Some authors have argued Michael Porter (1980) the famous scholar of strategic management with introduce of competitive five forces and generic strategies, has created the concept of Business Intelligence (Peyrot And Others, 2002). Porter pioneered to create association of competitive intelligence specialists in 1986 and has (made) published the first issue of competitive intelligence in 1990.

There is also a wide range of technology which for collecting information and knowledge in a level of organization and also help the process intelligence business, through analysis of this information by creating an inquiry. Peter Drucker relate intelligence with classified information data, and considers them relevant and targeted and admits that in order to survive organizations must establish capable systems in order to produce added value.

In the next section of article, it has been introduced the process of management and soon afterward components and features of business intelligence has been discussed. Then the functional dimensions of the BI has been investigated further more proposed framework for more accurate insights of organizations from BI and applying its principles in their business process has been persuaded.

FUNCTIONAL ELEMENTS IN THE PROCESS OF MARKET MANAGEMENT

Smart companies in the business arena to monitor market developments and in line with market changes and the use of incentive rules, usually strategic marketing systems are designed and developed. Marketing systems which process is complete harmony with the best companies are market opportunities that lead to better administer and manage the market is the market that the overall process management market, which includes four main steps are:

i. Market Analysis: environment is complex and constantly changing opportunities and new threats to bring together. Company and its strategic systems environment must always be under the surveillance environment requires a lot of information, including the consumer is and how to buy them. Include information systems and market research review and evaluation of consumer markets is the institutional markets.

ii. selected target markets: There are different companies and represent a strong variation in the production of similar goods between consumer tastes and no company is able to provide all consumers not satisfied. For any company that can make the best use of their potential abilities and to choose the best position in the market to be better and require review four-step measure and forecast demand, market share, target market and position in the market access.

iii. The combination of marketing elements: one of the basic concepts in modern marketing marketing mix is the same concept. Manageable set of variables that participate in the market and target them for their combined response is required. Because of this combination actually affect the market, the tools are organized. This combination includes product design, product distribution, pricing and advertising are advancing key new markets are trading.

iv. observing the market and competitors activities: This stage includes analysis of competitors and competitive market policies and planning, implementation and marketing
organization and control programs. An important aspect of corporate are Reviews on your competitors have to constantly put and prices of products and distribution and advertising practices and promote competition following closely and get to know in what circumstances.

General manager must adjust to at the helm of the organization pyramid marketing programs and then motivate everyone at all levels, and To ensure implementation of plans and goals, monitoring and auditing of marketing is also not forgotten.

The marketing process in different layers, should be special attention to customers as partners to the organization because the organization has customers, and emotions are what the companies are service activities is the most sensitive.

BUSINESS INTELLIGENCE (BI)

Different authors define their concept of Business Intelligence . They believe that intelligence in business includes characteristics such as ability of collecting processing and accumulate of the information that all levels of people of the organization could access to them according to their own requirements and help (them) to shape it in future and protect them against competitive treats. Terms of Business Intelligence, market research and intelligence organization are often used instead of each other. In order to define briefly and clear of the business intelligence we can say that business intelligence is collecting information about competitors and the environment to create and sustain competitive advantage (Damirchi, 2011).

In fact, intelligence in business is a systematic process to be ensured of the updated exact and related information of the competitors. An intelligent system is refer to a set of programs and origins that is used by managers in order to access to the daily information marketing environment.

BI is a set of concepts, methods, and processes (Maria, 2005) to improve business decisions, which use information from multiple sources and apply experience and assumptions to develop an accurate understanding of business dynamics. It integrates the analysis of data with decision support system to provide information to people throughout the organization in order to improve strategic and tactical decisions. With appropriate BI a company will be able to develop intelligent decision support systems to gain the competitive advantage of the industry (Davis, 2002).

Collect and evaluate information about rival companies involved in developing strategies have crucial role. However the company can acquire more information than rival companies the possibility of developing and representing of the successful effective strategies are more. Buytendijk (2001) has reported that, based on a study from 2001 to 2006, enterprises that apply BI had achieved two to three times return of investment more than those who do not (Buytendijk, 2001).

BI enables head managers of the organizations of any to adapt their decisions upon of their knowledge of market information, investment tactics in business and etc. Thus tracing understanding and responding to competitors is being proposed as a special aspect and it is necessary for companies to execute an effective program called BI figure 1 BI-forming domains are shown.
Business Intelligence is considered as a strategic management tool and one of the fastest growing areas of the world of business. Also competitive intelligence is one of the important techniques in creating competitive advantages and causes to targeted surveillance of strategic decisions at the competitive environment for competing and activating in the organization.

In any way business intelligence including the concepts that grows rapidly and the business intelligence society's specialists in each year grow by 40 percent. Many well-known companies include GE, Motorola, Microsoft, HP, IBM, Intel, Terry M, Xerox, Coke an Chrysler, all use competitive intelligent system. Some countries such as France, Japan, Sweden and the United States have considerable progresses in terms of using BI systems. In these countries BI has its own position as an important factor in gaining competitive advantage. Even Lund University in Sweden is the first university that establish Business Intelligence course at Phd. Different factors in achieving BI, the important and effective factors are as below:

- Ability to combine business activities and analytical information technology
- Focus on job skills in business intelligence center and prevent it from dispersion
- Creating appropriate infrastructure for Business Intelligence among of the strategic objectives and competitive organization
- The skill and analytical dexterities in Business Intelligence among staff
- Investigating the exact costs of Business Intelligence project and preformed investment
- Converge all its activities and organizational goals to make the maximum synergy
- To share and reuse methods concept information and insights
- Accommodation of BI promotion center with organization plan

Also a group of researchers has been described BI into three categories technological intelligence, market intelligence and strategic intelligence have divided each of them and has been described as below:

1. **Technological intelligence**: In this type of intelligence cost benefit of current situation and future necessity and preferences of customers new markets categories of the creative market opportunities and making the most important movements and changes in the field of marketing and distribution.
2. Strategic intelligence: This kind of intelligence is assessing the changes in competitive strategies in the specified timeframe that has been made of changes in the structure of competitors and new alternative product and industry.

3. Market intelligence: the kind of intelligence means the drawing a map of the state of current and future needs and preferences of customers, new markets, categories opportunities of market creative and most important movements and changes in the field of marketing and distribution.

Intelligence in business can be more than three groups such that the strategic and social intelligence can also develop strategic intelligence and social issues include details such as laws, taxes finance and economic political issues and affairs relates to human origins. Generally BI, collect broader information rather than market research pay to analysis and investigation of the immediate situation and supervise the recent competitive activities.

1. BI components

BI tools are widely accepted as a new middleware between transactional applications and decision support applications, thereby decoupling systems tailored to an efficient handling of business transactions from systems tailored to an efficient support of business decisions. The capabilities of BI include decision support, OLAP, statistical analysis, forecasting, and data mining. The following are the major components that constitute BI.

- Data sources:
  Data sources can be operational databases, historical data, external data for example, from market research companies or from the internet), or information from the already existing data warehouse environment. The data sources can be relational databases or any other data structure that supports the line of business applications. They also can reside on many different platforms and can contain structured information, such as tables or spreadsheets, or unstructured information, such as plaintext files or pictures and other multimedia information.

- Data warehouse:
  The data warehouse is the significant component of BI. It is subject oriented, integrated. The data warehouse supports the physical propagation of data by handling the numerous enterprise records for integration, cleansing, aggregation and query tasks. It can also contain the operational data that can be defined as an updateable set of integrated data used for enterprise wide tactical decision making of a particular subject area. It contains live data, not snapshots, and retains minimal history.

- Data mart:
  A data mart as described by Inmon (1999) is a collection of subject areas organized for decision support based on the needs of a given department. Finance has their data mart, marketing has theirs, and sales have theirs and so on. And the data mart for marketing only faintly resembles anyone else’s data mart. Perhaps, most importantly (Inmon, 1999) the individual departments own the hardware, software, data and programs that constitute the data mart.

  Each department has its own interpretation of what a data mart should look like and each department’s data mart is peculiar to and specific to its own needs. Similar to data warehouses, data marts contain operational data that helps business experts to strategize
based on analyses of past trends and experiences. The key difference is that the creation of a
data mart is predicated on a specific, predefined need for a certain grouping and
configuration of select data. There can be multiple data marts inside an enterprise. A data
mart can support a particular business function, business process or business unit.

- **Query and reporting tools:**

  OLAP provides multidimensional, summarized views of business data and is used for
  reporting, analysis, modeling and planning for optimizing the business. OLAP techniques
  and tools can be used to work with data warehouses or data marts designed for sophisticated
  enterprise intelligence systems. These systems process queries required to discover trends
  and analyze critical factors. Reporting software generates aggregated views of data to keep
  themanagement informed about the state of their business.

  Other BI tools are used to store and analyze data, such as data mining and data
  warehouses; decision support systems and forecasting; document warehouses and document
  management; knowledgemanagement; mapping, information visualization, and dash
  boarding; management information systems, geographic information systems; trend analysis;
  software as a service.

**Functions, objectives of BI and introducing framework**

The purpose of investing in BI is to transform from an environment that is reactive to
data to one that is proactive. A major goal of BI is to automate and integrate as many steps
and functions as possible. Another goal is to provide data for analytics that are as tool-
independent as possible (Biere, 2003)

The main key to a successful BI system is consolidating data from the many different
enterprise operational systems into an enterprise data warehouse. Very few organizations
have a full-fledged enterprise data warehouse. This is due to the vast scope of effort towards
consolidating the entire enterprise data.

Berson et al. (2002) emphasize that in view of emerging highly dynamic business
environment, only the most competitive enterprises will achieve sustained market success.
The organizations will distinguish themselves by the capability to leverage information about
their market place, customers, and operations to capitalize on the business
opportunities(Berson, 2002).

Moss and Atre (2003) describe BI as seamless integration of operational front-office
applications with operational back-office applications (Moss, 2003). Gangadharan and
Swamy (2004) define BI as an enterprise architecture for an integrated collection of
operational as well as decision support applications and databases, which provides the
business community easy access to their business data and allows them to make accurate
business decisions (Gangadharan, 2004).

A successful BI ties business and information technology together to help enterprises
manage and integrate ongoing investments in BI, allocate BI resources, prioritize projects,
and minimize the risk associated with BI implementations. The move towards BI reflects
organizations’ desire to manage their investment in and use of BI. Effective BI partnerships
for business and information integration are:

- business is responsible for capturing BI value;
- IT is responsible for delivering BI applications in an effective manner;
- BI projects should be funded based on a projected Return-on-Investment (ROI);
- BI expertise should be developed using a pool of knowledgeable business personnel;
business expertise should be developed using a pool of knowledgeable IT personnel; and

- an organizational emphasis should be placed for BI in order for it to be successfully implemented.

Business intelligence systems, the possibility of extracting trends from existing data types in data repositories that provide for strategic decision making processes and planning for future managers should be a remarkable help.

Also, BI systems, the possibility of producing complex reports for use in strategic decision layer can cause the organization. In order to know the functions of business intelligence systems, the most important of these is included below. Graphics as well as cases in question are shown in Figure 2.

On the other hand, intelligent systems in business follow to missions several. Help for your users to self-service with respect to repetitive tasks associated with BI(such as reports management and simplified analytical work) is one of these cases.

Also identify areas that are vulnerable and evaluate the effect of strategic actions on rival firms, is considered the main missions of the other intelligence programs in organizations. Generally, purpose of competitive intelligence programs, process to reduce environmental uncertainty is to improve management decisions (Wilma, 2005).

Implement business intelligence systems in general, including feasibility and identifying the current situation (identify goals, tasks, structures, processes, resources, processes and organizational data),data structures and the establishment of organizational data repositories and business intelligence deployment eventually The deal is the cycle in Figure 3 are displayed.
BI implementations demand a significant amount of business-process knowledge that offsite resources may lack. This challenge can be met by allowing onsite resources to focus on high-value roles and projects that address business knowledge while allowing offsite resources to focus on development and maintenance activities. Another challenge lies in the potential sensitivity of data involved in BI projects (Wilma, 2005). Organizations must make sure that appropriate security and privacy controls are in place when data are being shared offsite.

In addition, application systems of business intelligent increase between units. In other words among the unit employees of the Business Intelligence Unit, one person is also determined as the interferer with the other information applicants of the organization which coordinate the activities and equip the organization to respond faster to changes.

Considering the issues presented, in order to benefit the interests of organizations and benefits systems BI, the proposed framework is presented in figure 4. In this framework is used effectively the three skills of business, organization and IT to implement business intelligence. Each of these skills, significant impact is in the process of implementing BI.
Business Skills: organizations must be able quickly to analyze market changes and to adapt their processes, consistent with existing condition, must. Also according to the demands of multiple customers, using different tools to decide, prioritize needs and expectations and have to the strong strategy organization.

Skills IT: Organization should to provide all the necessary infrastructure to updates by identify, collect and receive of data and save and maintain them and be able to integration of the existing data. Also be to use IT, monitor on the BI programs and to assist this process effectively.

Organizational Skills: Organizations should your staff to implement this new system and warn appropriate organizational culture, trying to implement must step by step because In this section, if not carefully considered, staff and personnel to the resistance against the new changes. On the other hand, the organization and organizational strength to explore and describe data and finally analysis and summarization carefully (Ruddy, 2006).

In fact, the purpose of presented this framework, introducing aspects involved in implementing BI that the fundamental areas of this system, generally composed of three parts. Therefore, organizations can provide tips given in this context, situations and circumstances to suit your organization, and also attempted to use step by step implementation of this system that will bring a lot benefit in the future.

CONCLUSION

Managers are constantly looking at each project an estimating its benefits and costs and business intelligence and analytic databases are no exception. In the past profit and less benefit about business intelligence were done. The reason that can named are disabilities and
information about the processing of this work and even not requiting the estimation from the executive managers.

Result of studies show measured value or the amount of business intelligence and its impact on the organization is not carefully possible. But at the same time there are also simple and practical ways that the financial performance and market to business intelligence organization.

It is noteworthy that one of the most important estimated factors is investment return (ROI) during determining the value of business intelligence. Calculating the ROI enables the organization managers to set priorities for exacting for IT projects inside the organizations.

In this way the performance of the companies that use competitive intelligence in order to sell markets share, benefit of each share and other things compare with other companies that don't use this method. The method that was mentioned above is useful for the importance of the measuring activities and its role in organization success. Generally the benefits resulted from the full and fundamental execution of intelligent system of business are summarized as below:

- Facilitate the entry into new business
- Increasing the reliability from strategic decision
- Modify the multi communications in the organization
- Increasing the market knowledge
- Discovering the potential costumers and new ones

Production costs along with business intelligence, will bring very useful benefits including increased revenue, gain a new competitive opportunities, to gain more time for marketing, increased customer satisfaction through CRM, Automation hand processes, increase speed and agility of the organization, reducing cost And decisions for the organization.

Note that at the end of this article it is necessary that accessing to the accurate and timely information are important wealth for any company. When intelligent system in business were designed appropriate and correctly and accommodate to the organizations processes in one hard and from another hand its information has the ability for making decision thus the organization will able to improve of performance of it and it follow by making fast decisions and will bring satisfaction.

Abstract

Innovation is the result of human inquisitive nature. Transacting from Stone Age to the technological driven era, human has been endeavored hard to innovate and improve the life standards of this earth. This paper reviews the effect of recognition of intellectual capital (IC) on relevance of accounting information. The review of this paper suggests that recognition of IC has significant impact on financial information. This paper advocates the major modification in traditional accounting standards and conventional accounting practices to comply with the stipulations of modern and competitive business era and pave the avenue for the recognition of IC as an asset to the firm. Therefore, this paper proposes to researchers, practitioners, and accountants to resolve this long standing issue (non-recognition of IC) by extending the horizon of research, which measures IC.

**Keywords:** Intellectual Capital, Relevance of Accounting Information

1. Introduction

The shift in practices and trends though have shifted the overall emphasis from traditional economic system to knowledge intensive system and consequently, service based industries have taken the major share in the value creation process, especially in developed countries of the world. The rise of knowledge-based economy (IC) requires re-evaluation of the key intellectual factors, which leads to firm growth. Researchers have been contending that the traditional financial statement provides only limited information pertaining to the relevance of earnings to investors due to the non-recognition of IC (Collins *et al.*, 1997; Francis and Schipper, 1999; Lev and Zarowin, 1999), and non-recognition of IC at the same time increases the gap between market value and book value of the firm (Amir and Lev, 1996; Brennan, 2001; Holland, 2003). Recently, application of GAAPs and accounting standards
has led to the decrease in relevance of earnings as well as non-recognition of IC (Amir and Lev, 1996; Brennan, 2001; Holland, 2003; Lev, 2001). Moreover, GAAP and accounting standards do not permit recognition of IC as an asset because of uncertainty associated to the risk of intangibles’ and expected future benefits (Hendriksen, 1992; Shi, 2002). This suggests that IC has significant impact on financial information especially to firm earnings. In this very context, researchers, practitioners, and accountants are required to resolve this long standing issue by extending the horizon of research, which measures IC.

2. Literature Review

2.1 IC and Relevance of Accounting Information

Financial statement is a major source of information, which is considered valuable by the investors when evaluating the firm stock. FASB No. 2 discusses relevance and reliability as two primary criteria, which makes accounting information useful for decisions. Relevance of accounting information has the capacity to making a difference in a decision (FASB No.2 pare 47). Financial statement information is relevant if it is able to confirm or change investors’ expectations regarding the value of stock (Lubberink, 2000). Empirical researches have demonstrated the usefulness of accounting information particularly about earnings, which have decreased over the years as economies became knowledge intensive (Brown, Lo, and Lys, 1996; Chang, 1998; Collins et al., 1997; Francis and Schipper, 1999; Lev and Zarowin, 1999). Similarly, Francis and Schipper (1999) and Lev and Zarowin (1999) illustrated in their studies based on the U.S. data that value relevance of earnings has declined over the years and that recognition of R&D cost as expense has led to the decreasing trend of relevance of earnings. Other the other hand contemporary literature reveals that capitalization of IC increases the value relevance of earnings instead of recognizing it an immediate expense (Aboody and Lev, 1998; Ahmed and Falk, 2006; Lev and Sougiannis, 1996). Brooking Research institute (1996) pointed out that 62% value of the company used to be represented by its physical capital and 38% by intellectual capital. But recently, physical capital decreased to 38% and IC increased to 62%. This indicates that IC has substantial impact on financial information with respect to firm’s earnings.

Collins et al. (1997) examined the changes in the value-relevance of earnings and book value over time. They revealed that value-relevance of earnings has not declined for the period 1953-1994 based on the sample NYSE, AMEX and NASDAQ firms, though; bottom line of value relevance of earnings has declined. This decline has been replaced by increasing value-relevance of book value. The study also reported that much of the shift in value-relevance from earnings to book value can be explained by increase in the frequency of negative earnings, magnitude of in-time items, change in average firm size and intangible intensity across time.

Francis and Schipper (1999) in their study reported the significance of earnings and book value less relevant for the period 1952-1994 computed on a sample of U.S. stock exchange and NAZDAQ firms (Francis and Schipper, 1999). They revealed that decrease in value-relevance of high-technology stocks is greater compared to low-technology industries. Chang (1998) correspondingly, documented the declining trend in the value-relevance of both earnings and book value for the period 1953-1996. They further asserted that
recognition of R&D as an immediate expense leads to the decrease in value relevance of accrual for U.S. firms during the mid 1970s.

Lev and Zarowin (1999) in the same year examined the usefulness of financial information (earnings and book value) for investors compared to market value. They computed $R^2$ from stock prices (regression of stock price, $P$) model and earnings returns (regression of earnings return, $R$) model to evaluate the usefulness of financial information for investors. The result of the study reported the continuous decline in relationship between return on earnings and accounting information (earnings) for the period 1978 to 1996.

Goodwin and Ahmed (2006) investigated the fact whether value relevance of earnings has declined in Australia over 25 years covering the period from 1975 to 1999. They examined whether or not capitalization of intangibles, which have been capitalized under Australian GAAP had an effect on value relevance. They employed following (Ely and Waymire, 1999; Lev and Zarowin, 1999; Nwaeze, 1998) applied earnings response coefficient (ERC) and $R^2$ (price–earnings–book Value) to measure the earnings value relevance. The authors reported that firms with capitalized intangible assets had increased earnings value relevance.

Reinita (2007) recently reported that with the increase of research and development expense (R&D), value relevance of the market price on EPS and book value has also increased. The author stressed that in the U.S. GAAP all R&D costs must be immediately recognized as an expense and in the UK and in almost all other countries capitalizes of development costs and expenses off the research costs. The study revealed that the joint explanatory power of R&D, EPS and book value declined in 1999 but increased during the period from 2000 to 2005. The study concluded that research and development expense (R&D) increases the value relevance of the market price on EPS and book value.

The value-relevance of accounting information remained unchanged for the period 1983-2001 in Denmark as reported by (Thinggaard and Damkier, 2008). They examined whether the information reported in financial statement becomes less value-relevant over time, and if this assumption holds true, what should be done to develop and improve the current financial statement? And is it necessary to improve and develop the current financial statement through alternative reporting mechanisms for instance, green accounting statements, social and ethical reporting system, IC statements, etc? The U.S. literature postulates that value-relevance of earnings decreased over time but there is no evidence to indicate whether value-relevance of financial statement increased or decreased in European countries over time. The study concluded that value-relevance of financial statement remained unchanged over time.

Yu et al. (2009) examined the value relevance of IC using Ohlson’s (1995) valuation model and Dechow et al. (1999) framework in Taiwan’s information technology (IT) companies. They reported that previous researchers have evaluated IC using various aspects and that no research clearly documents the value relevance of IC in investor business valuation. The results of their study revealed that: 1) IT companies in Taiwan are focused on human and process capital than on innovation and relation capital; 2) there is value relevance between IC and IT companies’ business valuation; and 3) using a constant discount rate could unsuitable the value relevance of the study results which are computed using Ohlson’ model.
3. Proposed Framework and Hypotheses for Effect of Recognition of IC on Relevance of Accounting Information

The objective of the paper is to determine the effect of recognition of IC as moderator on the relationship between accounting information (earnings and book value) and market price (dependent variables). Many researchers have argued that traditional financial statement offers limited relevant information especially relevance of earnings to investors due to non-recognition of IC (Collins et al., 1997; Francis and Schipper, 1999; Lev and Zarowin, 1999), and non-recognition of IC increases the gap between market value and book value of the firm (Amir and Lev, 1996; Brennan, 2001; Holland, 2003). The next part discusses the linkage amid independent variables, moderator variable and dependent variable as plotted in the study framework.

3.1 Independent Variables, Moderator Variable and Dependent Variable

3.1.1 Independent Variables

Earnings and book value are classified as independent variables in this study; E and BV docket earnings and book value of the firm respectively. Where E is earnings per share of the firm for year t and BV is book value of the firm’s common equity per share.

3.1.2 Moderating Variable

Moderating variable is a variable which has a contingent effect on the independent – dependent variable relationship (Creswell, 2003). There are numerous classifications of IC, which have been referred into accounting literature. The International Accounting Standard Committee (IASC, 1998) defined intangible asset or IC as “non-monetary asset without physical substance”. Whereas, this study employs “value added” as an indicator of IC measurement in a firm. This classification is based on the “value added intellectual capital” (VAIC) method, which was advocated by Pulic (1998) and marked as ROA group method. Pulic (1998) defined IC as “how much and how efficiently IC and capital employed create values in the firm”. Pulic (1998) categorized IC into three main components:

- Human Capital (HC)
- Structural Capital (SC)
- Capital Employed (CE)

To remain consistent with the literature findings, this research will employ VAIC for measuring IC, the process to calculate VAIC entails seven steps procedure (Table 1), as advocated by Chan (2009); Chen, Cheng, and Hwang, 2005; Ghosh and Mondal, 2009; Goh, 2005; Kamath, 2007; Kujansivu and Lönqvist, 2007; Pulic, 2004; Shiu, 2006; Ting and Lean, 2009; Yalama and Coskun, 2007; Ze’ghal and Maaloul (2010).
Table 1: The Process of Calculating VAIC

<table>
<thead>
<tr>
<th>Steps</th>
<th>Label</th>
<th>Formula</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Value Added (VA)</td>
<td>VA = OUT – IN</td>
<td>OUT = revenues and include all products and services sold in the market. IN = all expenses for operating a company (exclusive of employee costs which are not regarded as costs).</td>
</tr>
<tr>
<td>2</td>
<td>Human Capital Coefficient (VAHU)</td>
<td>VAHU = VA/HC</td>
<td>HC = total investment in terms of salaries and wages of the staff.</td>
</tr>
<tr>
<td>3</td>
<td>Structural Capital Coefficient (STVA)</td>
<td>STVA = SC/VA</td>
<td>SC = VA - HC</td>

<td>VACA = VA/CA</td>
<td>CA = Book-value of net assets</td>
</tr>
<tr>
<td>6</td>
<td>Value Added Intellectual Coefficient</td>
<td>VAIC = VAIN + VACA</td>
<td></td>
</tr>
</tbody>
</table>

3.1.3 Dependent Variable

Stock price or market price is referred as dependent variable in this study; P docks stock price or market price. Where, P is “the price of a share of firm, i three months after the fiscal year-end t”.

3.2 Theoretical Framework

Based on the theoretical framework, this paper intends to determine the effect of recognition of IC as moderator on the relationship between accounting earnings, book value and market price as depicted in Figure 1.
Figure 1: Framework of (the Effect of Recognition of IC on the Relationship between Market Price with Accounting Earnings and Book Value)

To examine the above relationship this paper will employ the following model:

\[ P_{it} = \alpha_0 + \beta_1 E_{it} + \beta_2 BV_{it} + \beta_3 CEE_{it} + \beta_4 HCE_{it} + \beta_5 SCE_{it} + \varepsilon_{it} \]

Where:
- \( P_{it} \) = stock price of the firm at the end of year \( t+3 \) (over the 12 months beginning nine months prior to the end of year \( t \));
- \( E_{it} \) = earnings per share of firm for year \( t \);
- \( BV_{it} \) = book value of firm’s common equity per share;
- \( HCE_{it} = VA_i / HC_i \); human capital coefficient for Firm \( i \);
- \( CEE_{it} = VA_i / CE_i \); value added capital employed coefficient for Firm \( i \);
- \( SCE_{it} = SC_i / VA_i \); structured capital coefficient for Firm \( i \); and
- \( \varepsilon_{it} \) = an error term.
To determine the effect of IC on the relationship between relevance of earnings, book value and market price, above regression model subdivides in three new sub-regression models related to the different dimensions of IC (HC, SC, and CE).

- Effect of human capital on the relationship amid market price and relevance of earnings (related to hypothesis H1a1).

\[ P_{it} = \alpha_0 + \beta_1 E_{it} + \beta_2 BV_{it} + \beta_3 HCE_{it} + \epsilon_{it} \]

- Effect of structural capital on the relationship between market price and relevance of earnings (related to hypothesis H1a2).

\[ P_{it} = \alpha_0 + \beta_1 E_{it} + \beta_2 BV_{it} + \beta_3 SCE_{it} + \epsilon_{it} \]

- Effect of capital employed on the relationship amid market price and relevance of earnings (related to hypothesis H1a3).

\[ P_{it} = \alpha_0 + \beta_1 E_{it} + \beta_2 BV_{it} + \beta_3 CEE_{it} + \epsilon_{it} \]

3.3 Hypotheses Development for Framework (the Effect of Recognition of IC on Relevance of Accounting Information)

It is repeatedly asserted in economics that land, labor and financial are three significant resources for corporate enterprises (Sullivan, 1998). In the last two decades the trend has been transforming as the emphasis is shifting from traditional economic system to knowledge intensive system, and resulted in the hype of services industries world over as services industries swiped the major share in value creation process. In fact, IC is deemed as valuable and decisive actor of knowledge-based economy, which plays vital role in firm overall growth and has become a major source of competitive advantage (Holland, 2003). Therefore, growth patterns in knowledge intensive economy require re-evaluating the key drivers of growth, though, traditional accounting practices have failed to fully recognize the knowledge element as an asset in financial reporting system. Thus, non-recognition of IC diminishes the value significance of earnings (Collins et al., 1997; Francis and Schipper, 1999; Lev & Zarowin, 1999), and concurrently increases the gap between market value and
book value of the firm (Amir and Lev, 1996; Brennan, 2001; Holland, 2003). Consequently, non-recognition of IC increases the information asymmetry amid firms and the users of financial reports (Byrnes and Derhovanessian, 2002; McNamee, 2001; Reed et al., 2002). In order to determine whether non-recognition of IC decreases the relevance of accounting information (earnings and book value) this paper intends to investigate the effect of recognition of IC on accounting information (earnings and book value). Accordingly, the hypothesis states that:

\[ H_1 = \text{recognition of IC increases the relationship between market price with relevance of earnings and book value.} \]

To determine the effect of recognition of IC on the relevance of earnings, book value and market price, \( H_1 \) is subdivided into two new sub-hypotheses related to the different dimensions of IC:

\[ H_{1a} = \text{recognition of IC increases the relationship between market price with relevance of earnings.} \]

\[ H_{1a1} = \text{recognition of human capital increases the relationship between market price with relevance of earnings.} \]

\[ H_{1a2} = \text{recognition of structural capital increases the relationship between market price with relevance of earnings.} \]

\[ H_{1a3} = \text{recognition of capital employed increases the relationship between market price with relevance of earnings.} \]

\[ H_{1b} = \text{recognition of IC increases the relationship between market price with accounting information (relevance of earnings and book value).} \]

4. Conclusion

Researchers have been contending that the traditional financial statement provides only limited information pertaining to the relevance of earnings to investors due to the non-recognition of IC (Collins et al., 1997; Francis and Schipper, 1999; Lev and Zarowin, 1999), and non-recognition of IC at the same time increases the gap between market value and book value of the firm (Amir and Lev, 1996; Brennan, 2001; Holland, 2003). Recently, application of GAAPs and accounting standards has led to the decrease in relevance of earnings as well as non-recognition of IC (Amir and Lev, 1996; Brennan, 2001; Holland, 2003; Lev, 2001). This suggests that IC has significant impact on financial information especially to firm earnings. In this very context, researchers, practitioners, and accountants are required to resolve this long standing issue by extending the horizon of research, which measures IC.

Abstract
Purpose: The purpose of this paper is to throw light on the current context of teachers and teaching in Pakistan and to suggest further line of research on teaching and teachers in the country. Design: This paper is based on the review of different papers and articles available in different journals; and downloaded from internet and also on the daily experiences of mine which I face as a teacher and a teacher trainer. Findings: The review shows that teaching is a profession by default or an additional source of income. Male members only opt this profession because they could find any other job or adopt it for surplus income. Mostly the teachers are with low qualifications. Teaching is only the transmission of knowledge. Practical Implications: Future directions for the future exploration in this area of study are suggested. Originality: This paper is an attempt to know about the life of the teachers in developing countries, like Pakistan.

Key Words: Teachers, context and teaching.

Introduction
Pakistan is a developing country. The amount spent on education is only 2.2 to 2.5% of the total budget. Irrespective of the fact that every Government stresses on education, it is the most ignorant area to be addressed. Education always remains the sore point. As it is an open secret that the development of any country depends upon its education, education and educationists are always being ignored in our society. It resulted in the division of education at different levels and created segments in our society. A lot of work has been done and still is being done in the area of curriculum development and its implementation but the teachers who are the real implementers of curriculum are required to be included in the process of education effectively. That is why in this paper I tried to examine the profile or context of teachers with the intention to suggest further research in this area for the future betterment.

The Context of Teaching and Teachers in Pakistan:
Like many other developing countries, school teaching in Pakistan is the least-paid and least-respected profession which is not structured well. Always the average students who could not enter any other profession because of low scores opt for this profession.
Thus, most of the teachers in our country are teachers, by default and not teachers, by design. Male teachers get into this profession because either they could not find another job or they need a supplementary income to support their families well. Females are employed in a larger number because:

1. Schools provide a safe environment.
2. Their families compel them to join this profession.
3. They only have to interact with children and other teachers, mostly female.
4. They can share the expense as a homemaker.

Female teachers do not do any other job like male teachers but they have to look after their houses after the long tiring routine. Teachers are working in multi-grade over-crowded classrooms (40-80 students). Most schools lack the basic facilities. Many Government schools do not have a proper building. The lightning arrangements are very poor. Furniture is scarce and students are sitting on floors. Teachers do not have basic teaching material. Even laboratories do not possess sufficient equipment.

These conditions, along with poor salaries and limited incentives demoralize the teachers. Due to low remuneration teachers are not attracted towards this profession. These conditions are not changed since long.

Teachers also have to tolerate the social and cultural pressures. They are bound to the central Government to follow strict regulations, prescribed textbooks, national curriculum and other instructions issued and introduced by Centralist Ministries of Education, with little discretion given to them (Arthur 1998; Bjork 2004; Dhand, 2000; Coombe 1997). Teachers’ main concern in this respect is meeting the requirements of centrally devised diktats (WU, 2004). The teachers are also expected to develop the socially dominant values. They are supposed to transfer special sense of their society and loyalty. Teachers are not motivated at all as it is already mentioned that they are concerned with this profession due to one compulsion or the other, and not due to internal motives. Rarely any teacher is teaching because of personal interest or commitment. Mostly the teachers in rural areas join this profession because of the non-availability of any other alternative. Female teachers in the country give different reasons to enter the profession like love with children, idealism etc. their families play a key role in the selection of this profession. Many girls who were unable to score enough to get into a Medical college had “teaching” left for them as the only career option. Academically brilliant students go for Medical, Engineering or other socially high status professions. Average students with no other choice become teachers.

Mostly teachers have very limited content knowledge because they have gone through the same educational process under the supervision of same teachers as they are. Gaps in teachers’ subject matter knowledge have been well documented in other parts of the world but this issue has not been systematically studied in Pakistan (Ball, 1988; Ball and McDiarmid, 1990). Pakistani teachers could not even reach the minimum competency level of 40% in any of the three areas- mathematics science and pedagogical skills, probably due to poor reading habits (Saeed and Mahmood, 2002). Not a single individual was able to score more than 30%, which is passing grade for students in Pakistan (Ali, 2000).
Primary school teachers require matriculation certificate and PTC, Primary Teaching Certificate. Matriculation Certificate can be earned by taking the BISE examination, even without attending regular school at all.

Teaching in middle schools or secondary schools requires another two to four years college education. Students with third division or C-grade are acceptable as teachers. To enter in profession of teaching one does not have to be a high scorer as required to be on the merit list of Medical or Engineering Universities.

The certificates earned in the name of professional education are also not reliable. These certificates can be earned from Open University through distance education or as a private student by taking a written examination and providing a certificate of one year working in any school recognized by Education Department and affiliated with BISE. Schools normally provide this certificate to their teachers to avoid giving them study leave or normally the teachers have to leave the job. The threat of losing the job also keeps them away from any sort of professional training.

Commenting on the curricula of pre-service education programs (Smith et al. 1988) in their survey of teacher education in Pakistan, state that they did not see any evidence of:

- Differentiated objectives for children of different ages.
- Consideration of the interaction between child development and learning environments.
- The management of multi-grade schools in villages or large classes in cities, both of which are the key characteristics in Pakistani schools.

In PTC programs 58.3% time is used for teaching contact, 18.2% for teaching practice and 23.5% for examination activities (Mehrunnisa Ahmed Ali, 1998).

Most teachers in developing countries applied to teacher training programs because it is relatively inexpensive route to a settled and secure life (Dyer, 1996).

Teachers’ role towards them is not very encouraging. Majority of male teachers have other jobs. In Pakistan normally the male member is the head of the family and they are responsible to fulfill all the requirements. The money paid to them as salary is very meager to meet the expenses of their families. Thus they have to go for other jobs. This extra load of work causes a bad effect on their teaching standards. Along with less pays, the issue of promotion also affects the teaching and plays an important role in demoralizing the teachers.

Teachers are promoted on the basis of strict hierarchal structures. Knowledge, sincerity towards profession and hard work has nothing to do in the advancement of a teacher’s career. Teachers’ behavior towards teaching is not very encouraging. They are prepared as the knowledge transmitters but he modern world defines them as facilitators not knowledge transmitters. They are not concerned whether the students comprehend what they deliver. The teaching in Pakistani classrooms is more teacher-centered that student-oriented.

Teachers use lecture methods to cram the children with lots of information. Students are supposed to recall and print that information on a piece of paper in name of examination. This is actually a test of their memories and not knowledge or understanding of the subject. Teachers alone are not at fault for this. Actually they are pressurized by the education agencies to cover and transmit the prescribed subject content (Ali, 2000; White, 1997; Yildirim, 2003). They are supposed to cover the contents in the stipulated time. Students also like the teacher well who is able to transfer the knowledge in their brains and can prepare
them well for the examination. This is the yard stick to measure the competency of any teacher. Such teachers are taken as effective teachers and have no limit of evening tuitions. If we want to change this situation it is important to be realized at a higher level, because teachers are bound to obey the policies and are not motivated or have low tendency to bring the change or innovations in their teaching methodologies. Change is to be brought from up. In their times as students, teachers were also facing the same situations. They were supposed to show their strong memories. They are following the same practices as a teacher. Most teachers reject the students’ answers because they do not match the expected “right answer”.

(Arthur, 1998)
At last but not the least, the selection of teachers is highly politicized. Political leaders take votes from their constituencies after making long list of promises including the sorest issue of unemployment. When their voters come to them for jobs the most suitable job is teaching which in Pakistan is a job for which any unsuitable person can be the most suitable candidate.

Conclusion:
The conclusion is that the teachers are poorly trained, least paid and demoralized. The teaching profession in Pakistan also does not carry the respectable position it deserves. Teachers in Pakistan do not take it as a full time job. The meager incentives and promotion strategies make it an unattractive job for new professionals. Teachers have to obey the educational policies which are not designed by them or for the development of those policies in which they have no contribution. The teachers are not aware of the responsibility on their shoulders when they enter this profession. They must realize that “they are the builders of tomorrow’s nation.”

Direction for Further Research:
Further studies can focus on the:

- Different tasks of teachers.
- Gaps in teachers’ knowledge on subject matter.
- Teacher education at different levels.
- Teachers; lives and their careers.
- Teachers’ selection.

Qualitative study, in my opinion, can be suitable to provide deep insights into the teachers’ role and their impact in classroom teaching.

Abstract

Key success factors are the most important factors influencing the success of a business. The aim of this study is to offer a predictive model for the success of banks in this arena through identifying the most important features affecting encourage people to use internet banking. As using internet banking services requires a computer literate of the users, population of this research was made of the students in any of the state universities among which 267 people were selected through classified random sampling method. Data gathering tool is a questionnaire designed by the researchers that have evaluated the eight independent variables affecting intention to use internet banking customers, then the correlation between these variables with the intention to use internet banking to customers has been examined. Variables of Join relation (0.368), Order taking (0.336), the degree of vitality (0.332), price (0.329), the importance of human resources (0.269), Professionalism (0.239) and the degree of interaction (0.221), respectively, have had a significant correlation with the dependent variable. The decision tree presented also has shown that using this model the success of internet banking services can be predicted before running.

Keywords: Internet Banking, Customer Use Intention, Decision Tree.

1- Introduction

Electronic commerce refers to any business or economic activity through electronic communication. Business means all activities which cause the value associated with suppliers and customers [18]. Emergence of information technology has impressed many industries including banking. Electronic services are usually offered to customers through electronic channels such as ATM machines, telephones, personal computers, Internet and more recently via cell phone. Nowadays, information technology offers many online services as online and many customers have access to online services [10]. Also, internet banking has been defined as providing banking services through internet and the facilities of the network [17]. Internet has had many benefits for both the bank and its customers; using this technology not only can customers do their banking at any time and place, but also the cost reduction and increase in
productivity has been brought for the banks [17]. However, all organizations and institutes have not been similarly successful in applying e-commerce, so it is necessary to do some studies to create a favorable policy implementation and using e-commerce and the growing factors that facilitate it [9].

Due to increasing networking opportunities in the country and providing for admission of the achievements of organizations in order to provide customer service, reviewing the key factors that make effective electronic service delivery more desirable, is necessary. Such studies are more essential and useful particularly for financial-service institutions, especially the banks that have had considerable efforts in electronic and Internet services in recent years. Therefore, the aim of this research is to present a model to predict the success rate of offering this type of service by identifying the key factors affecting the successful offer of Internet banking services.

2- Literature Review:

2-1- Electronic Services:

Electronic services were expressed with growth of the Internet. At the beginning, online services reduced costs and caused the development of active institutions in this field. Although the companies gained some profit by selling online, but challenges emerged due to some weaknesses in the supply of this type of service and customer needs. Therefore, re-focusing on customer needs and demands and quality of online services, aimed at strengthening customer relationships and service providers, became essential. During the past few years online service providers have obtained considerable advantages by increase in communication with their customers. Until the researchers found that offering the best electronic services could be achieved through increase in communication with customer and company and product development. Despite the growth of electronic services there have been a few researches regarding the critical factors in providing optimal electronic services and the held researches on the quality of electronic services is still in experimental phase; hence evaluating the electronic service quality and judgment about preference and quality of electronic services, presented by Consumers, must be considered more [11].

