader, therefore, has an ability to be in the present and see the situation free from preconceived ideas” [4] and consequently, organizations with effective and successful leaders tend to [3]:

- innovate
- respond to changes in markets and environments
- creatively address challenges
- sustain high performance

According to Wagner [18], the twenty-first century leader should have the following specifications:

- No longer believes that to give away power is to lose something
- Possesses a global and holistic perspective
- Creates and communicates vision
- Employs strategic thinking
- Promotes and initiates change
- Embraces and values diversity and inclusiveness
- Manages technology and distributes information
- Inspires, motivates, and stimulates, leading through personal persuasion and valuing emotions as well as ideas
- Models integrity and ethical behavior, obeying unenforceable and self-imposed laws
- Integrates an ongoing system of evaluation, creating more open, effective, empowered, and excellent organizations
- Respects and values people with support, understanding, care and empathy

Thus, today’s world is a dynamic world. Organizations are changes like never before. Hence, “we need leaders to challenge the status quo, to create visions of the future, and to inspire organizational members to want to achieve the visions” [14]. Consequently, evidence reviewed by Leithwood [8] suggested that prosperous leadership creates a persuading sense of intention in the organizations by “developing a shared vision of the future, helping build consensus about relevant short-term goals and demonstrating high expectations for colleagues work”.

One last comment before we move on: For years, people have asked White, What does it take to lead successfully? His short answer has always been: Just do three things day: First, set high aspirations for your organization. Second, recruit great people. Third, bring tremendous energy and enthusiasm to work every day [19].
Leadership Style and The Managerial Grid Model

One of the very first questions which may be prevalence to the mind of any individual is to ask what we mean by ‘style’? “Style is usually seen as the way we behave and behavior reveals itself in many ways”. The manner we behave is a high-powered reflection of our individuality and character, the product of the often incognizant and unaware processes that are at work within us [7]. There are almost as several various definitions of “leadership style” as there are persons who have tried to define the concept. At one level the concept of ‘leadership style’ is simple to define: “it is the style that a leader adopts in their dealings with those who follow them. Clearly, underlying this is an assumption that there is a ‘right’ and a ‘wrong’ style” [7]. Because leadership cannot be accomplished without followers and always has situational factors that have to be taken into consideration, Kippenberger defines leadership style as the point of interaction between three things [7]:

1. The leader’s character type – their values, attitudes, and beliefs, their position and experience;
2. The followers’ character types – their values, attitudes, and beliefs, their cohesiveness as a group; and
3. The situation – the nature of the task, the life-stage of the organization, its structure and culture, its industry, and the wider socio-economic and political environment.

Explicitly, appropriate leadership style can attract employees and stimulate them on to novel, incentive, and challenging objectives [2]. Therefore, “there is a continuum of possible leadership styles extending from complete autocracy at one extreme to total democracy at the other”. Organizational leaders demonstrate broad alterations in the styles and behaviors which they represent and display at work. While some managers used a diversity of leadership styles and behaviors in their day-to-day activities, others exerted more than one of the leadership styles or behavior dimensions [12]. However, proper and effective leadership style(s) depends on the context [2]. Market circumstances change, internal circumstances change, external pressures change, or alternatively there may be a period of stability. These factors mean that as a business adapt to these different circumstances, then the type of leader that is best suited to the business will also alter. Thus, although, many different models are available for studying leadership styles, but the one we are getting help from is called The Leadership Grid or The Managerial Grid Model which has been developed by Blake and Mouton. Regarding to Marturano and Gosling, this grid appears to be ‘the most well-known model of managerial behavior’ and is still being used in leadership development and consulting practices around the world [11]. We will discuss the different components of the grid model more in detail.