In general, electronic service is an interactive, Internet-based and customer oriented process which is directed by the customer and gets integrated with customer-related processes and supports information and communication technology with the aim to strengthen the relations of customer and service provider [4].

2-2- Internet Banking:

Internet banking is a distribution channel of remote and virtual banking services [2]. Consumers can use the Internet to have access to the bank and their account information and perform banking transactions. At the basic level, internet banking means creating a Web page by a bank to provide information about products and services that are offered and at the advanced level, it is referred to access to accounts, transfer funds and online buying products or financial services [15].
Internet banking services are offered in three levels through internet. These levels are [14]:

1- Basic level of service: which includes communicating with customers via email and publish information about various products and services that are offered to customers;

2- Simple transactional Web sites: that allow customers to receive instruction and applications for the various services, but with no permission for transaction to their accounts such as transfers;

3- Fully transactional Web sites: they provide the necessary facilities for customers to access their accounts to transfer funds, pay bills of different account in other bank products, and purchase and sale transactions of securities, etc.

Internet has provided a context for the banks to enable them offering banking services such as paying bills and managing money at homes of their customers for 24 hours a day. For example, customers can receive the information about deposit and loan accounts, transfer funds between accounts and communication with other banks via email [13]. Even the possibility of buying and selling shares and bonds, receiving facility programs, providing electronic billing, international payments and providing international electronic payroll via the Internet is provided [12]. Internet banking is the means of cost reduction, improved productivity of the banks and creating added value for customers [8].

Though many activities in common business practices can be replaced by online methods as alternatives, but there are still certain limitations to providing such services, because customers are reluctant to use online services through the channels. Different researches has shown that while internet shopping, customers are heavily influenced by the risk level and also are greatly influenced by their perception towards ease of use for purchasing services [9].

2-3- Customers’ Intention to Use Internet Banking:

According to Ajzen, customers intend to use internet banking due to their personal interest in the use of systems which are provided for banking transactions. Many researchers have attempted to recognize behavioral factors affecting decisions of people to buy online. Different theories exist in this case that the most famous ones are rational action theory, theory of planned behavior and technology acceptance model; these theories show the predict intention of a good behavior [16].

In examining the marketing and sales literature, Degree of customization has been taken as one of the factors influencing customers to buy. Degree of customization is one of the dimensions of service characteristics which mean the amount of customer supply demands especially in the production and supply of goods or service. In other words, the degree of customization is simply the consistency of the implementation service process encountering with the customer personal needs [9]. In electronic commerce, calls and face to face human interaction has become the least through the application of technologies such as email, chat
and interactive multimedia. In addition, Internet application in service offers has provided the possibility of online support of customer demands more than ever.

Generally it has been observed that the concepts of flexibility in terms of interaction and customization have different meaning. In e-commerce, the necessity of online transactions and customization play similar role in facilitating online transactions in some areas [3].

The degree of customer concerns about understanding and awareness of selecting service provider expectations of service quality and confidence in the services offered, known as professional knowledge, has been impressive on the intention of use of the Internet service by customers [3].

Interactions between customers and bank employees in financial transactions seem very important. Over the past twenty years, banking sector has faced with enormous developments according to the perception of customer needs for technology, software and technology advances and restructuring the financial services sector. In response to these changes of banks, they have reduced the number of physical branches and have expanded electronic channels to increase effectiveness and decrease transaction costs [11].

The degree of interactions represents interactions frequency between service providers and customers in the whole process of transaction. The important factor in maintaining interactions with the customer is that customers present their recommendations and critics of the received service and get feedback from service providers [9].

Although information technology and Internet applications has gradually reduced the customers need to geographical accessibility, according to many experts [3], they are still effective as an important variable, e-commerce operations and strategies, while the degree of customer's need for geographical accessibility is basically dependent on product and service profile.

Furthermore, the urgency of the service levels desired (degree of criticality for customer), the price of the services offered to the Internet compared with other methods, as well as human resource capacity in manufacturing and service delivery and necessity of membership relation are considered as the other factors Influencing customers’ intention to use internet banking [9].

2-4- Decision Tree:

Decision tree is a flowchart with a structure such as a hierarchical tree that consists of three basic elements. Nodes are in accordance with decision variables, edges or branches correspond to different possibilities of values of the variables and the third component, known as leaf, includes objects that belong to a class or they are very similar and they can be placed in a class [6].

Decision tree analysis is a structured and systematic approach that facilitates knowledge and information for decision making. Decision tree help the analysis of a complicated issue and transform it into a smaller issue and analysts use it for achieving optimal decisions.
Decision trees help decision makers in taking decisions in which different variables are involved as an analytical tool and based on certain rules. Furthermore, when examining a subject according to its class, decision trees not only present solutions for it, but also clearly express the reasons for reaching it. Using this technique a large amount of data will be able to get managed. The structure of decision tree is similar to the real tree with root that represents the decision problem and each of the branches is the representative of each class. The so-called chance nodes and decision nodes represent the value of the tree classes. Hierarchical structure of data in decision tree form has been very popular and successful in practice. Many applicative programs in different fields work on analyzing the decision tree. For example, decision tree is used in the banks for making decisions about the credit, in industry to check the mechanical equipment, in manufacturing in order to quality control, in health care for the diagnosis of some diseases, in the molecular biology to analyze amino acid composition and in astronomy for automatic classification of heavenly bodies. These are just some of the areas of real-world applications of this technique and many potential applications have not yet been introduced [5].

3- Conceptual Framework:

Considering that the aim of this study is to identify factors affecting the successful offer of internet banking services and providing a model to predict the success of internet banking services, effective variables for customers’ purchase intention have been identified after reviewing the theoretical foundations and are shown in figure 1.

Fig.1. Conceptual Framework of the Research
4- Research Hypotheses:

4-1- In Internet shopping, price has a statistically significant positive effect on customer purchase intention.
4-2- In Internet shopping, professional knowledge has a statistically significant positive effect on customer purchase intention.
4-3- In Internet shopping, degree of vitality has a statistically significant positive effect on customer purchase intention.
4-4- In Internet shopping, human resource capacity has a statistically significant positive effect on customer purchase intention.
4-5- In Internet shopping, degree of interaction has a statistically significant positive effect on customer purchase intention.
4-6- In Internet shopping, geographical accessibility has a statistically significant positive effect on customer purchase intention.
4-7- In Internet shopping, membership relation has a statistically significant positive effect on customer purchase intention.
4-8- In Internet shopping, degree of customization has a statistically significant positive effect on customer purchase intention.
4-9- Using a decision tree the success of an organization in providing internet services can be predicted.

5- Methodology of Research:

This research is a correlation study and a survey regarding implementation. Both library and field methods of study has been used to collect data. Library method has been used to complete theoretical literature and a researcher-made questionnaire containing 45 questions has been used for collecting required data in connection with potential customers of internet banking. Some of the questions have been derived from the questionnaires of other similar external studies and some of them have been designed by the researchers with regard to the domestic situation. Answers have been set based on the five choice Likert range (very high, high, medium, low, very low). To confirm the reliability of the questionnaires, a number of experts were asked to review and announce their reform views. After applying the necessary reforms in the pilot study 28 questionnaire were distributed among members of the population. According to Table 1, Cronbach's alpha 6 / 75% was calculated and the reliability was ensuring a suitable research tool; then the final questionnaires were distributed among the statistical sample.

<table>
<thead>
<tr>
<th>Sample Volume</th>
<th>Percent</th>
<th>Chronbach's Alpha</th>
<th>No. of Questions</th>
</tr>
</thead>
<tbody>
<tr>
<td>Acceptable samples</td>

<td>96.4</td>
<td>0.756</td>
</tr>
<tr>
<td>Non-acceptable samples</td>
<td>1</td>
<td>3.6</td>
<td></td>
</tr>
<tr>
<td>Total</td>
<td>28</td>
<td>100</td>
<td></td>
</tr>
</tbody>
</table>

Table 1. Cronbach's alpha for pilot study

Since the use of internet banking require users to have computer literacy, all of the students of University of Sistan & Baluchestan (about 12,000 people) in educational levels of Associate, BA, BS, MS and PhD were considered as statistical population of research. In
order to increase accuracy of sampling and increase the similarity of sample and population, it was tried to use all educational levels. To calculate the sample volume given that the number of students was over ten thousand, sampling of the unlimited population was used in which the error level was 0.05 and sample volume was 267. To maximize the sample size \( p \) and \( q \) were considered equal to 0.5, significance level was \( \left(1 - \alpha\right) \) and the desired accuracy \( (e) \) were considered respectively 95% and 0.06. Thus sample size was determined as follows using the following formula:

\[
\frac{Z_{\alpha/2}^2 \cdot p \cdot q}{e^2} = \frac{Z_{0.025}^2 \cdot 0.5 \cdot 0.5}{0.06^2} = \frac{0.9604}{0.0036} \approx 267
\]

The collected questionnaires were analyzed by SPSS and SPSS Clementine Client 11.1 software. Pearson correlation test was used to determine the correlation between independent variables and the dependent variable. Also, decision tree technique was used to design a model for predicting the success of Internet banking services.

### 6- Research Findings:

#### 6-1- Hypotheses Test:

<table>
<thead>
<tr>
<th>Independent Variables Regarding to Correlation Rate with Dependent Variable</th>
<th>Dependent Variable: Intention to use internet banking</th>
</tr>
</thead>
<tbody>
<tr>
<td>Coefficient</td>
<td>Significance</td>
</tr>
<tr>
<td>1- Membership Relation</td>
<td>0.368</td>
</tr>
<tr>
<td>2- Customization</td>
<td>0.336</td>
</tr>
<tr>
<td>3- Degree of Vitality</td>
<td>0.332</td>
</tr>
<tr>
<td>4- Price</td>
<td>0.329</td>
</tr>
<tr>
<td>5- Human Resource Importance</td>
<td>0.269</td>
</tr>
<tr>
<td>6- Professional Knowledge</td>
<td>0.239</td>
</tr>
<tr>
<td>7- Degree of Interaction</td>
<td>0.221</td>
</tr>
<tr>
<td>8- Geographical Accessibility</td>
<td>0.019</td>
</tr>
</tbody>
</table>

Table 2. Correlation coefficient between independent variables and dependent variable

As it is shown in Table 2, given that significant coefficients obtained for all independent variables except the geographical accessibility are less than 0.05, all hypotheses except the sixth research hypothesis are confirmed based on a positive and significant relationship between membership relation, customization, degree of vitality, price, importance of human resources, professional knowledge and degree of interaction with the intention to use internet banking; but based on significant coefficient obtained for geographical accessibility, this hypothesis is not confirmed.

#### 6-2- Decision Tree:

After identifying the variables influencing the intention of online shopping by customers and confirmation of hypotheses, a model was designed using decision tree technique based on
which some predictions can be done in regard with the conditions of success of internet banking in compare with traditional banking (refer to fig. 2).

Figure 2 shows that, the most important variable is "price". The fact is that two variables, including price and professional knowledge influence mostly on preference of the use of internet banking in compare with traditional banking and also decision tree shows that professional knowledge has the greatest impact on price. Basically, if the relative frequency of "ok" is more than 50%, it means that implication of internet banking could be desirable. Using a decision tree other important results can be also mentioned as following:
Due to node 6, it can be concluded that if the price is too low, implementation of internet banking is recommended for offering services (81.416%).

According to the node 14, it can be resulted that if the price is low and requirement of professional knowledge is also very low, implementation of internet banking is considerably recommended (86.735%).

According to the node 7, we can conclude that if the price is low and requirement of professional knowledge is average, implementation of internet banking is recommended (77.344%).

According to the node 13, it can be concluded that if the price is low and requirement of professional knowledge is average, and also the degree of interactions of bank and customers is in a very high level, implementation of internet banking is considerably recommended (100%).

According to the first node, we can conclude that if the price is relatively high, implementation of internet banking is optimal (65.854%).

According to the node 5, we can conclude that if the price and the need for professional knowledge are very high, internet banking implementation is not optimal at all (0.000%).

<table>
<thead>
<tr>
<th>Predicted Value</th>
<th>Observed Value</th>
<th>Mean value for the dependent and independent variables</th>
<th>Service</th>

<td></td>
<td>Degree of Interaction (3.501)</td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td>Intention to Use Internet Banking (3.831)</td>
<td></td>
</tr>
</tbody>
</table>

Table 3. Internet Banking Acceptance by Customers

As mentioned, in this study the intention to use internet banking was the most important goal to measure success of internet banking. So, the observed success value of internet banking (76.620) in Table 3 is the customers intention to use internet banking and predicted value of internet banking success is the same predicted value in the last node (node 14) in decision tree which has the value of 86.735. According to the observed and predicted values of success of internet banking, since these two numbers are relatively close together and the
differences are small, it is found that decision tree is a very powerful tool in predicting the success or failure of an organization in providing electronic services. Compared with other techniques of data mining, this technique is widely used in various areas; therefore the decision tree is very strong for data distribution and measurement. And according to the results, the ninth hypothesis is confirmed, i.e. by using a decision tree model success of an organization in providing electronic services can be predicted.

7- Conclusion:
This study has attempted to help identification of some of the characteristics of internet banking service that encourage customers to use internet banking. According to the presented research literature, researchers such as Cho and Park (2002), Lee et al. (2007) and Loonam and O’ Loughlin (2008) have achieved these results that the degree of customization, professional knowledge effect, the degree of interactions, Geographical accessibility, the degree of vitality for the customer, the degree of importance of human resources, necessity of membership relation and price affect on the acceptance of internet banking by customers.

The results of this study also confirm widely the results expressed by these researchers except the influence of geographical accessibility which was not confirmed in considered population. This shows the high creditability of the research. Then data collected were used to develop a predictive model using a decision tree and the results showed an excellent accuracy of predictions. The results of this research will help to predict online success judging by accepting customers and to facilitate better understanding of ways of future adoption of Internet banking services. These findings, confirm the results of work done by Lee et al. (2007) in Korea. So it is recommended to the organizations that provide services through the Internet or are planning to make their services fully online to determine correct and proper conditions for the adoption of e-commerce and the factors that will facilitate or prohibit them to migrate from traditional physical channels to the internet and then to use decision tree prediction model to predict their success or failure that has less error than conventional methods.

Abstract
This paper focuses on Promotion objectives, strategies, and tools used by organizations. Business battles fiercely, making an enormous variety of products to meet different customer needs. In many businesses, promotion is the key to a new product success. Promotion is any technique designed to sell a product to a customer. To sell a product, promotional techniques, we will look at different reasons for & approaches to promotion, When & Why companies use particular tools & strategies & the special promotional problems & solutions of small business.

Keywords: Promotion Objectives; Strategies and tools

Introduction
Promotional Objectives, Strategies, & Tools

In developing a promotional plan, marketers must consider the company's basic promotional objectives. They must develop promotional strategies to reach those objectives. Then as a part of their strategies, they must choose among various promotional tools that may be used alone or in combination.

Promotional Objectives
You may think that the ultimate objective of any type of promotion is to increase sales. You're right. After all, the goal of any business is to make money, & companies make money by making sales. However, products, & control volume.

Communication of Information
A very basic objective of promotion is to communicate information from one person or organization to another. Consumers cannot buy a product unless they have been informed about it.

Information may advise customers about the availability of a product. It may educate them on the latest technological advances. Or it may announce the candidacy of someone running for a government office.

Information may be communicated in writing (newspapers & magazines) It may be communicated verbally (in person or over the telephone) Or it may be communicated visually (television, a match book cover, or a billboard). Today, the communication of
information regarding a company's products or services is so important that markets try to place it wherever consumers may be.

**Product Positioning**

Another objective of promotion, Product Positioning, is to establish an easily identifiable image of a product in the minds of consumers. For example, by selling only in department stores. Lauder products have positioned themselves as more upscale than cosmetics sold in drugstores. Given all the brands & trademarks in the market, marketers seek a unique position in buyer's minds.

Positioning a product is difficult because the company is trying to appeal to a specific segment of the market rather than to the market as a whole. First, the company must identify which segments of a market could be likely purchasers of its product & who is competitors are. Only then can it focus its promotional strategy on differentiating its product from the competition's, while appealing to its target audience.

**Controlling Sales Volume**

Another objective of promotions is sales volume control. Many companies such as Hallmark Cards, experience seasonal sales patterns. By increasing its promotional activities in slow periods, the firm can achieve a more stable sales volume throughout the year. As a result, it can keep its production & distribution systems running evenly. Promotions can even turn slow seasons into peak sales periods. For example, greeting card companies & florists together have done much to create Grandparents' day. The result has been increased consumer desire to send cards & flowers to older relatives in the middle of what was a dry for these industries.

**Promotional Strategies**

Once a firm's promotional objectives are clear, it must develop a promotional strategy to achieve these objective. Promotional strategies may be of the push or pull variety. A company with a Push strategy will aggressively push its product through wholesalers & retailers, who persuade customers to buy it. In contrast, a company with Pull strategy appeals directly to customers who demand the product from retailers, who in turn demand the product from wholesalers.

Makers from industrial products most often use a Push strategy And makers of consumer products most often use a Pull strategy. Many large firms use a combination of the two strategies. For example, General Foods uses advertising to create consumer demand (pull) for its cereals. It also pushes wholesalers & retailers to stoke these products. Once the promotional strategy has been determined, it guides the company's choice of promotional objectives & the types promotional communicational tools that will be used.
Picking the Right Tools for the Promotional Mix

Based on these strategies, the firm must select promotional tools. There are four basis types of promotional tools: Advertising, Personal selling, Sales promotions, & Publicity & Public relations.

The best combination of these tools—the best promotional mix—depends on many factors. The company’s product, the costs of different tools versus the promotional budget, & characteristics in the target audience all play a role.

The product. The nature of the product being promoted affect the mix greatly. For example, advertising can reach a large number of widely dispersed consumers. Thus it is used by makers of products that might be purchased by anyone, like sunglasses, radios & snack foods. Companies introducing new products also favor advertising because it reaches many times. Personal selling, on the other hand, is important when the product appeals to a very specific audience, such as piping or pressure gauges for industrial accounts.

Cost of the tools. The cost of communication tools is also important. Because personal selling is an expensive communicational tool, it is most appropriate in marketing high-priced goods like computers for industrial customers & homes for consumers. In contrast, advertising reaches more customers per dollars spent.

A promotional mix that is good for one company is not really good for another. For example, Frito-Lay can afford to spend millions of dollars on advertising & consumer promotions to promote Ruffles Cajun Spice potato chips nationally. But Zapps Potato Chips of Gramercy, Louisiana, the innovator in Cajun flavor potato chips, must rely on personal selling & publicity to promote its Cajun Craw-taters locally.

Promotion & Buyer Decision Process. Another consideration in establishing the promotional mix is the stage of the buyer decision process that customers are in. Customers must first recognize the need to make a purchase. At these stage marketers need to make sure buyer is aware that their products exist. Thus, advertising & publicity, which can reach a large number of people very quickly, are very important.

At the next stage, customers want to learn about possible products. Advertising & personal selling are important because they both can be used to educate the customer about the product. During the third stage, customers will evaluate & compare competing products. Personal selling is vital at this point because sales representatives can demonstrate their product's quality & performance in direct relation to the competition's product.

Next, customers decide on a specific product & purchase it. Sales promotion is effective at these stage because it can give consumers an incentive to buy. Personal selling can also help by bringing the product to convenient location for the consumer.

Finally, consumers evaluate the product after buying it. Advertising, or even personal selling, is sometimes used after the sale to remind consumers that they made wise & prudent purchases.
Advertising Strategies

Advertising strategies most often depend on which stage of the product life cycle their product is in. During the introduction stage, Informative Advertising can help develop an awareness of the company & its product among buyers & can establish a primary demand for the product. For example, when a new textbook is being published, instructors receive direct-mail advertisements notifying them of the book's contents & availability.

As products become established, advertising stages must change. During the growth stage, Persuasive Advertising can influence customers to buy the company's products, not those of its rivals. For example, during its growth stage, Advil used this approach to attract buyers of Tylenol & other pain relievers. Persuasive advertising is also important during the maturity stage to maintain the product's level of sales. In addition, Comparative Advertising may help to steal sales away from the competition. After proclaiming that << most people in Ford country drive Chevy pickups>>, the ad then discusses specific features of the two brands, in a classic example of the comparison approach.

Finally, during the latter part of the maturity stage and all of the decline stage, Reminder Advertising keeps the product's name on the tip of the consumer's lips. And so Atari continues to advertise its home video games, even through attention has shifted over to a newer competitor, Nintendo.

Whatever the product's life cycle stage, advertising strategies must consider timing. Should the organization advertise throughout the year on a continual basis, or seasonally? Companies such as commercial banks space ads evenly throughout a year.

Advertising Media

In developing advertising strategies, marketers must also consider the best Advertising Media for their message. IBM, for example, uses television ads to keep its name fresh in consumers' minds. But it uses newspaper & magazine ads to educate consumers on the product's abilities & trade publication to introduce new software. Each advertising medium has its own advantages & disadvantages.

Newspapers. Newspapers are the most widely used advertising medium, accounting for about 27% of all advertising expenditures. Newspaper offer excellent coverage, since each local market has at least the daily newspaper & many people read the paper ever day (Like you are). This medium offers believable coverage, since ads can change from day to day. It also offers believable coverage, since ads are presented side-by-side with news. However, newspapers are generally thrown out after one day, often cannot print in color, & have poor reproduction quality. Moreover newspapers don't usually allow advertisers to target their audience very well.

Television. Television accounts for about 22% of all advertising expenditures. In addition to the major networks, cable television is becoming a major advertising medium. Cable ad revenues have increased from 58$ million in 1980 to 1.4 $ billion in 1988, & are projected to be over 2$ billion by 1990.

Television allows advertisers to combine sight, sound, & motion, thus appealing to almost all the viewer's senses. National advertising is done on television because it reaches more people than any other medium.
One disadvantage of television is that there are too many commercials, causing viewers to confuse products. Most people for example, can't recall whether a tire commercial was for Firestone, or Goodrich. Viewers of VCR tapes of shows often fast-forward past the ads. Another disadvantage, is that the normal << Commercial spot>> lasts only a short time (usually 30sec), & then its gone. If the viewer is not paying attention, the impact of the commercial is lost. Brevity also makes television a poor medium in which to educate viewers about complex products. Finally television is the most expensive medium. A 30sec commercial during the Super Bowl costs about 750,000$!

Direct Mail. Direct Mail advertisements account for 17% of all advertising expenditures. As the name implies, direct mail often involves fliers mailed directly to consumers' homes or places of business. Direct Mail allows the company to select its audience & personalize the message. Consumers are also exposed to far less direct mail than to other advertising media. Moreover, although direct mail incurs the largest advance costs of any advertising. These features have helped to make direct mail a fast-growing advertising medium.

Radio. About 7% of all advertising expenditures are for radio time. A tremendous number of people listen to the radio each day, and radio ads are very inexpensive. In addition, since most radio is programmed locally, this medium gives advertisers a high degree of customer selectivity. For example, radio stations are already segmented into listening categories such as rock & roll, country & western, jazz, talk shows, news & religious programming.

Like television however, radio ads are over quickly. And radio permits only an audio presentation. Also people tend to use the radio as a background while they're doing their things, paying little attention to the advertisements.

Magazines. Magazine advertising accounts for roughly 5% of all advertising. The many different magazines on the market provide a high level on consumer selectivity. Magazine advertising also allows for excellent reproduction of photographs & artwork that not only grabs buyer's attention, but may also convince them on the product's value. And magazine allow advertisers plenty of space for detailed product information. Another advantage of magazines is that they have a long life & tend to be passed from person to person, thus doubling & tripling the number of exposures.

The problem with magazine advertising is that ads must be submitted well in advance to be included in a certain issue. Often there is no guarantee of where within a magazine an ad will appear. Naturally, a company would prefer to have its advertisement appear near the from of the magazine or within a feature article.

Outdoor. Outdoor advertising – billboards, signs, & advertising buses, taxis, & subways-makes up a little more than 1% of all advertising. These advertisement are relatively inexpensive, they face little competition for customer's attention, & they are subject to high repeat exposure. Unfortunately, companies have little control over who will see their advertisement.

Types of Advertising

Regardless of the media used, advertisements fall into one of several categories. Brands Advertising promotes a specific brand, such as Kodak 126 film, Head & shoulders shampoo, & Nike Air Jordan basketball shoes. Advocacy Advertising promotes a particular
candidate or viewpoint, as in ads for political candidates at election time and antidrug commercial. Institutional Advertising promotes a firm's long-term image, as when AT&T assures customers that it is the right choice.

**Advertising to Specific Market's**

Advertisements also differ in to whom they are directed. That is, advertisements depend on the company's target market. In consumer markets, local stores usually sponsor retail advertising to encourage consumers to visit the store & buy its products & services. Larger retailers use retail advertising on both a local & national level. Often retail advertising is actually cooperative advertising, with the cost of the advertising shared by the retailer & the manufacturer.

In industrial markets, to communicate with companies that distribute its products. Some firms use trade advertising publications. And to reach the professional purchasing agent & managers at firm buying raw material or components, companies use industrial advertising.

**Relation of Advertising**

Advertising affects nearly every American. Because it can be used to deceive as well inform buyers, advertising has increasingly come under regulation. The first regulation of advertising activities came in 1914. this act created the Federal Trade Commission to protect competition from unfair trade practices.

Members of the advertising industry also regulate themselves to some degree. Advertising media, including television networks & local stations magazines, & newspapers, decline ads they believe to be false or in poor test. And the National Advertising Review Board investigates complaints against national advertisers. If it finds in favor of the advertiser, chargers are dropped. If it finds in favor of the complaining party, then the advertiser must modify or withdraw its claim.

**Personal Selling Promotion**

Virtually everyone has engaged in some sort of sales activity. Perhaps you had a lemonade stand or sold candy for the drama club. Or you may have gone on a job interview-selling your abilities & service as an employee to the interviewers company.

Personal selling- the oldest form of selling- is a vital cog in many companies' promotional efforts. It provides the personal link between seller & buyer. It adds to a firm's creditability because it provides buyer with someone to interact with & to answer their questions.

Because it involves personal interaction, however, personal selling requires a level of trust between the buyer & the seller. When a buyer feels cheated by the seller, that trust has been broken & negative attitude towards salespeople in general develops. To counteract this reputation, many companies are emphasizing customer satisfaction & generally striving to improve the effectiveness of whatever personal selling they undertake.

Personal selling is also most expensive form of promotion per contact because presentations are generally made to one or two individuals at time. Personal selling expenses
include salespeople's compensation & their overhead, usually travel, food & lodging. The average cost of sales call has been estimated an approximately $240 & has been increasing rapidly in recent years. The high cost of personal sales have promoted many companies to set up Telemarketing departments. Telemarketing is the use of the telephone to carry out many of the activities involved in marketing a company's products. Telemarketing can be used to handle any stage of the personal selling process or to set up appointments for outside sales people.

Types of Personal Selling Situations

Managers of both telemarketing & traditional personal sales people must always consider how personal service are affected by the difference between consumer products & industrial products. Retail selling involved selling a consumer product for the buyer's own personal or household use. Industrial selling deals with selling products to other businesses, either for manufacturing other products or for resale.

Each of this selling groups situations has its own distinct characteristics. In retail selling the buyer usually comes to the seller. The industrial salesperson almost always goes to the prospect's place of business. The industrial decision process also may take longer than a retail decision because more money, decision makers, & weighting of alternatives are involved. And industrial buyers are professional purchasing agents who are accustomed to dealing salespeople. Consumers in retail stores, on the other hand, may be intimidated by salespeople.

Personal Selling Tasks

Improving sales efficiency also requires marketers to consider salespeople's tasks. Three basic tasks are generally associated with selling: order processing, creative selling, & missionary selling. Sales jobs usually require salespeople to perform all three tasks to some degree, depending on the product & the company. As you will see, this tasks differ in the skills required, the methods used, & the reasons for using them.

Order Processing. At the most basic level, Order Processing, a salesperson receives an order & sees to the handling & delivery of that order. Route salespeople are often order processors. They call on regular customers to check the customer's supply of bread, milk, snack foods, or soft drinks. Then, with a customer's consent, they determine the size of the reorder, fill the order form their trucks, & stack the customer's shelves.

Creative Selling. When the benefits of the produce are not clear, creative selling may persuade buyers. Most industrial products involves creative selling because the buyer has used the product before or may not be familiar with the features & uses of a specific brand. Personal selling is also crucial for priced consumer products, such as homes, where buyers comparison shop. Any new product can benefit from creative selling can help to create a need.

Missionary Selling. A company may also use missionary selling to promote itself & its products. The goal of missionary selling is to promote the company's long-term image than to make a quick sale.
The Personal Selling Process

Although all three sales tasks are important to an organization using personal selling, perhaps the most complicated is creative selling. It is the creative salesperson who is responsible for most the steps in the personal selling process described here.

Prospecting & Qualifying. In order to sell, a sales person must first have a potential customer, or prospect. Prospecting is the process of identifying this potential customers. Salespeople find persons through past company records, customers, friends, relatives, company personnel, & business associates. Prospects must then be qualified to determine whether or not they have authority to buy & the ability to pay.

Approaching. The first few minutes that a salesperson has contact with a qualified prospect are called the approach. The success of later stages depends on the prospect's first impression of the salesperson, since this impression affects the salesperson's creditability. Thus, salespeople need to present a neat, professional & to greet prospects in a strong, confident manner.

Presenting & Demonstrating. Next, the salesperson must present the promotional message to the prospect. A presentation is the full explanation of the product, its features, & its uses. It links the product's benefits to the prospect's needs. A presentation may or may not include a demonstration of the product.

Handling Objections. No matter what the products, prospects will have some objections. At the very least, prospects will object to a product's price, hoping to get a discount. Objections show the salesperson that the buyer is interested in the presentation & which parts of the presentation the buyer is insure of or has a problem with. They tell the salesperson what customers feel is important & essentially, how to sell them.

Closing. The most critical part of the selling process is the close, in which the sales person asks the prospective customer to buy the product. Successful salespeople, recognize the signs that a customer is ready to buy. Salespeople can ask directly for the sales or they can indirectly imply a close. Questions such as << Could you talk delivery Tuesday?>> & << Why don’t we start you off with an initial order of ten cases ?>> are implied closes. Such indirect closes place the burden of rejecting the sale on the prospect, who often will find it hard to say no.

Following Up. The sales process doesn’t end with the close of the sale. Most companies wants customers to come back again. Sales follow-up activities include fast processing of the customer’s orders & on-time delivery. Training in the proper care & usage of the product & speedy service if repairs are needed may also be part of the follow-up.

Sales Promotions
Sales promotions (motivators) are a very important factor in the promotional mix because they increase the chances that consumers will try a product. They also enhance recognition for the products. And they can increase the purchase size & amount. Did you ever here a promotional slogan << buy three & get one free>>.

To succeed, however, sales promotions must be convenient & accessible when the decision to purchase occurs.
Types of Sales Promotions

Sales promotions can talk a variety of forms. The best known are coupons, point of purchase displays, free samples, trading stamps, premiums, trade shows, trade promotions, & contests & sweepstakes.

Coupons. Any certificate that entitles the bearer to a stated savings off a product's regular price is a coupon. Coupon may be used to encourage customers to try new products, to attract customers away from competitors or to include current customers to buy more of a product. They appear in newspapers & magazines & are often sent through direct mail.

Point- of – Purchase Displays. To grab customer’s attention as they walk through the store, some companies use Point of Purchase Displays. Displays located at the end of the aisles or near the checkout in supermarkets are POP displays. POP displays are always coincide with a sale or the item being displayed. They also make it easier for customers to find a product & easier for manufacturers to eliminate competitors from consideration. The cost of shelf & display space, however, is becoming more & more expensive.

Free Samples. Trading Stamps, & Premiums. Purchasing incentives such as free samples, trading stamps, & Premiums are used by many manufacturers & retailers. Premiums are gifts, such as pens, pencils, calendars, & coffee mugs, that are given away to customers in return for buying a specified product. Retailers & wholesalers also receive premiums for carrying some products.

Trade Shows. Periodically, industries sponsor Trade for their members & customers. Trade shows allow companies to rent booths to display & demonstrate their products to customers who have a special interest in the products or who are ready to buy. Trade shows are relatively inexpensive & are very effective, since the buyer comes to the seller already interested in a given type of product.

Contests & Sweepstakes. Customers, distributors, & sales representatives may all be persuaded to increase sales of a product through the use of contest. For example, distributors & sales agents may win a trip to Hawaii for selling the most pillows in the month of March. Although sweepstakes can’t require consumers to buy a product to enter, they may increase sales by stimulating buyers’ interest in a product.

Publicity & Public Relations Promotions

Much to the delight of marketing managers with tight budgets, Publicity Is FREE. Moreover, consumers see publicity as objective & highly believable. Thus, it is a very important part of the promotional mix. However marketers often have a little control over publicity.

Public relations is company- influenced publicity. It attempts to establish a sense of goodwill between the company & its customers through public service announcements that enhance the company’s image. From this topic, so far, you may think that only large companies can afford to seriously promote their goods & services. Although small businesses have fewer resources, cost – effective promotions can improve sales & enable small firms to complete with a much larger firms.
Small Business Advertising

The type of advertising chosen by a small business depends on the market the firm is trying to reach: Local, National, International.

Local Markets. Advertising is non prime-time slots on local television offers great impact at a cost many small firms can afford. More commonly through, small businesses with a local market use newspaper & radio advertising & increasing direct mail.

National Markets. Many businesses have grown from small to large operations by using direct mail, & particularly catalogues. By purchasing mailing lists of other companies’ customers, a small firm can target its mailing, reducing costs. The ability to target an audience also makes specialized magazines attractive to small businesses.

International Markets. Television, radio, & newspapers are seldom viable promotional options in reaching international markets because of both their costs and their limited availability. Most small firms find direct mail & magazine advertising the most effective promotional tools.

Small Business Personal Selling

Like advertising, personal selling strategies used by small businesses depend on their intended market.

Local markets. Some small firms maintain a sales force to promote & sell their products locally. Others contract with a sales agency – a company that handles the products of several companies – to act on their behalf. Insurance agents who sell insurance for several different companies are sales agencies.

National Markets. Because of high costs of operating a national sales force, many companies have established telemarketing staffs. By combining telemarketing with a catalog or other educational product literature, small companies can sell their products national & compete against much larger companies.

International Markets. Small companies can’t afford to establish international offices in order to conduct businesses. Even sending sales representatives overseas is expensive. Thus, many small companies have combined telemarketing with direct mail in order to expand internationally. Small businesses often depend on an interesting or unusual sign to attract new customers.

Small Business Sales Promotions

Small companies use the same sales promotion incentives that larger companies use. The difference is that larger firms tend to use more coupons, POP displays, & sales contests. Smaller firms rely on premiums & special sales, since coupons & sales contests are more expensive & difficult to manage.

Small Business Publicity

Publicity is very important to small businesses with local markets. Small firms often have an easier time getting local publicity than do national firms. Readers of local papers like to read about local companies, so local papers like to write about such businesses. But fierce
competition for coverage in national & international publications limits the access small businesses have to those markets.

**Distributing Goods & Services**

In selecting a distribution mix for getting its products to customers. A firm may use any or all of six distributing channels. The first are aimed at consumers & the last two at industrial customers. Channel 1 involves a direct sale to the consumer. Channel 2 includes a retailer. Channel 3 also includes one wholesaler, while strategies include intensive, exclusive, & selective distribution.

Wholesalers act as distribution intermediaries, extending credit & storing, repackaging, & delivering the product to other members of the distribution channel. Full-service, & limited-service, merchant wholesalers differ in the number of distribution functions they offer. Agents & brokers never take legal possession of the product.

Retailing involves direct interaction with the final consumer. The major types of retail stores are department, specialty, bargain, convenience, supermarkets, & hypermarkets. (Like in Moscow). They differ in terms of size, services, & product type they offer, & product pricing. Some retailing also takes place without stores, through the use of catalogs, vending machines, & video marketing. According to the wheel of retailing, conventional retailers are periodically Displaced by low-priced innovative retailers, who then become more conventional & subject to displacement.

Distribution ultimately depends on physically getting the product to the buyer. Physical distribution includes customer-service operations such as order processing. It also includes warehousing & transportation of products. Warehouses may be public or private & may be used for long-term storage or serve as distribution centers. Costs of warehousing include inventory control & materials handling.

Truck, plane, railroad, water, & pipeline transportation differ in cost, availability, reliability of delivery, & speed. Air is the fastest but most expensive. Water carriers are the slowest, but least expensive. Most products are moved by truck at some point. Transportation in any form may be supplied by common carriers, freight forwarders, contract carriers, or private carriers.

**Developing & Pricing Products**

Products are a firm’s reason for being, their features offer benefits to buyers, whose purchases are the source of business profits. In developing products, marketers must take into account whether their market is individual consumers or other firms. Marketers must also recognize that buyers will pay less for & worry less about the exact nature of convenience goods than about shopping & specialty goods. In industrial markets, expensive items are generally less expensive & more rapidly consumed than are capital items.

The seven stages of product development are development the ideas, screening, concept testing, business analysis, prototype development, test marketing, & commercialization stage.

When new products are launched, they have a life cycle that beings with their introduction & progresses through stages of growth, maturity, & decline Revenues rise
through the early growth period; sales rise through the late maturity period. In terms of the growth–share matrix, this progression appears as a product moves from questions mark to star to cash cow to dog.

Each product is given a visible identity by its brand & the way it is packaged & labeled. National, licensed & private brands are developed to create brand loyalty. Packaging provides an attractive container & advertises the product. The label informs the consumer of the package contents. The pricing of the product will determine its business success, depending on the business objectives that are being sought. Profit maximization, market share, & other business objectives may be relevant to the pricing decision. Economic theory, cost-oriented pricing, & break-even analysis are used as tools in determine prices.

Pricing also involves choices of a basic pricing strategy can be used for new products. Existing products may be priced at, above, or below prevailing prices for similar products, depending on the other elements in the marketing mix. Within a firm’s pricing strategies, managers set prices using tactics such as price lining, psychological pricing, & discounting.

INTEGRATED BUSINESS STRATEGY FOR INTERNATIONALIZATION PROCESS: CASE STUDY ON KOREAN COMPANIES ENTER CHINA CONSUMER ELECTRONIC MARKET

Lee Jing Wen and Lawrence Arokiasamy

Universiti Tunku Abdul Rahman, Premier International University Perak

Abstract
In the recent years, a number of emerging issues are posing serious challenges to the consumer electronic companies. Hence, these consumer electronic companies enter the new area, dramatic challenges begun such as globalization, information technology advancement, competition and financial constraints. Thus understanding the problems and think a way to expand and strategies electronic company’s to future progress and grows. Therefore this article explore the integrated business strategy based on the case study on two Korean’s consumer electronic companies in their internalization process, in particular concentrated on enter into China’s market. Based on the finding of qualitative analysis, this paper proposes a model to integrate international marketing, business and operation strategy from some literatures on internationalization process models and a case study on two Korean companies for enter into foreign market. This conceptual paper is aiming to incorporate both theoretical and practical business strategies into firm’s international expansion. We finish with implication for international management, and a concluding statement.

Key words: Integrated Business Strategy, Globalization, Strategic Management, Consumer Electronic Market

INTRODUCTION
Conventionally, the motives that encourage firm expand their business to other countries, including access to distinctive resources, access to greater market growth, take advantage of the economies of scale, (Hutzschenreuter ,D’Aveni & Voll 2009).Other reasons are competition among competitors such as large and major players of consumer electronic company, they need to expand their business internationally in order to stay competitive in the industry.

The consumer electronics industry is rapidly growing globally, with many innovative products being invented by recent advances technology. Due to the current ‘digital revolution’, many older product formats up dated by more advanced technology and has driven massive increases in consumer demand (Datamonitor, 2006). The product segment of global consumer electronic industry has divided in three categories, which is sale of video, audio and games consoles (Datamonitor, 2005). The global market is approximately equally distributed between the US, Europe and Asia-Pacific. The Americas region accounts for 38% of the global market, and is dominated by the US market. Additionally, the economic growth in substantial markets such as China and India has also boosted global consumer electronic market revenue (Datamonitor, June 2006).

The advancement of technology has contributed many great advantages and motivation to the company to internalize their business; due to the success of the communication and information technology, transportation and infrastructure technology. It
shortens the distance among the countries; help companies more easily operate their business globally via e-mail, video conferencing and e-commerce. Globalization is accelerated by improvement of information and communication technology, it increases connectivity and interdependence of the world’s markets and business (Lunga, 2008). Beside the great invention of technology, the government and economic of the countries have played an important role in the process of globalization. Country’s government who willing to reduce barriers for trading will ease the company for internationalizes. (Lasserre, 2003).

This paper begins with review the literature of globalization, internationalization process models, and highlights the importance of integrated business strategies. Presents studies analyze the integrated business strategies from a case study based on two major Korean companies in the global consumer electronic market, entering into china market, i.e. LG and Samsung. We propose a model for integrated business strategies in foreign market and finally the implication for international business and conclusion.

PROBLEM STATEMENT

Dealing with international market it is more complex compare to indigenous market. Therefore, the company’s strategies are needed to re-evaluate more frequent in order to stay competitive. An integrated strategy is needed to improve the company’s internationalization process.

LITERATURE REVIEW

Globalization

Most of the researchers regards the word ‘global’ and ‘international’ are to be used interchangeably (Scholte, 2008). Scholte (2008) illustrated that when the increase of transactions and interdependence between two countries, the concept of globalization or internationalization is emerging. Lunga (2008) commented that the rest of the world will be benefited when globalization happen, as it having the potential to create greater opportunities for company’s growth globally. Globalization created an “interrelated, interconnected, and interdependent, a total interconnected marketplace, unrestricted by time zones or national boundaries (Lunga, 2008). Country’s economic health becomes more inter-related. The opportunity and competition with a marketplace is increased at the same time (Lasserre, 2003). Rugman (2000) argued that globalization is actually either regionalization or trading between the three great trading blocs of the world, which is North America, Europe and the Far East.

Internationalization Process Models

The internationalization process theory introduced that firms are internationalize slowly by developing step by step from producing and serving for the domestic market to exporting via agents and abroad sales offices in foreign market (Amdam, 2009). Firm find easier to expand their business in countries that with short psychic distance to the domestic market, which mean firm tend to expand to the country with less different in term of business laws, education level, languages and culture (Benito & Gripsrud, 1992; Kogut & Singh, 1988; Amdam, 2009). According to this theory, firm will provide stronger commitment in internationalize business to the foreign market when they learn more about the international
operation. The learning of the market specific operation knowledge is develops over time by involvement of the business activities in that market. (Amdam, 2009) In addition, Johanson & Vahlne (2003) suggested strong business networks are important in the internationalization process.

Many researches have been conducted for different phenomenon of internationalization such as the location, mode or timing of internationalize Along the research most of the scholars are focus on internationalization models on the temporal and geographical dimension (Hutzchenreuter et. al, 2009). Based on the timing aspects, there are numerous literatures emerged on the internationalization frameworks. (Hutzchenreuter et. al, 2009), such as:-

- Vernon’s (1966) first approaches to explain internationalization process in three-stage model; first stage, company choose to export to the developed countries, second stage, company strengthen its export activities and being to invest in developed countries, and final stage are choosing to invest in developing countries.
- Uppsala Internationalization model by Johanson and Wiedersheim-Paul (1975) argue that due to require to learning about other country, firm tend to expand in a small steps, there are four successive stages in Uppsala-Model, stage one with no regular export activities, stage two are export product via independent representatives or agents, stage three is establishing overseas sales subsidiary, finally establishing overseas production or manufacturing units.
- Bilkey and Tesar (1977) propose six-staged model of export behavior.
- Chang (1995) focus on increasing commitment.
- According to Song (2002) previous investment serves as future upgrading of internationalize activities.
- Jones and Coviello (2005) commented that that Internationalization event happen in specific point of time.

**Integrated Business Strategies**

This section of the literature review of reflected how the integrated business activities will increase firm’s efficiency and effectiveness in internationalization process. The right combination of the business, marketing and operation activities in internationalization process will produce competitive advantage to the firm.

**Case Study for Samsung Integrated Business Strategies**

**Market Entry Strategy**

There are many different methods that a company could exist in the foreign countries; some companies might set up manufacturing plant, R&D laboratory, sale subsidiaries, offices through partnership and franchise. The selection of the methods depends on the company resources and the market place’s openness (Lasserre, 2003). Samsung’s strategy to enter China can be divided into three stages First stage is in the early 1990s, strategy to secure production base, second stage is in the second half of 1990s, shift its aim to product high-quality product segment and third stage is try to make China as a key market for sales (Choi, 2003).
Commitment Strategy; Second headquarters

Samsung developed a second headquarters in China in order to strengthen its operations over there. Headquarters in China are giving supervision to its 21 manufacturing companies. This second headquarters will control the recruitment and deployment of personnel as well as sale channels in China. It was also responsible for set up the Samsung’s long term vision for China, conducting market survey and setting up marketing strategy. Its goal is to consolidate the strategy planning and well delegate to individual companies in order to maximize the group’s synergies (Nomura Research Institute, 2003).

Production and R&D Strategies

According to the Electronic News on 29 December 2003, Samsung Electronics Co. Ltd. announced the expansion of its Suzhou, China business, its facility with a new assembly and final test line, and an R&D center for package technology and local engineering support. The new R&D center, Samsung Semiconductor China R&D Co. Ltd. (SSCR), is the company’s first R&D center for the core component business established in China. Referred to Yoon Woo Lee, the president and CEO of Samsung’s electronics' device solution network business mentioned The R&D center and production line will increase local customer support and strengthen their relationship with China's IT industry and academia (Choi, 2003).

Case Study for LG Group’s Integrated Business Strategies

Market Entry Strategy

LG enter China in 1993 which slightly later than Samsung, for the purpose of reducing their production costs (Choi, 2003). It began by establishing an audio equipment and CR-ROM production in Huizhou, then set up LGESG in Changsha in August 1994 to manufacture cathode ray tubes, and LGETA in Tianjin in August 1995 to manufacture air conditioners and microwave ovens. Most of the products they manufactured were lower-priced, thin-print-margin household electrical appliances aimed at the Chinese domestic market (Choi, 2003).

Expanding Local Production

LG have to expand its local production to compete with the LG’s competitors i.e. Haier Group, become the world’s largest manufacturer of air conditioners, refrigerators and washing machines and the Legend Group, the world- class company that ranks fourth worldwide behind Sony, Matsushita and Philips in color television manufacturing capacity. Originally, the Chinese market for low-priced household electronic appliances, but Chinese’s domestic manufacturer which is LG’s competitors they are able to improve their technological expertise and product marketability at a much faster pace than had been expected, soon LG realized that they were limits to what it could do by simply expanding its local production (Choi, 2003).

Differentiation Strategy

LG Group chairman Koo Bon –Moo chaired a China Strategy Conference attended by some 30 top managers from its electronics and chemicals division in Shanghai in October 2001, announced LG’s second phase China strategy. LG Group’s new strategy is called “Bipolar” strategy which serves the high-income and moderate income market. It offers high
value-added digital home appliances to high-income and low-priced general household appliances to people with more moderate income level. (Choi, 2003)

Commitment and Localization Strategy

LG electronics established its local subsidiary in Huizhou in 1993, the LG group’s 12 subsidiaries have come to manage some 34 local companies, including 22 manufacturers. LG Group is enthusiastic and committed to its business in China; they built LG Beijing Towers which is centrally located on Beijing’s Chang’an Avenue close to Tiananmen Square, the complex have two towers with 30 stories above the ground and four stories below (Choi, 2003). This headquarters are promoting LG’s localization strategy in China, Roh Yong-Ak, vice chairman of the LG Electronic China holding company, is stressing that the construction of LG company headquarters does not symbolize LG’s success as a foreign company in China. It symbolizes the fact that they are determined to become a ‘Chinese company’ (Choi, 2003).

Strategy Alliance

LG is aggressively pursuing global partnership in selected business and technology areas by establishing a wide ranging of strategic alliances with world leading companies in order to becoming first mover in the market and leading the industry standard for example LG is concentrating on strengthening strategic alliances in the digital TV industry.

Brand Management Strategy

LG launches worldwide brand management strategy on 12 December 2004 (United Arab Emirates). Its global and regional digital leader LG Electronics has integrated its brand campaigns and strategies at a global level to strengthen brand management systems. LG has set up a management system, LGePR, to manage its global brand campaigns and LG has come out an integrated Brand Communications Guideline and slogan, Life's Good. K H Kim, the president of LG Electronics Middle East and Africa Operations stated that they are aiming to be the top three consumer electronic manufacturers in the world, and their global public relations mission is to empower the LG brand; implement strategies to increase brand recognition and position LG Electronics as a digital convergence leader.

RESEARCH METHODOLOGY

The two firm Samsung and LG are chosen for case study are the large Korean consumer electronic company which successful operated they business in the global market. They provide and manufacture electronic appliances and devices such as TVs, computers and related products semiconductors, fiber optic products. Both have their headquarters in Seoul, South Korea and operate in more than 30 countries, employ more than 82,000 peoples operates subsidiaries and retail outlets around the world include the Europe, Asia, North America, Central and South America.

This paper aim to investigate what is the integrated strategies they adopted for internationalize their company; qualitative methods were selected because it is more on exploratory study. Issues were addressed to the key strategic decision makers for different department of the company, such as Chief Executive Officer and, Managing Director, etc. Through secondary data research on the company website find out their strategies for
internationalization and later focus on what are the integrated strategies for enter into China market.

FINDING
International Marketing Strategies
Market Entry Strategies

Samsung’s former business was export goods to China. The company was founded on 1938 by Byung-Chull Lee started his business in Taegu, Korea. At first, this little business was primarily trading by export, selling dried Korean fish, vegetables, and fruit to Manchuria and Beijing. In the other hand, LG was started as an exporter in 1962, exported radio to the US and Hong Kong as Korea’s first. By export it products follow by set up sale subsidiary, services subsidiary and R&D in US the key market; it help LG to become a global player. Initially, due to the attractiveness of the low cost production at China, most of the companies, including Samsung in early 1990s and LG in 1993 slightly late then Samsung; both had operated their business at China by building up manufacturing plant. In order to continues growth and maintain the company, LG have a number of partnership with the selected companies, established a wide ranging of alliances and collaboration with world leading companies. For example, in 1999, LG have established a joint venture with Philips. Respond to the rapid changing digital era, LG has established a wide ranging strategic alliance with the world leading companies. Through collaboration efforts with the world class technologies, it enables LG to strengthen its status and has a solid basis of growing into a front runner of the multimedia industry.

Diversification

The similarities we could find among the leading companies of consumer electronic are the companies diversify their business into many different products or segments. They are not only dealing with consumer electronic products or segments. They have their own diversify area, for example, Sony is in the entertainment industry through subsidiaries dealing with recorded music, motion pictures, TV programming, DVDs and videos, but Koninklijke Philip Electronics is provides a range of products, from medical systems, domestic appliances and personal care and consumer electronics to lighting and semiconductors.

Marketing Mix

Samsung used high quality products to carry out its 5 percent strategy by selecting and concentrating targeted market. In the other hand, LG have invested more in R&D to carry out its LG’s technology strategies. Aim to develop No. 1 products and reinforce its core technological capability. LG’s ‘bipolar’ strategy has a two pricing product; one for the high income, another for medium income. Advertising is important in this industry, to build up brand recognition LG’s have been investing in lot of brand awareness activities and campaigns. In 1995, LG realised that to success on the world market it was necessary to have a global name: for this reason LG has launched worldwide brand management strategy; the company has integrated its brand campaigns and strategies at a global level to strengthen brand management systems. Public relations LG has set up a brand management system, LGePR, to manage its global brand campaigns and LG has come out an integrated Brand Communications Guideline and slogan, Life's Good that can be understood everywhere and
that can become a very important competitive asset. K H Kim, President, LG Electronics Middle East and Africa Operations stated that they are aiming to be the top three consumer electronic manufacturers in the world, and their global public relations mission is to empower the LG brand; implement strategies to increase brand recognition and position LG Electronics as a digital convergence leader. **Place** Samsung’s selection and concentration strategy and ‘5 percent’ strategy, they only target urban areas for example, 10 major cities including Beijing, Shanghai and Tianjin, and comprise some 65 million people who have high purchasing power.

### International Business Strategies

#### Standardization

Globalization of business is a must for certain industry to continue staying competitive among its competitors. For example in the consumer electronic industry, there are a few multinational companies that dominate the market elsewhere, like LG, Sony, Samsung, Philip and the other well known brand that everyone can name. They all have business standardize globally. They have set up office, sale subsidiaries, manufacturing plant, R&D laboratory, website, and e-commerce and so on, in different foreign countries.

#### Differentiation

Professor Michael Porter, from Harvard Business School, has mentioned that a successful competitive strategy needs to be either Cost leadership, Differentiation or Specialization. Some books called it Porter generic strategies or Porter’s model of competitive advantage. Lasserre (2003) stated that this typology can apply to global positioning, which means the company can either position itself as a Global differentiator or a Global cost leader. Samsung had applied **differentiation**, it start from selection and concentration and in the latter stage Samsung only focus on selling high quality product; it is called 5 percent strategy. Samsung initially competed with the "Cost leadership" strategy, which opened plants in China to mass-produce the low to medium priced products. Most of the products were exported back to Korea or to third countries and the remainders were sold in China. Once into the second half of the 1990s the Chinese economy started growing rapidly. Samsung had started to switch it competitive strategy to "Differentiation" strategy called 5 percent strategy. The company is aiming to be unique from other competitors by using a high quality product rather than the low cost mass production's product; by selected and concentrated on 65 million people whose have high purchasing power to buy high quality products. It helped avoid the intensity of price competition and strengthen the brand name by manufacturing and selling high-quality products.

#### Localization

Company that has their own organization design will help effectively aligned with the company’s overall global strategy and strategic orientation. Some of the role of organization design is to maximize company’s global-scale efficiently, gaining global coordination, generate global learning, adapting to local conditions and exploit location economies. The efforts to localization, for example set up headquarter at China and use the local employee. This helped LG to get to local information easily, and used this information to generate a suitable marketing strategy. Headquarters for promoting LG’s localization strategy in China, Roh Yong- Ak, vice chairman of the LG Electronic China holding company, is stressing that
the construction of LG company headquarters does not symbolize LG’s success as a foreign company in China. It symbolizes the fact that they are determined to become a ‘Chinese company’.

Level of Commitment

Samsung expanded R&D center in China; LG expanded its production in China, and showed the commitment and willingness to invest for the long term. A global company like Samsung and LG electronic is not just developed in a short-term period, it had set up the global ambition in a very early stage. It has successful business strategy to pursue their goal. For example, LG is continue strengthen their strategic capability, created and maintain competitive advantage to compete in a rapidly advancement electronic industry. Through different types of entry strategies allow LG to improve it globalization process, and toward the objective to be a global leader in the electronic industry. LG Group is enthusiastic and committed to its business in China; they built LG Beijing Towers which is centrally located on Beijing’s Chang’an Avenue close to Tiananmen Square, the complex have two towers with 30 stories above the ground and four stories below.

International Operation Strategies

Logistic Management

The Value Chain Analysis created by Michael Porter has mention some activities that can added value to the product; R & D is one of the value-adding activities that have a goal to maximize the product's quality while minimize the production costs. Samsung believed that its new R&D center and production line will increase local customer support and strengthen their relationship with China's IT industry and academia.

Location

There are many advantages from Samsung's second headquarters in China; it served as a very effective strategy for the company. It will attract more investors, example like Samsung have shown a very clear commitment on long-term investment in China by developing a second headquarters in China. This will draw more capital from local or foreign investors to invest in Samsung in China. Headquarter will strengthen company access to local information. Headquarters in China allow Samsung easy to get local information and customer's taste and behavior. Samsung included the local people to be its employee will help the company conducting market survey and setting up marketing strategy that adapt and customize its products to meet the customer's need and want, Additionally, headquarters in China will easy to give supervision to its manufacturing companies and control the sale channel in China. It helps strengthen its operations over there by consolidation of the strategy planning and will delegate to the individual companies in order to maximize the group's synergies.

CONCEPTUAL RESEARCH FRAMEWORK

The propose model are significant different from other models, due to it is incorporate both theoretical and practical implications of international operation for a firm. Most of the models were conducted in the temporal and geographical aspect. The model proposes here is
more on strategic move in internationalization process. The model are focused on the mode or “how” to entry foreign market and international implementation.

![Diagram of Integrated Business Strategies in foreign market]

**Figure 1: The Model of Integrated Business Strategies in foreign market**

**IMPLICATIONS**

**Apply suitable business strategy to the right direction**

Companies can start learning from many successful strategies and methods that been used by Samsung and LG, even from the very beginning of planning stage of what strategies to enter China’s market. Identify and plan the strategic direction that the company can pursue. This will help to save a lot of time and money in unnecessary work, avoid making mistakes and grab the right direction and ideas from others companies’ experiences.

**Situation analysis is the fundamental of successful strategy**

In order to choose the right entry strategy and business strategies that benefit the company’s objective, mission and vision. Most studies are suggesting that companies examine their company and the market situation before making any decision; examine their company's internal and external condition and position. For example, find out the capital and resource the company own, and then make a decision either aiming to become cost leader or differentiator. Also, they might have to decide either to customize or standardize their products and services. In order to make the right decision making for any steps of the company planning to expand its business, well and sufficient research and analysis is important for a company to generate ideas and strategy for success.
Clearly define and delegate the company's strategy

Clear communication between managers to his subordinate is very important, particularly at the global competitive stage. The international managers have to be aware of the different culture existing in the country and they have to find out the appropriate ways to deal with the subsidiaries all over the world.

Apply the 4 Ps marketing mix

According to the analyses, both Samsung and LG have well focused on the marketing mix, i.e. Product, Price, Promotion and Place. The marketer called them marketing mix, because each P is inter-related to each and other. For example from Samsung, the first P-Product, Samsung have increased its product’s quality to target the high-income consumer; the second P- Price, the price for the product is high because of the high purchasing power of its target market and by selling high value-added product to this targeted market, hence Samsung has avoided the intensity of price competition with the local Chinese companies; the third P-Promotion, Samsung has strengthened its brand name because manufacturing and selling high-quality products; and the fourth P-Place, the place that it choose to sale it product are in the major urban city where the high status people live.

Enter China by Strategy Alliance

Recently, the ever changing technology makes the consumer electronic industry so much more of a challenge than before, and for many new companies it is hard to enter a market on its own. In this case, strategy alliance has become common entry methods in this industry, for example LG have many strategy alliance projects with other companies to add value to its products and services, and this has increased its brand reputation. If company wants to enter the market by strategy alliances, they will need to understand the local company motif of collaboration and both parties’ success criteria, it will help guide the manager on how to build relationships and interact with the partners.

CONCLUSION

This study contributes to the internationalization process for consumer electronic companies to successfully competing in the global rivalry’s environment. Most internationalization process’s literature was conducted from the perspective of the right location, mode or timing of internationalize, but this study is to focus on the integrated business strategies to successfully enter and operate their business in China market.(Hutzchenreuter et. al, 2009).

This case study shows the successful integrated business strategies of Samsung and LG in entering into China’s market. The interrelated business strategies have been used by Samsung and LG are categories into firstly, international marketing strategies which included market entry strategies, diversification and marketing mix, secondly, international operation strategies that included logistic management, oversea subsidiaries, oversea production and headquarters, and finally, international business strategies that included standardization, differentiation, localization and level of commitment.

For future research, there are many well-known consumer electronic companies who compete in the global stage like Sony, Philip and Matsushita have business in China, which worth to research and find out their experience in entering China market and lessons can be learn.

Benefits and Risks Analysis of Outsourcing technical-vocational Training of Charmahal and Bakhtyari Province from Professionals Viewpoints

Fereshteh Bayati
Graduate Student Public Administration, Islamic Azad University, Khorasgan Branch, Isfahan, Iran

Mohammad Hossein Moshref Javadi, Ph.D
School of Business Administration, University of Isfahan, Iran

Abstract
Objective of implementing present research was to study the effect of outsourcing training from viewpoints of experts in the headquarters of technical and vocational training of Charmahal and Bakhtiari County. The population of this research consisted of 490 people included center bosses, experts and mentors (in the public sector) and performers and mentors (in the private sector) of Charmahal and Bakhtiari’s technical and vocational headquarters for the year of 1989. From those numbers, 120 samples according to the statistical population volume were selected by categorical sampling method. Statistical methods such as: single variable T test, Hoteling and multi-variable variance analysis were used for testing research hypothesis. Comparison of factors with regard to the variables were used as well. The result indicated that according to the experts and personnel opinions of the technical and vocational headquarters of Charmahal and Bakhtiari county, outsourcing has been meaningful (p ≤ 0.05) in increasing training service quality, saving the costs, and decreasing volume of public sector activities, and it has most effects on upgrading training service quality but the least effects on saving the costs.

Keywords: Outsourcing, Technical - Vocational Training, Benefits, Risks

1. Introduction
Organizations are usually seeking to adapt themselves with changes that occur around them. For instance the organization could enhance using of products and services of other companies through downsizing process which is called using of external resources (outsourcing). This is caused in re-designing of working process in order to increase production (Robins & Decenzo, 2001).

Outsourcing has been considered during the recent years by managers and authorities of governmental organizations as one of the powerful tools for developing organizations and enhancing their productivity and is proposed as a device for reducing the size of the company. It could play a significant role in progressing of the organization' purposes if it is applied correctly and appropriately and its advantages and disadvantages are considered. If this tool is used without adequate care, attention and accuracy, not only any of the expected benefits obtained but irreparable damages are imposed on long-term benefits of the
organization. Applying outsourcing has been one of the characteristics of organizations from 1990 onward. According to the view of many managers of the organizations who have got through outsourcing, its implementation results in reduction of costs, focusing on key (central) competencies and increasing of assets (Enarsson, 2008).

We can discuss about outsourcing from various social, economical, professional aspects and the like but lack of written studies and subjects in this field is felt clearly.

1.1. Importance and objectives of research

This article is important in terms of:

1.1.1. Although outsourcing is performed in the technical and vocational training centers in Iran and in the Chaharmahal Bakhtriyar province but not any written study or survey has been done so far in such field in this province, so we have studied it in this survey.

1.1.2. By proposing of privatization in the country (especially in the technico-vocational educations) it is possible and suitable to consider outsourcing as a practice for privatization.

This survey tried to study the current situation of outsourcing "in the form of granting management of educational units and centers to nongovernmental sectors" with a scientific approach along with considering government's purposes in downsizing of governmental organizations and to activate private sectors for recognizing strength and weakness points of outsourcing based on experiences of other countries. It is hoped that future decisions related to outsourcing in the technical and vocational training organization would be resulted in better realization of the organization's objectives along article 44 of constitutional law through enjoying of its results.

2. Review of related literature

The term outsourcing has different definitions from various viewpoints like other scientific subjects and has traversed its evolutionary path like many other management concepts. Traditionally, managers intended to secure all of their working tasks inside of the organizational borders. Organizations have gradually learned that they can rely on external suppliers in securing of some of their tasks. Developing of outsourcing culture has been resulted in granting of problematic activities to the outside of the organization. Nowadays organizations have focused on their main capability and have resorted to outsourcing of activities which don't support the competitive position of the organization (Rahnavard, 2007).

In other words the concept based on which a part of tasks of a company is transferred from inside to the outside and is performed by others recalls outsourcing. In the past outsourcing occurred when organizations weren't able to perform well, were weak in competition, had reduction of capacity, were faced with financial problems, were underdeveloped or failed in terms of technology. While, today those organizations that are totally successful use this tool in order to renew the structure of their organization. Today managers of such organizations have perceived outsourcing as vital subject that establishes key capabilities for satisfaction of customer's (addressee) needs, therefore, necessary attempts must be done in implementation of such tools (Cheshmerah & Mortazavi, 2008).
2.1. Benefits of using outsourcing

Reasons of applying this approach by organizations will be studied based on the following classification:

2.1.1. Organizational reasons

A. Improving and increasing of focus on fundamental competencies

Employers have concluded that they can't have superiority and advantages in all respects. They have focused their attention on key technologies and have submitted other affairs to companies that support them well. Main (central) activities could be considered in four components (Alexander & Yaung, 1996).

- Activities that have been done successively inside of the organization.
- Activities which are important for business success.
- Activities which create potential or actual competitive benefit.
- Activities which affect future growth and modernization of the company.

B. Accessibility to technology and empowerment

The reason that why many tasks are outsourced is because organizations want to improve their technical services but they are not able to find that technical knowledge or they need quick and confidential accessibility to modern technology. These tasks could be simply performed by companies which have specialty on such services with the purpose of having access to world capabilities without accepting of management development risk. Entering of the nongovernmental sector in to the governmental sector usually ends into the increasing of creativity and innovation. Therefore, the method of administrating of nongovernmental sector could be different from governmental organizations, in which it could change systems and processes (Lussier, 1997).

C. Improving of services and having access to new services and skills

Managers can choose the best service providers who have the most prominent records and the highest flexibility in service delivery. Through such selections they can achieve proficiency, skills and technologies that having direct access to them is impossible or difficult by their organization. Also, cooperation with the contractors is resulted in improvement of services and satisfaction of customers from performance of the organization. It is believed that increasing of such services will be performed in the future as well (Maschuris & Kendylis, 2006).

D. Realization of organizational policies

Some organizations perform outsourcing in order to escape from problematic and laborious parts like one section of the organization that performances of its employees are lower than the usual level or the organization which follows reduction policy of human force policy.

2.1.2. Reasons related to financial affairs and costs

When a company has specialty in offering of special services it focuses on its specialized field and offers such services to many different organizations. As a result reduction of investment on assets and better utilization of them will be feasible for main purposes of the organization. Thus these companies perform more efficiently, since they use saving with regard to the scale and can allocate costs among more companies (Belcourt, 2006).
2.1.3. Reasons related to human resource

Enjoyment of human resources' proficiency belonging to contractors, concentration of individuals' power and commitment on major activities and special specialty.

Utilizing of experts and specialists will reduce risks and responsibilities of the organization. Specialists know the law better than anyone else and can assure employees of the organization that all their actions are consistent with law and the organization will have access to specialties, skills and technologies which have not been accessible before.

2.2. Risks of using outsourcing

Despite the mentioned benefits, applying outsourcing has limitations for organizations as well. Almost half of the companies which have outsourced their duties and activities have found that management of outsourced tasks would be more expensive than what they expected in the beginning and the quality of services is not as well as it was expected (Albertson, 2000).

We can group the scopes of risk creation in outsourcing as of the following:

2.2.1. Scope of strategic decisions

Using of outsourcing at a very high level will discharge the organization and leaves it like a shell. Outsourcing contracts may encourage providers of external services to opportunistic behavior (Gainey & Klaas, 2005).

Outsourcing of major competencies has the risk of reduction and weakness in what is the organization's existence.

2.2.2. Scope of outsourcing execution

Outsourcing needs more informed and intelligent decision-making in comparison with performing of work in the organization. In decisions related to outsourcing, considerations of cost and profit, financial assessment, risk and efficiency dimensions in relation to quality of the provider, confidentiality of progression times and delivery besides strategic issues are also considered. A wrong decision could be resulted in spending of higher costs, loosing of opportunities and customers.

Many of the Chinese corporations are not intended in outsourcing of service activities so much. They believe that private information of the organization will be permeated outside through outsourcing. Another factor in their view is increasing of costs, because personal relations among individuals in the governmental organizations results in increasing of costs in different governmental sectors with outsourcing. Unfamiliarity with outsourcing is another factor that causes less applying of it in their organizations (Xu, 2009).

In order to be successful in outsourcing of activities we should pay attention to other factors in addition to risks management. The most important of such factors are:

2.2.3. Culture of the organization

There must be a positive culture with regards to the issue of outsourcing in order to set or fit it in the organization. Managers should work on organizational culture in various ways so that those sections remain after outsourcing would accept it easily and don't create any problems.
2.2.4. Employees

Paying attention to employees and having relation with them are among the key characteristics of an outsourcing program. When it is decided to perform outsourcing of an internal activity and that decision is made, employees are captured with anxiety and stress and feel that their job security is subjected to danger; since they generally consider this approach synonymous with their unemployment. This issue has unfavorable effects on their working motivation and performance. In order to avoid such anxiety it is necessary to make wise and justice decisions about the issues of employees and inform them about such decision.

2.2.5. Costs

Costs related to changing of situation towards outsourcing include the following cases:

- Explicit costs: looking for suppliers and selecting them, compiling of characteristics and features, preparing of a framework and compiling of contracts, tender costs, studying of recommendations and negotiations.

- Implicit costs: modifying and reviewing of characteristics, interlocutory regulations and adaptations and negotiations for quantities, fluctuations and quality.

2.2.6. Tasks and expectations

Expectations and demands of parties from each other must be clarified totally. Ways of providing of goods, manner of supervision and evaluation criteria and other cases must be specified completely. Parties should behave and interrelate truly with each other from the beginning.

2.2.7. Functional criteria

Procedures and mechanisms of evaluation must be specified from the beginning, both parties must have agreed upon that and they must be written down. Various criteria are used in order to control this issue that outsourcing tasks are performed effectively (Haji Karimi & Jamalie Bastami, 2009).

Outsourcing tasks are controlled by results obtained and not based on the time spent to create such results. One person is appointed to control the intended results and a team may be employed for supervision in the complex contracts. Providers of educational services should have a close relation with managers of the organization for defining of educational terms and enjoy their support. Fundamental framework, purposes and missions of the organization must be clarified; main core and existential reason of the organization should be determined; it must be specified that in what respect the organization has competitive benefit, what it is seeking and try to establish. We should look at the resources of the organization with open eyes and study whether it is necessary to perform all stages of a certain action inside of the organization or not.

3. Research methodology

This research is descriptive-survey. It is placed in the scope of descriptive researches because it studies the current situation and is survey, since it studies advantages and risks of outsourcing of technico-vocational education to the private sector in Chaharmahal Bakhtriary province. The statistical population includes 490 of experts, instructors, executors and chiefs of technico-vocational education centers in Chaharmahal Bakhtriary province. It
has been selected as a sample by means of classified random sampling in proportion to the volume of 120.

3.1. Sample volume
First, thirty (30) individuals were selected randomly in this survey and questionnaires were distributed among them. Statistical sample volume was obtained after exploiting data related to the above group and pre-estimation by the following formula.

\[ n = \frac{Nt^2pq}{(N-1)d^2 + t^2pq} \]

By substitution of the related numbers in the above formula sample volume has been calculated as of the following.

\[ n = \frac{(490)(1.96)^2(0.88)(0.12)}{(489)(0.05)^2 + (1.96)^2(0.88)(0.12)} \]

n=120

Researcher self made questionnaire was the tool of data collection with 22 questions based on Likert five point scale. Reliability of the questionnaire was obtained by means of cronbach alpha coefficient of 0.89. Meanwhile, its construct and content validity were confirmed by professors and specialized experts of technico-vocational education. Data analysis was performed through SPSS software on descriptive level (frequency, percentage, mean and standard deviation) and inferential level (one variable t-test, Hoteling t-test, multi variable variance analysis test).

3.2. Research questions
3.2.1. Effect of outsourcing of technical and vocational training on increasing of educational services quality from viewpoint of experts of technico-vocational education in Chaharmahal Bakhtriary province?
3.2.2. Effect of outsourcing of technico-vocational education on costs saving from viewpoint of experts of technico-vocational education in Chaharmahal Bakhtriary province?
3.2.3. Effect of outsourcing of technico-vocational education on reduction of the governmental educational section's activities from viewpoint of experts of technico-vocational education in Chaharmahal Bakhtriary province?

4. Research findings
Data analysis related to the first question of research revealed that observed t is larger than the critical amount of table on error level 5%, therefore experts believe that role of outsourcing of technico-vocational education in increasing of educational services' quality is more than the average level and therefore, it is significant. It means that role of outsourcing of technico-vocational education in increasing of educational services quality is more than the average level and is significant. Based on findings the highest response score average is
related to "using of standard educational books by instructors" with average amount of 4.12
and the lowest average is related to "enhancement of education quality by executing of
outsourcing" with average amount of 3.51.

Data analysis related to the second question of research revealed that observed $t$ is lower than
the critical amount of table on error level 5%. Thus role of outsourcing of technical and
vocational training in cost saving is on average level and positive. The obtained weight
average of this component is 3.08 which is significant ($t \leq 0.05$).

Data analysis related to the third question of research revealed that observed $t$ is larger than
the critical amount of table on error level 5%. Therefore role of outsourcing of technical and
vocational training in reduction of governmental sector's activities is more than the average
level and the obtained weight average of this component is 3.20 that is significant ($t \leq 0.05$).
The highest role is related to increasing of educational services' quality and the lowest role is
related to cost saving. Data show that the highest responses score average is related to
"resignation plan has been resulted in decentralization of the organizational decision-
makings" with average amount of 3.32 and the lowest average is related to "ability of
responding to customers has been enhanced by executing of this plan" with average amount
of 2.96.

5. Discussion and conclusion

Experts and employees of technical and vocational training administration in Chaharmahal
Bakhtriary province believe that outsourcing is effective in increasing of educational
services' quality in technico-vocational educations in cases such as improving of educational
quality, delegation of authority to executors for presenting educational methods, dispatching
of instructors to retraining terms of teacher training, using of specialist and capable
instructors by executors, using of standard educational books by mentors, quality of
equipments and tools of workshops, safety and hygiene of granted workshops, increasing of
accessibility to various educational fields.

Effect of outsourcing of technical and vocational training on cost saving in view of experts of
technical and vocational training administration in Chaharmahal Bakhtriary province is on
the average level and towards positive direction. Also findings show that the lowest role of
outsourcing is associated with "costs saving" which had been lower than the expected level.
Data demonstrated that all executor costs have been covered in granting rate with average
amount of 3.27 by predicted costs and average amount of cost saving has been 2.88.

Experts and employees of technical and vocational training administration in Chaharmahal
Bakhtriary province believed that implementation of outsourcing in cases such as reduction
of managers and employees' working volume, creating of more opportunities and more
propensity towards performing of other affairs, decreasing of instructors' activities, creating
of more opportunities for controlling quality of education, de-centralization in decisions of
the organization, delegation of authority to executors, downsizing the organization's body
and improving of the organization's accountability power to customers could be effective in
reduction of the governmental sector's activities.
5.1. Research recommendations

Executive recommendations

5.1.1. According to findings of the first question of the research about "positive impact of outsourcing of technical and vocational training on educational services' quality" it is recommended to authorities who grant technical and vocational training to hold short-term educational terms for employees, managers and instructors with regards to importance of outsourcing and strategies for qualitative growth of educations and employ those who are aware of privatization and its objectives and empowering specialists in outsourcing more than others.

5.1.2. According to findings of the second question of the research about "role of outsourcing of technical and vocational training in cost saving in the organization" it is recommended to authorities of technical and vocational training to prepare a consumables list for each course with its price (like cost index for constructive projects) and match them with required materials in standards of educational workshops.

5.1.3. According to findings of the third question of the research about "role of outsourcing of technical and vocational training in reduction of the governmental sector's activities" it is recommended to authorities of technical and vocational training to determine precise supervisory or controlling mechanisms for reduction of individual judgments in identifying performance rating of service providers and use them in assessment of individuals and specialists inside and outside of the organization.

Abstract
Imports play an important role in the growth process. Import is the source of raw materials not available domestically as well as technology and capital goods for raising productive capacity of the economy. Import led growth is debatable and it remains a contentious topic. Most studies used aggregate imports in order to examine the causal relationship between imports and growth. Using various categories of imports this study test the import led growth hypothesis in case of Pakistan over the period 1970-2008. The results of Granger Causality technique strongly support a bi-directional causality between chemicals imports to gross domestic product (GDP) and machinery imports to gross domestic product (GDP). Where neither food imports causes GDP nor GDP causes food imports. We conclude that at aggregate level we found a bi-directional causality between imports and growth. In terms of policy recommendation we suggest that a careful policy should be adopted about the imports of those goods (raw materials) which are necessary for the production in the domestic industries and which have positive impact on the economic growth.

Keywords: Analyzing ; Causal relationship; Imports ; Economic growth

1. Introduction
Pakistan has gradually liberalized its trade regime especially after 1988, when the government accepted the first International Monetary Fund (IMF) Structural Adjustment Program. After 1995, this policy gained greater momentum and World Trade Organization (WTO) related compliances have induced Pakistan to reduce import duties and does not eliminate various subsidies.

The large demand for imports in developing countries does not become satisfied fully due to limited export growth and because foreign exchange earnings from merchandise exports are used to finance both merchandise imports and international services. Therefore, the statistical relationship between merchandise exports and imports may not be very close, and may be further influenced by international loans, credit and grants which often translate into imports of raw materials and machinery that are needed for development purposes. These facts may
be significant in showing whether economic development is affected by openness as measured by exports or imports.

One of the principle components of economic reforms in Pakistan is import liberalization. The empirical studies generally concentrate on export promotion as the ultimate objective of liberalization with lesser emphasis on the role of import sector in promoting economic growth. As Pakistan is now passing through the phase of growth, imports are crucial for attaining development goals.

Imports play an important role in the growth process. Import is the source of raw materials not available domestically as well as technology and capital goods for raising productive capacity of the economy. Imports also help in generating economic efficiency as well as price stability (Shirazi and Manap, 2004). Aim of the import liberalization is to promote rapid economic growth through growth of export sector. The positive relationship between liberalization and growth is empirically well established (Frankel and Romer, 1999). Aggregate imports of a country depend upon a large number of factors like size and growth rate of gross domestic product, relative prices of imports, foreign exchange reserves etc. At disaggregate level, the various categories of imports also depend upon their domestic production. One way of looking at relationship between imports and growth is to investigate their causal relationship. Furthermore, exports can provide foreign exchange that allows for more imports of intermediate goods which in turn raises capital formation and thus stimulate output growth.

The import-led growth (ILG) suggests that economic growth could be driven primarily by growth in imports. Endogenous growth models show that imports can be a channel for long-run economic growth because it provides domestic firms with access to needed intermediate factors and foreign technology (Coe and Helpman, 1995). Growth in imports can serve as a medium for the transfer of growth-enhancing foreign R&D knowledge from developed to developing countries (Lawrence and Weinstein, 1999; Mazumdar, 2000).

The import-led growth hypothesis advanced by Hanson (1982) suggests imports are important source of economic growth. According to the model that generates this hypothesis, a socialist economy first imports capital goods and develops industrial infrastructure and then promotes economic growth. That is, the amount of capital goods that a socialist country can import limits its achievable rate of economic growth.

2. Literature Review

Many researchers investigated the causal relationship between macro aggregate like exports and growth, exports and imports and other macro variables of trade liberalization and growth.

Afxentiou and Serletis (2000) examined the causality between the growth in GNP and exports, as well as GNP growth rate and imports with the help of Granger Causality test. The sample of fifty developing countries was considered over the period of 1970 to 1993. An overall conclusion, which emerged from the study was that for a comprehensive sample of
developing countries, irrespective of the geographical location or level of development, export growth and much less import growth did not causally affect per capita GNP growth.

Nandi and Kumar (2005) examined the causality between exports and imports of India with the help of quarterly export and import data from 1987 to 2002. The study found that import-led growth causes the growth of exports in Granger sense. On the other hand causality in opposite direction (exports growth to imports growth) was not statistically supported.

Toda and Phillips (1993), adopts recent advances in time series modeling by specifying causal models based on vector error correction model. The empirical results indicate a bi-directional causal relationship between exports and growth in Bulgaria and causality from imports to economic growth in the Czech Republic and Poland.

Francisco (2001) investigates the Granger Causality between exports, imports, and economic growth in Portugal over the period 1865 to 1998. The role of the import variables in the investigation of exports output causality is emphasized, enabling one to test for the cases direct causality, indirect causality, and spurious causality between export growth and output growth. The empirical results do not confirm a unidirectional causality between the variables considered. There is a feedback effect between exports output growth and imports output growth and there is no kind of significant causality between import-export growth.

Coe, Helpman and Hoffmaister (1997) show that trade allows developing countries to benefit from research conducted in developed countries. Imports of a larger variety of intermediate and capital goods, which incorporate the outcome of research led in the developed trading partners, can increase the productivity of the developing economies. From a cross-sectional study of 77 developing countries, the work shows that R&D spillovers through trade are transmitted from 22 industrial countries to the former group.

Sadia (2006) investigates a semi-reduced export equation, for a sample of 1973-2005 annual data, through Ordinary Least Square method. The results indicate that in Pakistan’s case, there is a long-run relation between exports and imports of intermediate and capital goods. This study provides empirical evidence in support of the hypothesis that imports of intermediate and capital goods are critical inputs in the export production of the country. Thus, any short-run divergence in trade balance due to these would lead to higher exportable surplus in the long-run.

3. Model and Data Source

The variables incorporated in this paper are GDP and total imports (TI), we also use other import variables like chemicals (CHM), food (F), machinery (MCH) and miscellaneous (MIS). Where MIS includes rubber, wood, jute and paper products. TI is import at aggregate level and CHM, F, MCH, MIS are imports at disaggregate level.