The Leadership Grid (called the Managerial Grid in its earlier version; Blake and Mouton 1964, 1978, 1985) was another, more practical approach mirroring the findings of the research done at the Universities of Michigan and Ohio State. This model and the respective questionnaire identify and analyze manager behavior within two useful dimensions – ‘concern for people’ and ‘concern for production’ – on a scale from 1 (minimum concern) to 9 (maximum concern). The managerial grid has 81 possible combinations, but identifies seven major styles [10]. Using the axis to plot leadership ‘concern for production’ versus ‘concern for people’, Blake and Mouton defined the following seventh dominant patterns of behaviors:

1. ‘Impoverished management’ (1, 1 score): Managers in this position have little concern for people or productivity, Mostly ineffective, avoid taking sides and stay out
of conflicts [13]. In other words, minimum effort is being exerted in regard to both dimensions by rather indifferent or even apathetic managers [11].

2. ‘Middle-of-the-road management’ (5, 5 score): This management behavior is also known as organization man management [12]. Managers exercising this style seek to balance their concern for people and their concern for the tasks involved on a level of adequacy and moderation [11].

3. ‘Country-club management’ (1, 9 score): Highly friendly relations and a very good atmosphere have the clear prevalence over low concern for productivity and task completion within this leadership style [11]. Managers avoid any conflicts and seriously focus on being well liked. Their ultimate goal is to sustain people happy [13].

4. ‘Authority-compliance management’ (9, 1 score): Job performance and task completion are the major focus of this result-driven leadership style. Relationship and communication with people is reduced to the minimum necessary for clear instructions and performance control [11]. Managers consider creativity and human relations unnecessary [13]. In other words, managers under this condition are very autocratic; the leader has strict work rules, policies, and procedures. Also the leader views punishment as the most effective means to motivate employees.

5. ‘Team management’ (9, 9 score): This leadership style has a very high consideration for both tasks and people. Fostering commitment through supportive relationships and teamwork is equally important to promoting the efficiency and effectiveness of the organization [11].

Furthermore, two additional patterns of behavior have been identified by Blake and McCanse (1991):

- Paternalism/Maternalism: Some leaders appear to use both the ‘Country-club management’ as well as the ‘Authority-compliance management’ style without integrating them. Benevolent behavior is demonstrated only to secure goal achievement and job performance [11].
- Opportunism: Any combination of leadership styles can be demonstrated at various times by managers who strive for personal advancement rather than for job performance or relationship building [11].

The following figure (Figure 1) and table (table2) demonstrates the managerial grid model.
Table 1. The leaders characteristics according to the grid model

<table>
<thead>
<tr>
<th>Components of the Managerial Grid Model</th>
<th>Leader's Characteristics</th>
</tr>
</thead>
</table>
| 1 Impoverished Management (1, 1 score) - The Impoverished Manager | 1. Mostly ineffective  
2. avoid taking sides  
3. stay out of conflict  
4. The leader has neither a high regard for creating systems for getting the job done, nor for creating a work environment that is satisfying and motivating. |
| 2 Middle-of-the-Road Management (5, 5 score) - The Status Quo Manager | 1. The compromiser, sensitive, keen, and strong to keep everyone happy.  
2. The leader is not strong on either task or people.  
3. The leader is underachieving, failing to get the best out of people or their productive capacity.  
4. Settling for average performance and often believe that this is the most anyone can expect. |
| 3 Country-Club Management (1, 9 score) - The Country Club Manager | 1. The leader will seek compromises between staff members and solutions that are acceptable to everyone.  
2. The leader focuses on being agreeable and keeping human relations smooth.  
3. Although innovation may be encouraged, the leader tends to reject good ideas if they are likely to cause difficulties between staff members. |
| 4 Authority-Compliance Management (9, 1 score) - The Sweatshop Manager | 1. Very autocratic  
2. They tend to rely on a centralized system and the use of authority.  
3. The leader has strict work rules, policies, and procedures.  
4. The leader views punishment as the most effective means to motivate employees. |
| 5 Team Management (9, 9 score) – The Fully Functioning Manager | 1. The leader will discuss problems with the staff members, seek their ideas and give them freedom of action.  
2. Difficulties in working relationships will be handled by encouraging people directly and attempting to work out solutions with them. |
| 6 Paternalism – The Paternalistic Manager | Some leaders appear to use both the ‘Country-Club Management’ and the ‘Authority-Compliance Management’ style without integrating them, in exchange for compliance and loyalty. |
| 7 Opportunism – The Opportunistic Manager | Any combination of leadership styles can be demonstrated at various times by managers who strive for personal advancement rather than for job performance or relationship building. |

During the following study, the researchers try to test the following hypotheses:
1. A common leadership style is applied among the selected fortune 100 Iranian organizations.
2. The employees’ perception about the type of employed leadership style is the same as their managers.