The data span covered in this study is from 1970 to 2008 on annual basis. All variables are...
4. Methodology

To study the causal relationship, the well known Granger causality test has been applied. This test procedure assumes that the information relevant to the prediction of respective variables is contained solely in the time series data on the variables. More generally, since the future cannot predict the past, if variable X (Granger) causes Y, then changes in X should precede changes in Y (Gujrati, 2004; Granger, 1981; Greene, 2003).

This means if forecast of variable Y using both the lagged values of Y and lagged value of some other variable X, is superior to forecasts obtained using past values of Y alone, then X is said to Granger cause Y. In the same way, if the lagged values of Y can improve the forecasts of X in the presence of past values of X, then Y is said to Granger cause X.
The causal behaviour between given pair of variables can be put into one of the following four categories.

1. **Unidirectional causality**: When X causes Y (X → Y) or when X is caused by Y (X ← Y) after some lag. In other words, it indicates if the estimated coefficients on lagged X are statistically different from zero as a group and set of estimated coefficients on lagged Y is not statistically different from zero and vice-versa.

2. **Feedback or bilateral causality**: When both the variables X and Y, are cause of one another with some lag (X ↔ Y) or when the sets of X and Y coefficients are statistically different from zero in both regressions.

3. **Instantaneous Causality**: When both the variables X and Y are simultaneously the cause of one another without any lag.

4. **No Causality**: When one of the variables, say X, does not or is affected by the other, say Y (with or without any lag) i.e., there is no indication of causality.

Granger test of causality presupposes the stationarity in the data. Data used in our study has been investigated and found to be stationary.\(^{60}\)

As we have already confirmed stationarity in our data. Further steps involved in implementing Granger causality test are as follows:

For example we have:

\[
Y_t = \sum_{i=1}^{n} \alpha_i x_{t-i} + \sum_{i=1}^{n} \beta_i y_{t-i} + \mu_t \quad (A)
\]

\[
X_t = \sum_{i=1}^{n} \lambda_i x_{t-i} + \sum_{i=1}^{n} \delta_i y_{t-i} + \mu_t \quad (B)
\]

1. Equation (A) regress current Y on all lagged Y terms and other variables, if any, but do not include the lagged X variables in this regression. This is a restricted regression, from which obtain restricted residual sum of squares (RSS).
2. Now run the regression including the lagged X term, which is an unrestricted regression. It gives us unrestricted residual sum of squares (RSS).
3. Set the null hypothesis Ho: \( \sum \alpha_i = 0 \), i.e. lagged X terms do not belong to the regression.
4. To test this hypothesis we apply the F-test i.e.

\(^{60}\) We can investigate the stationarity by two ways. Firstly, after measuring regression if we get \( R^2 \) greater than d statistic, it shows the case of spurious regression, which exists when we regress one non-stationary time series on another non-stationary time series (Gujrati, 2004).

Secondly, with the help of unit root test.
\[ F = \frac{RSS_r - RSS_{wr}}{m} / \frac{RSS_{wr}}{n-k} \]  

Which follows F-test with 'm' and 'n-k' d.f where m is number of lagged X terms and k is number of parameters estimated in unrestricted regression.

5. If computed F value is greater than the tabulated or critical F value at chosen level of significance, we reject the null hypothesis, in which case lagged X terms belong to the regression or X causes Y. Step 1 to 5 can be repeated to test the model (B), i.e. whether Y causes X (Gujrati, 2004).

The number of lagged terms to be introduced in the causality test by the use of the Akaike or Schwarz information criterion (AIC). We take the lag in which AIC has the minimum value. We estimated different causal relationship by taking both single and double lag. We calculated F, using equation (C), where m = 1 in single lag case and m = 2 in double lag case. Similarly, 'n-k' is 37 and 35 in single and double lag cases respectively.

5. **Empirical Results**

The bidirectional causality of Table 1 which reconcile model 1, confirmed the fact that Pakistan has import led growth as well as growth also causes imports in long run i.e. (TI↔GDP). This result implies that Pakistan’s import consist of raw materials and machinery which leads to increase productivity, investment and hence accelerate economic growth while the causality from Gross Domestic Product (GDP) is very simple to interpret this is due to fact that imports always depend of income level as increase in domestic income level accelerate the demand for imports.

6. Concluding Remarks

This study uses the time series data from 1970 to 2008 for Pakistan to explore the causality between imports and growth. The results strongly support a bi-directional causality from GDP to imports as far as disaggregate level of imports concern. The results suggest that at disaggregate level, there is bidirectional causality between chemicals imports, machinery imports to gross domestic product (GDP). Where neither food imports causes GDP nor GDP causes food imports.

The economic importance and relevance of understanding the import growth relationship lies in the fact that import of intermediate goods is of crucial importance for economic growth. Increase of imports of intermediate goods enhance the productivity of domestic industries, through a bundle of beneficiary effects i.e. more advanced production technology, more productive raw material (chemicals for textile industry), improved organizational and managerial skills, and ultimately increases the exports of the country.

The findings of this study do have some important implications for policymakers in Pakistan. As it is clear that increase in aggregate and disaggregate imports in Pakistan supplements domestic industry and exports as well as economic growth. In terms of policy recommendation we suggest that a careful policy should be adopted about the import of those goods (raw materials) which are necessary for the production in the domestic industries and which have positive impact on the economic growth.

Abstract
This study investigates the role and performance of Pakistan government and humanitarian agencies during relief and emergency aid assistance to 2005 earthquake victims. This comparative study is based on empirical data collected from 30 most affected villages of NWFP (Pakistan) and AJK through a sample survey on 1st anniversary of 2005 earthquake. About 500 randomly selected heads of the families were interviewed in the sampled area. Mann-Whitney Wilcoxon test is used to compare the relief assistance provision and satisfaction shown by sufferers toward government agencies and Non-governmental Organizations (NGOs) during relief program. While Chi-Squire test is used only to investigate the relationship between affected areas and respondents’ demographic characteristics. Evidently, results show that the NGOs provided more relief items in a better way to victims of 2005 earthquake than did the Government of Pakistan. This study will be helpful in disaster management planning at government and non-governmental levels.

Keywords: Performance; Earthquake; NGOs; Government; Relief Efforts

BACKGROUND AND INTRODUCTION

Pakistan experienced a destructive earthquake on October 8, 2005, at 8:50 PST, intensity of 7.6 measuring on Richter scale. Arguably, this was the most devastating disaster in Pakistan’s history. The earthquake epicenter was located 100 kilometers north-northeast of Islamabad. Intensity of losses increased by a series of aftershocks, more than 1000 aftershocks ‘ranging from magnitude 5.0 to 6.0’ were recorded as of October 27th in India-Pakistan Kashmir region.

61 Authors are very thankful to PATTAN Development Organization (National NGO) and Dr. S.M. Naseem for financial help and motivation in study conduction
At least 73,000 people had died, another 70,000 had been severely injured or disabled and over 2.8 million persons have been left without shelter. In addition, 600,000 houses, 6,298 schools and 796 health facilities were demolished. About 6,440 kilo meters roads were damaged and 50-70% of the water supply, sanitation, telecommunication and power infrastructure was rendered un-operational. (Pakistan 2006)

It is nearly impossible to figure out exact economic impact of earthquake 2005. In total, about US$5.2 billion was estimated cost of earthquake; includes cost of relief provision to victims, restoration of livelihood support and short, medium and long term reconstruction (ADB and World Bank, 2005). The most immediate task was rescue of people trapped in collapsed buildings and to transport them at safer places along with provision of relief to survivors to save the lives and to secure the dignity of affected population (ERRA, Annual Review 2005 to 2006).

The Government of Pakistan immediately realized the enormity of the task and appealed to the international community for emergency assistance. The Government of Pakistan and national & international agencies took immediate measures for rescue, relief and reconstruction for 3.5 million affected people of NWFP and AJK.

Generally, donor agencies and the external sources prefer to channelize emergency assistance to disaster victims through international and/or indigenous NGOs due to all pervasive corruption and misappropriation of relief funds on the part of the Governments. The government of Pakistan and participating local, national, and international non-governmental organizations (NGOs) with the help of domestic and external sources initiated massive rescue and relief activities in the area. (ERRA, Annual Review 2005 to 2006)

Both, government of Pakistan and NGOs played important role in relief distribution and rehabilitation activities. Government of Pakistan established the central coordination office for rescue and relief started to work at Prime Minister (PM) Secretariat immediately after the earthquake. Federal Relief Commission was established on 10th October 2005 to mobilize all resources, to coordinate activities and to facilitate flow of relief goods (ERRA, Annual Review 2005 to 2006).

The Federal Relief Commission (FRC) of Pakistan Government, Armed Forces, International donors, UN agencies and local NGOs joined hands to undertake the huge operation for delivering emergency relief against challenges such as mountainous terrain, distant and difficult to access communities, changing weather conditions, resource constraint, and overwhelming suffering of the people.

On March 31st 2006, the Government of Pakistan officially ended the ‘Relief’ phase and the Federal Relief Commission (FRC) was subsumed into Earthquake Reconstruction and Rehabilitation Authority (ERRA). Government of Pakistan, NGOs and international non-governmental organizations (INGOs) performed different rescue, relief and rehabilitation activities during the first year of the 2005 disaster. Relief provided by FRC with assistance from foreign governments, INGOs, NGOs, individuals and corporate sponsors are summarized in Table 1.

*Source: ERRA, Annual Review 2005 to 2006 (From October 2005 to March 2006)*

Empirical studies suggest that nations with greater resources, better awareness and preparedness are more able to restore and move to normality faster than poor and less prepared nations during disasters. According to the Mid-America Earthquake Center, “the biggest earthquakes in the region (Pakistan & India) are yet-to-come” (Boyd 2006, p. 1). “Theoretical studies indicate that the energy stored along the Himalayan arc suggests a high probability of several massive earthquakes of magnitude (greater than) 8.0 in the future” (Shaheen 2007, p. 1)

“Theoretical studies indicate that the energy stored along the Himalayan arc suggests a high probability of several massive earthquakes of magnitude (greater than) 8.0 in the future” (Shaheen 2007, p. 1). Research on disasters could be used as a tool for creating better preparedness to combat with future disasters. Further, it helps formulate a comprehensive strategy for disaster management. This research study based on Pakistan’s experience and response to disaster 2005 would be of greater importance for other countries facing similar disasters.

Objectively, researchers have investigated various aspects of the 2005 earthquake. However, this study sheds light on role, responsibilities and performance of Governmental institutions and Non-governmental organizations during rescue and relief efforts. This study compares performance of the Pakistan government with NGOs with regard to management and distribution of emergency aid to 2005 earthquake victims during and immediately after the disaster. This comparison is based on data obtained from three most affected areas of NWFP (Pakistan) and AJK through a sample survey conducted on earthquake victims in October 2006, on the 1st anniversary of 2005 earthquake.

**Literature Review**

Pakistan is prone to frequent disasters that inflicted severe losses to property and lives. More frequent disasters are floods, droughts and earthquakes. However, the history reveals that earthquakes were the worst disasters regarding losses to lives (ERRA, Annual Review 2005 to 2006). In 1950, Pakistan witnessed the first severe flood disaster that claimed 2910 lives and affected more than 10,000 villages. Since then, floods, droughts, cyclones, earthquakes and landslides have been striking with regular intervals but none of the successive governments could ever devise a comprehensive strategy for disaster management (A Review of DMP&S in Pakistan). There was a major earthquake in Quetta, Balochistan,
1935 when the entire city was destroyed. From 1974 to 1990, approximately 5669 people were killed due to earthquakes in the Northern Areas (NA), NWFP and Balochistan (A Review of DMP&S in Pakistan). A brief history of earthquakes in Pakistan along with intensity and resulting human losses is given in Table 2.

As Pakistan is in a seismic belt, therefore, it suffers from frequent earthquakes of small magnitudes. Mountain ranges of Koh-e-Suleman, Hindu Kush and Karakorum are significantly vulnerable. The devastation can be immense because of the poor quality of buildings and housing (A Review of DMP&S in Pakistan). During the 2005 earthquake a large number of government buildings constructed by the contractors in AJK and Balakot area, collapsed in the first jerk of the quake. This is the overall impression of the people in the earthquake devastated areas that between 30 and 60 per cent of funds for government buildings, including schools, are spoiled by corrupt officials. Contractors habitual of such kickbacks spend less on quality materials resulting in poorly constructed buildings. Therefore, systemic corruption in government construction projects would be directly responsible for the devastating losses of next generation in northern areas of Pakistan (Shaheen, 2008). In addition, there was no adequate crisis management structure in Pakistan prior to the 2005 earthquake and none have any past experience to deal with such severe natural disasters. Although, the army and several NGO groups took the initiative in launching rescue and relief efforts, however, the onerous responsibility of reconstruction and rebuilding rested on the government (Prakash Ouis, 2001). Further, high dependence on natural resources makes communities vulnerable particularly to changes in resource condition (Pomeroy et al., 2006).

Mostly, all-pervasive corruption and abuse of relief aid by Government agencies and bureaucratic style of humanitarian organizations distracts them from the needs of the people they are supposed to assist, in favor of other values that their institutional frameworks dictate (Binini, 2006). This claim was tested by investigating the response to the Pakistan 2005 earthquake and a closer look at data suggests that there was not an optimal match between survivor needs and relief deliveries (Binini, 2006). A certain degree of coordination failure is, of course, inevitable in disasters of this scale. However, Pakistan’s domestic and external political situation made such co-ordination even more problematic and highlighted the need for a bottom up strategy to tap the resources at the local and grass-root levels. Literature represents different strategies adopted by the world by learning from experiences, how to combat with future disasters, how one can better prepare to face less socio-economic and
human losses. Many countries like Italy adopted insurance policy measures to combat natural catastrophes (Amendola, 2000).

This raises the question whether government agencies and NGOs played the required role during relief phase of 2005 earthquake? Did the government or NGOs performed better during provision of relief aid to victims. Whether the international donations and NGO development programs aimed at reducing vulnerability to earthquakes are an appropriate response to the earthquake hazard or not (Shaheen, 2008). Are earthquake victims satisfied that relief provided by Government and NGOs was according to their need and secured dignity during relief disbursement? So did Pakistan learn any lesson? If yes, what policy planning Pakistan adopted for future Disaster Risk Mitigation? These all aspects are required to investigate for better preparedness, mitigation and for future disaster response.

The purpose of this research is to investigate the role and performance of government of Pakistan and humanitarian agencies during relief and emergency aid assistance of 2005 earthquake victims. Further to evaluate, comparatively who performed better. This study will be helpful in disaster management planning at government and non-government levels. Typically, this study is unique in its nature and will be an imperative contribution to the body of research concerning disaster management in Pakistan.

Methodology and Data collection

The primary source of data for this research was field survey conducted in October 2006, immediately after the Pakistan government earthquake emergency relief assistance programs ended. About 500 household heads in the most affected districts (areas) of Pakistan and Kashmir “Mansera, Bagh and Muzaffarabad” were contacted to investigate the role and performance of Government agencies and NGOs in various rescue, relief and rehabilitation programs. While survey team couldn’t conduct interviews in fourth most affected district “Batagram” due to adverse circumstances (i.e. cultural, religious and political reasons, at the particular moment). Individual household was the basic sampling unit. “A household is a group of people in a dwelling unit living together as a family and sharing the same kitchen” (PAUL 2003). In the first stage of the design of the survey, out of nine, three most affected districts were selected. In the second stage, 15 most affected union councils were selected (5 UCs in each district). In the third stage, 30 villages or Mohalas (for urban) were randomly selected. As affected area is consisted of diversified topography, so to find impartial and faultless response urban and rural localities were also considered. Similarly, male and female respondents were selected proportionately to find statistically reliable and significant results.

A comprehensive questionnaire containing demographic information of respondents followed by data relating to socio-economic impact of disaster along with opinion questions with regard to the distribution of inflict relief by the government and NGOs were asked to household heads. “A household head is defined as the person who makes the major economic, social, and household decisions, irrespective of this individual's age and gender” (PAUL 2003).

Key Questions

1. Comparatively, who performed better during rescue and relief phase of 2005 earthquake, the NGOs or Government of Pakistan?
Analysis Techniques

To analyze the amount of external support provided to the afectedees by the government and to test whether the amount of received support was in accordance with their socio-economic conditions, chi-square test of association and Mann-Whitney Test (non-parametric tests) are used. Chi-Squire test is used only to investigate the relationship between affected areas and respondents’ demographic characteristics (occupation, education, sex and locality). Mann-Whitney Test is used to determine if a difference exists between performances of two groups: Government and NGOs. Unlike t-test, Mann-Whitney Test does not require normal distribution of data (MacFarland, 1998). Subsequent analysis is performed by using the SPSS. The nature of the relationship between socio-economic indicators receipt of assistance will be helpful for evaluation of the equitability and performance of the government and NGOs relief assistance efforts during earthquake 2005. In general, there is a positive relationship between the amount of emergency aid received by earthquake victims and their socio-economic conditions. Poor victims, owing to their weak political and economic power, receive much less assistance than rich victims.

Results and Discussion

Devastation of 2005 earthquake could be portrayed by housing destruction of affected regions. Data represents that 100% living was affected by disaster. In total, 75% people substantiated complete demolition of houses, while remaining 25% claimed partial damage. Table 3 explains the area wise house damage caused by earthquake. Remarkably, data regarding house damage shows approximately similar trends as shown in district profiles prepared by ERRA.

Nearly, all the respondents reported that they had received the external aid ‘in any form’, either from governmental agencies, NGOs, INGOs, friends/relatives or from individual philanthropists. Collectively, about 85% respondents ranked NGOs and Government agencies topmost helping hands during relief phase. The remaining 15% reported that they seek assistance either from relatives, friends, neighbors, individual philanthropists and they ranked the same at top. The following analysis of the assistance received by victims is based on the response of 85% of respondents who availed some form of assistance.

Table 4 shows selected characteristics of the respondents; mainly they were segregated into four occupational groups: farming, services, business, and others. Mountainous geographic location of the area is the reason that only 6.5% of the selected population is engaged in farming and 19.7% in business profession. Moreover, majority of respondents (68%) were employed in services sector (including both public and private services). The analysis based on Chi-square test reveals that there was a significant difference in the occupational characteristics of respondents in all the three sites covered in the present study. Analysis indicates greater dependency of the affected area population on non-farming income generation sources. While in Mansehra (NWFP) 11% of respondents disclosed that their major source of income was agriculture which was highest engagement in farming throughout study area. The survey data revealed that sample consisted of 45% illiterate respondents. Further gender analysis shows that illiterate women ratio was significantly higher than male illiterate population i.e. 70% and 30% respectively of total 45%. Table 5 illustrates discriminating behavior of society regarding educational facilities to female population of the area. Chi-Squire test shows highly significant results, that is educational

\[ X^2 = 76.827 \text{ (df=3; p=0.000) } \]

The null hypothesis that there is no difference in provision of relief assistance to 2005 earthquake victims by Government and NGOs was tested by using Mann-Whitney test. Significance can be verified by comparing the computed test statistic (e.g., U) with its critical value. By interpretation of the p (probability) value, it is observed that p = 0.005, which is smaller than the 0.05. Comparison of test statistics with its table value and the probability method both suggest the rejection of Null hypothesis which states that there is no significant difference between government-provided relief aid and that of NGOs. Further, the higher mean rank for NGOs (518 vs. 467) supports the conclusion that the NGOs provided more relief items in better way to victims of 2005 earthquake than Government of Pakistan.

Evidently performance is directly associated with satisfaction. Satisfaction is persons feeling of pleasure as a result of comparing a product perceived outcome in relation to his/her expectations. Consequently, if the performance exceeds the expectation, the beneficiary is very satisfied. If outcome equals the expectation, the receiver is satisfied. But if the performance falls below the expectation, then the recipient is dissatisfied. In this study Mann-Whitney Wilcoxon test is used to compare satisfaction shown by sufferers toward government and NGOs role during relief program. Test shows extremely significant results. Similar to 1st null hypothesis, 2nd null hypothesis is also significantly rejected, that is, there is no difference in satisfaction shown by victims towards NGOs and Government of Pakistan for relief provision. Further, it explains that NGOs (including both the indigenous and the international) prevailing in Pakistan have played an effective and impartial role in the distribution of relief assistance than did the government organizations. So results show that
credibility of NGOs bottom-up approach is higher than that of the government based on top-down directives. In so far as performance is concerned, people are more satisfied with the role played by NGOs/INGOs as compared to Government Agencies during the relief phase.

Conclusion

In 2005, Pakistan experienced the most disturbing earthquake in its history. Pakistan government and humanitarian agencies initiated wide range of relief efforts for the survival of victims. This study is an effort to compare the relief disbursement efforts carried out by the NGOs and the government. Further, it looks at the possible association between socio-economic characteristics of the disaster victims and the amount of assistance they received from the government and/or from the NGOs. To probe these objectives, this study used a primary data in which 500 household heads of 30 villages of 15 union councils of three districts have been interviewed.

The analysis of data indicates that though both, government of Pakistan and NGOs’ played significant role during rescue and relief assistance, the majority of respondents reported that they were more satisfied by the NGOs work compared to government efforts. Further majority of the respondents believed that NGOs performed much better in relief provision than the government of Pakistan. Recognition to NGOs efforts could be due to non-bureaucratic working style, proper need assessment, ensuring victim participation in decision making, acting as per sphere standards while helping the communities. Moreover, wide range of experience in working with effected communities and use of more participatory approach made them more efficient and successful.

Respondents’ opinions regarding less efficient role of government could be due to unmet very high and irrational victims’ expectations. Further NGOs are supposed to work in specified area with having fewer responsibilities and more skills. Whereas governments’ working area and responsibilities are spread to all affected population regardless of degree of severity.

Moreover, important policy implication of this study is that if government agencies would not handle relief efforts effectively and efficiently than donor agencies may rethink their procedure and channelize future emergency aid and development funding through NGOs or sub-offices. This mistrust has been experienced by government of Pakistan in current flood disaster on both, public and donors’ ends. But optimistically this might lead to
expansion of NGOs in Pakistan. So government need not only develop institutional and technical skills to cope with future disasters but also consider expansion to NGOs as alternative to mitigate the hazards and strive to strengthen them.

Abstract
Investor decision is a complex and dynamic phenomenon in behavioral finance. It has been under consideration by researchers and other stakeholders since 1850s. All this effort is being done to better understand the investment patterns, their mental approach towards investment choices, and the reasoning patterns. This study will focus on the investor decision in perspective of disclosure quality and perceived credibility emitting from the management’s forecasts specifically in the context of range forecasts. It will also allow us to analyze the decision making process of investors for entrepreneurs, researchers, and besides other stake holders, investors themselves.

Keywords: Management Forecasts, Point and Range Forecasts, Disclosure Quality, Perceived Credibility, Investor Decision

Introduction
In this study, we extend prior research on the investment decision in response to Management and Analysts’ forecast by examining the association between Point and Range aspect of Management Forecasts and Disclosure Quality and afterwards the affect of this association on the investors’ choices. Point forecast refers to one possible outcome whereas on the other hand Range Forecasts depicts multiple and vague possible outcomes making investor’s reluctant and in the state of confusion while making their investment decision.

Investment Decision is a very complex concept and analytical in nature. Whenever making an investment choice investors are looking for a mix of information from the information provided. (Collin Mason & Matthew Stark 2004). Literature also suggests that investor decision is affected by the information they are looking for (Leonard Karakowsky, A. R. Elangovan 2001; Collin Mason, Matthew Stark; 2004) the risk propensity of investor’s (Hongwei Xu, Martin Ruef 2004; Herbert Kalthoff 2005) the disclosure quality and
information asymmetry. (Millicent Chang, Gino D’Anna, Iain Watson, and Marvin Wee 2008) Previous literature on disclosure quality reflects that an effective investor relation can foster higher disclosure quality. According to (Kaohsiung, Taiwan 2008) firms with better information disclosure quality do not show any direct but an indirect impact on corporate performance. They further state that it is proper to measure disclosure quality by corporate reputation. Previous literature has failed to lay emphasis and depict the effect of disclosure quality of a firm on investors’ decision which needs further study and this study will help us in doing so.

The purpose of this study, keeping in view the complexity of the investor decision, information demands of the investor, biasness presence in the information, disclosure quality of the issued forecasts and the importance of forecasts to be market competitive investor decision is to be further studied in order to better understand the situations investors face. This study will help us in analyzing the investors’ choices when the role of disclosure quality is playing its part.

**Literature Review and Hypothesis Development**

Management earnings forecasts are a valuable tool for a firm to communicate its expectations to market participants. These forecasts are important for investors as they inform them of the firm’s future prospects, information asymmetry is also lessened, and these reduce the firm’s cost of capital by higher confidence in the investor’s mind. Prior literature on management forecasts has been looked at various angels to judge their impact on investors’ choices. Like (Ball and Brown 1968) has focused on market efficiency with respect to earnings information they argue that it has attracted substantial attention from accounting researchers they also lay weigh that investors response to Post Earnings Forecasts change the managements perspective when issuing such forecasts making the information bias and increase the information asymmetry thereof. In our study independent variable is Management Forecast and specifically point and range forecast. Previously literature has focused on forecasts in various aspects. Little information is available on Point and Range Forecasts. But since Point and Range is also a Forecast we assume that these forecasts will behave exactly like Management Forecast and the previous literature of management forecast stands true for these forecast as well.

H1:  Range Forecasts will behave as other Management Forecast.

These forecasts were first discussed by (Highhouse 1994). They explain that Point Forecast is one estimate of mainly Firm’s EPS whereas in Range Forecast firms provide a minimum and maximum value of EPS and investor has to use his own perception, skills, knowledge, experience, and evaluating abilities to judge the situation and reach at a conclusion of whether to make an investment choice or not. When faced with range forecasts investors evaluate the possible outcomes and make their investment choices. But the question is how they evaluate such information, what are the factors involved and what affects different investor’s to react differently? Previous studies of management’s forecasts show that earnings forecast affect earnings management (Sunil Dutta, Frank Giglert 2002) biased information is issued to affect the stake holders decision, (Bin Ke, Yong Yu 2006) credibility of forecasts affects the stake holder’s decision (D . Eruchirst , Lisakonce, 2007) existence
of incomplete information in such types of forecasts (Weihong Xu 2009), and the user influence of forecast accuracy (Carlo D. Smith, John T. Mentzer 2010).

H2: Firms issue bias and incomplete information.

Prior Literature on Forecasts show the management’s perspective towards what they believe to be the future position of their firm, company or business. When issuing such forecasts management perception plays its part and since they want what is better for their company rather than depicting the true picture the issued information is bias which then increases the information asymmetry already existing in the parties to the contract (Francis, Philbrick 1993; Das, Levine, Sivaramakrishnan 1998). Later research also proves the concept of presence of biasness from Management or the issuing authority in such earnings forecasts (Lim 2001; Matsumoto 2002; Richardson, Teoh, Wysocki 2004).

H3: Biasness increases information Asymmetry.

This concept was further explored by (Kato, Skinner, Kunimura 2009) where they argue that the managers’ initial annual earnings forecasts (In the Year Start) are, on average, upward biased (optimistic) depicting Management’s purpose to misguide the investor’s and generate more funds than actual if the true forecasts were provided. Importance of such forecasts for the firms and management is examined by (Lambert and Stock 1993) where they positioned forecasting as the driving force behind all forward planning activities within the firm. Research provides evidence that when such forecasts are accurate, they help companies and supply chains to prepare for short and long term changes in market conditions and help improve operating performance (Fildes and Beard 1992; Gardner 1990; Wacker and Lummus 2002). Whereas when forecasts accuracy degrades, decisions based on the forecasts may lead to operational missteps.

H4: Forecasts affect Organizations positively and negatively.

Investor Decision is our dependent variable in this study. In previous literature by (Leonard Karakowsky, A. R. Elangovan 2001; Collin Mason, Matthew Stark; 2004) explained concept was the fact that investor decision and their investment choices are affected by the information demands of investors or the information they are looking forwards in such forecasts. They have also argued that information demands or the required information differentiates from investor to investor and it also depends on the type of investment. Investor decision besides the above mentioned factors is also affected by their relationship with other investor’s (John Hendry, Paul Sanderson, Richard Barker, John Roberts 2006; Elaine Henry 2008) there training (Kim Hoque, Nicolas Bacon; 2008) how the information is provided to them (Elaine Henry 2008) and the peer affects while making an investment decision (Lilian Ng, Fei Wu 2010). (Collin Mason, Matthew Stark 2004) define investor decision as a mix of information regarding “Entrepreneur, Strategy of the business, Operations of the firm, Product/Services in which they are dealing, Market Situation, Financial Strength of the company, Investor Fit with the organization and various others”.

H5: Investors Decision is mix.

Disclosure Quality of these forecasts is our mediating variable in this study. Effect of disclosure quality and information asymmetry on investor’s decision is discussed by (Millicent Chang, Gino D’Anna, Iain Watson, and Marvin Wee 2008) where they argue that investors are affected by the authority providing the information and the reliability of
information has a direct and positive relationship with investor’s decision. According to (Kaohsiung, Taiwan 2008) firms with better information disclosure quality do not show any direct but an indirect impact on corporate performance. They further state that it is proper to measure disclosure quality by corporate reputation.

H6: Disclosure Quality has a direct relation with investor’s choices.

Previous literature has failed to lay emphasis and depict the effect of disclosure quality of a firm’ point and range forecasts on investors’ decision which needs further study and this study will help us in doing so. This paper will also provide theoretical support to better judge the perceived credibility in the eyes of the investor when they analyze management forecasts and specifically point and range forecasts.

Discussion

Human Financial Decision Making in various aspects has been under consideration by investors as well as other stakeholders. Prior literature evidence shows that studying the financial decision making started from 1850s in order to better look at Behavioural Aspect of Finance and better understand the investors physical, the reasoning patterns of investors, including the emotional processes involved and the degree to which they influence the decision-making process. Investors while making a decision have to face uncertainty. Prior Literature shows that information uncertainty affects investors and in turn their decision (Zhang 2006). Investors face this situation of uncertainty because of low level of available information, and the quality of information at hand. Prior literature also proves that biased information is issued by organizations and management to impact positively, their future image, in the eyes of their stakeholders to improve their own earnings capacity, by avoiding or reducing the cost of capital (Sunil Dutta, Frank Giglert 2002; Bin Ke, Yong Yu 2006). Literature also focuses on the fact that besides biasness incomplete information is released which in turn increases ambiguity, uncertainty, and confusion in the investor’s while they make their investment choices.

This happens because the information communicated is different rather than expected causing an increase in the information asymmetry. (Millicent Chang, Gino D’Anna, Iain Watson, and Marvin Wee 2008) Expectations exist because the investors are loss averse. Prior literature has viewed investor’s choices in perspective of loss averseness. (Hirst, D. E., L. Koonce and J. Miller. 1999) Since investors are risk averse and they want profit they analyzing the information according to their profit and cost ratio, risk and return aspect. But investors are expecting and planning their investments by analyzing various investment options according to their own perception, need and requirement (Collin Mason, Matthew Stark 2004).

As our assumption states that Investor Decision is a mix and different investors react differently (Collin Mason, Matthew Stark 2004) and that they perceive the information required differently because of their business, their rules and procedures, their working environment and their rules and regulations question arises how will investors perceive and react when faced with range forecasts and with presence of all the ambiguities, uncertainties and asymmetries present.
This line of enquiry was explored by (Hongwei Xu and Martin Ruef, 2004). They explored the fact if entrepreneurs are more risk tolerant than the general public. For this purpose they compared the investment patterns and the perception towards investment choices of (‘nascent entrepreneurs’) NE those who are in the process of starting a business and the perception of (‘comparison group’) CG who have prior experience of investment decisions. They concluded their study by acknowledging the fact that investors with prior experience in investment will be more risk tolerant and perceive the information with all the ambiguities and uncertainties more positively than those with less or no previous investing experience. Our assumptions of Biasness presence and incomplete information also prove the above mentioned fact as both these increase confusion in investor’s mind making the investment decision more risky because of increased perception towards risk. This concept is also acknowledged by (Hongwei Xu and Martin Ruef, 2004) where they confirm this fact in context of venture capitalists. Also based on prior literature and our discussion we also believe that different type of investors will react differently because of their needs, requirements, business, procedures and others.

Disclosure Quality refers to the strength of information provided in the eyes of the investor from the management. (Millicent Chang, Gino D’Anna, Iain Watson, and Marvin Wee 2008). Although investors have their own perception of the information provided but if the disclosure quality is in the high notes it has a positive impact on the investor’s choice (Hongwei Xu and Martin Ruef, 2004). As discussed earlier that investors are looking forward for the information in the shape of forecasts, they perceive it, and then make a choice. Importance of issuing such forecasts for the firm’s and management has also been focused. Since issuing forecasts is important for both investors and firms the concept of disclosure quality is also of equal importance while analysing forecasts and the investor decision thereof. The question here is how to improve this disclosure quality.

This line of enquiry has been explored by (Millicent Chang, Gino D’Anna, Iain Watson, and Marvin Wee 2008) where they conclude their study by saying that high disclosure quality can be achieved by an effective investor relationship program. They also extend their research in investor’s choices and by concluding the fact that investors while making an investment choice not only rely on the information provided they also try to verify the information provided through various private sources as well. Besides that other literature also proves the fact that information providing authority if credible will have a direct impact in the investor’s mind. So we can easily say that the information providing authorities’ increase or decrease the disclosure quality of the information provided and in this case the range forecasts. If positive this will increase the investor confidence and inturn a positive investor decision and if not this will have a downward impact for both investors and firm’s issuing forecasts.

**Conclusion**

After analyzing the previous literature and investor behavior, their investment patterns, and their reasoning patterns we believe those investors with low risk propensity and risk awareness because of no previous investment experiences and knowledge of market, or in other words investors having low perceived credibility of the forecasts in hand will invest less than investors with some previous investing experience or investors with a higher perceived credibility of forecast. Also we believe that disclosure quality depends on mainly two things i.e. the issuing authority and the regulators perception towards these issued
information. Also we conclude our study on the fact that disclosure can be improved with proper communication of not only the information but explaining the information as well as this will reduce information asymmetry existing already. Based on our literature and discussion we can also say that different investors will react differently to the same information as their demands are different, because of their business, their perception, in all their requirements.

**Practical Implications and Future Recommendations**

This research will enable organizations in issuing their forecasts and grasp more investor confidence, and more market competitiveness with low cost of capital. Also this study will enable the investors in response to management by reacting accordingly with the information available in forecasts. This study will also enable other stake holders to understand the management motive behind issuing forecasts. Future study can focus on the same forecasts when Analyst’ provide their perspective, Confidence in the decision can also be measured after analyst estimate in response to such forecasts. Also the role of regulating authority and the Government can also be seen in accordance with these forecasts. Also this study needs to be tested in the original market situation to confirm our results.

Abstract
The main purpose of this study is to investigate how workforce diversity managed in the Small and medium enterprises in Pakistan. How education, gender, religion, motivation and family members of the entrepreneur employed affects diversity in the organization? Personally administrated interviews, document analysis and generalization of entrepreneur are useful resources to vast our understanding. Findings show that organization with well educated and highly motivated entrepreneurs have more diverse culture. Firms with female and minority members also have well diverse human force and policies. While age of the entrepreneur and number of family members employed are not much influenced on organizational diversity. Limitation of this research is due to short course of time number of respondents are very low, limited to just two cities. Practically this research is very important for the entrepreneurs, directors and partners of surgical and sports organizations as well as educational institution that they can adopt diverse culture to bring innovation and creativity to enhance productivity of the organization.

Keyword: Diversity, SME’s, Entrepreneur role

Introduction:
The concept of diversity comes with boom of multinational organizations. When organizations start working globally for using competitive advantage, they tend to hire workforce from different areas of the world. There are some reasons for doing so; first one is that they want to use cheap labor from across the world so that operating cost would be lower. Secondly, they want to use highly skilled labor or you can say brain drain, so that they have creative minds in the workforce. Those who can show their creativity, which brings innovation and innovation linked with the performance of the organization. So indirectly we can say that diversity increases the performance of the organization. Diversity plays important role in the performance of the organization. Diversity is recently very popular among Entrepreneurs, and they want to get benefited from diversity. Diversity has advantages as well as disadvantages but the use of diversity counts more. Diversity may
increase the problem like communication but beyond this diversity increases more potential of the organization (Carrell et al. 2006). Managing diversity is also a big issue these days but effectively managed diversity always puts positive impact.

Survival is most important for the small and medium enterprises. They have to grow fast otherwise organizations with more experience and resources dominates them and SME’s fail to compete because they have low resources as compared to big organizations (Allen, 1999; Hatten, 1997). For survival they have to grow quickly, many SME’s fail within five years of their start up, because of their ineffective labor force.

There are five main stages for growing of a small enterprise to a mature organization. First out of these five stages is existence of the firm that organization came into being with a product or service line with some resource in the business field. Then there is second stage that is survival, which we earlier discuss survival is very important for the enterprise, so that it can run its operations significantly. Success is third stage when it starts growing it must be at continuous pace. Fourth one is take-off stage, when organization at its boom and entrepreneur now converting the enterprise at big level organization. The last stage for the success of an enterprise is resource maturity, now enterprise and entrepreneur should think to expand. All these stage are concerned with the management factors that are people, quality, diversity, strategic planning and owner’s ability to delegate. (Churchill and lewis, 1983)

The word Diversity is a new in Pakistan, mostly our entrepreneurs are not familiar with this word. Entrepreneur in Pakistan using this concept now a day to run effectively. A drawback associated with it, that entrepreneur in Pakistan are not so much literate, there are many reasons behind this. So because of that the attitude and behavior of entrepreneurs are not democratic.

Practically this article is very important for the entrepreneurs, directors, partners of surgical and sports organizations as well as educational institution, so that they can adopt diverse culture to bring innovation and creativity to enhance productivity of the organization.

The rationale of this study is to see how workforce diversity managed in the Small and medium enterprises in Pakistan. How education, gender, age, religion, motivation and family members of the entrepreneur affects diversity in the organization. The personal characteristics of the entrepreneur also effects the diversity in the enterprise (Gudmundson and hartenian, 2000)

**Literature review:**

There is limited work done on the workforce diversity, there is lack of empirical and theoretical base, the field of workforce diversity can be considered a virgin field as work on this field is just started (Gudmundson and hartenian, 2000).

Diversity defined by (Triandis et al., 1994) as such characteristics which reminds people, that person is different from me. There are some characteristics of the diversity, like culture, race, gender, age, national origin, religion, language and sexual orientation (Carrell, 2006). There are two main types of diversity which are dominant function diversity and interpersonal function diversity, first one deal with senior management while second one deals with each individuals. Second type of diversity deals mainly in SME’s (Yap et al. 2005).

Globalization and fast pace internationalization increased the importance of workforce diversity as it is hot issue these days. Everywhere importance of diversity is being discussed at political, corporate and at educational institutes (Shen et al. 2009).
Mostly diversity is related to Human resource policies and it has strong relation with Human resource manager. It is significant to consider the social, legislative and political difference in diverse cultures (Kamenou, 2007). Diversity policies are also included in employee selection procedure from recruitment to retirement program, which shows that business people have increased awareness about the diversity (carrel, 2006). But here entrepreneur do all these HR activities, all are in his/her hands that how he/she manage diversity in the enterprise. The entrepreneur should give freedom to employees so that they can contribute in maintain the guidelines of the business and help the entrepreneur in the business activities. Leadership quality is very important to start commitment towards achieving the goals of the organization (Hite and McDonalds, 2006).leadership qualities are considered vital for an entrepreneur so that he can lead the organization effectively, mange and motivate the workforce. Organization use resources to run the operations effectively. The attitude and behavior of the entrepreneur is based significantly on the education and knowledge of the entrepreneur, if entrepreneur is well educated and have well knowledge of the business activity then the enterprise survive and work efficiently. But unfortunately the education level of Pakistan is not up to the mark, entrepreneurs are also not well educated, very low % age of entrepreneurs are graduate. So for this purpose people should be educated about diversity at training and educational level in organizations and educational institutions (Kulik and Roberson, 2008). The main goal of the training should be that it shared with others and training can be provided by chamber of commerce and group of industries (Usry and White, 2002).

Diversity enhances the performance of the organization using human resource policies as intermediate effect (Benschop, 2001). Effectively management diversity results in enhanced performance of the enterprise. Technological advancement also puts positive impact on the performance of the enterprise. The more diverse workforce an entrepreneur has the more that enterprise have technological skills. Competitive strategies can be useful in the business for entrepreneur so that they can compete with other firm to greater extent (Davig, 1986).Another way to enhance the skills and capabilities of the employee, entrepreneur can use digital workplace like placing advance facilities like internet etc(Esmaeeli H.,2011).

Research hypothesis:
Motivation:
If the entrepreneur has good capability to judge the employees, hire creative employees and reduce discrimination among the employees, he has such guts and abilities that increase it motivation level then he should tend to more diversify than those who were not well motivated about the diversity that it works. So the behavior and attitude towards diversity of the entrepreneur plays an important role in hiring diverse workforce. Decision making capability of the entrepreneur depends on the motivational Behavior of the entrepreneur (gudmundson and hartenian, 2000)

H1 The entrepreneur with high motivation level for diversification will tend to diversify more than the entrepreneur who has low level of motivation for diversification.

Religion:
Mostly the minority owners have their business in such areas where more minorities are living and they are more responsive to the minority employees so that’s why minority owner will have more diversified workforce at its business. (Gudmundson and hartenian, 2000)

H2 Enterprises with minority owners will have more diversified workforce than those who has non-minority owners.
Age:
The young entrepreneurs are more creative and want quick changes so they need such people who are well cooperative and are more skilled, they tend to increase their experience and so that they hire some diverse experienced labor force (Gudmundson and Hartenian, 2000).

H3 Enterprises with younger owner will have more diverse workforce than enterprises with older owners.

Education:
The owners who are well educated are more diverse in nature because today’s education enhance peoples knowledge about diversification and they know what are the minority issues and how to cope with them, they know how to cope with gender discrimination, as they have more knowledge than those who are not educated so they are more diversified. (Gudmundson and Hartenian, 2000)

H4 Enterprises with well educated entrepreneurs will have more diverse workforce than enterprises with less educated entrepreneurs.

Gender:
As Pakistan is a male dominating society so females are not encouraged to do jobs and start their own business, but if there is a female owner so she is more diversified and have more females in business because she knows the problem of gender discrimination, ethnicity and minority issues better than others and there will be a snow ball effect (Dieterle, 2004).

H5 Enterprises with female owners are more diversified than the enterprises with male owners.

Family Members Employed:
Family members in an enterprises cause big deal of problem because most of time the family members are hired without any job responsibilities which are Burdon on the financial perspective of the enterprise and some time they are hired for job without any skills which is a big cause that firms are not hired a skilled people and so not well diversified. When job is not offered to skilled persons and family member retain in organization then there is low turnover rate so low opportunity to hire skilled labor (Gudmundson and Hartenian, 2000).

H6 Enterprises with low number of family members as employee are more diversified than enterprises with high number of family members as employees.

The important factors we have concluded form the literature discussion is that the entrepreneur should have motivational skills and are well educated about the diversity related issues so that he can effectively manage diverse workforce using efficient human resource policies. Effectively managed diversity in an enterprise puts positive impact on the performance of that enterprise. Diversity benefits the small firms but it depends on the characteristics of the diversity and motivational behavior of the entrepreneur.

Research methodology:
This is interview based data collection. This survey is self administered and filled through direct interview by using generalized form from the entrepreneur, director and partners of the organizations. Our survey mainly focused on small and medium organizations from sports, surgical, leather and educational industry. These Entrepreneurs are fully conversant with overall operations of the organization. This survey conducted in two Pakistani cities Sialkot and Gujranwala. The data collected from almost 40 organizations. In this research the responses of respondents will be quantified in percentage. As it is personally administrated interviews, documentation analysis and direct meeting with entrepreneurs so response rate is 100%, 40 organizations selected for
data collection purpose because it was very hard to interview as many heads of organization within a limited time frame.

**Result analysis & discussion:**

Results of our research are much similar to previous studies held on this idea i.e. (gudmundson and hartenian, 2000) and (Dieterle, 2004). Our survey result shows that the level of motivation counts much for diversification, high motivation level of entrepreneur tend to increase the chance of highly diverse culture of the organization, the motivation entrepreneur to his/her employees in reward system, supporting culture, mentoring, networking of the employees within organization and outside of the organization, consulting with managers, using team building approach, inspiration from the work of someone, using proper problem solving skills, influencing upward, delegating, enhancing decision making capabilities and better communication within and outside of the organization are all the characteristics of a entrepreneur through which employees are well motivated, encouraged to enhance their capabilities. Entrepreneurs attitude and behavior towards employee also matters and the entrepreneur with good attitude and behavior have well motivated and diverse workforce as people enjoy working under such entrepreneur and they encourage other to come and join the organization and they are committed to the organization as well, so results in enhanced productivity and promotes diverse culture. 60% Woman are found to be gave more importance to motivation as compared to males so that’s why we have seen that female owned organization have more diverse culture, but 35% male entrepreneur also using this capability to greater extent.

As (gudmundson and hartenian, 2000) said there are very few minority owners in the industry, Same was the case here, those we found have not much developed setup, 3 out of 40 respondents are minority owners who belongs to Christianity, one have surgical setup with not more than 25 employees, in his setup 18 out of these are belongs to minorities, there is no female in his setup. While other two are educational setups and they have more than 50 employees in their organizations.70-80% are female workers and almost 60% are belongs to minorities. Data is too short to discuss, although it showed that organization with minority owners are more diversified than organizations with non-minority owners.

50% of the respondents are fall in the age category of 20-29 and remaining 45% respondents are fall in age category of 30-39 and 5% are fall in category of above 50. Result here for this hypothesis is quite different from previous studies, respondents with age 20-29 have low diverse culture as compared to respondents from age category of 30-39, basic reason for this observed is that the organizations of age category 20-29 are not well developed and are at small scale with not more than 50 employees, but they have their intentions towards diversity initiatives they all have female and minority employees on the other hand organization of age category 30-39 are mature organizations with more than 100 employees they have more no. of female and minorities in their organization.

80% of our respondents are having masters or above degree remaining are bachelors degree holders so here we have not found any difference, but to some extent two respondents have PhD. Degrees and they have more diverse force and well organized setup. So education always matter and so the case here more educated person have more intentions towards diverse culture.

As (Dieterle, 2004) said in their research female owners are more tend to adopt diversity, it also seen here in our survey as well, but a difference arises in study is that the industry of the organization plays vital role in diversity enhancement. As there are some industries where
only male workers are mostly preferred and there are some professions where only females are highly encouraged. As exampled here, we examined the industry of surgical as it is full of men only, totally male dominated industry because hard hitting, use of power and proper use of metal are some things which are rare in females, so it is very difficult to adopt such profession for females. While on the other side of our study in profession of education, females are highly encouraged to do work, as it think to be less time consumed, safe and secure profession for females in our society and generally women have their intentions towards teaching, entrepreneurs also encourage females in educational institutions because they to pay less as compared to males.

Respondent are mainly owners of the organization where as some are partners and directors as well. All the respondents are well informed about the working of organization working; mostly owners and partners are from surgical and sports industry while directors are from educational institutions with full authority to do work in organization.

10 Out of 40 respondents are females. 7 out of 10 females are partners in organizations and some of them are sleeping partners and some are active partners but both are well informed about operations of organization, remaining 3 are owners of organizations and working on their own and one of them is running a leading organization of sports industry in Pakistan. Resulted that where females are owner there are more diverse culture in sense that females are encouraged to do work and working in almost every department of organization while minority employees are also part of the organization. In female owned organization 30-35% are females and 20-25% is minority employees remaining are male. So this ratio is quite good in societies like Pakistan, where females are not much encouraged to do work. But one thing is quite impressing, that is the ratio of female entrepreneurs from the sports industry described above, while situation in surgical industry is quite different, females are only 2-3% in surgical industry under female owners and all female workers on office work position like secretary and telephone operators etc. while minority ratio is similar here as in sports good industry.

60% of the respondent organizations have family members employed in the organizations and at top management level, remaining do not have family members in the organization. Among the above mentioned 60% most of them are partners in the organization. So it may not put so negative impact on managing diversity in organization. All organization have no more than 5 family members in their organization, but the organization with no family members have more outside people at top positions. So to some extent we can say organizations with no family member in organization setup have more diverse culture.

Conclusion and recommendation:
So it is concluded that organization where entrepreneur are well motivated about diversity and have the capability to motivate and handle its employees in a manner that they tend to be committed with the organization. Behavior and attitude of the entrepreneur for employees helpful in producing the diverse culture of the organization. Well educated entrepreneur have more knowledge about diversity issued and advantages and disadvantages of the diversity so he/she can easily decide to how to adopt and how can manage the diversity in the organization (Carlos et al., 2007).

Female employees feel safe and easily communicate with females so that’s why probability level high for diversity in organization when entrepreneur is female. Same is the case for minority owners they also easily communicate with minorities and to avoid conflict issues they mostly hire minorities in their organizations.
Effectively managed diversity always results in positive performance outcomes; it affects groups as well as individual’s performances, so workplace discrimination, age and educational level of groups and individuals pivotal for implementing diversity in an organization (Belijenbergh et. al. 2010).

Number of family members must be limited in the organization to promote diversity, but if family member is deserved for the positions and have guts and capabilities than any other then he/she must be hired. Diverse workforce can be a good solution for young entrepreneur to achieve goals and landmarks and to grow organization, so diversity adoption is benefited for him to bring creativity for increasing productivity. Limitation and future recommendation of this research is that due to short course of time number of respondents are very low, limited to just two cities. It can be extended to other industries, geographical areas and other characteristics of entrepreneur can be discussed under this study.

Practically this research is very important for the entrepreneurs, directors and partners of surgical and sports organizations as well as educational institution that they can adopt diverse culture to bring innovation and creativity to enhance productivity of the organization.

ABSTRACT
Man instinctively loves an easy life and science has helped him to do so. This love for easy life urges him to disobey the Commands of the creator. To him, fasting (eating no food and drinking no water from sunrise to sunset) seems opposing to his desire for easy life. Having this in mind, there are many Muslims who do not observe fast. So, in this piece of writing several misconceptions regarding fasting and good health have been removed. To make this article as informative as he could, the scholars studied books, journals and findings of medical researches concerning fasting. To make this article a complete one for those who are non-Muslims as they do not know the ABC of Islam, the scholars provided the different meanings of "Islam". Then he discussed the pillars of Islam on which the building of Islam rests. The reader of this article will find the meaning, obligations and origin of fasting. The status of fasting in the eyes of medical sciences is the pivotal feature and purpose of this piece of writing. The expression of information in an economical way with simple language really deserves to be encouraged. Each and every idea is not a mere statement, rather, every idea has been strongly supported by Quranic text and sayings of renowned and authentic doctors and scholars. The finding of this research work is that fasting carries unlimited advantages. The account of fasting in religions other than revealed one's, enhances its important. It is of great importance both as an act of worship and as a curing technique.

Keywords: Concept; Fasting; Religions; Medical Sciences

Introduction
Islam holds a great importance in the world religions. In terms of population it is the second greatest religion. Its followers live in all parts (continents) of the world.

The meaning of Islam is obedience i.e. Allah's obedience. The chief feature of Islam is that its teachings are most comprehensive, vast and surround all what is life. It provides guidance both for the individual and social life. In Islam the importance of worship and ethical manners is equal to that of social, political and financial system. It is the religion that founded human unity and brought humans closer to humanity in the true sense. It also puts an end to all kinds of differences (distinctions) of casts, colour and creed among human beings.

In short Islam determines the fundamental principles for human life and provided a system of faiths and worships. The obedience and to be follower of it ensures a success for both present life and the future life.

Literal Meaning of Islam:
Islam is from the root S ل M سللم. They join to form حسلام. Following are its literal meanings.
(a) Free from apparent and confidential/hidden evils and vices (pure and safe)
(b) Peace and safety.
(c) Well being.
(d) Obedience.
(e) Islam, Istimslam, Inqiad (submission, obedience) surrender, obedience.
(f) Of these meanings pure, sacred and unblemished are remarkable.

According to Muslim Scholars the religious or dogmatic meanings of "Islam" derive themselves out of its literal meanings and they are in close relation to each other. Linguists have explained the religious meanings in the words.

The religious meaning of Islam is the expression of obedience and submission, expression of being religious, and sticking fast to the Sunnah of The Holy Prophet."(2)

The discussion and introduction to Islam as a word and as a religion (Din) may never come to an end for it, being a complete code of life, encloses (surrounds) all what makes life and even beyond it "Islam" is a comprehensive word bearing unlimited aspects, but to make a long story short we can say that Islam is a Din (Religion)

Lo! religion with Allah (is) the surrender (to His will and guidance).(3)

There are some other words in the Holy Quran to depict Islam such as.

(4) The Religion of Truth.
(5) The religion of Allah.
(6) The right religion.

What is the ultimate conclusion of all the discussions about Islam is that Islam is a set of beliefs, actions (deeds) and a complete code of life. Its collective name is Din (religion) which includes creeds (faiths), prayer services (worships), and matters (individual, collective, political, economical, military, judicial and international).

Faiths in Islam:

Hazrat Abu Huraira (R) relates in a lengthy Hadith, that a person appearing before the Prophet, (who, was in fact the angel Gabriel in the shape of a man), said to him, "Tell me, what is meant by faith." The Prophet replied "Faith means belief in Allah and His angels, belief in the Holy books revealed to man, belief in the prophets of Allah, holding as the truth, the day of Judgement and having firm belief in the fact that whatever happens in the world is by the will of Allah, whether it be good or bad."(7)

It was all about faiths included in Islam. This is an extract from a lengthy hadith, also known as the 'Hadith of Gabriel'.

Now we come to the acts of worship and importance of worship in Islam.

Acts of Worship and Concept of Worship in Islam.

The Holy Book (Quran) as the basic source of Islamic law emphasises.

I created the Jinn and humankind only that they might worship me.(8)

This shows that the rationale behind creating this Universe and its creature is nothing but worship.

Now we come to the list of acts of worship.

(i) Prayer (ii) Zakat (iii) Fasting (iv) Hajj

As far as the obligation to perform each of these acts is concerned, we can quote verses from the Holy Quran.

Prayer (Salat)

Worship at fixed hours hath been enjoined to the believers.(9)
Zakat:-

Those who, if we give them power in the land, establish prayer and pay the poor-due.(10)

Fasting (As-Siyaam)

O ye who believe! Fasting is prescribed for you, even as it was prescribed for those before you, that ye may ward off (evil):(11)

Hajj (Pilgrimage):-
And pilgrimage to the House is a duty unto Allah for mankind, for him who can find a way thither.(12)

Fasting as a pillar (Fourth one) of Islam.
Fasting is the Fourth pillar in acts of worship in Islam. It is known as Som(Saum) in Arabic which means stop, refrain, desist. According to some scholars it has been named as patience (Sabar in Arabic) which means self-control, resoluteness, and perseverance. The above mentioned meanings express to some extent what fasting means in Islam.

It is, indeed, to keep self-control and to keep oneself resolute among sensual greed and to keep oneself unwavering in the times of lust. Let us see what do authentic books say about fasting and its meaning.

Fasting:-
Fasting (As-Siyam) Generally means "to abstain from something."
What is meant here is abstaining from food, drink, and sexual intercourse from dawn until sunset with the explicit intention of doing so (for the sake) of Allah.(13)
Fasting to go without food or without certain kinds of food, especially as a religious duty.(14)
To eat little or no food for a period of time, especially for religious reasons.(15)
Fast is obstinence from food, or certain kinds of food, for a period of time. (16)
Fasting is the practice of abstaining from food, either completely or partially, for a specified period. (17)
Fasting is a ritual abstention from food and drink, observed by either individuals or communities for varying lengths of time. (18)
Fasting, obstinence from food or drink or both for ritualistic, mystical, ascetic, or other religious or ethical purposes. (19)
It is from the root من. Its literal meanings are to abstain from something or to leave it. In religious meanings it means if a person is bound to religious commands and if he refrains himself from food, drink and other absurdities, he will be said observing fast.(20)

The Origin of Fasting:-
The history (dates) about the origin of fasting is unknown. A very famous physician of England Herbert Spenser in his book, "Principles of Sociology" makes a guess on the basis of examples of few uncivilized (savage) tribes that the fasting might have originated in the way that people in times of savageness would have kept themselves hungry and would have thought that their meal reaches in return to male and female. But scholars do not seem to rely on this conjecture.(21)
The origin of fasting is unknown. But the custom of fasting has played a part in the practices of every major religious group at some time.(22)
It is an ancient practice found in most religions of the world. (23)
Fasting has been practiced from antiquity worldwide by the founders and followers of many religions. In the religions of ancient people and civilizations, fasting was a practice to prepare persons, especially priests and priestesses to approach the deities.

In the Hellenistic mystery religions, the gods often revealed their divine teaching in dreams and visions only after a fast that required the total devotion of the devotees. (24) Like prayer fasting has also been a compulsory part of the Shariah of Prophets for old times. (25)

**Fasting in Different Religions:**

Fasting has been somehow in vogue in all, religions before Islam because all religions regard starvation and meditation necessary for spiritual development. No world religion has encouraged abundant eating. Even uncivilized nations, where there is no concept of any religion, have been found somehow practicing fasting.

Our discussion here will take into account the concept of fasting in different religions of the world.

**Fasting in Hinduism:**

Hinduism is regarded as the oldest religion in world religions. Many of its rites and rituals started in 6th century B.C or later, but it carries one or the other form of all religions. It does not have any remarkable founder. But inspite of all this we see that there exists an act of fasting for two days in each month on 11th and 12th for Brahman.

The fasting is known as Akadas. This makes 24 fasts round the year. In Hinduism, fasting is only for Brahman. Non-brahman are exception. Some Brahman observes fast on each Monday in Katak which lasts from 17th October till 15th November. The Hindu ascetics, going for mystic seclusion, observe fasting for 40 days. (26)

There are some other kinds of fasting as well in accordance with the purpose, for the achievements of cherished desires, and duration. Sometimes, personal or political goals are sought through fasting. Mohandas Gandhi of India used fasting both as a penance and as a means of political protest. (27)

**Apwas Fasting:**

Apwas means to be hungry. It is a fasting of mild class. The person observing it specifies a day and pronounces the name of that supernatural being to whom he wants to gift his fasting, for instance some god or goddess. The person observing fast eats lunch one day before fasting and then after picking his teeth intends for fasting for the next day and stops eating. This lunch is like pre-dawn meals. The next day after taking a bath the fasting person performs the day duties, takes water in his palm and throws it in all directions. The next day after sun rise he has the authority to break his fast at that time or at noon. If it lasts till noon then it is named as Lakant rather than Apwas. (28)

**Parak fasting:**

In it, the fasting person eats lunch on three consecutive days, for the next three days eats only dinner and then for the following three days observes fast. There is also another fast same to Parak, namely Karchara but it is for only four days. (29)

**Chandrabin fasting:**

It is observed on the day of full moon. Maswas is also of the same kind. (30)

**Fasting in Judaism:**

Our discussion here will be about the nature and duration of fasting in Judaism.
Jewish law orders a yearly fast on Yom Kippur, the Day of Atonement. Many Orthodox Jews follow the custom of having the bride and groom fast on the day before wedding. (31)

In Judaism, fasting is a command of God. Moses spent 40 days without eating and drinking on the burning bush. So Jews regard the fasting for forty days following Moses. It comes on the 10th of their 7th month. Therefore it is known as Ashura (10th). It was the day when Moses received ten commandments of Torah. Therefore Torah has laid great stress on this day for fasting. (32)

Judaism is an ancient revealed religion. The mentioning of fasting is found in its texts with speciality. But the fasting on 40th day is compulsory which falls on the 10th of 7th month (Tashreen) Torah has laid great stress on this Yom Kippur. Jews also had a fasting of quietness. The fasting person is required to be quiet all the day. (33)

In Judaism, the days for fasting are limited and specified.

- In the times of Babylonia, fasting was considered a sign of mourn.
- According to Jews when they felt God was angry with them, they observed fast or when the king set off for an expedition, they observed fast.
- Fasting is in practice as a sensation of some terrible event that took place.
- Some other fasts are also in practice but they are local. They also belong to some mishap.
- Some Jewish communities observe fast on the very first day of the new year.
- Some of them are in the hands of Jewish religious scholars. Occasionally they are prescribed for certain purposes.
- There also exist some personal fasts which the fasting person keeps according to his free will.
- Fasting is also practiced on having a nightmare. In Jewish law, fasting is prohibited on Eid. (34)

**Fasting in Christianity:-**

In Christianity, fasts, originally voluntary, became the subject of legislation only in the 4th century. The Roman Catholic Church distinguishes between fast and obstinence. The former, obligatory on all persons over 21, permits only one full meal in 24 hours; the latter, which binds all over 14, forbids meat or dishes made from meat.

The only obligatory fasts today are those of Ash Wednesday and Good Friday. The faithful are also required to observe a one-hour fast before receiving Holy Communion. Formerly, fasting was enjoined throughout Lent (except on Sundays), on Ember days, on vigils of the more solemn festivals, and on all Fridays except between Christmas and Epiphany and between Easter and Ascension. According to universal church law, abstinence was prescribed for all Sundays in Lent, St. Mark's day, Rogation Days, all Saturdays, and all Fridays except those noted above. The universal law, however, was usually adjusted by local custom and dispensation. The older system is followed, at least nominally, by the Church of England. The Greek Orthodox Church recognizes 266 fast days in a year. These include every Wednesday and Friday; the 40 days before Christmas and the 40 before Easter, the fast of the Apostles, between Whitsunday (Pentecost) and the feast of St. Peter; and the Lent of the Virgin, from August 1 until August 15 (The feast of the Assumption, or, as it is called in the East, the Dormition). In contrast to the Roman Catholic Church, the Orthodox never keep Saturday as a day of abstinence.
The reformed churches of Europe fasted during Lent only; the Scottish Presbyterians recognized only fasts with Scriptural authority. (35)

Many Christians Commemorating the 40 days that Jesus spent fasting in the wilderness. In general, for Christians, fasting seldom means doing without all food for an entire day at a time. In addition, people who are not well can usually receive permission from their religious leaders not to fast.(36)

Roman Catholicism and Eastern Christianity, has observed a 40 days fast period during Lent, a spring period of penitence, and during Advent, a penitential period before Christmas. Protestant churches generally leave the question of fasting to the consciences of individual church members.(37)

There are certain differences among various sects of Christians regarding the obligation and observance of fast. However, Christian Calendar prescribes following types of fasts.

(i) Christian fast  (ii) Polis fast  (iii) Eranus fast  (iv) Fast of cross  
(v) Eid-ul-Fasah  (vi) Church fast.

Fasting in Buddhism:-
Buddhist monks fast on certain days and confess their sins in quiet whispers. (38)

While Buddhism is an ascetic religion and regards the body as evil, Buddha was opposed to excessive ascetic practices of any kind, mainly because excess was evil. Hence, though food was to be taken in moderation as a method of guarding the gateways of the senses, he never advised excessive fasting. One of the ten abstinences is that of eating at forbidden times. Monks must eat but one meal, at mid-day, and nothing after it, they must fast on the days of the new and full moon. (39)

Fasting in Zoroasterianism:-
Among the western religions, only Zoroastrianism prohibits fasting because of its belief that such a form of asceticism will not aid in strengthening the faithful in their struggle against evil. (40)

Zoroasterian, religious leaders have protested against fasting from food. They claim that the food fast actually has no moral value, when compared with "fasting from evil" with eyes, hands, tongue, or feet. (41)

Fasting in China:-
In China, before the sacrifice during the night of the winter solstice, when the heavenly Yang (positive energy) principle was believed to begin its new cycle, a fixed period of fasting and abstinence was observed. (42)

Fasting in Egypt:-
Fasting is conditioned with some religious festivals in traditional Egyptians.

In Egypt, fasting as a method of expiation for sin, either occasional or at fixed times, was recognized. All luxuries had to be abstained from, as well as every form of gratification of the passions. (43)

Fasting in Greeks:-
Only Greek women observe fast on 3rd of Thismo feria among traditional greeks. (44)

Fasting in Islam:-
The main fast of Islam, ordained by Mohammed himself is the 30-days period of Ramadan, when no food may be eaten until sundown. Even though this month often comes during the hottest seasons of the year. Devout Muslims also observe the six days in the
following month; the fast of Ashura, on the 10th day of Muharram; every Monday and Thursday; and the 13th and 14th of each month (known as "the bright days."). (45)

Fasting is often referred to as a good work and it is one of the recognized duties of the Muslim. Hence, there are many stated times of fasting, some of which are obligatory, and others may be regarded as works of supererogation undertaken by the devout. Chief amongst the former class is the fast of the 30 days of Ramadan, rigorous and strictly observed, in which no water is allowed between dawn and sunset, and from which only the sick and infirm, travellers, idiots, and children are exempt. (46)

**Obligation of fasting:-**

All the above given discussion strongly advocates the importance of fasting not only in Islam but also in other world religions. But here we shall stick to the obligation of fasting in Islam. The command of obligation of fasting was given after two weeks of the incident of alternation of Qibla in 2 A.H. Ramadan was specified as a month for fasting about which it was revealed in Shaabaan. (47)

**In Quran:-**

And whosoever of you is present, let him fast the month. (48)

O ye who believe! fasting is prescribed for your. (49)

The two verses advocate strongly the significance and obligation of fast in Islam. The whole Muslim nation agrees that the fast of Ramadan is obligatory.

**In Hadith:-**

Allah has made it mandatory for all to fast during this month.

The person fasts in the month of Ramadan, in the condition of faith and with the specific intention, of gaining a reward in the hereafter, he will have the sins has committed till that time, forgiven. (50)

Your fast is a shield.(51)

Fasting is for me and I shall reward for it. (52)

**Purposes of Fasting:-**

Whatever command was revealed to Muhammad (P.B.U.H.) is not a mere command of God but it is full of wisdom and advantages. The building of Islam is on such pillars that carry spiritual, moral, collective, material benefits along with them. So the purposes of fasting are also well said in the words of Holy Quran.

(53) (54)

These two verses explain the purposes of fast.

(i) That ye should magnify Allah for having guided you.

(ii) And that preadventure ye may be thankful.

(iii) That ye may ward off (evil)

So it is our duty regarding the purpose of fasting (i) to magnify Allah for having guided us.(ii) to be thankful to him and (iii) to ward off( Evils).

**Fasting and Society reformation:-**
So far we have discussed the obligation and usefulness of fasting in the light of Quran and Hadith. Now we are going to analyse the role of fasting in society reformation. We shall see how it plays its role in eradicating social evils.

i. Prayer is a daily training while fasting is a training schedule of extraordinary kind for one month. It holds the man for 720 hours in the strong claws of its discipline to uproot the evils. This kind of training causes an entire change not only in individual but also in society.

ii. It gives Muslims a sense of service. He feels that he is a servant to Him. He must consider himself dependant upon God.

iii. Along with the sense of service it gives the feeling (sense) of obedience. It trains man for complete obedience of His command to abstain from gratification of desires such as food, drinking etc. Without obedience fasting (eating and drinking nothing) will be like a dead body without soul.

iv. It helps the individuals to build their character. The character is based on fear of God. It kills all what is negative in man and promotes all what is positive.

v. The training in fasting includes self control. i.e. control for the gratification of desires such as eating, drinking and sexual pleasure. It also helps individual to control his passions such as anger. A fasting person is bound, in the true sense, to show such a self-control in all his dealings that it becomes ideal. This self-control helps individuals to evolve a society full of peace, prosperity and care (feel) for other's rights. The society thus transforms into an earthly paradise. (55)

The Spiritual Aspect of Fasting:-

The spiritual aspect of fasting is implicit in the verse that makes the obligation of fasting known to the people.

O ye who believe! fasting is prescribed for you even as it was prescribed for those before you that ye may ward off (evil). (56)

Piety is the name of that feeling at heart having gained one hesitates to commit what is regarded as sin. He finds anxiety in him for what are known as good deeds.

We can say that the spiritual goal of fasting is piety.

(ii) It gives Muslims the lesson of true love and sincerity.
(iii) It motivates Muslims for service (worship) and makes him closer to God.
(iv) It awakens the human being by making him broad minded
(v) It teaches tolerance and selflessness.
(vi) It makes him moderate. (57)

Fasting and Medical Sciences:-

Now we have come almost to the concluding part of this research article. This part is about the significance of fasting in the eyes of Medical Sciences.

The Holy Quran Says:-

And that ye fast is better for you if ye did but know. (58)

M. Arifuddin (Scientist Centre for Cellular and Molecule Biology Haidrabad India) Says:-
Human body is, indeed, like a machine which can be named as Biological Machine. It also works in the same manner as other machines do. For example, motor car is a machine but it needs petrol which gives it energy. For maintenance it needs servicing and overhauling occasionally.

Similarly the biological machine of human body needs food for energy as well as occasional service and overhauling so that it may produce good deeds which will effect the soul and morality of him. The Creator of this machine, therefore, has made fasting obligatory to keep the machine neat and clean to get neat and clean (good) deeds as a result. These good deeds will help him to reach a high spiritual place. Now we see the importance and role of fasting in making the biological machine neat and clean.

i. Obesity means the increase in size and number of Adipose cells, Fasting is the best way to control Adipose cells.

ii. People compel the stomach to produce Hydrochloric Acid consistently by having food more than enough for them. It increases the chances of Peptic Ulcer. Fasting in this regard gives stomach rest and the production of HCL stops. Thus the chances of falling ill decrease.

iii. Liver is Lipogenic Glycogenic and Cholestrogenic in well Fed condition. It means that it produces fat, glycogen and cholestrol but when one observes fast, the liver produces glucose from glycogen, fat and proteins. The liver produces 160 kg glucose in one day in a man with fast. Our brain needs it badly. Moreover the coricycle which does not work in well fed condition starts working in fast.

iv. It is a notable fact that the amount of energy we get from food is produced without food in fasting from the waste matter in our body. It is known as calori Homostasis.(59)

Our discussion here will focus on the effects of fast on different systems of human body. Our this discussion will help us to analyse the unimaginable usefulness of fast for healthy body and healthy mind.

**Fasting and Digestive System:**

Fast casts its effect on all organs of human body but it must be kept in mind that fasting is prescribed by the creator of humans who knows the most. He knows the limitations of human body and His commands do not take any one beyond limitations.

i. The very first effect of fast is on water level in a human body. Though it surely decreases but, with the help of some natural system one can overcome the decrease in water level, to prevent water loss harmones such as Nor. AdreNalin start working.

ii. With the decrease in water level digestive juices also decrease. In the last hours of fast these juices appear but in a very less quantity. The glands producing these juices go in rest which enhances their working later after Aftar. (60)

**Fasting and Liver:**

Fasting also effects liver like other organs. It is an interesting fact that fast influences liver functioning wonderfully.

Fast provides liver a rest condition for four to five hours. This rest is not possible without fast. Liver produces bile to digest the food. Science suggests the duration of rest for liver at least one month in a year. It is possible only through fasting.
The modern man, who values his life very much, considers himself safe after several medical check-ups. But if liver had the ability to speak, it would have said to such a man you can favor me only by observing fast.

During fast liver is free to digest and store food so it can produce Globulin which strengthens immune system. (61)

**Fasting and Obesity Resulting in Sterility:**

Obesity causes sterility in too much fat women. Fasting helps pregnancy in fat women. Thus fasting is helpful both to cure sterility and as causing pregnancy in fat women. (62)

**Fasting and Hormones Functioning:**

The substance produced by body to digest food is through Retrogogue and Secretogue processes. We eat 1.5 litre food in one day. While Secreto Gogue produces 7.5 litres to digest food. This makes 9 litres in total. During fast the production of 7.5 stops and thus this system takes rest. During fast the following hormones increase in their numbers.

Cortisol Aderndcorticorts Hormone (Acth) B- Endorphine B-Liportophine Harmone, Adrenaline, Noradrenaline. (63)

**Fasting and Immune System:**

The quantity of Adrenaline increases from 200 Pmal / 1 to 700 P mal/1. Noradrenaline increases from 0.25 n mal/l to 1.5n mal/1. Glucogon and Insulin increase from 2 to 7 in proportion. The chief function of cortisol is to enhance immunity. It decreases inflammation. B-Endorphine is a natural pain killer which works like opium. Its function is to make human feel no pain. It also casts good effect on mood and sleep. With the increase in Adrenaline, the Glycogen in Liver and Fat in Adipose Tissue starts dissolving.

Fasting, thus, causes an extraordinary Tuning, Overhauling and Servicing of human body. All the organs start functioning with a new power. The decrease in Follice Stimulating Harmone decreases sexual urge and increases the ability to think. (64)

**Fasting and Metabolism:**

Complete Fast decreases hunger or eradicates hunger and thus the body weight decreases quickly. Allancot in 1975 in his book "Fasting, Way of life" emphasises that fast gives rest to digestive and nervous system and causes body metabolism to be balanced. (65)

Metabolism is the chemical activity in a body that uses food to produce energy one needs to work and grow.

**Fasting and Health:**

Dr. Jack Gold Stein, who has been approved by American Natural Society, advocates fasting in his book. "Triumph over Diseases by Fasting" in these words

Fast causes an end to Toxin in human body which is very much necessary for better health. Another book of 45 pages about the effects of fast has been published by Ahmedabad Gala Publishers. Dr. Gala and Dharrun Gala have provided the medical advantages of fast by showing detailed facts and figures of cases reaching health with the help of fasting. They say that following were the diseases which came to an end due to fasting.

<table>
<thead>
<tr>
<th>Disease</th>
<th>Effect of Fasting</th>

</tbody>
</table>
Fasting and Blood Production:

Blood is produced in bone marrow. When the human body needs blood, an automatic system stimulates the bone marrow. In weak people, the bone marrow is also in passive working. During fasting when food is at the lowest level, the bone marrow starts its function. In this way, weak persons can cause more blood production by keeping fast. (67)

Fasting and Intestines:

Fast provides energy and rest to intestines. It happens because of healthy digestive juice production and the muscles' movement of the stomach. There lies Endothelium under the layers of intestines to cause immunity. This network of intestines gets new power and freshness. Thus, a fasting person becomes safe from all such diseases that may come to him because of digestive intestines. (68)

Fasting and Nervous System:

During fasting, in some people, feeling of anxiety and peevishness increases but this has nothing to do with the nervous system. It is mainly because of Egotistic in such persons. On the contrary, during fasting, the nervous system is at rest. The comfort gained from full offering of worship eradicates all hatred and anger. All worries and anxieties dissolve in complete obedience to Him. Fast casts pleasant effects on the nervous system and thus helps the fasting person to be free from worries. (69)

Fasting and Diabetes:

In the list of modern diseases, Hypertension and Diabetes Mellitus are such two which have caused disturbance in every second person. The patient of diabetes, despite expensive treatment, do not recover because of over dieting. They are always found eating something with the idea that diabetes can cause weakness. It rather adds to the sickness and disturbs stomach and liver. The only curing technique for such persons is fasting. Fast saves one from over dieting. This causes the functioning of the stomach and liver to come to normal. That's why fast proves healthful for diabetic patients.

The sugar level in persons without fast may fluctuate but in persons with fast it becomes normal. (70)

Fasting and Cancer:

The findings of a recent research have astonished everyone by saying (disclosing) that fasting prevents cancer. It causes the growth of cancer cells to slow down. The glucose level decreases during fasting. Our body needs fuel as energy. So, to get energy, our body uses fats instead of glucose. It produces Ketone bodies which cause the decomposition of protein to stop. The cancer cells need decomposed proteins for growth. During fasting, they are produced in less number and so fast prevents cancer. (71)
Conclusion

In the light of all discussion which is authentic too, it can be concluded that the observance of fasting is found much earlier than Islam. The words of Holy Quran strongly advocate this notion.

As it was prescribed for those before you.

Fasting is a pillar of Islam but it also occupies a high status in other religions as well including the most ancient Hinduism, Judaism, Christianity etc.

Islam being a complete code of life carries unlimited wisdom in all its commands whether they are worships or daily matters. Fasting as the fourth pillar of Islam is also full of profound advantages for humankind without regard of religion. That is the reason that it has been in vogue since the very beginning. Moreover the recent researches of medical sciences prove its unlimited advantages.

Medical sciences show its vital role in making a human body rich in health. The opinions of European Doctors given at the end of the article show that they prescribe it as a cure for certain fatal diseases such as Cancer and Asthma. It also proves handy in curing obesity causing sterility. It has been found more useful than expensive treatments in diabetes and hypertension. In the light of all its advantages which cannot be taken into account one can say that fasting carries great importance both as an act of worship and as a curing technique.

Abstract
This piece of writing throws light on the origin and evolution of languages and provides detailed information about the languages spoken in Subcontinent. This is a commendable effort of the researcher as to collect the required information he had to go through a laborious work. The task was not easy but the way it has been dealt with is appreciable. As far as the origin of language is concerned, 4 theories have been presented, and for the evolution of languages the researcher has given sketches to make the reader understand the gradual progress of languages. The reasoning and argumentation from Quranic verses is a unique effort of this research as it was purely a topic of linguistics, but the researcher has proved that the Holy Quran contains all kinds of knowledge in its contents. We only need to meditate them deeply and as a result we will find ourselves in an endless ocean of knowledge.

Keywords: Origin; Language; Light; Quran; Phases; Evolution; Languages Spoken; Subcontinent.

Introduction
Man is eager to learn by nature. It means that it is in the nature of man to find out about all the living things on earth and in the universe. Man wants to know how all these things originated. Language which is the most important human activity has remained a subject of serious meditation by language scholars over the centuries. In an attempt to find out the origin of language, linguists have gone even up to the extent of studying the language of children, primitive societies, the behaviour of the higher animals and even the language of those people who are suffering from speech defects. But origin of languages is wrapped in mystery and we are profoundly ignorant about the origin of language. We have to content ourselves with more or less plausible speculations. Because of this ignorance 20th century linguists have refused to discuss the matter, on the ground that it is wastage of time on a subject where we lack evidence. It seems probable that speech arose at the same time as tool-making, and the earliest form of specifically human cooperation.

Mr. Ehsaan-ul-Haq has given a beautiful lingual analysis in the magazine “Fikr-o-Nazar” with the topic “Linguistics: A Historical Analysis”. about the origin and evolution of languages. This analysis is given in the following.

“Language occupies the status of an important phenomenon in human personality. Therefore, man, from the very beginning, is making a serious consideration about the universe around him. Similarly the universe inside a man is
also a centre of attention for him. The wonders of this universe are diverse and the mysteries of it are indefinite. Language is also one of these mysteries.

God Says in Quran.

“And there are (Signs) in thy soul, Thou do not consider.”(1)

Another saying,

We shall show them our portents on the horizons and within themselves until it will be manifest unto them that it is the Truth.(2)

Language is also one of these signs as described in Quran.

And of His signs is the creation of the heavens and the earth, and difference of your languages and colours.(3)

On another occasion, God says,

“And by the Lord of the heavens and the earth, it is the truth, even as (it is true) that ye speak.”(4)

Besides humans, the mutual communication in animals also has not reached to the level of language rather it is very defective in comparison to humans. Allah interpreted this communication of humans as utterance as mentioned in Quran.

“He hath created man. He hath taught him utterance.”(5)

So philologists and philosophers are busy in exposing the mysteries that are there within human languages for centuries. (6)

Philologists and philosophers raise this question regarding the mysteries of language: what is the origin of human language, how it originated, and how variations are taking place. What is the number of language families? What is the nature of difference between languages of different sects (classes) of society?

Mr. Ehsaan-ul-Haq writes.

“When did man begin to meditate about these (lingual) mysteries? It is obvious that to discover the time of meditation in this field, before the advent of calligraphy or copying book, is difficult. But the first book of this series was written by Panini in 4th century B.C. in view of clear religious purposes. In it, he has skillfully explained the sound system, and grammatical system of Sanskrit. European Scholars discovered this book in 19th century.” (7)

This discovery made the connection of Sanskrit with the European languages known (clear). And a strong movement of Comparative Linguistics rose up. It reached fame and popularity in 19th and 20th century.” (7)

Ehtishaam Hussain writes in “A Brief Sketch of Urdu Linguistics”.

“In 1786, Sir William Jones expressed these thoughts after studying Sanskrit, Greek, Latin, German and old Persian. He said that all these languages have some connection with one language. Of these languages the most ancient one is Sanskrit. Since that time there started the study of comparative linguistics. The comparative linguistics and comparative rules got promoted. (8)
The study of Panini’s book reveals that Greeks and Romans were aware of linguistics. But one can find no book of such status as that of Panini. Probably the reason for it was the interest in the philosophy. They looked towards it under philosophical point of view.

Dr. Nayaf Khurma wrote about language.

“Regarding language, the most important problem raised by Greek scholars, the effects of which did also impress (influence) contemporary literal researches is that whether language is a natural phenomenon or a social sign (indication). Plato’s thought is that language is natural phenomenon, and words and their sounds are such ingredients which can not be separated from their meanings. But the school of thought of Aristotle opined that language is a reflective (phenomenon) of society, and words and their sounds are such secret terms which have no connection (direct or physical) with their meanings. So, the first school of thought got fame with the name “Tauqueefia” and the other was called Technical or Tawaziah. (9)

Ibn-e-Faris defended the Tauqeefi theory about language in 4th century Hijri and produced the evidence with the verse of Surah Al-Baqra Ch.2, Verse 31.