And also they try to provide answers for the following research questions. They are as follows:
- Is a special leadership style employed among the selected fortune 100 Iranian organizations?
- Do the employees have the same perception about the type of employed leadership style in their organizations?

It is worthy of attention that in posing questions, the authors hardly attempt to consider the following factors:
1. Being momentous in terms of theory and application
Research Methodology

Even though, this research project was inspired by Blake and Mouton works, and has been intended to utilize their leadership styles definition, but the research design employed is based on the administration of questionnaire in face-to-face interviews. The fundamental reason for this choice is related to the main purpose of the project; this study more focuses on defining and investigating the dominant leadership style and consequently studying its effects on organizational performance in separation of people's position in the organizations and Blake and Mouton concentrated on defining and comparing various leadership styles or management behaviors. Furthermore, the research provides the opportunity of studying employees’ perception about the type of employed style in their organizations and simultaneously compares it with the current employed one by their managers. It is worthy of attention that during conducting this study, the researcher faces with the following limitations:

- Getting a long time of permission for conducting the research in the six various Iranian organizations
- Time limitation of managers and employees
- “The time needed for data collection increases markedly for delivery and collection of the questionnaires where the samples are geographically dispersed” (15).

The Design Strategy

The survey strategy is the chosen strategy among several various existing strategies during this study. The major reasons for selecting such strategy are as follows [15]:

- It allows the researcher to collect a large amount of data from a sizeable population.
- Data obtained by using a questionnaire administered to a sample are standardized, allowing easy comparison for the researcher.
- The survey strategy is perceived as authentic and credible by people in general and is both respectively easy to explicate and understand.
- It allows the researcher to collect the quantitative data which then the researcher can analyze quantitatively using descriptive and inferential statistics.
- Having more control over the research process by the researcher and also when sampling is used, it provides the opportunity of generalizing findings for the researcher. More precisely, these findings can be representative of the whole population.

Data Collection Technique

Perhaps not surprisingly, the questionnaire is one of the most widely used data collection techniques within the survey strategy. Because the respondent is asked to respond to the same set of questions, it provides an efficient way of collecting responses from a large sample prior to quantitative analysis [15]. As a result, the choice of questionnaire was the selected option for the purpose of conducting the research in the six various Iranian successful organizations. It is noteworthy that the administration of questionnaire was based
on face to face interviews as well as through the net in which “the questionnaire was posted to respondents, who return them by post (mail) after completion” [15]. As a result, in regard to the Iran Insurance Company the following points are considerable:

- In regard to the employees of this company, the questionnaire was distributed among eight various branches of this company which were located in different areas of the Capital by the researcher herself.
- In regard to the managers and supervisors, the questionnaire was distributed among different branches of this company which were located in different cities of Iran. The responsibility of distributing the questionnaires was accomplished by the kind cooperation of the Research and Educational centre of Iran Insurance Company and was done through the net.

The Questionnaire and Its Specifications

As the next step to rank each dimension of the grid model two questionnaires were designed, one for employees and the other for managers and supervisors. The questionnaires are composed of nine items, each with five questions. It should be noted that the designed questionnaire was inspired from the work of Maders [9] and the type of employed questions that are ‘closed questions’.

For tasks execution, questions focuses on checking staff’s work, assessing employees’ progress, level of managers’ intervention in problem solving, monitoring employees, and employees’ welfare.