“And He taught Adam all the names”. (10)

It means language (vocabulary) is a gift of God but this theory was opposed by a famous philologist Ibn-e-Janni. He calimed that language is neither a revelation nor a thing settled by God. Rather it is elected and deducted one (means the technical or tawaziah theory). In addition, the meaning of the knowledge mentioned in the verse is the ability to speak and name (ability of naming things.)

**Various Theories regarding the Origin of Language.**

Linguists have put forward various theories regarding the origin of language/languages. Of these theories the most prominent are following. (11)

a) Pooh Pooh Theory.
b) Ding Dong Theory.
c) Yo-He-Ho Theory.
d) Gesture Theory.

A brief introduction of above mentioned theories given by different authors is given in the following.

**a) Pooh Pooh Theory:-**

This theory was pointed out by Max Muller in 19th century. It is also called “Interjection Theory.” According to this theory, man articulated (uttered) some sounds in the states of grief, happiness, anger and amazement.

These various sounds assumed the form and shape of language in the following period.

**b) Ding Dong Theory:-**

Ali Nawaz Jatoi wrote about this theory.
According to this theory it has been concluded that there is a connection (link) between the sounds of language and their meanings. The earliest humans used suitable sounds as a result of effects of outer atmosphere. These sounds assumed the shape of language. (12)

C) Yo-He-Ho Theory:-

According to the opinions of the experts of this theory when a group of ancient humans performed a task with a joined effort and produced certain sounds such as Hay, Ho, Hon, Han etc.(13)

Lado wrote about linguistics.

Linguistics is the Science that describes and classifies languages. The linguist identifies and describes units and patterns of sound system, the words, and morphemes and the phrases and sentences, that is, the structure of language. (14)

The definition of language according to human nature is that language is a relation of sounds and vocal signs which came into existence along with man. It is such system, and such a process with the help of which the members of one social group can establish a connection (relation) with the members of other group, and can understand each other.(15)

In short, it can be said that the effort that linguistic psychology does to access the origin of human languages does not contain scientific absoluteness and linguistic facts (evidences), yet it produces a vague outline about it. The theories mentioned about the origin of language are partially true but they do not give certain knowledge that how language originated. Any how it is a reality that on the grounds of being old (worn out) of civilization traces whatever is the ancientness of humans, we are to admit that man from the very start had the quality of using gestures and vocal language for the actions of command, inquiry and expression. He adopted social life as being subject to his needs. And language came into being due to social requirements.

The Languages Spoken in Subcontinent.

Some people have this point of view that the origin of all languages of world is one language. But this does not seem right as some languages are such different from each other in their structure that any link (connection) between them is out of imagination. Some experts have made divisions about languages that they are divided in four, eight, twelve, twenty six or even more groups. But the division at which the experts on the whole are agreed is that the languages known to this world are classified in two divisions.

(1) Classification on the basis of characteristics of words, and letters.

(2) Classification on the basis of historical and racial relations.

Remember this is the most agreed classification.
The way scholars (experts) have classified the languages of the world is given in the following.

### Historical Group

#### Wordy group

**a) One word group.**

The languages, the foundation words of which do not add variation in their meaning and sense through changes in their shape (form). Such kind of languages are in vogue in China, The eastern countries of India, and the surrounding habitations. All words in these languages are usually free (independent) and there is no usage of suffixes and prefixes with them.

**b) Derivatives group**

This group is one word or origin from which hundreds of words are derived. According to the classification of languages of world, the second group is Historical and Racial group.

#### Historical relations and Racial relations group.

In this group the world languages are divided in eight major groups. Each family clarifies that the speakers of that are members of particular countries or particular tribes. Of these some have been separated but the ancient common factor is still there in their language.
Eight languages constitute this group.

(i) Semitic
(ii) Chinese India
(iii) Dravidian
(iv) Monra
(v) African Banton.
(vi) American
(vii) Malaya
(viii) European India.

My intent, here, are the languages spoken in the Subcontinent. Thus, for its explanation the connection with European India language is essential which is a branch of Racial and Historical group.

Dr. Syed Mohayuddin Qadri wrote in “Indian Linguistics” in this context.

“In comparison to other groups (families) of language, this group (European India languages) is very vast and is spread on a relatively important part of the globe. In our country, India, most languages spoken are of this family”.

(16)

From the given sketch of European India languages, Persian India group shows the languages spoken in the Subcontinent.
Rajhistani

Ehtishaam Hussain writes in “A Brief Sketch of Urdu Linguistics”(17)
“The History of Irani (Persian) language is very old. But its most ancient (antique) patterns belong to 600 B.C. The most important pattern is that which is in the form of Avesta. This one and Sanskrit have strong resemblance and likeness. This language turned into Persian after going through frequent changes. (18)
Irani was the language of Aryans.
“Where did Arya born”? is a question of dispute among scholars. But majority of them are agreed on this idea that this nation reached various parts of the world after migrating from Central Asia. One group of Aryans travelled to Europe after leaving Central Asia, and there got divided in groups. This is the reason of the resemblance between Greek and Sanskrit. Another group of Aryans settled in Iran and got divided in various tribes. They entered Sub continent from Iran crossing mountain channels and brought their languages along with them. The Aryans in Iran and the new comer Aryans in Subcontinent had the same racial back ground. But when they got separated their languages developed in different ways. Irani got promoted in Iran while Sanskrit in Hindustan (India). The date of Sanskrit is determined 1500 B.C.
After Sanskrit there started an age of Parakrats. The age of it is described 600 B.C. to 1000 A.D. Ehtishaam Hussain writes about these “Parakrats are traced in the books of Budhism and Jainism, the epitaphs of Ashok, and in some religious poetry that was written in that age. Of these languages the prominent ones are Magdhi Ardhgidhi, Shorsaini, Maharashtri, Nagar, Abnagar, Verachdi and Kaiki. Beside these there comes the name ‘Paali Parakrat’ frequently in history. Infact, Ardhgidhi is the shape that Gautam Budh used, and Ashok used in his epitaphs. It spread through Subcontinent with Budhism. (19)
Parakrati period lasted for one century and a quarter in Subcontinent. It went through great variations. The greatest variation is “Up Bhrunsh. Its time is almost from 800 A.D to 1400 A.D. Scholars have not regarded it a separate lingual age (period). Rather this third age of central and modern Aryan India is called the age of dialects. It starts nearly 1000 A.D and lasted till the time in which all those languages are included which came into being after 1000 A.D. Some of these languages remained limited in the form of dialect and few assumed the shape of languages and they are rich of a high class of literature. All these three periods of the evolution of Aryan India are very vast as well as wide. Modern Aryan India is its last period. This last period languages are divided in five or six groups on the grounds of geographical areas.

Grierson and Doctor Mohayuddin divided it in five parts but Dr. Swenti Kumar Chattarji divided them in six parts.

Here, I analyse the division in the light of “Indian Linguistics.” by Dr. Mohayuddin Qadri.
2: South Western Group