For decision-making, questions focuses on group or individual decision making, consistency of decisions, importance given to the employees’ ideas and creativity, and selling decisions.

For violation of rules, policies, and procedures questions focuses on the essentiality of uniform rules, importance given to respecting rules, enforcing rules, strict rules, policies, and procedures, adjusting the rules, and enacting rules.

For contested decisions, questions focuses on insistency on enforcing decisions, binding decisions, informing and reporting a taken decision, remarking the genesis of decision and decision explanation, and acceptance of change in a taken decision.

For obligations to reconsider a decision questions, focuses on proceeding according to new instructions, changing instructions periodically, acceptance of change in workplace, postponing a decision, and using previous experiences in a process of decision making.

For relation with the head, questions focuses on team work, importance given to the relationship with team members, freedom of action, asserting by results and accomplishments, and importance given to the relationship with superior managers.

For disputes between subordinates, questions focuses on stressing on existence of conflicts, minimizing or eliminating conflicts, ways of facing conflicts, impacts of conflicts, and seeking the best compromiser.

For employees motivation, questions focuses on preference for taking responsibility, possibility of decision making by staff, earnings and work, performance and work pressure, and tasks distribution.

For performance indicator, questions focuses on setting goals, employee satisfaction, trust in subordinates, transmitting instructions, and systems of promotion.
The Method of Filling out the Questionnaire

The type of applied closed questions in the questionnaires is ranking questions “where the respondents are asked to place things in rank order” [15]. This means that it provides the opportunity of discovering their relative importance to the respondents for the researcher. As a result, in answering the questionnaires, the participants in the survey were asked to determine the prevalent employed management method in their organizations by number one as well as the substitute one (the one which is employed as the second management method in each organization) by number two, each in their own specified columns. This action should be done for the entire nine items in the questionnaires. It is noted that each item has only two answers (one as the prevalent method and the other as the substitute method). In other words, the respondents were asked to indicate their significance and importance they attach/supplement to two of the five issued questions for each item with a logical comparison. Generally each questionnaire has only eighteen answers. It is worthy of attention that managers and employees at any age, at any organizational level, and at any educational level were asked to fill out the questionnaires.

The Questionnaire Validity and Reliability

For assessing the validity and reliability of the employed questionaire in the following study, the questions have been translated from French and English to Farsi. To avoid language bias for the translated questions, first the researcher translates the questions in Farsi. Thereafter, the supervisor who did not participate in the process of translation and who is specialized in the field of Organizational Behavior (OB) and Human Recourse Management (HRM) translated the questions from Farsi to the original languages. The next step was to compare the results and eventually change the Farsi questions if needed (the action of localizing was done on the questionnaire which means the issued questions hardly tries to be accordant with the Iranian culture.). So, through this way the validity of the questionnaire can be approved. It is noteworthy that the employed questionnaire is a source. Generally, the questions tried to be obvious, transparent, and far from any ambiguity. In other words, the author extremely insisted on being understood and clear in wording the questionnaires for staff and managers at any organizational level specially because of using ranking questions, the researcher needs “to ensure that the instructions are clear and will be understood by the respondent” [15]. Furthermore, in the following study, the common approach of test re-test is utilized to assess reliability. As a result the questionnaires were distributed among at least five persons in each organization. Overall forty five participants were asked to participate in the conducted survey and fill the questionnaires out. After the process of analyzing the acquired data, the obtained reliability was equal to 0.73 through the Lambda coefficient.