2

3 2 1
36 Gadh Baghali Orhi
```

```
2 1
Western Eastern
2
Urya Bengali Asami
3
Bhojpuri Maghi Marathi
```
Gist of discussion is that there were numerous dialects (languages) spoken in Subcontinent. But when Muslims appeared on the scene of Subcontinent, Aryans were at the peak and Sanskrit was spoken there. “What languages were spoken here before Aryans”? This question has been explained to some extent in “The Old History of Urdu Language” by Ainul Haq Fareed Koti. He writes “Before the arrival of Aryan tribes the languages of Awwal Manda group were in vogue in Subcontinent and later came Dravidian group. The present public languages of North India (Urdu, Punjabi, Sindhi etc.) and the forerunner local prakrats sprung from the Manda and in particular Dravidian group that were in vogue before Sanskrit in Subcontinent. (25)

Ehtishaam Hussain in his book “A Brief Sketch of Urdu Linguistics” writes “When Aryans came in Subcontinent there were other nations already settled here e.g. Kolmanda and Dravidian Kolmanda came here and settled in India in 5000 B.C. or earlier. After that Dravidian people reached Subcontinent in 3000 B.C. and settled in Sindh (Indus). They founded the great civilizations of Harappa and Mohenjodaro. This age is described as 2500 B.C. Dravidians declined after the arrival of Aryans and they migrated towards Deccan leaving North India and they are limited there at this time.” (26)

Conclusion
In the light of all the discussion above it can be concluded that though linguists have put forward numerous theories to understand the origin of language to some extent but none of the theories is final and absolute one. Each theory seems a plausible speculation as to find the record of that prehistoric time is impossible. Islamic point of view is that language is a gift of God to mankind. Though these theories are lacking, yet they produce a vague outline about the origin of language. The information about the languages spoken in Subcontinent has been conveyed in the form of sketches for the convenience of the reader. These sketches prove the laborious effort made by the researcher. To study this research work is equal to the study of an encyclopaedia about languages as the valuable information is conveyed with economy of words.

Analyzing the Causes/Factors of conflicts in Male & Female Secondary Schools

Abdul Ghaffar
PhD Scholar Education
Qurtuba University of Science and Information Technology, Peshawar (KPK), Pakistan

Dr. Umar Ali Khan
Director Institute of Education & Research (IER)
Gomal University DI Khan

Abstract

This paper examines the probable causes of conflict in work environment with respect to performance of school teachers keeping in view both male and female secondary schools of Khyber Pakhtoonkhwa. The findings suggest that causes of conflict vary from male to female schools but both male and female schools’ principals responses testify that causes do exist and these needs to be resolved. On the basis of findings of the study some recommendations have been forwarded for policy implications. The paper concludes that remedial measures for resolving of conflicts although are very important one should not ignore the root causes of differences.

Keywords: Conflict, Conflict management, Education

Introduction

Conflict is “a situation in which the conditions, practices, or goals for the different participants are inherently incompatible”. The nature of conflict with its potential caliber either to be destructive or constructive is an essential phenomena for all human organizations. Negative connotations have been associated with the existence of conflict in any situation, whether it is in an organization or in individual dealings. Most of the people opin that whenever you hear the word conflict, its consequences will definitely be destructive.

Kreisberg (1973), for example, defines conflict as a "relationship between two or more parties who... believe they have incompatible goals." Another view about conflict is that it should not be discouraged but that "organization's goal should be to control conflict rather than to eliminate it".
Studies show that conflict has always been regarded a positive force depending on its proper management. Campbell et-al (1983) opines that educational leaders must be aware of the fact whether the conflict is beneficial or harmful to the organization. If the conflicting situation proves to be of some value to the organization it must be encouraged and its output must be accumulated. And if the situation presents an adverse effect on the employees and organizational goal achievement it must be discouraged and if possible must be eliminated.

1.1 Statement of the Problem

Conflicts as necessary phenomena of school setting have contributed one way or the other for promotion of working relation; however these inter-personal relations got a set back when these conflicts were poorly managed. The present study aims at answering the following research question;

1. What are the contributing factors/causes for conflicts in the schools?

1.2 Research Methods and Design

This study covers randomly selected male and female high secondary schools in the two districts of KPK. The subjects for the study include school principals, and vice principals (in case where the school principal was not available at the time of data collection). Both primary and secondary data was collected for the study. The primary data were collected through questionnaires and secondary data was obtained from literature.

Out of the selected districts 20 schools were selected from each district. Out of these 20 schools, all principals i.e. a total of 40 principals (both male and female) were targeted. Principals of these schools were informed about the purpose of the study and questionnaires were handed over to them.

1.3 Selected Review of Literature:

Administrator ability lies in the fact that he should be able enough to understand the causes of conflict and thereof to control it as well as ensure the organization progress. Williams (1978) argue that good and effective administrators should solve the problems whatever its intensity might be. He should not avoid problems but should face it boldly and cash its positive results for the staff and institution as well. This is because they accept problems as challenges and as an opportunity to prove their worthiness for advancement. Owens (1998) state that since educational/organizational objectives cannot be achieved without proper cooperation, harmony and collaboration of the staff, it is essential that the administrator must foster cooperation among the staff.

Educational administrators try to influence their subordinates’ behaviour, they try to have full control of their staff but the administrator’s influence varies from situation to situation.

Educational administrators have different leadership styles which are classified into autocratic, participative and laissez-faire style.
Starratt (1996) states that educational administrators are like teachers of autobiography, in which he tries to teach his students his own life history. In this autobiography, he conveys the message that how we live, how we take administrative decision and how we resolve various issues and problems of our life. In solving the problem the whole process is coloured by our personal likes and dislikes. Our feelings of others and behaviour towards other people and the situation is marred by our personalities.9 Principals are the key players for implementing any conflict resolution strategy in the school. It depends on the leadership style of the concerned principal and his/her background knowledge/training in conflict resolution that how he/she deals with a particular conflict situation. Finally, it is hoped that most of the research reviewed here provide a theoretical framework for ascertaining different types of conflicts, the sources of conflicts, and techniques of resolving conflicts. It is concluded that on the basis of theoretical aspects an in-depth investigation will be carried out in order to answer the questions which were posed for this study.

1.4 Findings and Discussions

In this section major findings and discussions of data gathered from both the primary and secondary sources have been presented. The presence of conflicts in schools in the province and its occurrence among the staff members is undisputable.

Table 1: Assigning of duties/work distribution among the staff

<table>
<thead>
<tr>
<th>Respondents</th>
<th>Yes</th>
<th>No</th>
<th>Total</th>
</tr>
</thead>
<tbody>
<tr>
<td>Male Principals</td>
<td>38</td>
<td>22</td>
<td>60</td>
</tr>
<tr>
<td>%age</td>
<td>63%</td>
<td>37%</td>
<td>100%</td>
</tr>
<tr>
<td>Female Principals</td>
<td>43</td>
<td>17</td>
<td>60</td>
</tr>
<tr>
<td>%age</td>
<td>72%</td>
<td>28%</td>
<td>100%</td>
</tr>
</tbody>
</table>

Table 1 illustrates both male and female principals’ responses to the question that whether Assigning of duties/work distribution among the staff can be regarded as a cause of conflict in their respective schools. For the above question 63% male and 72% female principals respectively responded in affirmative whereas 37% and 28% responded in negative.
In the above table the symmetric measures between the responses of male and female principals are tested on question assigning of duties/work distribution among the staff. Its result shows a significant level which means that both of the principals agree on the same level of response.

**Table 2: Misappropriation and embezzlement of school funds**

<table>
<thead>
<tr>
<th>Respondents</th>
<th>Yes</th>
<th>No</th>
<th>Total</th>
</tr>
</thead>
<tbody>
<tr>
<td>Male Principals</td>

<td>47</td>
<td>60</td>
</tr>
<tr>
<td>%age</td>
<td>22%</td>
<td>78%</td>
<td>100%</td>
</tr>
</tbody>
</table>

Table 2 shows both male and female principals’ responses to the question that whether misappropriation and embezzlement of school funds can be regarded as a cause of conflict in their respective schools. For the above question 13% male and 22% female principals respectively responded in affirmative whereas 87% and 78% responded in negative.
In the above table the symmetric measures between the responses of male and female principals are tested on question misappropriation and embezzlement of school funds. Its result shows a significant level which means that both of the principals agree on the same level of response.

Table 3: Indiscipline (on the part of both staff and students)

<table>
<thead>
<tr>
<th>Respondents</th>
<th>Yes</th>
<th>No</th>
<th>Total</th>
</tr>
</thead>
<tbody>
<tr>
<td>Male Principals</td>
<td>12</td>
<td>48</td>
<td>60</td>

In the above table the symmetric measures between the responses of male and female principals are tested on question Role conflicts. Its result shows a significant level which means that both of the principals agree on the same level of response.

3.2 Suggestions for Conflict Resolution and Management in Schools:

Some suggestions and recommendations on the causes of conflict in school are made for possible implementation:

1. In order to create and provide a working environment, the school principals should distribute work equally among the staff.

2. School funds should be properly managed and utilized and the principals should keep a clear record so that if there is any doubt among the staff the principal may clear his position.

3. For maintaining a good working relation and maximum output the principal need to maintain discipline in the school.

4. Principals should keep check on all the staff to involve them and utilize their staff potential to the maximum possible level.

5. Conflicts exist no doubt everywhere and in all kinds of relation; the principal should do his best to resolve their staff personal clashes.

6. Principals should treat all the staff on equal footing so that there may be no complex among the staff.
7. For smooth running of the school, the principals should not favour one teacher on the other because all of them belong to the same family/institute.

8. Teachers often feel that they are assigned extra duties and they are overburdened with extra work, principals should keep in mind that they should be given the role which best suit their potentials.

Conclusion:

Conflict, no doubt, remains central to all matters associated with school staff; whether they face each other in personal capacity or in group form. Human beings are prone to personal likes and dislikes; their relationship gets a setback when they are odds with each other. In order to minimize and to mitigate their differences, the authorities need to resolve their differences so that they might feel at ease and might work in congenial environment. The authorities should address all their issues not only for the time but rather they should go deep into the matters and should try to know the root causes of their differences.

Impact of Global Financial Crisis on the Auditing Profession in the Republic of Yemen (An Empirical Study)

Dr. Atef Aqeel Al-Bawab
Philadelphia University, Amman - Jordan

Abstract
This study aimed to identify the impact of financial crisis on the auditing profession in the Republic of Yemen, where the level of income for the offices of the audit firms and level of financial advisory, tax, and level of performance and services audit. To achieve the goal of this study, was designed questionnaire was distributed to (75) of accountants and auditors working in the offices of the audit firms operating in the Republic of Yemen, recovered from (54) questionnaire by recovery was (72%), and after analyzing the data using a program (SPSS), The study reached several conclusions, including: (i) Financial crisis negatively affected on the auditing profession in Yemen. (ii) Decreased level of income of the offices and the audit firms, as well as decreased the level of financial advisory, tax, and also the level of performance and audit services. (iii) The activity decreased and the number of visits by the auditors of the companies that are audited.

One of the most important recommendations of the study include: (i) The need to raise the level of trust between the offices and the audit firms with firms that are audited. (ii) Increase free advisory services to companies that are audited. (iii) The necessity of activating the role of internal control units in companies that are audited.

Keywords: Impact; Global Financial Crisis; Auditing Profession; Republic of Yemen; Empirical Study

1. Introduction to the Study
Started appearing on the global financial crisis appears within the United States of America is attributed with the year 2007, as the crisis in the real estate sector, for complicated and then turn to a credit crisis within the banking and financial system American. (Sidani, 2009). But the appearance of clear signs of the global financial crisis was in September 2008, which is considered the worst of its kind since the time of the Great Depression of 1929. First, the crisis has begun in the United States of America, then spread to countries in the world to include European countries and Asian countries, and the Gulf States and developing countries that link their economies to the U.S. economy directly, "capitalist economy.

It is worth mentioning that he had reached the number of banks that have declared bankruptcy in the United States of America since the beginning of the crisis and until January 2010 145 banks.

It was the global financial crisis impact on the global level and the Arab world, and the Republic of Yemen has been affected by the global financial crisis like the rest of the world, where it is linked to global trade, and deal with the economies of the capitalist world, and it was necessary to study the effects on economic and financial sectors, and to what extent influenced the crisis on these sectors, and what actions have been taken to reduce this crisis?, and whether there are pros to the crisis?, and this study was to examine the vulnerability of the auditing profession in the Republic of Yemen, and whether this will be the crisis negative or positive on the performance of the profession?
1.1 Study Problem
We can be summarized the problem of the study by asking the following questions:
1. Is the global financial crisis has affected negatively on the auditing profession in Yemen?
2. Is there a decrease in the level of income of the offices of the audit firms of Yemen?
3. Is there a decrease in the level of tax and advisory services provided to customers?
4. Is there a decline in the level of performance and audit services provided to customers?

1.2 Study Significance
The importance of this study of the important role played by the auditing profession in the legalization audit the accounts of companies to be trusted applicants, as well as to be certified and accredited by the beneficiaries of these data, both existing investors or potential, in addition to the Government requesting financial statements are supported by auditor, giving it the status of official and credible, and that lenders such as banks rely on them as well, and therefore the impact of any factor on the profession that would affect customer confidence to the financial statements, and here it was necessary to identify the impact of the financial crisis in this sector of the economy, which reliable financial investors and others in the building of economic decisions.

1.3 Study Objectives
This study aims to identify the impact of global financial crisis on the auditing profession in the Republic of Yemen, through the study:
1 - the income level of the offices of the audit firms of Yemen
2 - the level of tax and advisory services provided to customers
3 - level of performance and audit services provided to customers

1.4 Literature Review
There are many studies that addressed the issue of the impact the global financial crisis on many economic sectors and related to the subject of the study. I have been searching for a study focused on the impact of global financial crisis on the auditing profession in general and on the profession in Yemen in particular, could not be found in any study. The studies that have been obtained and had a link to the study were as follows:

Farhan (2010) titled "The impact of current global financial crisis on the performance of Islamic banks and development". This study aimed to identify the five axes show the impact of Islamic banks and global financial crisis, these themes are:
1. The nature of Islamic banks in terms of definition and the importance and objectives as well as the difference between them and the traditional commercial banks.
2. What is the current global financial crisis and what are the impacts.
3. The impact of current global financial crisis, Islamic banks, especially on the assets of Islamic banks, and profits in terms of size and accounting treatments.
4. Impact the current global financial crisis on the Yemeni Islamic banks in terms of assets, deposits and investments, as the case of Islamic banks are applied.
The most important results of the study include:
1. The apparent decrease of the volume of deposits in Islamic banks.
2. The apparent decrease in the volume of assets in Islamic banks.
3. Achieve a minimum rate of investment in Islamic banking since its inception.
4. The current global financial crisis originated in the real estate sector, and moved it to the banking sector, and then moved it to other sectors.
5. Was the first direct impact on economic sectors is labor where she tried to enterprises of all economic sectors to restructure their resources and their uses, and among the items covered by the restructuring is a strong item of human resources.
6. Crisis was more severe on economic development when she moved the crisis to the real sector, and in particular the automotive sector, which was almost collapsing, despite treasures, and strength and magnitude, but the brunt of the crisis was above all.
7. Decline in value of financial assets especially stocks and bonds, and low revenues and consequent aggravation of the problem of access, and increasing the debt of individuals and institutions.

Kholi (2010) titled "The impact of financial crisis on the banking sector." A study on the banking sector Arabia. This study aimed to reveal the pros and sockets of the financial crisis that affected the Saudi banking sector, and most important of these drawbacks as follows:

1. High concentration of lending to the names and limited companies.
2. Some investment banks, the amounts are relatively high outside the Kingdom of Saudi Arabia.
3. Reservation bit to give more local credit.
4. Some of the losses hitting a number of banking customers Arabia as a result of foreign investments.

One of the main recommendations of this study include:

1. Work on the integration of small banks to benefit from the advantages of large economies.
2. Establishment of the Department of crises, co-formed by representatives from all the banks in addition to SAMA, the Ministry of Economy.
3. Making decisions about targeting and correct the wrong tracks, and work to show the negatives with a view to correction, and not settling accounts.
4. Reconsidered in the interest rate by sectors that are funded, which allow the running of a larger number of people, and reduce unemployment, giving notice to pay to help the growth of such projects.
5. The need to define the duties of the auditor on the basis of a clear understanding of the nature and objectives of the audit function in society, and modify the expectations of society, and increasing awareness and culture of the public audit function and objectives.
6. Enhance transparency and accountability, and dissemination of sound regulatory, encourages integrity of financial markets, and enhance cooperation between financial institutions.

Miqdaam (2009) titled "The global financial crisis and its impact on the insurance sector in Yemen." The purpose of this study was to investigate the reality of insurance industry in Yemen and the impact of the global financial crisis on the global economy, as the study aimed to identify the impact of the global financial crisis on the insurance in Yemen, and the
ability of insurance companies of Yemen to face the repercussions of the financial crisis. One of the most prominent results of the study include:

1. The negative effects of the current financial crisis on the economy and banks and insurance companies low expectations, according to the International Monetary Fund because of their small balances banking and financial sector in overseas banks.
2. Insurance industry was not affected by the repercussions of the financial crisis in Yemen, because the insurance companies in Yemen often complain of leakage of the bulk of insurance premiums to the oil companies abroad.
3. Were not the effects of the crisis on the insurance companies directly, because of the reinsurance operations of major global companies.

The study recommended the need to join efforts and work continuously to raise the awareness of insurance and the dissemination of its importance among citizens in order to activate the role of its larger, as in the interest of insurance companies to combine their efforts to guard against any dangers that may be facing the insurance sector in the future.

Study Ghurery and bin Awad (2008) titled "2008 Global financial crisis, the nature and causes, impacts and ways to address them." This study aimed to identify the causes of the global financial crisis 2008 and the statement raised the global economy. The study hypothesis is that the lack of attention to rules of the correct cash flow and non-application of the terms of bank credit and the lack of government control of the will of a banks and financial institutions related to the problems of bankruptcy and failure.

The study found many of the most important results:

1. Proved the global financial crisis the state's role in economic activity, especially in dealing with economic crises as they arise.
2. Have not been applied by banks and mortgage lending conditions did not assess the correct potential borrowers and their ability to pay, and did not take adequate safeguards them.
3. Speculators contributed to a crisis in the mortgage because of their expectations high housing prices and real estate in the future.
4. Turning to the financial crisis stock market or the stock market which led to a sharp decline and rapid in the shares of banks and American companies and achieve substantial losses in the indicators of such exchanges.
5. Affected the financial crisis on the economies of the Arab influence is clear so that the prices of oil and gas and raw materials exported by Arab countries to the global market.
6. Financial crisis demonstrates that transparency and accuracy of information and clarity in the management of banks and companies in accordance with the LCB and the existence of effective supervision, it can avoid those banks and firms risk bankruptcy and collapse.

The study recommended a number of recommendations including:

1. Emphasis on the state's role in maintaining the stability of economic activity and to prevent manipulation and speculation and monitor the performance of companies.
2. The adoption of government oversight and follow-up to the financial statements published by companies and the emphasis on the principle of transparency and clarity in this area.
3. Adoption of rules and the right foundations to maintain liquidity in banks and companies.
4. Strengthening the role of central banks to follow the work of local banks, financial companies and control assets and liquidity that is owned in order to protect them.
What distinguishes the current study from previous studies is the following:

The present study is the first to look at the impact of financial crisis in the sector auditors in the Republic of Yemen, which had not been addressed by scholars and researchers informed by the researcher. This study also focused on the practical side of the field through a questionnaire designed to collect and analyze data in a scientific manner.

1.5 Study Methodology

Will follow two approaches to achieve the objectives of the study: First - the descriptive method of this study, where he was to go back and access to periodicals, articles, books and references on the subject of study. Second - the analytical method and the practical side (field) for this study where a questionnaire was designed to gather information and analyzed using statistical methods computerized SPSS.

1.6 Study Hypothesis

Based on previous studies have been formulated the following hypotheses:

The main hypothesis:
According to this hypothesis as follows:
H0: There is no negative impact of the global financial crisis on the auditing profession in the Republic of Yemen. To test this hypothesis has been building the following sub-hypotheses:

1.6.1 First sub-hypothesis:
According to this hypothesis as follows:
H0: There is no reduction in the level of income and corporate offices of the Audit of Yemen as a result of the global financial crisis.

1.6.2 Second sub-hypothesis:
According to this hypothesis as follows:
H0: There is no reduction in the level of tax and advisory services provided to customers as a result of the global financial crisis.

1.6.3 Third sub-hypothesis:
According to this hypothesis as follows:
H0: There is no reduction in the level of performance and audit services provided to customers as a result of the global financial crisis.

1.7 Study Variables

For the purposes of testing hypotheses of the study, were used the following variables: First: the independent variables: measured and all questions through a questionnaire distributed to a sample of the study population and these variables are:

1. The income level of the offices of the audit firms operating in the Republic of Yemen.
2. The level of advisory services and the tax provided for customers.
3. The level of performance and audit services provided to customers.

Second: the dependent variable: the measured independent variables affected by the above, this shows the extent of the negative impact of global financial crisis on the auditing profession in the Republic of Yemen.

1.8 Statistical Universe
The study community consists of staff and external auditors and the Yemeni's (113) one hundred and thirteen a chartered accountant practicing the profession, working in audit firms operating in the Republic of Yemen. (Association of Chartered Accountants of Yemenis, 2009).

1.9 Data Sources
Data were collected from the following sources:
First - the primary sources: include questionnaires, interviews, and observations, and the financial statements and final accounts.
Second - Secondary sources: This includes books, reference works, periodicals, studies, research, and theses.

Upon the above, split the study into four chapters, where he was the first to the methodology of the study in terms of defining the research problem, significance and objectives, as well as the exposure of this chapter to previous studies that looked at this topic, or have had close association of the methodology, where it was utilized in building some of the assumptions the current study, as well as building tool for the study were analyzed on the basis of the collected data, was also identified variables and the community and a sample of the study.

In the second chapter was to address the theoretical framework of the study, as has been identified on the concept of the manifestations of the financial crisis and its causes and effects.

In the third chapter is an analysis data and conduct the necessary tests of the hypothesis, using the computerized statistical methods for this purpose, and during the analysis was to identify the characteristics of society, and the credibility of the responses on the instrument of the study, as well as learn how to accept or reject the hypotheses of the study.

In the fourth and final chapter of this study was to review the results showed that the credibility of the study and the characteristics of society and the study sample, as the analysis results of testing the main hypotheses and sub first, second and third.

After obtaining the results of the study was to provide many of the necessary recommendations, which we see the importance to be taken into account in order to maintain the standards of the profession's services and to address deficiencies in some ways necessary.

2. The repercussions of the global financial crisis
2.1 for a historical overview of the financial crisis
The nature of the profitability of the capitalist system has made its economic activities characterized by speculation and exaggerations, derivatives and futures contracts in order to achieve a profit. And therefore the economy spider rapid deployment rapid collapse, which makes it always passes cycles recession and recovery 'is this economy is in crisis.
The evidence of this are many, including the crisis of global recession in 1929, and the crisis in financial markets known as the Tib Black in October 1987, and the crisis in financial markets in 1997 and in 2006, which collapsed on the impact of Gulf bourses, especially of the TASI, and whatever has taken the world of action with survival mechanisms of the capitalist system, in particular the interest rate, the crisis will be repeated each period will be adopted from time to time on the size of exaggerations and speculations that precede each crisis. (Farhan, 2008).

In the present global economy is interdependent with each other by virtue of technical development, especially communication technology. and then, any faulty economic in any country of the capitalist countries directly affects the domestic and international markets in less than one minute through electronic networks interrelationship between markets, when look to the current crisis, we will find that the world had been upset the whole simply because the two financial institutions were hit by losses in the United States of America and by Dalk shook the global financial system as a whole to varying degrees. (Farhan, 2008).

2.2 The emergence of the current global financial crisis

Global financial crisis started by the U.S. banks to grant facilities for the mortgage lender over the past two years, where he was investing in real estate sector profitable .. and then flocked to individuals and institutions to borrow from banks to purchase real estate and re-sold to a quick profit through speculation, and what has become the real estate prices fictional result exaggerations and speculation have become their price does not reflect reality. began this sector is being depressed, and as a result, no individuals can debt borrowed from banks to pay premiums on these loans, they started offering their properties for sale, as banks seize the property because of their subject for the benefit of these banks as collateral for these loans Even banks can meet their obligations to their depositors, and this led to a doubling of the problem of stagnation in the property. (Farhan, 2008).

Thus began collapsing mortgage lending institutions, and the stock market collapsed in the stock market, and given the close interdependence between financial institutions has begun affected by institutions that have had a relationship with lending institutions, real estate, and began every bank and institution affected by the other, and so fell apart and appeared current global financial crisis. (Farhan, 2008).

2.3 Manifestations of the global financial system crisis

When the global financial crisis started to emerge taken several aspects including the following: (Shehata, 2008).

1. Rush to withdraw deposits from the banks.
2. The fact that many financial institutions to freeze the granting of loans to companies and individuals fearing the difficulty of recovery.
3. Lack of liquidity among individuals and financial institutions and companies, which led to a contraction of the economy and for the borrowers to repay their debts.
4. Low level of trading in money markets and money, and that an imbalance in the indicators of ups and downs.
5. Low level of energy used by the companies due to lack of liquidity and freeze access to credit from financial institutions, but high interest rates and guarantees high.
6. Decline in sales due to poor liquidity, especially in real estate and cars.
7. The increasing rate of unemployment due to the bankruptcy and liquidation, and every employee and worker threatened with dismissal.
8. The increasing rate of demand for social benefits from governments.
9. Low rates of consumption and saving, spending and investment which led to recession and unemployment, bankruptcy and liquidation.

2.4 The main causes of the global financial crisis
I have noted many of the leaders of the global economy into a number of reasons led to the emergence of the global financial crisis, and for these reasons: (Shehata, 2008).
1) the spread of moral corruption such as economic exploitation, lies and rumors, fraud, monopoly and fictitious transactions, and this led to the grievance debtors and the poor and small depositors by the owners of capital and the rich.
2) The money became the dominant policy and decision-making sovereign in the world.
3) the traditional banking system is based on the interest rate system, the higher the interest rate on deposits, the higher the interest rate on loans, and the beneficiary is the banks and financial intermediaries, the burden is on borrowers, whether for consumption or production.
4) the financial system and the traditional banking system is based on the rescheduling of debt at an interest rate higher, and this is causing additional burden on the consumer debtor who was unable to pay the first loan.
5) the global financial system and the system of financial markets is based on financial derivatives, which are mainly dependent on transactions and fake paper does not involve any over exchangers actual goods and services, they are gamblers, and betting based on luck, and that most bank loans, and when the wind does not blow as ship breaks down everything and spoke of the financial crisis.
6) The behavior of financial intermediaries based on the temptation of wanting to borrow and obtain loans that high commissions in the case of a risk, and which bears all the debtor is the borrower.
7) The expansion in the application of credit cards without balance (overdraft), which enables them to bear the high costs, and when unable to repay the indebtedness of what it is by booking your property.

2.5 The devastating effects of the crisis of the global financial system
Appeared ill effects of the global financial crisis rapidly and these adverse effects: (Shehata, 2008).
1 - panic, fear, anxiety and confusion that all people, including:
- Governors, presidents and ministers.
- Owners of financial institutions based on the financial markets.
- Owners of financial intermediation institutions.
- Owners of the deposits in banks.
- Borrowers from banks.
- Consumers who are threatened by high prices.
- Workers and staff threatened with losing their jobs.
- The poor and needy people who live on subsidies and handouts
2 - the bankruptcy of some banks and financial institutions due to lack of liquidity and increasing withdrawals of depositors. And the fact that some governments through central banks to save the rest so there is no total breakdown of economic life and is located in the State Department of bankruptcy.
3 - the bankruptcy of some firms that were dependent on loans against interest or halt some production lines to some other companies, some banks have also begun the implementation of mortgages and guarantees with them and this led to an imbalance in their cash flows.

4 - job losses and the high proportion of asylum and other social benefits.

5 - by some states to impose more taxes to compensate for deficits in their budgets because of the high budget support and assistance to companies and banks to bankruptcy.

6 - loss of assets of the borrowers and mortgaged their homes because of loans and are among the displaced persons and refugees and displaced persons and the poor and needy.

2.6 The Impact of the Global financial crisis on the international trade

The financial crisis has led to a decline and contraction of the global economy through lower commodity prices, especially of raw materials and oil, in addition to the decline in demand for tourism services P developing countries, the decline in demand in the markets of world exports by 5% to 10% for the whole of 2009. (WTO, 2009).

Has shown that indicators including the World Bank over the low real growth in world GDP, stood at 205 in 2008 when he arrived to 0.09 in 2009. (World Bank, Global Economic Prospects, 2009).

The impact of financial crisis on the oil sector, has declined a request States Economic Cooperation and Development (OECD) estimated at 205% since May 2008. (OPEC, 2009).

As a result of these effects has declined because of credit tightening is granted, except that the data of the central banks of some Arab countries, pointed to a rise in total bank lending directed to the trade sector, such as Qatar, Jordan, Egypt, Saudi Arabia, United Arab Emirates. (Arab central banks, 2009).

Data also indicate the Union of Arab Banks in 2009 to a rise in banking credits of the total assets and total deposits of 10.9% and 93.89% respectively in 2009 compared with 45.08% and 90.93% respectively in 2008 (the Union of Arab Banks, for central banks in the Arab States).

The crisis has had an impact on the Arab Trade Foreign Trade, where he International Monetary Fund that the proportion of exports and imports for Arab countries has decreased, and the intra-regional trade also declined, for example, in Yemen, the percentage of exports 9.7% in 2008 while in 2009 the percentage of exports 6.4%. (IMF, Regional Economic Outlook, Middle East and Asia, October, 2009).

2.7 Impact of the global financial crisis on Yemen

Yemen is one of developing countries with limited ties to international markets, they do not have the Stock Exchange. However, there is nothing to Yemeni banks, both conventional and Islamic banks in the world or in Europe as banks U.S. correspondent for the completion of commercial transactions between Yemen and the outside world, and the size will be influenced by the size of affected U.S. and European banks to banks messaging Yemeni crisis. Yemen also be affected in the future, down the flow of international loans and grants as a result of the global financial crisis. (Farhan, 2008).

3. Statistical analysis and hypothesis testing

3.1 Statistical Universe and Sample

Consists of community and a sample study of the external auditors of the Yemeni and counted (113) one hundred and thirteen as an accountant a legal practitioner of the profession

**Demographic characteristics of study universe**

I have included the demographic characteristics of the sample job description, age, years of experience, qualification, and vocational rehabilitation, and the following table illustrates these properties:

**Table (1): Description of study sample**

</tbody>
</table>
Given the table above we note that the rate of 42.6% of the sample work function of assistant auditor, and this is normal as the number of workers in offices and audit firms are virtually non-obtaining the license check, which proves the credibility of the responses, and accounted for 31.5% and 16.7% are Key auditors and managers and also the result of this nature, as well as 9.3% are partners and this is normal because many of the auditors did not wish to establish an auditing company for the sharing of income and all of this is consistent with the above ratios, which indicate the credibility of the responses to the questionnaire.

With regard to age was the highest percentage is the age group 31-40 years increased by 46.3% which shows the novelty of the profession and Auditors are young people who have a university scientific qualification and considerable experience in accounting work, but the rest of the sample was less whether the owners of the age groups large or small, as shown in table No. (1).

With regard to the experience came in line with other properties where the category was 6-10 years occupies a rate of 38.9% of the total members of the sample and this corresponds with the age group significantly, which indicates the modern trend among graduates of universities and working in the sector and wish to practicing the profession, The remaining percentages were lower, especially the category that represents 16 years and over, as shown in table No.(1).

With regard to rehabilitation university has occupied the eligible bachelor's rate of 81.5% and qualified Master's 11.1%, and Doctoral 7.4% and this is normal as who wishes to practice the preparation and study for a leave the profession and the belief that it is better than graduate, especially if you look at the perspective of material because the profession may generate higher income.

The auditors practicing it is natural that the ratio of obtaining a certificate of auditor Yemen is the highest, reaching 38.9% in addition to obtaining the certificates of other professional, even if it is their combination of ratio was very high and may reach more than 70% as shown in Table (2), and other certificates are of interest by the offices of the audit firms, therefore, often find these certificates from the campaign working in the offices of the audit.

3.2 Statistical methods Used

To achieve the goal of this study, was designed questionnaire was distributed to (75) of accountants and auditors working in the offices of the audit firms operating in the Republic of Yemen, recovered from (54) questionnaire by recovery was (72%).

The data were analyzed using statistical program (SPSS), was used the following statistical methods:
A - test validity and reliability study tool (Cronbach's Alpha).
B - Descriptive Statistics through the use of the following:
   1. The arithmetic mean.
   2. Standard deviation.
C - test (t-test) to test the hypotheses of the study.

3.2.1 Test validity and reliability study tool Cronbach's Alpha Test

Tool has been tested through the study of test Cronbach, where the analysis shows that the value of Cronbach alpha reliability coefficient (Cronbach, 1990) is 0.877 at the level of all paragraphs of the resolution, which reflects the degree of good and acceptable of internal consistency between paragraphs of the study compared with the accepted ratio of 60%.
3.2.2 paragraphs of the resolution analysis

3.2.2.1 First sub-hypothesis

Table No. (2) shows Averages and standard deviations of the paragraphs of the resolution relating to the first sub-hypothesis that the results were as follows:

<table>
<thead>
<tr>
<th>No.</th>
<th>Paragraphs</th>
<th>mean</th>
<th>Standard deviation</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Factors affecting the income of the offices of the audit firms as a result of the global financial crisis</td>
<td></td>
<td></td>
</tr>
<tr>
<td>1</td>
<td>there is a decrease in the level of annual income of audit firms</td>
<td>3.83</td>
<td>1.28</td>
</tr>
<tr>
<td>2</td>
<td>There are 2 drop in the prices of services such as consulting</td>
<td>3.64</td>
<td>1.13</td>
</tr>
<tr>
<td>3</td>
<td>withdrawal of a number of companies affected the income of the audit firms</td>
<td>3.53</td>
<td>1.19</td>
</tr>
</tbody>
</table>

We note from the table above that all the averages were higher than the middle premise is 3, with the highest results with paragraph (1) and the low level of income for the audit firms, where he was the arithmetic mean (3.83) and standard deviation (1.28), although there is a decrease in the prices of consulting and other services where it reached the arithmetic mean (3.64) and standard deviation (1.13), and analysis showed that there was a withdrawal of a number of companies have negatively impacted on the income of the audit firms where it reached the arithmetic mean (3.53) and standard deviation (1.19). This is a whole indicates that the income levels of the offices and audit firms had fallen.

3.2.2.2 Second sub-hypothesis

Table No. (3) shows averages and standard deviations of the paragraphs of the resolution on the second sub-hypothesis that the results were as follows:

<table>
<thead>
<tr>
<th>No.</th>
<th>Paragraphs</th>
<th>mean</th>
<th>standard deviation</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Factors affecting the level of advisory services and tax provided to customers as a result of the global financial crisis</td>
<td></td>
<td></td>
</tr>
<tr>
<td>4</td>
<td>decreased the level of tax consultancy as a result of the global financial crisis</td>
<td>3.5</td>
<td>1.17</td>
</tr>
<tr>
<td>5</td>
<td>decreased the level of financial advisory as a result of the global financial crisis</td>
<td>3.2</td>
<td>1.21</td>
</tr>
<tr>
<td>6</td>
<td>did not prepare the auditor provides consulting services with a high level as a result of lower prices for those services.</td>
<td>3.22</td>
<td>1.36</td>
</tr>
</tbody>
</table>
We note from the table above that all the averages were higher than the middle premise is 3, with the highest results with paragraph (7) and related Balmedkq where no longer provides consulting services almost free, where the arithmetic mean (3.55) and standard deviation (1.11), the table also showed that there is a decrease on all tax and financial consulting, and decreased the level of confidence of the profession by the companies. This is a whole indicates that the levels of handling and confidence and consulting to offices and audit firms had fallen.

3.2.2.3 third sub-hypothesis
Table No. (4) shows averages and standard deviations of the paragraphs of the resolution relating to the third sub-hypothesis that the results were as follows:

Table (4): Averages and standard deviations for the questions of the third sub-hypothesis

<table>
<thead>
<tr>

<td>decreased the level of professional care enough as a result of the low level of fees and wages paid to the auditor as a result of the global financial crisis</td>
<td>3.11</td>
<td>1.28</td>
</tr>
</tbody>
</table>

We note from the table above that all the averages were higher than the middle premise is 3, with the highest results with paragraph (11) and on the number of meetings with the heads of boards of directors and managers in companies that are under scrutiny, where the arithmetic mean (3.25) and standard deviation (1.29), the table also showed that there is a decrease in the number of visits and the sample size and the level of professional care. This is a whole indicates that the levels of performance and audit services has decreased as a result of the global financial crisis.
3.3 test hypotheses: Hypothesizes Test

3.3.1 First sub-hypothesis:

H0: There is no reduction in the level of income and corporate offices of the Audit of Yemen as a result of the global financial crisis.

To test this hypothesis test was used (t-test) to all paragraphs of the hypothesis, reaching values of (t) to the clauses of the premise 21.92, 23.61, 21.78, respectively at the level of significance 0.00 for each of the paragraphs, and in that this level of significance less than 0.05, we reject nihilism hypothesis and accept the alternative hypothesis is that there is a decrease in the level of income and corporate offices of Yemen as a result of the audit of the global financial crisis. The following table illustrates this.

<table>
<thead>
<tr>

3.3.2 Second sub-hypothesis:

H0: There is no reduction in the level of tax and advisory services provided to customers as a result of the global financial crisis.

To test this hypothesis test was used (t-test) to all paragraphs of the hypothesis, reaching values of (t) to the clauses of the premise 21.84, 19.31, 17.29, 23.53, 19.19, respectively at the level of significance 0.00 for each of the paragraphs, and in that this level of significance less than 0.05 we reject the hypothesis nihilism and accept the alternative hypothesis is that there is a decrease in the level of tax and advisory services provided to customers as a result of the global financial crisis. The following table illustrates this.

</tbody>
</table>
3.3.3 Third sub-hypothesis
H0: There is no reduction in the level of performance and audit services provided to customers as a result of the global financial crisis.

To test this hypothesis test was used (t-test) to all paragraphs of the hypothesis, reaching values of (t) to the clauses of the premise 19.07, 17.38, 18.54, 17.81, respectively at the level of significance 0.00 for each of the paragraphs, and in that this level of significance less than 0.05 we reject the hypothesis nihilism and accept the alternative hypothesis is that there is a decrease in the level of performance and audit services provided to customers as a result of the global financial crisis. The following table illustrates this.

<table>
<thead>
<tr>
<th>Paragraph</th>
<th>the value of T</th>
<th>degree of freedom DF</th>

</tr>
</tbody>
</table>

3.3.4 Main Hypothesis
According to this hypothesis as follows:
H0: There is no negative impact of the global financial crisis on the auditing profession in the Republic of Yemen.

To test this hypothesis test was used (t-test) to all paragraphs of the hypothesis, reaching values of (t) to the clauses of the hypothesis as shown in Tables (6), (7) and (8) respectively at the level of significance 0.00 for each of the paragraphs, and in that this level of significance less than 0.05 we reject the hypothesis nihilism and accept the alternative hypothesis is that there is the impact of the global financial crisis on the auditing profession in the Republic of Yemen. The following table illustrates this.

<table>
<thead>
<tr>
<th>Paragraph</th>
<th>the value of T</th>
<th>degree of freedom DF</th>
<th>Sig. (2-tailed)</th>
<th>95% Confidence Interval of the Difference</th>
</tr>

</tbody>
</table>
4. Results and Recommendations

4.1 Results:
The study found the number of results, are summarized as follows:
1. World financial crisis affect negatively the auditing profession in the Republic of Yemen.
2. Decreased the level of income and corporate offices of Yemen as a result of the audit of the global financial crisis.
3. Decreased the level of advisory services and tax provided to customers as a result of the global financial crisis.
4. Decreased the level of performance and audit services provided to customers as a result of the global financial crisis.
5. There is a decrease in the prices of services provided such as consulting and the withdrawal of a number of companies have negatively impacted on the income of the offices.
6. Decreased the level of confidence of the profession by the companies so that the impact on the quality and level of advisory services provided.
7. Decreased number of field visits and meetings with the heads of boards of directors and managers for companies to carry out the audit.
8. Decreased the size of the test sample being tested by the auditor scrutiny, and this led to the low level of professional care as a result of lower fees and auditor fees.

4.2 Recommendations:
researcher recommends the following:
1. Increasing advisory services free and almost free for companies, because of the interest for the continuation of the work of companies and businesses replace audit.
2. Need to work to raise the level of trust between businesses replace audit offices and audit firms.
3. The auditors to persuade and invite the Yemeni government to deal with a loss of business in a positive manner through the reduction of taxes or installments to the lack of adequate liquidity.
4. That the offices and audit firms to invite companies to re-trade policies and financial conditions in line with the global financial crisis.

5. Increase the number of meetings and joint meetings between the auditors and business owners to re-drafting of regulations, and accounting and to ensure that the face of financial crises that may occur in the future.

6. That the offices and audit firms help companies trade on the work of the financial analysis necessary to detect weaknesses and mistakes that led to the decline in corporate income business.

7. The necessity of activating the role of internal oversight units, or sections of the Internal Audit in the business and strengthening the relationship between the external auditor and internal auditor.

8. That the work of other researchers for more research and studies in this sector to come out with recommendations to help maintain the audit profession and its relationship with business.

ABSTRACT
Since the beginning of the 21st century, ecological problems have been described as the most important problems of the humanity and surely will affect the life quality of the next generations. In order to solve ecological problems, businesses are trying to develop more ecological approaches as green in the market. These events caused to develop green marketing. Environmental protection consciousness which is called green movement has been supported by the great part of society that enterprises has adopted this view and has caused to develop the least destructive applications for the environment. At this point green marketing is taking a critical and crucial role to create a sustainable development framework. This study focuses primarily green marketing philosophy as an important part of sustainable development and global environmental problems and the reasons which cause the enterprises to apply the green marketing are going to be discussed and lastly examine some of the reason that organizations are adopting a green marketing philosophy.

Key Words: Green Marketing, Ecological Marketing, Protecting the environment, Social Responsibility, Sustainable Marketing

1. INTRODUCTION

Nowadays, a lot of changes as well as in the global field, rapid change in business management philosophies, scope of activities, marketing strategies, consumer needs and their demands are developing. While settlement of environmental awareness and understanding the nature conservation began to have crucial point around the world, these developments which related to the subject caused to implement several civil society organizations and environment related criteria in international quality standards and legal regulations start to take place in business life. All these developments also significantly affect marketing activities so under the name of green marketing there is an apprehension which taking into account ecological factors in designing marketing activities at each level was improved.

As it’s supposed that the sources of earth aren’t limitless and coming to an end, also threatening of the environmental problems to the human health and ecosystem put the governments, civil social organizations and consumers in action. In order to find a solution many countries collaborate and determine common policies in international area. Factors such as population growth, global warming, threatening the future of human beings, exhaustion of natural resources that have attracted world attention to green marketing. In many national and international areas, many government and non-governmental organization
has started to develop co-operation with each other to seek common solutions to environmental problems. In the 1980’s environmental issues had dominated the world. Since the 1980’s there have been a progressive increase in consumer environmental consciousness, as increasing kinds of environmental problems put a strong impact on all forms of life. Specifically, society in general regarded business as the source of variety of environmental problems. In particular, the concept of sustainable development more and more has an important place and this led businesses to adopt sustainable green strategies.

In our country, Turkey, environmental awareness and environmental marketing activities is increasing rapidly in recent years. In businesses advertising messages, product packaging, manufacturing strategies and in many other different areas which do not harm the environment and strategies to protect the natural balance of the results began to appear in daily life routine.

Many of the articles assign that, marketing science is one of the most important elements to create sustainable relationship between ecology and industry, and also among the people of the world. All of these developments revealed the concept of “Green Marketing” and this concept has come to an important place in marketing literature.

2. THE CONCEPT OF GREEN MARKETING

True definition of green marketing is quite difficult. Yet defining green marketing is not a simple task. Indeed the terminology used in this area has varied, it includes: Green Marketing, Environmental Marketing and Ecological Marketing. Up to date, the studies carried out under a multi-title but now these are carried out under the heading of green marketing (Chammorro, 2009). While green marketing came into prominence in the late 1980s and early 1990s, it was first discussed much earlier. Description must be compatible in the formations of time changes. Terms like Phosphate Free, Recyclable, Refillable, Ozone Friendly, and Environmentally Friendly are some of the things consumers most often associate with green marketing (Polonsky, 1994). Today’s some of green concept may lose its importance year after year. For instance, saving bulbs firstly introduced as environmentally friendly in the world; however, in the light of today’s technology, unfortunately it is accepted as a hazardous substance that damage to human health.

Today’s green marketing experts define green marketing as “A holistic management process which is responsible for identifying the needs of consumers and the community as profitable and sustainable manner and also it is responsible for forecasting and satisfaction these needs” (Annick, 2004). Also, according to the American Marketing Association definition, green marketing is a science that analysis on marketing studies about pollution and it analysis advantages and disadvantages of energy consumption and consumption of exhaustible resources (Uydacı, 2002). In general, green marketing approach is a marketing activity that businesses more realized the importance of natural environment (Tarhan, 1996). Furthermore, according to the Oxford University Business Dictionary definition of green marketing is as follows; “Green marketing approach can be define as if businesses do its production, promotion, and distribution activities firstly in order to be the benefit of environment, it is called as green marketing.” (Oxford, 2002).

There is growing interest among the consumers all over the world regarding protection of environment. Worldwide evidence indicates people are concerned about the environment and are changing their behavior. As a result of this, green marketing has
emerged which speaks for growing market for sustainable and socially responsible products and services.

Hence, green marketing incorporates a broad range of activities, including product modification, changes to the production process, packaging changes, as well as modifying advertising.

3. THE IMPORTANCE OF GREEN MARKETING

The roots of green marketing can be traced back to the wave of environmental concern of the 1970s which spawned the ‘ecological marketing’ concept (Baker, 2003). The developments which in media (television), communications (internet), manufacturing (miniaturization) and the use of personal computers has caused the world to become a large village (Zinkhan and Carlson, 1995). Furthermore, there is a growing awareness that a ‘greener consumer society’ need not be one of joylessness and abstention and need not be in total opposition to the current system of production and marketing (Solomon, Bamossy, Askegaard and Hogg, 2006).

Thus, companies should work at developing the dimensions of environmental sustainability (Kotler, Wong, Saunders and Armstrong, 2005). For instance; Hewlett-Packard has evolved through three distinct phases of environmental sustainability over the past two decades. In the 1980s, the environmental concerns were primarily pollution control and prevention, with a focus on reducing emissions from existing manufacturing processes. HP has recognized that pollution prevention and product stewardship have become baseline market expectations. To be an environmental leader in the 21st century, HP needs to integrate environmental sustainability into its fundamental business [vision and] strategy (Preston, 2001).

Even the green goods that have caught on have tiny market shares. Organic foods—which consumers buy more for their own health than for the environment’s- accounted for less than 3 percent of all food sales in 2006, according to the Nutrition Business Journal. In 2006, green laundry detergents and household cleaners made up less than 2 percent of sales in their categories. And despite their trendiness, hybrid cars made up little more than 2 percent of the U.S. auto market in 2007, according to a report by J.D. Power and Associates (Bonini and Oppenheim, 2008).

Firms could adopt management systems that create conditions for reducing the environmental impact of value-addition processes (Prakash, 2002). An important strategic reason for green marketing is that it could help firms to pre-empt command-and-control regulations that often hurt their profits and enable them to shape future regulations, thereby reaping first-mover advantages (Fri, 1992). Therefore, green marketing is inevitable.

4. BENEFITS OF GOING GREEN

While modification of business or production processes may involve start-up costs, it will save money in the long term. For example, the cost of installing solar energy is an investment in future energy cost savings. Moreover, companies that develop new and improved products and services with environmental impacts in mind give themselves access
to new markets, substantially increase profits and enjoy competitive advantages over those marketing non-environmentally responsible alternatives.

Today, with the overwhelming Green Wave that seems to be sweeping the nation, design professionals are finding their world is changing rapidly, as it is for their clients. Companies like Wal-Mart Stores Inc. Promise to slash energy use overall, from its stores to its vast trucking fleets, and purchase more electricity derived from renewable sources. Also, Dow Chemical Co. is increasing research into products such as roof tiles that deliver solar power to buildings. Similarly, Ford Motor Co. put on a 10- acre grass roof to capture rainwater on its main plant, and its designers are incorporating sustainable materials into vehicle interiors. Mega search engine Google announced in November 2007 that it will spend hundreds of millions of dollars over the coming years to develop renewable energy technologies, with a corporate goal of producing one gigawatt (enough power to serve the City of San Francisco) of renewable energy through solar, geothermal and wind power cheaper than that produced by coal-generated power (Quatman, Manies and Thomson & Kilroy, 2008). McDonald's replaced its clam shell packaging with waxed paper because of increased consumer concern relating to polystyrene production and Ozone depletion (Gifford and Hume, 1991).

Green power marketing offers utilities and power marketers a way to differentiate their products. The market for green power is growing (Wiser and Pickle, 1997). Companies that develop new and improved products and services with environment inputs in mind give themselves access to new markets, increase their profit sustainability, and enjoy a competitive advantage over the companies which are not concerned for the environment (Pirakatheeswari, 2009).

Some of the advantages of green marketing are:

• It ensures sustained long term growth along with profitability.
• It helps the companies market their products and services keeping the environment aspects in mind.
• It helps in accessing the new markets and enjoying the competitive advantage.
• Most of the employees also feel proud and responsible to be working for an environmentally responsible company.

5. BEYOND THE GREEN MARKETING: SOCIAL RESPONSIBILITY

The social responsibility is an approach which is focused on the customers and it takes into account the environmental problems, and its long term welfare (Vazifehdust and Asadollahi, 2011).

It seems that these days, every product has a social reason behind it. At the moment, marketing is one of the most important activities of the companies due to social and environmental considerations.

Green marketing must satisfy two objectives: Improved environmental quality and customer satisfaction. Many environmental products have become so common and widely distributed that many consumers may no longer recognize them as green because they buy them for non-green reasons. Green household products, for instance, are widely available at
supermarkets and discount retailers, ranging from energy-saving Tide Coldwater laundry detergent to non-toxic Method and Simple Green cleaning products (Ottman, Stafford and Hartman, 2006).

Environmental management is the driving force behind eco-(re)design (existing products) and eco-innovation (new products) with information percolating down to designers (engineers) through checklists (Charter and Clark, 1996). Most companies also divorce eco-efficiency from the social dimensions of sustainability (Charter, 1998).

Companies with socially responsible corporate values will appear more credible to target audiences, but it is critical that they also back up environmental claims (Ginsberg and Bloom, 2004). Some firms can be very environmentally responsible but does not promote this fact. For example, Walt Disney World has an extensive waste management program and infrastructure in place, yet these facilities are not highlighted in their general tourist promotional activities (Murphy, 1985).

6. CONCLUSION
Green marketing covers more than a firm’s marketing claims. Also, consumers are demanding more ecological products. Environmental problems which occur in today’s most important issue are emerging as the spam result of industry and industrialization. Ecological system was broken because of rapid population growth and industrialization, consumption of energy and natural resources and growing environmental pollution. The result of unconscious production and consumption caused climate change, decreasing the biodiversity and increasing diseases. These developments led to questioning of the enterprises and industries.

All these negative developments have led to unease in national and international societies. While communities began to be more conscious about the environment, governments began to corporate with each other and with the effects of consumer and legal pressures on businesses; production process was forced to make changes. Hence, businesses have begun to develop their production and marketing strategy towards greener wave. Now, in the process of product design, not only the general features of the products but also environmentally friendly products began to crucial for businesses’ marketing strategy.

Green marketing approach was based on the natural environment at every stage of marketing activities. Furthermore, businesses can gain competitive advantage through effective green marketing strategy. Green marketing is based on the premise that businesses have a responsibility to satisfy human needs and desires while preserving the integrity of the natural environment.

Today’s consumers are becoming more and more conscious about the environment and are also becoming socially responsible. Therefore, more companies should become responsible to consumers’ aspirations. Effective green marketing targeted at the right audience will make a difference. Green marketing should not neglect the economic aspect of marketing so marketers need to understand the implications of green marketing.

Information Technology, Accounting Information System and their effects on the Quality of Accounting University Education: an empirical research applied on Jordanian Financial Institutions

Dr. Shamsi S. Bawaneh
Department of Business Administration
King Talal School for Business
Princess Sumaya University for Technology Amman 11941 Jordan

Abstract
This study examines the effects of information technology and accounting information system on the quality of accounting university education for Jordanian financial institutions working in Jordan and listed on Amman Stock Exchange in 2010, because these institutions are recruiting the major part of fresh accounting university graduates by showing the advantages of using information technology and its importance in developing the accounting information system. The study, also, investigates the importance of information technology in developing the accounting information system and then the expectation ability of the quality of accounting university education. In order to achieve these objectives, a four-section questionnaire was developed and its data was input to SPSS V16.0. Having the responses analyzed, it was shown that employers do recognize that advances in information technology and the developing of accounting information system have a positive interaction effect on the quality of accounting university education. Furthermore, the respondents believed that more applications of information technology in accounting university education, and training hours for accounting students are needed in order to increase the quality of accounting university education and to bridge the gap between theory and practice in accounting education.

Keywords: IT, AIS, Financial institution, Accounting Education, Quality assurance, Jordan.

1. Introduction
Information technology (IT) refers to the hardware and software used in computerized information systems and has been a major force in shaping our current society. Such technology influences our lives in many personal ways. In this information age, for example, fewer workers actually make products while more of them produce, analyze, manipulate, and distribute information about business activities. These individuals are often called "Knowledge workers" (see, Thottam, 2004). Companies find that their success or failure is often dependent on the uses or misuses of the information that knowledge workers manage.

Consistent with this view, Bagranoff et al. (2005) viewed accountants as knowledge workers and the information age has an important implication for accounting. Because their role has
been, in part, to communicate accurate and relevant financial information to parties interested in how their organizations are performing, accountants have always been in the “information business”. In a computerized system, the collection, recording and transmitting accounting data are done automatically or by giving the command to process. Also, financial reports are generated based on an instruction given to the computer which is actually a group of hardware components that work together with software to perform a specific task which enable an Accounting Information System (AIS) to fulfill its functions in any organization. This study expected that to be able to give the accounting students the scope of knowledge needed in real-life situation, the study of IT should be integrated as far as possible in the study of accounting, which allow the students to evaluate the performance of information systems in an accurate and timely manner. Therefore, the technology should be studied from the perspective of their usefulness and application to business situation and should not be seen as an end in itself.

The business press frequently reports the many ways in which IT is profoundly changing the way that accounting and many other business activities are performed. Because this impact is likely to continue, the study focus on understanding how IT can be used to improve the performance of an AIS and then the quality of accounting university education (QAUE). To do so, we have to recognize the advantages of using IT and its importance to AISs and their effects on the QAUE and this study tries to consider these issues in the remainder of this paper is organized into seven sections; The next section presents a theoretical framework of this study. Section three provides a literature review of IT, AIS and QAUE. The fourth section identifies the research framework and research propositions. The fifth section presents the research methodology and describes the research methods adopted. The sixth section presents the findings of this study, and the summary and concluding remarks will be presented in the last section.

2. Theoretical framework:

2.1 The recognition of and the advantages of using IT

In automated accounting systems, IT serves as a platform on which other system components in part rely. According to Bagranoff et al. (2005) AIS view as a set of five interacting components: hardware, software, data, people, and procedures. Computer hardware is probably the most tangible element in this set, but “hardware” is only one piece of the pie. Computer hardware must work together with the other system components to accomplish data processing tasks. Without computer software, for example, the hardware would stand idle. Without data to process, both the hardware and the software would be useless. Without procedures, accounting data could not be gathered accurately or distributed properly. And

---

62 In Statement of Financial Accounting Concepts No.2, the Financial Accounting Standards Board defines Accounting as being an Information System. It also that the primary objective of Accounting is to provide information useful to decision makers. Therefore, it is not surprising that the Accounting Education Change Commission recommended that the Accounting curriculum should emphasize that Accounting is an information identification, development, measurement, and communication process. The commission suggested that the Accounting curriculum should be designed to provide students with a solid understanding of three essential concepts: (1) the use of information in decision making, (2) the nature, design, use, and implementation of AIS, and financial information reporting (Romney & Steinbart, 2000 pp 4-5).
finally, without people, it is doubtful that the rest of the system could operate for long or be of much use.

Researchers (Anderson, 2002; Huber, 2004) make clear that IT and accounting systems are intimately related, and a computer system must interact with all the other system components to create a working AIS. Giddens (1984) explains that using and developing IT in accounting firms is considered an essential element through which such firms can strongly establish themselves and improve their productivity.