Sampling

Choosing the sample was the next step. The selected organizations are among the list of one hundred superior companies which is a collection of Iranian big companies according to the Industrial Management Institute (IMI) [21]. This research had been conducted in the six of these organizations, each with distinct functions. These organizations were selected randomly. The questionnaires were distributed among at least thirty managers and supervisors as well as thirty employees in each organization. Thus, the acquired sampling size is as follows:
The sample size that needed to obtain a 95% confidence interval was calculated through utilizing the following equations (Equation 1 and Equation 2) according to the “Theories of sampling and its applications” [1], which is based on a 95% confidence level and +/- 5% margin of error.

\[
\begin{align*}
n &= \frac{n_0}{1 + \frac{n_0}{N(n_0 - 1)}} \\
n_0 &= \frac{\left(\frac{s}{d}\right)^2 \alpha(1-\alpha)}{p(1-p)}
\end{align*}
\]

(1)  
(2)

Table 2. The results of sampling

<td>Employee</td>
<td>13000</td>
<td>0.05</td>
<td>0.07</td>
<td>1/10</td>
<td>n₀</td>
<td>n</td>
</tr>
</tbody>
</table>

According to the above-mentioned equations, the recommended sample size for managers and supervisors is equal to 165 and also the recommended sample size relative to employees is equal to 197.

The Method of Analyzing Data

As the final step, after gathering the questionnaires, the answers given to each item were weighted according to the Maders Table [9] for each participant in the survey. As a result, two various X and Y are obtained for each participant in the survey, one for the prevalent method column as X1/Y1 and the other for the substitute method column as X2/Y2. Afterwards, the mean of the resulting scores are calculated for each column and intermixed and placed on a two-dimensional grid including ‘concern for people’ (X axis) and ‘concern for production’ (Y axis) in the organization - on a scale from 1 (minimum/least concern) to 9 (maximum/uppermost concern) (Marturan. These two points indicate an area in the nine-by-nine matrix which specifies each organization current employed leadership style in separation of people status which include managers, employees, and all together. By this way the dominant and more efficient style that is held in common among the six various Iranian successful organizations can be determined and simultaneously the opportunity of comparing employees’ perception about the employed style with their managers is provided. Moreover, the obtained outcomes indicate the companies’ location in the nine-by-nine matrix according to their employed leadership style and determine the leaders’ characteristics under the employed style in each organization. The Maders Table is demonstrated in Table 2.

</table>

Generally, this study is a quantitative research which is based on “meanings derived from numbers, collection results in numerical and standardized data, and analysis conducted through the use of diagrams and statistics” [15]. Hence, the acquired data from the administration of questionnaire are analyzed through the SPSS 19 and the obtained outcomes allow us to define and investigate the dominant leadership style.

The Results

This part indicates an area in the nine-by-nine matrix which determines the organization’s current employed leadership style according to the Managerial Grid Model. By this way the dominant and more employed style which is exerted in each organization can be specified in separation of participant’s job status and all together. It also allows us to compare the perspective of the employee’s of each organization with regard to the employed leadership style with the current applied one by their managers. It should be noted that the position of each participant in the nine-by-nine matrix is drawn in separation of participant’s job position and all together according to each organization (dispersion graph).

</table>
Table 4 and its relevant graphs (Figures 2, 3, and 4) indicate the located area of the six Iranian prosperous and propounded organizations in the nine-by-nine matrix respective to their employed leadership style(s) separate from their staff’s position including the employees and managers. As it is indicated, all companies are roughly close to the middle-of-the-road management area (5, 5 score) in the leadership grid. It is worthy of attention that the acquired results are representative of two important points which include:
1. The middle-of-the-road management style is held in common among the six various Iranian successful organizations.

2. The employees’ perception in regard to the employed leadership style in their organizations is hardly close to the current employed style by their managers.

Generally, this style may at first appear to be an ideal compromiser. However when you compromise, you necessarily give away a bit of each concern so that neither production nor people’s needs are fully met and leaders under this style are [7]:

- the compromisers, sensitive, keen, and strong to keep everyone happy
- not strong on either task or people
- underachieving, failing to get the best out of people or their productive capacity
- settling for average performance and often believe that this is the most anyone can expect

Consequently, the following graphs (Graphs) show the position of all the employees and managers in the leadership grid separately according to the acquired results from the administration of questionnaire. As mentioned before, two different scores can be calculated for each participant in the survey including (X1, Y1) with regard to the prevalent method column as well as (X2, Y2) with regard to the substitute method column. It is worthy of attention that the more colorful points are representative of at least two managers. Therefore, as it is demonstrated, the colony of managers is more concentrated in the middle of the graph compared with the other areas of the following graph, which approves that style of middle-of-the-road management is the most applied style in these companies according to the managers and employees and all together.

Figure 5. The employees’ dispersion graph

Figure 6. The managers dispersion graph
Conclusion and Future Works

Nowadays, with the rapid changing environment of business, competition among organizations becomes more and more vigorous, survival and continuity of organization in this challenging environment demand choosing right leadership style to react, to change quickly, and to mobilize employees for the success of organization. The obtained results during the research indicate the middle-of-the-road management as the employed style which is held in common among the six various successful organizations according to the grid model. This means that the leader has moderate concern for the two dimensions. In other words, both needs are not fully met. It might be important that organizations in Iran focus on enhancing the leadership behavior of management team, so that organizations would be more prepare for this new business environment.

Apprehending how staffs are led in successful organizations provide some immediate insight into how the employed style can bring the organization forward and make it closer to its final objectives. Thereupon the consequences provide the opportunity for managers to ponder profoundly about their employed style in their organizations and comprehend better their points of strengths and weaknesses in relation to their applied style. The consequences of such critical self-assessment will be the manager’s higher potential to understand employees' satisfaction as well as organizational performance and simultaneously allowed the leader/manager to develop their general leadership skills to its uttermost.

As mentioned before, this research provides the opportunity for managers to identify and critically assess their employed leadership style. But as future works, it is suggested through which ways the successful organizations can improve their current situation in the nine-by-nine matrix as well as to what extent training is useful for improving the current situation of organizations from the middle-of-the-road management style to the team management style. Also what the employed leadership is in the unsuccessful organizations. Indeed, the success and effectiveness of any types of organization including profit or non-profit ones in accomplishing and fulfilling their objectives depend on managers as well as their employed leadership style and consequently implementing a successful leadership in various types of organizations through selecting an appropriate style can be considered as a core competency for the organization and it can take advantage of it.

Abstract
In this paper while introducing market management processes, significant necessity of innovation and creativity in these processes for competing in current global trading is discussed. Furthermore, BI definitions from different authors’ point of view and BI principles and characteristics is addressed. Then the proposed framework is introduced with consideration to variant dimensions and functions of BI to furnish organization characteristics toward acquiring BI approach and derived benefits from it in business trend. Business area development, progressive and goal-based presence in international environment, and organization efficiency increase are some of few key functions that is argued in continue. Purpose of this paper is introducing practical framework to help organizations in direction of their goals toward BI, which it caused they acquire correct and well-timed understanding from market condition.

Keywords: Innovation, business, market management, business intelligence, knowledge.

INTRODUCTION
Today’s organizations are in an unending struggle to differentiate themselves from relentless competitors, as markets become saturated with new innovations all the time (Lee Sung, 2006). In recent years according to the importance of the information in organization management and also advanced information technology there are application systems of business (that) enable companies and institutions to decide (make decision) with more knowledge and to establish high efficiency for the organization.

In the United States there are so many companies in their organization chart as job as head of its analysis, business strategy manager, director or assistant director of information services in the market assessment or reason for the importance to analysis of competitive situation (David, 2000).

In today’s highly competitive and increasingly uncertain world, the quality and timeliness of an organization’s “business intelligence” (BI) can mean not only the difference between profit and loss, but also even the difference between survival and bankruptcy (Fuld, 1995).

For example an organization to compare using systems of business intelligence, information and environment indicators and forecast future of trends in their activity. Today, business intelligence is one of the important concepts of management and organizations and become a leading institution in the field of global markets and take advantage in all their activities and processes.
Business Intelligence isn't a non-professional activity (but) also requires special skills and thus the leading companies in this field, establish separate sections in the organization called "Business Intelligence Unit". Businesses and organizations have always tried to know what their rivals do. The concept opened its way in the academic circles during 1980s.