The information age and the IT that created it, are influencing all areas of accounting, including financial and managerial accounting, auditing, and taxation. With respect to financial accounting, critics contend that periodic, audited financial statements are less relevant in the information age. The accounting profession has responded by studying the needs of financial information users and improving the relevance of accounting information. Managerial accounting is also developing new costing approaches such as activity-based costing systems, new performance measurement approaches such as the balanced scorecard (Kaplan & Norton, 2001), and new IT to help managers make more informed business decisions (Zeller et al., 2001). Auditing practice is expanding to include a variety of new assurance services, and the nature of the audit has also shifted (AICPA/CICA, 1999). Finally, the availability of tax software and extensive tax databases influences both tax preparation and tax planning.

Therefore, the use of computer in the college classroom has become so commonplace that on most campuses, it is difficult to find a classroom that does not have at least an instructor computer workstation connected to a projector (Guthrie & Carlin, 2004). Also, it is likely to affect the way accountants will work in the future. IT will become even more important to accountants as AIS continue to incorporate technological advances in their designs, and also as this technology becomes more important to their daily professional and personal tasks. These reasons became major factors to conduct this study. Therefore, this view consists with Bagranoff et al. view (2005) that there are many reasons to study AIS and to recognize the importance of IT to it.

2.2 The importance of IT in developing of AIS

Before recognizing AIS we have to understand the terms data and information which are the raw material for an AIS and both are some of an organization’s most valuable assets according to Romney & Steinbart (2003). Data refers to any and all of the facts that are collected, stored, and processed by an information system. Once data have been collected,

---

63 Others researchers present six reasons to show that IT is important to accountants and must be compatible with, and support, the other components of an AIS (for details, see Bagranoff et al, 2005).

64 Romney and Steinbart (2003) show three kinds of data need to be collected for any activity: facts about the event itself, the resources affected by the event, and the agents who participated in that event (p.9).
it is the job of the AIS to transform the facts into useful information so they can be used to make decisions.\textsuperscript{65} The study of AISs is, in large part, the study of the application of IT to accounting systems. We begin by answering the question, “What are AISs?” and then look at some advantages of developing the characteristics of AIS which are affected by IT.

Many researchers (Bagranoff \textit{et al.}, 2005; Romney & Steinbart, 2003; Moscove & Simkin, 1984) believed that we cannot define AIS by its size, but it is better to define it by what it does. Bagranoff \textit{et al.} (2005) define AIS “as a collection of data and processing procedures that creates needed information for its users” and suggest that AISs stand at the crossroads of two disciplines: accounting and information systems. In the same track Moscove & Simkin (1984) define AIS as “an organizational component which accumulates, classifies, processes, analyzes, and communicates relevant financial-oriented, decision-making information to a company’s external parties and internal parties.” (pp. 6-7).

We conclude from these definitions that, it is convenient to conceptualize AIS as a set of components that collect accounting data, record it, store it for future uses, and process it for end users.\textsuperscript{66} Today, however, AISs are concerned with nonfinancial as well as financial data and information because many of the end users of the information of an AIS are not accountants, but include customers, investors, suppliers, financial analysts, and government agencies. Thus, the present definition of AIS as an enterprise-wide system views accounting as an organization’s primary producer and distributor of many different types of information. The definition also considers the AIS as process focused. This matches the contemporary perspective that accounting systems are not primarily financial systems (see, Drucker, 1992).

Consistent with previous definitions Romney & Steinbart (2003) argued that AIS consists of five components: people, procedures, data, software, and information technology infrastructure. Together, these five components enable AIS to fulfill three important functions in any organization:

- Collecting and storing data about the activities performed by the organization,
- Transforming data into information that is useful for making decisions that enable management to plan, execute, and control activities,
- Providing adequate controls to safeguard the organization’s assets, including its data, to ensure that the data are available when needed and are accurate and reliable.

Thus, the study of AISs is viewed as the study of computerized accounting systems. Computerized accounting systems, in the information age, perform many of the tasks once performed by traditional manual systems- for example, collecting, processing, storing, transforming, and distributing both financial and non-financial information for planning, decision-making, and control purposes.

Therefore, most accounting transactions, which are done automatically or by given the command to the computer, are processed in a three-phase operation called input-processing-output cycle. The starting point of the input-processing-output cycle –especially when organizations process accounting transactions- is input which is a records of a business

\textsuperscript{65} To make information meaningful and useful for decision making, Romney and Steinbart, (2003) intended that it must have the following characteristics: relevant, reliable, complete, timely, understandable, and verifiable.

\textsuperscript{66} So that, it is useful view AIS as a collection of hardware, software, data, people, and procedures that must all work together to accomplish processing tasks.
activities. Thus, even where the amount of data is small, computerized AISs require input methods and procedures that ensure complete, accurate, timely, and cost-effective ways of gathering and inputting accounting data. The starting point for collecting accounting data in most AISs is a source document. A source document is a piece of paper or an electronic form that records a business activity such as the purchase or sale of goods. Therefore, in order to process source-document data electronically, the data must first be transcribed into machine-readable media, where most AIS designers prefer data-capturing methods that gather data that are already in machine-readable formats, because electronic source documents eliminate many errors that are introduced by human input. Therefore, computerized AISs make extensive use of source documents. Also, source documents help manage the flow of accounting data in several ways (Bagranoff et al., 2005). Many devices enable AISs to capture data that are already in machine-readable formats, and to store and archive data on media that permanently maintain its accuracy and integrity, yet permit the system to access and modify this information quickly and easily.

A well-designed computerized AIS can add value to the organization by: improving the quality and reducing the costs of products or services by reducing the amount of wasted materials, improving efficiency of operations by providing more timely information, improved decision making by providing accurate information in a timely manner, and sharing of knowledge by providing competitive advantages.

The information produced by well-designed computerized AIS can improve decision making in several ways. First, it identifies situations requiring management action. Second, by reducing uncertainty, accounting information provides a basis for choosing among alternative actions. Third, information about the results of previous decisions provides valuable feedback that can be used to improve future decisions (for details, see Romney & Steinbart, 2003).

Therefore, the advances in IT will permit AIS to create more information. Nevertheless, although more information is often better, this is only true to a point. There are limits to the amount of information that the human mind can effectively absorb and process. Information overload occurs when those limits are passed. Information overload is costly, because decision-making quality declines while the costs of providing that information increase. Thus, information overload reduces the value of information. Consequently, information systems designers must consider how advances in IT can help decision makers more effectively filter and condense information, thereby avoiding information overload.

Moreover, it is important to recognize that there are costs associated with producing information. Those costs include the time and resources spent in collecting, processing, and storing data, as well as the time and resources used to distribute the resulting information to decision makers. There are also many opportunities to invest in additional IT to improve the overall performance of the AIS.

Most organizations, however, do not have unlimited resources to invest in improving their information systems. Therefore, another important decision involves identifying which

---

67 First, they dictate the kinds of data to be collected and help ensure legibility, consistency, and accuracy in recording data. Second, they encourage the completeness of accounting data because these source documents clearly enumerate the information required. Third, they serve as distributors of information for individuals or departments. Finally, source documents help to establish the authenticity of accounting of accounting data.

68 POS devices, MIRC readers, OCR readers, and magnetic-strip readers.

69 Magnetic (hard) disks, floppy disks, CD-ROMs, DVD disks, and USB flash disks
potential AIS improvements are likely to yield the greatest return. Making this decision wisely requires that accountants and information systems professionals understand their organization’s overall business strategy (Porter, 1996).

These arguments allow us to raise this question: how AISs operate properly and record accounting data accurately? Documentation explains how AISs operate and is therefore a vital part of any accounting system. For example, documentation describes the tasks for recording accounting data, the procedures that users must perform to operate computer applications, the processing steps that computer systems follow, and the logical and physical flows of accounting data through the system (Bagranoff et al., 2005).

Although written narratives can be used to document an AIS, several graphical tools are available that are usually more efficient such as document flowchart and a data flow diagram. A document flowchart describes the physical flow of documents through AIS, for example, by providing an overview of where documents are created, what departments receive and review them, what activities they trigger, and where these documents are stored (see also, Lehman, 2000). System flowcharts are similar to document flowcharts, except that system flowcharts usually focus on the electronic flows of data in computerized AISs. Documentation also describes the logic flow of data within a computer system and the procedures that employees must follow to accomplish application tasks. Accountants can use many different types of diagrams to trace the flow of accounting data through AIS. Therefore, documentation includes all the flowcharts, narratives, and other written communications that describe the inputs, processing, and outputs of AIS. By using IT, these flowcharts pictorially represent data paths in compact formats and therefore save pages of narrative description and make better communications (Bagranoff et al., 2005).

The information which are created and documented by computerized AISs will be used by interested users in different locations. According to Moscove & Simkin (1984) in their definition for AISs insisted that AIS communicates financial information to both company’s external and internal parties. In this situation, IT will be very helpful in transmitting accounting data and information to various locations, because, data communication which refers to transmitting data to and from remote locations, enable AISs to transmit accounting data over local and wide area networks. Many accounting applications use data communications in normal business operations. For example, banking systems enable individual offices to transmit deposit and withdrawal information to centralized computer locations.

Therefore, accountants must understand data communication concepts because so many AISs use them and also because so many clients acquire AISs that depend on data transmissions. Many AISs now use LANs or WANs for e-mail, sharing computer resources, saving software

---

70 There are seven reasons to document AIS:

1. to explain how the system works,
2. to train others,
3. to help develop new systems,
4. to control system development and maintenance costs,
5. to standardize communications among system designers,
6. to provide information to auditors,
7. to document a business’s processes (for details, see Bagranoff et al 2005).
costs, gathering input data, or distributing outputs. Wi-Fi technology of the future will significantly increase the ability of accountants to be mobile, yet connected to their offices as well as to their clients (Malik, 2003).

The above discussion recognized the advantages of using advanced IT in developing and enhancing the performance of AISs.

3. Literature Review

The last few years have witnessed a steady increase in using IT in various aspects of life. Organizations (ER, 1987) and universities (Thomas, 1983; Wu, 1984; Haugland, 1997; Siam & Rahahleh 2005) were not isolated from such development, as IT enjoys several advantages making it an ideal method to be used in improving the educational process and enhancing it. Significant research on the adoption of technological innovations has been undertaken by Rogers (1995), who identified individuals on a continuum from Innovator to Laggard. Less (2003) used Roger’s research as a basis to classify full-time faculty teaching in degree programs into one of five categories developed by Rogers. Faculties identified as either users or non-users of computer technology in instruction and were studied using the demographic characteristics of age, gender, race/ethnicity, teaching experience and highest degree attained. No differences were found in any of these five categories between faculty who used computer technology in instruction and those who did not. Faculty members who reported employing technology for instruction often utilized multiple techniques, such as e-mail contact with students, posting assignments and other information on course websites, and using course management software for record keeping functions. Non-users identified a number of reasons for not incorporating technology into instruction, as well as which strategies might be employed to encourage them to adopt computer technology into instruction.

Thomas (1983) and Wu (1984) explained that the use of IT methods in the educational field will develop the students’ analytical thinking capacities, thus it is considered as an effective way to prepare them for practicing accountancy. Haugland (1997) examines two Accounting courses where computer instructional technology was used to present course material to students. Haugland’s study describes the procedures used by the professor, observations of the professor and the reactions from students enrolled in the two courses. The results of Haugland’s study indicate the use of computer instructional technology and course web pages enhance student’s learning: students are more motivated to attend and participate in class; students retention of information is increased; students are able to integrate information, concepts and course materials, leading to a greater understanding of class content and ultimately improved grades; and students gain confidence in utilizing these resources themselves, which enable them to make more effective and professional presentations in the future.

In the same track, Saim & Rahahleh (2005) recommended that the use of IT in education achieves many advantages that support quality assurance of accounting university education and increase its effectiveness.

---

10 Wi-Fi is the ability to transmit voice-grade signals or digital data over wireless communication channels. Wi-Fi application has two dimensions: connectivity and mobility.
Thus, this study sought to extend previous research on IT use in accounting university educations, with respect to the developing of AISs to enhance the quality of accounting university educations.

Yaverbaum (1996) focuses on the idea that faculty and students need to change their approach to the learning process when technology is introduced. The traditional model of talk versus listen will frequently not be appropriate. What is appropriate depends on how the technology is integrated into the learning environment.

Najjar (1998) examined the information transfer process and found strong links between presentation structure and test performance. Although the evidence was not conclusive, it did indicate that presentation channel (visual, pictorial, verbal) did have an effect on test performance. In general if the testing was done using the same channel as the presentation there was somewhat better performance than if there was a change in channel between the two. This would seem to indicate that if assessment is to be done with conventional text based tests it is important to make sure that the presentation is text based as opposed to being highly visual.

McAdams & Duclos (1999) report on the conversion of a traditional multimedia (film based slides, video, and audio) presentation to an integrated PowerPoint based presentation of the same material. Although it was easier for the presenter to deal with supporting aids with PowerPoint, they report that students did not receive it as well. They also expressed concerns about the amount of time that it took to generate the PowerPoint based presentation. They had over 700 hours in the conversion process, including digitizing the old slides and video clips. All of this was to support a 90 to 120 minute presentation/discussion.

Parks (1999) reported on his first four years of using technology to aid his presentations in a Principles of Macro Economics class. Like others, he identified the additional preparation time as a significant change. He found this beneficial to the extent of being more organized but also detrimental as significant amounts of time were invested in mechanics that could have been better spent on content development.

Duchasted & Turcotte (2001) saw that among the advantages of accounting tele-education are the availability of information and the attractive way in which it is possible to access the material at the time and place that is appropriate for the student and proved to be efficient and spread via the Internet.

Rankin & Hoaas (2001a) investigated the effect of PowerPoint presentation on student performance in accounting courses, and they found no significant effect on student performance.

Rankin & Hoaas (2001b) report on a paired comparison test they ran in Principles of Economics classes where two sections were taught traditionally and two sections were taught with PowerPoint presentation aids. After adjusting for ACT score; gender; freshman versus non-freshman standing; whether the student had a high school economics course; and time of day, they found that grades were not significantly effected by the use of PowerPoint. Of the variables examined, ACT score was the only one to have a significant effect on student grades. Additional t-test was performed to determine if student satisfaction or instructor evaluation were impacted by the use of PowerPoint. No significance was found in either case.

Hicks (2002) indicated that employing IT in education was as assisting factor in improving the level of students and meeting their academic needs. The same results were found by Haugland’s study (2000) on the use of e-education in some accounting courses.
Guthrie & Carlin (2004) attempted to learn student perceptions about the value that Audience Response Systems (ARS) add to the classroom. Their research reveals that while initially leery of the technology and the modest cost it adds to the course, students are generally positive about its use, and prefer courses that use the technology over those that do not, also student participation approaches 100% in class sessions where ARS are used due in part to anonymity, ease of use and the ability to see how many others answered in the same way.

Domermuth (2005) presents a detailed approach to setting up a classroom for technology aided teaching. In the article he discusses some of the trade-offs that need to be addressed and the impact on cost that specific choices can have. His primary focus is on getting the room effective within a tight budget.

Craig & Amernie (2006) presented a wide-ranging analysis of the use of PowerPoint technology in higher education, and concluded that all users of PowerPoint should respond to Postman’s (1993) call and pause to reflect about any new technology and how it affects their engagement with what and how they teach, and they should engage in conversations and critique of new technologies, rather than to accept them blithely and unquestioningly.

Daniels et al. (2007) examined the impact of PowerPoint on student performance and the results showed that PowerPoint did not have an impact on grades when controlling absences, hours of study, previous high school and college economics courses, math learning styles, and gender. Although the majority of students expressed a preference PowerPoint over more traditional teaching methods, the effect on student course evaluation mixed.

In a research conducted by Monem (2007) provides empirical evidence on the effect of releasing tutorial solutions in a management accounting course at a large Australian university and the findings of this research that there was no evidence that releasing tutorial solutions improved performance in the final examination.

Some studies resulted in determining some problems facing the use of IT in university educations. Abo-Ghabah (1990) argued that, one of the main problems facing universities is the method of benefiting from IT in developing and updating accounting education. Granger & Benke (1998) confirmed that the use of IT in university education must take into consideration the problems related to how beneficiaries (students in the case) understand this technology, and should regard that their misunderstanding of the importance of using technology may be attributed to their lack of skills in using such technology or because they lack English language skills especially that English is the language of modern IT, in addition to the differences between cultures from one region to another, as people differ in accepting and adopting the use of IT.

Duchastel & Turcottee (2001) and Morgan (2001) indicated that it is difficult to determine the total cost related to e-education, as such expenses involve the cost of developing the skills of faculty members, administrators and students, in addition to the costs of training them on using modern technology, and the costs of computer software, moreover, there are the costs of maintaining, developing and supporting websites, which are seen as hard to be calculated, in addition to the cost of designing the teaching material and transfer it from a traditionally taught material to an interactive electronic material than can be taught through modern IT.

Collectively, many of previous articles make a strong case that the presentation aids do not make the presentation. Unless they are contributing to the objective of the presentation, the technology doesn’t accomplish anything except diverting the time that the presenter would otherwise be devoting to content development.
Thus, most previous research focused on IT use to improve student performance in classroom, relatively little is known about the effect if IT on AISs and their effects on the QAUE. One of the motivations for this study was to help redress this neglect.

4. Research framework and research propositions

Despite a number of studies on IT and QAUE (Hicks, 2002; Saim & Rahahleh, 2005) we know very little about IT and AISs and their effects on the QAUE. The recognition of IT, the AISs response to IT, and the recognition of these variables on the QAUE led us to formulate some specific theoretical questions.

The fundamental theoretical questions guiding this study are: first, how does theory and relevant previous research conceptualize and define IT and AISs?, and secondly, how do theory and relevant previous research conceptualize and define the QAUE responses to advances in IT and the developing of AISs?

Based on the above argument and the fundamental theoretical questions, this study will examine: (1) the two-way interaction effects of IT and AIS on the QAUE; and, (2) the one-way interaction effects of IT and AIS on the QAUE; and IT on AIS.

In this study, the basic premise is that there are important links between IT and AIS, and it is expected that the interaction effects between these variables is essential to better quality of Accounting university education, as depicted in Figure (1).

INSERT FIGURE 1 HERE

The above argument convinced the researcher to formulate the following four propositions for testing, and the researcher’s aim is to convince the reader rather than prove relationships between variables:

\[
P1: \text{There will be a positive interaction effect on quality of accounting university education between advances in IT and the developing of AIS.}

P2: \text{Advances in IT enhance the quality of accounting university education.}

P3: \text{Developing AIS leads to better quality of accounting university education.}

P4: \text{Advances in IT develop the characteristics of AIS.}
\]

After narrowing our focus in relation to the relevant previous research themes, designing the research framework and formulating the theoretical questions and the research propositions, the final refinement of the research methodology, methods, and procedures require justification. These are the focus of the next section.

5. Methodology of the study

5.1 Study population and study sample:
The research population consists of all Jordanian financial institutions. The study was restricted to banks and insurance companies working in Jordan in 2010, because these institutions are recruiting the major part of fresh university graduate no matter what their academic level was. This is due to fast expansion of banks and banking services in Jordan. New employees are usually enrolled in training courses in the training centers that belong to the same financial institution in most cases. The Companies Guide issued by the Jordanian
Security Commission (JSC) every year since 1990 showed that there were 15 banks and 20 insurance companies listed on Amman Stock Exchange in 2010.

The research covered only the financial institutions headquarters where the targeted respondents were expected to exist. The targeted respondents represent the parties that had the ability and knowledge to address it; therefore, the postal questionnaire was distributed to the head of accounting department, computer department, and employees departments in each of the financial institution during the summer of 2010, because these departments are the qualified parties who recognized the academic level of new accountants graduate whom recently involved in the working place in these institutions. Three questionnaires were distributed on each bank and insurance companies in order to maintain an equal numbers of questionnaires distributed on all financial institutions. One hundred and five questionnaires were distributed; one hundred were received in a usable format. Telephone calls were made after three weeks as follow-up reminders.

One way to assess the potential for non-response bias is to compare data from late respondents to data from on-time respondents as in Oppenheim (1992) and Wallace & Mellor (1988). In this study, five responses were received following a reminder. Those late responses were not significantly different from other responses in any of the analyses reported later in this study.

5.2 Research method:
This section examines data collection, measurement of variables, and the data analysis. For the purpose of data collection, the researcher depended on the findings of prior studies and published articles which addressed the subject of his study in order to enhance the comparability and reliability of the findings of this study. The questionnaire was developed accordingly within the theoretical framework and contained questions of the following issues: the recognition and the advantages of using IT; the importance of IT in developing AIS; and the QAUE and had many variables. Each variable in the relevant group was given a name and a number. This makes it easier for any one else to read the results. Unless otherwise stated, each question was measured on a five-point ‘Likert-type’ scale, ranging from (1) ‘very low level of expectation’ to (5) ‘very high level of expectation’. This helped the respondents answer quickly over a continuous range (Otley, 1976).

To investigate research instrument validity, professionals and academics were consulted. They were asked to check whether the suggested variables that exist in the research questionnaire represent essential elements in the advantage of using IT in developing AIS and then enhance the QAUE. They were also asked to confirm that each point is categorized under the correct and representative group. Furthermore, the questionnaire was pre-tested with a sample of two financial institutions one bank and one insurance company, and adjusted to incorporate their comments before being mailed to the full sample.

To encourage managers to respond, the length of the questionnaire was kept at the necessary minimum. An enclosed stamped and addressed envelope was included with the questionnaire in order to encourage respondents to mail the questionnaire back. Such cooperation was considered to increase the response rate significantly, and to decrease non-response bias, generally considered as a major disadvantage of mail questionnaire surveys. The low response rate was expected by the researcher because of "a competitive business environment which provides little incentive for companies to respond to surveys by indicating data which were successfully employed" (Chia, 1992; cited in Gul & Chia 1994, p. 418).
The revised questionnaire included four sections. The first section contained four questions which covered the respondents’ background, qualification and experience. The second section contained nine questions which used to measure the level of recognition of IT and the advantages of using this technology. The third section contained eight questions for measuring the development of AIS characteristics. The fourth section contained fourteen questions about the most influential factors affecting and enhancing the QAUE. Thus, the instruments for measuring each set of variables were chosen in this study for two reasons. First, they are well documented and representative of the current IT- AIS and quality accounting education relationship literature. Second, they measure key concept discussed previously in the early sections.

Data from the questionnaire was input to SPSS V16.0. The first task of data analysis was to find the basic distributed characteristics of each variable used in the subsequent analysis. Various statistics were calculated from SPSS to be able to answer some basic questions such as: how many respondents gave a particular answer or response, and how are the scores distributed or does there form a normal distribution? The answer to the first question is conducting frequency distribution, and the test of normality for the later question, for each variable. These provide necessary information required for selection of specific statistical techniques for the analysis. Although the data were ordinal scaled, a test of normality of the data (through histograms, skewness, kurtosis, normal plot, and boxplots) resulted in the data from the population being normally distributed. For a further test of normality of data, the researcher applied the studentized range test for each variable (see Pearson & Hartley, 1954). The test showed that the observed values are less than critical values (see David et al., 1954) which indicated that the null hypothesis of non normality of the distribution of the variables was rejected (see also Hoque & Hopper, 1995 as an example). Thus, the studentized range showed that the observations were normally distributed. Therefore, we should not have an estimation problem with our parametric tests. However, it should be noted that the observations are of an ordinal scale and therefore, it may be considered a suspicious measure to apply a parametric test. So, we interpret our parametric test with caution.

The background information of the respondents (87% males, 13% females) are presented in Table 1, indicating that they are mature, highly educated with very good working experience.

**INSERT TABLE 1 HERE**

The measurements of IT was based on responses asking to rate the characteristics of nine variables on the degree of the level of recognition and the advantages of using this technology. The results depicted in Table 2 show the level of recognition of and the advantages of using IT.

Table 2 shows high level of recognition of IT and high level of advantages of using IT in seven variables out of nine variables, where the percentage rating 57%-80% recording 4 or 5, and the other two variables show a medium level due to the low level of using the course web page or less of using technology in presenting or collecting course assignments.

**INSERT TABLE 2 HERE**

The descriptive statistics (means and standard deviations) of responses to each question on IT variables are also presented in Table 2. The mean scores in seven variables range (from 3.68
to 4.14) indicating high level of recognition of IT and great advantages of using IT by employers due to their understanding the importance of technology in developing their businesses.

The study applied an alpha analysis to judge the reliability of the answers obtained from the respondents. The alpha coefficient was 0.759, which indicates that the data is reliable (Cronbach, 1951; Nunnally, 1967; Amir & Sonderpandian, 2002). Moreover, factor analysis was performed "to improve interpretability" (Chenhall & Morris, 1986, p.25), "to understand the common underlying dimensions of the data" (Joseph & Hewins, 1991, p.250), and "to construct validity" (Gul & Chia, 1994, p.419). A measure of sampling adequacy was 0.612 and p<0.001 at 95% confidence and 72% of the total variance was explained (Stevens, 1992). The measurements of AIS was based on responses asking to rate the characteristics of eight variables on the degree of the level of importance of IT in developing the AIS. The results depicted in Table 3 show the importance of IT in developing the AIS. Table 3 shows high level of importance of IT in developing the AIS in eight variables where percentage rating 51%-78% recording 4 or 5.

**INSERT TABLE 3 HERE**

The descriptive statistics (means and standard deviations) of responses to each question on IT variables are also presented in Table 3. The mean scores range (from 3.43-3.80) indicating high level of the importance of IT in developing the AIS by employers who recognized the importance of using IT in storing data on media and transforming it into useful and accurate information, making better communication, and saving pages of narrative descriptions.

The study applied an alpha analysis to judge the reliability of the answers obtained from the respondents. The alpha coefficient was 0.717, which indicates that the data is reliable (Cronbach, 1951; Nunnally, 1967; Amir & Sonderpandian, 2002). Moreover, factor analysis was performed "to improve interpretability" (Chenhall & Morris, 1986, p.25), "to understand the common underlying dimensions of the data" (Joseph & Hewins, 1991, p.250), and "to construct validity" (Gul & Chia, 1994, p.419). A measure of sampling adequacy was 0.717 and p<0.001 at 95% confidence and 74% of total variance was explained (Stevens, 1992).

The measurements of QAUE was based on responses asking to rate the characteristics of fourteen variables on the expectation ability of the QAUE. The results depicted in Table 4 show the level of expectation ability of the QAUE. Table 4 shows low level of the expectation ability of the QAUE in twelve variables out of fourteen variables, where the percentage rating 52%-80% recording 1 or 2 due to the very low level of the ability of accounting graduates in writing report, and in speaking or writing in English especially when there was no training hours available during their academic years at the universities, and the other two variables (Q28, Q29) show a medium ability level of recognizing accounting concepts which covering the contemporary issues.

**INSERT TABLE 4 HERE**

The descriptive statistics (means and standard deviations) of responses to each question on IT variables are also presented in Table 4. The mean scores range (from 1.74-3.01) indicating low and medium level of expectation ability of the QAUE by employers who recognized the
lack of accountants' ability in writing report in English (Q32, 78% recording 1 or 2; Q34, 80% recording 1 or 2) and using documentation technique (Q35, 65% recording 1 or 2), and this may due to no training hours available (Q30, 77% recording 1 or 2).

The study applied an alpha analysis to judge the reliability of the answers obtained from the respondents. The alpha coefficient was 0.897, which indicates that the data is reliable (Cronbach, 1951; Nunnally, 1967; Amir & Sonderpandian, 2002). Moreover, factor analysis was performed "to improve interpretability" (Chenhall & Morris, 1986, p.25), "to understand the common underlying dimensions of the data" (Joseph & Hewins, 1991, p.250), and "to construct validity" (Gul & Chia, 1994, p.419). A measure of sampling adequacy was 0.839 and p<0.001 at 95% confidence and 73% of total variance was explained (Stevens, 1992).

6. Results and discussion:

As indicated in the previous section there are three groups of variables related to IT, AIS and QAUE. Because of the multidimensional nature of the variables related to IT and AIS and QAUE, a single measure for each of these three group is computed by three method: (1) using standardized value for each case for all variables related to each group (Finn, 1974); (2) using unweighted value (raw data) for the variables related to each group (Chenhall & Morris, 1986); and, (3) using weighted average scores after computing the weighted average of the raw data to each set of variables using factor scores (Ezzamel, 1990). The most common statistical method for prediction is regression analysis, where there is one dependent variable and one or more independent variables, and could be simple (uses one independent variable) or multiple (uses more than one independent variable) regression. Because this study uses more than one independent variable, the technique used for prediction is called "multiple regression analysis" (Allison, 1977).

Therefore, propositions one, two, and three indicated in section 4 was tested using not only multiple- regression routine but also stepwise regression technique in order to determine which explanatory variables are "best" in explaining variation based on the following multiplicative model to test these propositions, which expresses the relationship between two independent variables and their multiplicative interactions on one dependent variable:

\[ Y = b_0 + b_1X_1 + b_2X_2 + b_3X_1X_2 + e \]  

Where:
- \( Y \) = quality of accounting university education (QAUE)
- \( X_1 \) = information technology (IT)
- \( X_2 \) = accounting information system (AIS)
- \( X_1X_2 \) = interaction term
- \( e \) = error term

I conducted the regression above by using the three method mentioned above. The regressions' results indicate the standardized value gives better results than unweighted or weighted values in terms of adjusted R square, standard error, overall significance, and the significance of the individual variables. Therefore, the rest of the analysis will be based on the standardized value for the variables.
The model in Equation (1) was used to test proposition one, which reflects the two-way interaction on QAUE, which predict an interaction effect on QAUE between IT and AIS. The results are presented in Table 5.

**INSERT TABLE 5 HERE**

The b3 coefficient for the interaction between the advantages of recognizing and using IT and its importance in developing the AIS is 0.447 and significant (t-value= 4.291, p=.000), providing support for proposition one which predicts a positive interaction effect on QAUE between advances in IT and the developing of AIS. The prediction model in equation (1) accounts for 47% of the variance (R square=.478; F(3,96)= 44.470; p=.000) in QAUE. Although, this effect is positive and significant but it is at low level, a possible explanation for these results is that the employers have little ability to predict IT change and the developing of AIS within the university education system. These variables (IT and AIS) were combined to anticipate and predict effects which may be out of reach to those employers who have no power over the university education system which is accounted a major drawback of this study by the researcher. This provide new research opportunities for future investigation by taking the view of the universities academic staff into consideration in these issues to be able to avoid the major deficiency of this study.

Because the two-way interaction is significant, the model in Equation (1) was also used to test propositions two and three which reflect the one-way interaction effects of IT on QAUE in proposition two, and the interaction effects of AIS on QAUE in proposition three. The b1 coefficient for the interaction between IT on QAUE is 0.761 and significant (t-value= 7.739, p=.000), providing support for proposition two which predicts advances in IT will enhance the QAUE. This effect is slightly high, positive, and significant, a possible explanation for these results is that the employers recognize the availability of technological software in the universities but they believe that the course materials and assignments are still not fully accessible to students through technology.

The b2 coefficient for the interaction of AIS on QAUE is 0.646 and significant (t-value= 6.844, p=.000), providing support for proposition three which predicts the developing of AIS leads to better QAUE. This effect is moderate, positive, and significant, a possible explanation for these results is that the employers recognize the lower abilities of those new comers to the work field in dealing with technology in terms of modifying accounting data, writing reports, and speaking or writing in English, and this may due to textbook which not include technology software and not available in English. Although, training hours not available for accounting students during their academic life at the universities.

Furthermore, Equation (1) was recalculated by using AIS as dependent variable and IT as independent variable based on the following model to test proposition four.

\[ X_2 = b_0 + b_1X_1 + e \]  

(2)

The model in Equation (2) was used to test proposition four, which reflects the one-way interaction effects of IT on AIS. The results are presented in Table 6.

**INSERT TABLE 6 HERE**
The $b_1$ coefficient for the interaction of IT on AIS is 0.312 and significant ($t$-value = 2.915, $p = .004$), providing support for proposition four which predicts advances in IT develop the characteristics of AIS. The prediction model in Equation (2) accounts 8% of the variance ($R^2 = .080$; $F(1,98) = 8.500; p = .000$) in AIS. This effect is very low, positive, and significant, a possible explanation for these results is that the employers recognized very well the advantages of using IT and the importance of IT in developing the AIS but these technology and its applications not very well accessible to students during their academic life.

Previous studies, which support these findings, argue that IT enhance student's learning (Haugland, 1997) and increase the quality assurance of accounting education (Saim & Rahahleh, 2005). Also Hicks (2002) argued that employing IT in education was as assisting factor in improving the level of students and meeting their academic need. The same results were found by Haugland's study (2000) on the use of e-education in some accounting courses.

In addition to regression analysis, which is subject to misinterpretation of interaction coefficients unless coupled with correlation (see Hirst, 1987). Therefore, intercorrelations are employed among all independent and dependent variables as shown in Table 7. The correlation coefficients presented in Table 7 show a positive correlation between both IT and the QAUE and significant at the 0.01 level, and between AIS and QAUE is significant at the 0.05 level. Also, the correlation coefficients between the independent variables (IT and AIS) are far lower than the percentage, which has been noted greater than 0.70 to indicate potential problems (Tabachnick & Fidell, 1989, cited in Cone & Foster, 1993).

### 7. Summary and Conclusions:

The results explained in the previous section indicate that a two-way interaction improved the predictive ability of the model, which explains a significant amount of variation in the dependent variable, which provides support to previous studies (e.g. Gul & Chia, 1994). The results indicate that the employers highly recognized IT and the advantages of using this technology in their business by employed highly qualified accounting university graduate, but the major set back is that the employers have no power or access over the universities education system. So to bridge this gap a kind of cooperation should be established between employers and the university and what they teach, because the employers believe that the course materials and assignments are still not accessible to students via technology.

So in practical issues, course materials should be accessible to accounting university students, and assignments should presented and collected by using technology.

The results indicate that the employers also highly recognized the importance of advances in IT in developing and enhancing the QAUE in terms of storing accounting data on media and transforming these data into useful information, which allow accountants to use this technology in modifying accounting information quickly, making better communications, and saving pages of narrative descriptions.

So in practical issues, accounting students should encourage by the university via the accounting academic plan to study the application of IT to accounting systems. Therefore, accountants students must learned and understand data communication concepts because so
many AISs use them and also because so many clients acquire AISs that depend on data transmissions because technology of the future will significantly increase the ability of accountants to be mobile and connected to their offices as well as to their clients.

Also, the results indicate that the employers recognized the expectation ability of the QAUE which is very low in terms of gathering, processing, modifying, and transmitting data; and in terms of writing report and speaking or writing in English.

So in practical issues, universities should increase the technical ability and English proficiency for accounting students by using accounting textbook in English which include technology software and covering contemporary issues, also increase their communications skills by increasing their ability in writing report and in using documentation technique e.g. flow charts. These issues may develop better by increasing the availability of training hours for accounting students during their academic life as the employers recognized.

As a concluding remarks, the results of this study indicated that the advances in IT use and apply permits AISs respond to user needs- that is, they gather data cost-effectively, store them in useful forms and formats, process data in efficient, timely, and accurate ways, output useful information, and transmit accounting data to various user in different locations which makes accounting information easily accessible and widely available. Therefore, accounting students when they understand AISs properly, and recognized and used their related IT they became “knowledge workers” creators and distributors the information system of the organization and that it will provide users (external as well as internal) with the information they need, and then, will enhance the accountants role in their organizations.

Herd behavior and market stress:  
The case of Tunisian stock exchange  
Mohamed Amine BEN GABSIA (Corresponding author)  
Department of Accounting and Finance  
Faculty of Business, commerce and computer, Tunis

Abstract  
The aim of this paper is to test the presence of herding behaviour in the Tunisian Stock Exchange. To this end, two techniques estimating the Cross-Sectional Absolute Standard Deviation suggested respectively by Chang, Cheng and Khorana (2000) and Tan, Chiang and Nelling (2008) are used. Studying a sample of 20 firms listed on the Tunisian Stock Exchange and monthly data during the period January 1 2005 to December 31, 2010, the results confirm the existence of a herding behaviour in the Tunisian Stock Exchange mainly during downward cycles.

Key words: Financial behaviour, herding behaviour, Cross-Sectional Absolute Standard Deviation

1. Introduction  
Research has extensively studied investors’ behavior and its impact on stock rates. This behavior is believed to be linked to a number of factors mainly investment horizon, behavior of other actors and market volatility degree. The concept of hedging behavior dates back to the work of Keynes (1936) who considered the financial market as a beauty contest. In case of herding, stock prices do not reflect information available in the market. Specifically, when an individual decides to imitate others in contrast to information he holds, this latter is not reflected in the stock price which harms the accurate estimation of this stock. Such a situation may deviate the stock price from its real value and this at the expense of financial markets efficiency. Accordingly, herding behaviour may contribute in explaining excessive rates volatility (Park and Sabourian (2006)). According to Lakonishok, Shleifer and Vishny (1992), herding behavior emerges when individuals alter their private beliefs to make them align with opinions publicly expressed by others. For Nofsinger and Sias (1999), herding behavior exists when a group of investors uniformly negotiate over a period of time. Jondeau (2001) define herding behavior as a set of correlated individual behaviors.

Reviewing the financial literature allowed us to reveal that herding is due to two forms of behavior; rational and irrational behaviors. According to Scharfstein and Stein (1990), rational herding is linked to the principal-agent problem in which managers imitate others in order to preserve their reputation in the market, while completely ignoring information at their disposal. Bikhchandani et al. (1992) and Welch (1992) relate herding to an informational stunt. However, Devenow and Welch (1996) use human psychology to explain irrational herding where investors neglect their own beliefs and blindly follow other investors.

Rational herding behavior may be explained by referring to the principal-agent nexus. Indeed, Scharfstein and Stein (1990) and Truean (1994) propose a theory of rational herding behavior based on managers’ reputation whose performance is often measured in a relative fashion. Each one of them receives information on the return of a given investment. This signal will be informative if the manager is competent and it will be a simple noise if the manager is less competent.

The underlying idea of Scharfstein and Stein (1990) assumes that if the manager as well as the employer are not sure about the manager’s competence in selecting the best stocks, then imitating other professional investors fuels uncertainty on the manager’s ability to efficiently manage the portfolio.
Maug and Naik (1996) consider the case of a risk-averse investor (agent) whose compensation increases with his own performance and diminishes with the performance of a reference investor. These two investors are supposed to have perfect information on stock returns. In the first place, it is the reference investor who decides on investments, then the agent selects his portfolio after having observed the reference investor’s stocks. Compensation mode is another reason for adopting a herding behavior. The agent’s compensation diminishes if he achieves a performance inferior to that of the reference investor. This compensation mode is the best for the employer in case of a moral problem or of a conflicting principal-agent relationship. Admitti and Pfeiderer (1997) analysed a model based on several risky stocks in terms of a delegated portfolio management in which the agent has private information on stocks returns. They found out that reference-based agents’ compensation contracts are inefficient, incompatible with optimal risk sharing, and inefficient in solving moral problems and principal-agent conflicts.

2. Detecting Herd Behavior

According to Christie and Huang (1995), detecting herding behavior during a period of high fluctuation of stock prices may be done by calculating cross-sectional standard deviation. Indeed, if investors tend to conform with the market’s general opinion, individual returns tend to approximate market returns. Statistics-wise, standard deviation allows for evaluating deviation of individual stocks returns from the mean. Level of dispersion increases when stocks returns deviate from market returns. If, during periods of high fluctuation, investors follow the market’s average opinion, dispersion level becomes significantly less than the average.

The measure of Christie and Huang (1995) is based on a cross-sectional dispersion of returns:

$$CSSD = \sqrt{\frac{\sum_{i=1}^{N} (R_i - R_{m,t})^2}{N-1}}$$

Where;

CSSD, is the cross sectional standard deviation

$R_i$, is the observed return of a firm i;

$R_{m,t}$ is the cross-sectional average return of the N returns in the market portfolio

This measure examines the magnitude of cross-sectional deviation (or volatility) of returns of an individual stock during important price changes. If dispersion is lower during price changes, Christie and Huang (1995) suggest that there is no proof of herding behavior. In their study of the US market, they found no proof for herding behavior.

Chang, Cheng and Khorana (2000) proposed a new approach which is more powerful and less rigid that that proposed by Christie and Huang (1995) in order to detect herding in international stock markets. This approach is based on measuring cross-sectional absolute deviation of returns defined as follows:

$$CSAD_t = \frac{1}{N} \sum_{i=1}^{N} |R_{it} - R_{m,t}|$$

Where:

$CSAD_t$ : Measure of stocks returns deviation from market average return

$R_{it}$ : return of stock i at time (t)

$R_{m,t}$ : cross-sectional average of N portfolio returns at time (t),

$N$ : number of firms
In order to detect herding behavior using Chang, Cheng and Khorana’s model (2000), first we should compute cross-sectional absolute standard deviations of returns, consistent with equation (2). Then, we regress these cross-sectional absolute returns on the average return and its squared value. More formally, we are estimating the following regression:

$$CSAD_{t} = \alpha + \gamma_{1} |R_{m,t}| + \gamma_{2} R_{m,t}^{2} + \epsilon_{t}$$  \hspace{1cm} (2)$$

This regression allows identifying herding behavior. During periods of high stock prices fluctuation, we expect that an increase in CSAD is less proportional for $$R_{m,t}$$ extreme values. Nonlinearity between CSAD and market returns is estimated by the coefficient $$\gamma_{2}$$. Chang, Cheng and Khorana (2000) analysed the behavior of different international markets participants (US, Hong Kong, South Korea, Taiwan and Japan) between 1963-19997 and found out an absence of herding behavior in the US and Hong Kong markets. However, they found partial evidence of herding in Japan and pointed to a significant proof of herding behavior in emerging markets, mainly in South Korea and Taiwan.

Tan, Chiang and Nelling (2008) estimate that in order to consider an eventual existence of a symmetric relationship between CSAD and market return, it is convenient to test this hypothesis through the following two models:

Asymmetric effects will be examined through the two specifications below:

$$CSAD_{t}^{+} = \alpha + \gamma_{1}^{+} |R_{m,t}^{+}| + \gamma_{2}^{+} R_{m,t}^{+2} + \epsilon_{t}^{+} \hspace{1cm} \text{if} \ R_{m,t}^{+} > 0$$  \hspace{1cm} (3)$$

$$CSAD_{t}^{-} = \alpha + \gamma_{1}^{-} |R_{m,t}^{-}| + \gamma_{2}^{-} R_{m,t}^{-2} + \epsilon_{t}^{-} \hspace{1cm} \text{if} \ R_{m,t}^{-} < 0$$  \hspace{1cm} (4)$$

with :  

$$R_{m,t}^{+} , R_{m,t}^{-}$$ : are respectively weighted averages of monthly returns when the Tunisian stock market is performing upward or downward,  

$$\left(R_{m,t}^{+}\right)^{2} , \left(R_{m,t}^{-}\right)^{2}$$ : are respectively the squared values of $$\left(R_{m,t}^{+}\right)$$ and $$\left(R_{m,t}^{-}\right)$$.

$$CSAD_{t}^{+} , CSAD_{t}^{-}$$ : are respectively the monthly CSAD of $$\left(R_{m,t}^{+}\right)$$ and $$\left(R_{m,t}^{-}\right)$$.

3. Data and empirical results

3.1. Data

Our data is composed of monthly closing rates of a sample of 20 firms listed on the Tunis stock exchange for the period January 1 2005 to December 31 2010. returns are computed by $$R_{t} = \log \left(\frac{P_{t}}{P_{t-1}}\right)$$.

3.1. Detecting Herding Behavior

In order to detect herding behavior in the Tunisian stock market, we will use the method proposed by Tan, Chiang and Nelling (2008) based on the work of Chang, Cheng and Khorana (2000) who proposed a new measure of herding behavior using the Capital Asset Pricing Model, i.e. cross-sectional absolute standard deviation of returns. Following Chang, Cheng and Khorana (2000), if investors imitate then a non-linear relationship is sensed between the cross-sectional absolute standard deviation of monthly returns and the market’s average monthly return during periods of high stock prices fluctuation.

3.2. Empirical results
Our aim is to check in the short-run whether investors within the Tunisian stock market show herding behavior. To this end, firstly we compute the cross-sectional absolute standard deviations of returns and market’s average returns analysing normality and stationarity of these two series. Secondly, we estimate CSAD regression on market’s average returns and its squared value.

**Insert table 1**

It is obvious that CSAD series is not normally distributed. It is leptokurtic since skewness is positive (superior to zero) and kurtosis is superior to 3. Jarque –Bera statistics confirms the rejection of the normality hypothesis of the CSAD series. Similarly, market returns series is leptokurtic (kurtosis superior to 3) with a positive skewness. However, Jarque –Bera statistics does not reject the normality hypothesis.

**Insert table 2**

The results reported in table 2 show that all coefficients are significantly different from zero. The coefficient $\gamma_2$ is negative. The relationship between cross-sectional standard deviation and market returns is linear and decreasing. These results confirm the existence of a herding behavior and suggest that investors followed average market opinion. It is possible then to point out that if investors adopt a herding behavior during periods of high fluctuations, the cross-sectional standard deviation increases less proportionally. Consistent with the work of de Chang, Cheng and Khorana (2000), individual returns are not compatible the CAPM and the relationship between cross-sectional absolute standard deviation ($E(CSAD)$) and market returns is increasing, yet non-linear.

In order to refine our empirical investigation, we thought it useful to refer to Tan, Chiang and Nelling (2008) who hold the possibility that the relationship between market return and CSAD is symmetric.

**Insert Table 3**

Table 3 indicates that herding behavior exists during a downward market cycle. During the upward cycle, the coefficient $\gamma_2$ is negative and insignificant, indicating that herding behavior is absent, i.e. market returns do not reveal any information in favour of herding behavior during up ward periods. However, during down ward cycles, the coefficient $\gamma_2$ is negative significantly different from zero which confirms the presence of herding behavior within the Tunisian stock market.

**4. Conclusion**

In this paper, we tested the presence of herding behavior in the Tunisian stock market using two techniques. The first technique, proposed by Chang, Cheng et Khorana (2000), consists in regressing the cross-sectional absolute standard deviation on market return to check for the nature of the relationship between these two variables. If this relationship is linear and increasing, then investors’ behavior is consistent with the rationality hypothesis suggested by CAPM. However, if we note that the deviation of individual returns from market returns is increasing yet with a decreasing rate, this confirms the presence of herding behavior. If
market participants are more likely to herd during periods of large price movements, then there should be a less than proportional increase (or decrease) in the CSAD measure. At the end of our study, we noted that analysing herding behavior by referring to the techniques of cross-sectional standard deviation allows for confirming its presence for the investors of the 20 Tunisian firms studied in this paper. Estimating the relationships suggested by Tan, Chiang and Nelling (2008) indicates that herding behavior exists only during periods when the market is on the down cycle.

MACRO DETERMINANTS OF GROWTH AND PRODUCTIVITY IN THE CONTEXT OF ENDOGENOUS GROWTH THEORY

Dr Abdul HAMID (Corresponding Author)

Income Distribution Specialist at the Centre for Poverty Reduction and Social Policy Development (CPRSPD), a UNDP and Government of Pakistan joint Project

J. Hanns PICHLER

Dr. J. Hanns Pichler is em.o. Professor of Economics at Vienna University of Economics and Business (WU-Wien) Austria

Abstract

Endogenous growth theory (EGT), proposes a “bootstrap” approach to accelerate the pace of growth for less developed countries (LDCs), i.e., pulling themselves into the information economy by making efficient use of available resources, especially human capital. Empirical studies show that sizeable contributions have been made through human capital and technological advances in most of the developed economies. This study aims at to determine and analyze the major factors of growth and productivity for Pakistan in purview of EGT and to undertake related comparisons with some other empirical findings. The empirical results illustrate that traditional factors are still predominant for the economy of Pakistan whereas contributions of human capital and technology lag behind as compared to developed and many of the dynamically emerging countries. Their contribution in Pakistan amounts to around 25% while in developed and in more dynamic emerging economies exceeding 50%.

Keywords: Endogenous growth; technological change; technical efficiency; human capital

JEL Classification: C13; O47; O53

1. Introduction

The basic argument of EGT is that long run growth and development of an economy is determined by systemic forces. EGT opens new avenues for developing countries by putting emphasis on using internal resources, especially human resources more efficiently. Technological change and technical efficiency brought about by human capital always has played a vital role for growth and development. According to Kendrick (1956), Denison (1967), Baumol (1986), Lucas (1988), Romer (1990) human resources contributed up to two thirds of growth performance in developed countries. Due to human capital and related skills to technological change and technical efficiency output growth in industrialized countries is higher today than it was a few decades ago.

“Output per hour worked in the US today is 10 times as Valuable as output per hour worked 100 years ago”.

(Romer, 1990, S-71)
EGT focuses on education, on the job training and development of new technologies for the world market. EGT assumes that human capital accumulation causes positive relationships between scale and productivity, outweighing thereby the impact of diminishing returns. Developed countries have been giving due attention to education, training and development of human capital. However, most of the developing countries like Pakistan have failed to place sufficient emphasis on it. Thereby, instead of proving an engine of growth, lacking availability of adequate human capital has resulted in a vicious circle of poverty and dependency.2

Pakistan has neglected human resources to such an extent that the country still lags behind the average of comparable low-middle income countries in education, training, R&D, nutrition, health, poverty alleviation and in other social indicators representing human development and as a result, after more than half a century of its existence, still stands at 134th position on the scale of the world human development indicators.3

The main objective of this study is to analyze the major determinants of growth and productivity in Pakistan and to make an international comparison with some existing studies in case of some developed and developing economies and to suggest some policy recommendations. Keeping in view the above mentioned objectives, layout of the study consists upon five sections. Section I gives the statement of the problem. Review of literature and historical background will be presented in Section II. Methodology, estimation techniques, measurement of variables and data sources are depicted in Section III. Section IV deals with empirical findings and discussion of results. Based on the results and conclusions, policy recommendation and summary is presented in the final section followed by references.

2. Review of Literature

Abramovitz (1956) in his empirical study for the US labour market over the period 1900-1950 found that up to two-third of the increase in labour productivity could not be explained by rising factor inputs. Solow (1957), Schlutz (1962, 1964), Ferguson (1965), Hulten (1973) and Kendrick (1973) came to similar results for subsequent periods.

Frankel (1962) provides the first version of endogenous growth theory in the form of an AK model by combining physical with human capital arguing that intellectual capital in an economy is accumulated when innovations occur.4 According to Nelson and Phelps (1966), human capital stock for any country determines the speed of its economic growth.6

Robinson (1971) estimated technological change, technical efficiency and spillovers caused by human resource accumulation for 39 developing countries and found that, on average, the share of productivity in total growth with only 15 % attributable to technological change, technical efficiency and human capital accumulation is much smaller than that in developed countries.

Romer (1986) in his model proposed that economic development and growth are being driven primarily by the accumulation of knowledge, considering knowledge a basic form of capital with investments in knowledge and R&D leading to increasing returns in the marginal product of factor inputs. Knowledge accordingly to be seen as a “natural externality”.7 Romer (1990) further assumed that there are four basic factors as relevant for endogenous growth, i.e., capital, labour, human capital and an index of the level of technology. Human capital is the most fundamental factor in Romer endogenous growth model. Grossmann and Helpman (1991) and Aghion and Howitt (1992) argue that from an endogenous view the variety of
goods in an economy expands through the process of innovation triggered by R&D activities entailing increased marginal productivity. Perelman (1995) analyzed eleven OECD countries over the period 1970-1987 measuring technical change, technological progress and total factor productivity (TFP) growth for the manufacturing industries, showing that TFP growth at 1.6% and technological progress at 1.8%.

Sarel (1996) measured TFP growth for East Asian countries and showed that in four Asian newly industrialize economies (NIEs) TFP growth exceeded that of the USA and Japan during 1975 to 1990 ranging between 3.0% to 3.8% for Hong Kong, Taiwan and Korea while for Singapore it was 1.9%, for Japan and the USA it was 1.9% and 0.9%, respectively, during the same period.

Edwards (1998) measured the difference of TFP, technical efficiency and technological change between developed and developing countries and could demonstrate that respective degree of openness in trade, levels of per capita income and difference in human capital accumulation were the major determinants of TFP growth and income divergence between developed and developing countries.

Baily (2003), Maudos et al. (2003), Brunner and Shields (2006) and Lee and Kim (2006) more explicitly measured the role of human capital for productivity growth in OECD countries demonstrating that the development and accumulation of human capital played a significant role not only for productivity gains but also for technological advances and enhanced efficiency. Keller (2004) similarly showed that international technology and its spillovers play an important role in most of the countries investigated contributing up to 90% of total domestic productivity.

Kim and Lee (2006) analyzed TFP, technological change and technical efficiency for 49 countries over the period 1965-1990 and found that East Asian countries were leading worldwide in technical efficiency, productivity and growth with Korea, Taiwan, Hong Kong and Japan owing at 8.51%, 8.62%, 8.03% and 5.74%, respectively; technological developments, human capital accumulation and technical efficiency thereby proving to be the major contributors.

Kemal (1981), Kemal and Ahmed (1992) and Kemal et al. (2002) estimated technological change, technical efficiency and productivity for Pakistan with TFP growing at a rate of 1.66% and a share in the GDP growth of roughly one-third during 1964-65 to 2000-01.

Iqbal and Zahid (1998) defined macroeconomic determinants of growth for Pakistan over the period 1959-60 to 1996-97 and could demonstrate that human capital formation through education (especially primary education), openness of trade and physical capital were indeed the major determinants of growth.

Khan (2006) estimated major determinants of TFP for Pakistan concluding that macroeconomic stability, foreign direct investment and conducive financial sector development were the significant contributors to productivity growth. Expenditure on education as a determinant of TFP was found to be rather insignificant and there was an inverse relationship between openness of trade and TFP.

From review of literature it becomes clear that human capital formation, technological change and efficiency are an indispensable source of growth both in developed and in developing countries.
3. Methodology

Endogenous growth assumes four basic inputs:
1. Capital
2. Labour
3. Human Capital
4. Index of Technology Level

\[ Y = f (A, K, L, H) \]  

Where

- \( Y \) = growth rate of GDP or Value-added
- \( K \) = growth rate of Physical Capital
- \( L \) = growth rate of Labour
- \( H \) = growth rate of Human Capital (activities as education & training, R&D, on the job training etc.)
- \( A \) = growth rate of Technology Level

Openness of the economy and interaction into world economy had also been one of the major determinants of growth for several economies. If we include openness of the economy or international trade as a determinant of growth Eq (1) can be written as:

\[ Y = f (A, K, L, H, T) \]  

Where; \( T \) = Degree of Openness of the Economy

In order to measure the major factors contributing to growth, technological change and technical efficiency, Cobb-Douglas production function is applied. Equation (2) in the form of Cobb-Douglas production function can be written as:

\[ Y_t = A H_t^\gamma K_t^\alpha L_t^\beta T_t^\psi \]  

Technological change is assumed with the following specification;

\[ e^{\lambda_1 t + \lambda_2 t^2} \] = Variable and continuous growth of technological change.

Cobb-Douglas production function with variable technical change is written as:

\[ Y_t = A e^{\lambda_1 t + \lambda_2 t^2} H_t^\gamma K_t^\alpha L_t^\beta T_t^\psi \]  

Where

- \( Y_t \) = Value of output or value-added
- \( K_t \) = Capital Stock
In order to eliminate certain econometric problems, particularly multicollinearity among the explanatory variables (especially between K and L), the following normalized transformed variable are used for estimations.

\[
y_t = \frac{Y_t}{L_t} \\
k_t = \frac{K_t}{L_t} \\
h_t = \frac{H_t}{L_t} \\
tr_t = \frac{T_t}{GDP}
\]

Taking log and using transformed variables, equation (4) in the estimatable form can be written as:

\[
\ln y_{it} = \ln A + \lambda_1 t + \lambda_2 t^2 + \alpha_1 \ln k_{it} + \alpha_2 \ln h_{it} + \alpha_3 \ln tr_{it} + u_{it}
\]

3.1 Measurement of Absolute and Relative Contribution
The method for calculation of absolute contribution was introduced by Hicks (1979) and calculation of relative contribution by Hadjimichael et al (1995). The absolute share of any factor of production towards growth can be found by multiplying the estimated coefficient of the explanatory variable by the standard deviation of the respective explanatory variable. The relative contribution for each independent variable can be measured by dividing its estimated absolute share by the standard deviation of the dependent variable. The relative share of variables will be unit free.

3.2 Measurement of Total Factor Productivity (TFP) Change Index
TFP change index is defined as the difference between rate of change of output and rate of change of inputs:

\[
\text{TFP} = y - x
\]

Where

\[
\text{TFP} = \text{total factor productivity change index}
\]
\[ y = \text{rate of change of output} \]
\[ x = \text{rate of change of inputs} \]

TFP growth can be estimated by subtracting the contribution of measured input growth from output growth as follow:

\[ \frac{\dot{Y}}{Y} = \frac{\dot{A}}{A} + \alpha \frac{\dot{K}}{K} + \beta \frac{\dot{L}}{L} + \gamma \frac{\dot{H}}{H} \] (7)

and

\[ \frac{\dot{A}}{A} = \frac{\dot{Y}}{Y} - (\alpha \frac{\dot{K}}{K} + \beta \frac{\dot{L}}{L} + \gamma \frac{\dot{H}}{H}) \] (8)

Where

\[ \text{TFP} = \frac{\dot{A}}{A} = \text{TFP change index} \]
\[ \frac{\dot{y}}{y} = \frac{\dot{Y}}{Y} = \text{rate of change of output} \]
\[ \frac{\dot{x}}{x} = (\alpha \frac{\dot{K}}{K} + \beta \frac{\dot{L}}{L} + \gamma \frac{\dot{H}}{H}) = \text{rate of change of inputs} \]

### 3.3 Major Determinants of TFP

As already mentioned, that besides the importance of conventional factor inputs (labour, capital etc.), the impact of TFP on growth has widely been accepted. TFP measures the change in value-added or output that is not contributed by the change of combined inputs. TFP is the joint effect of micro and macro level factors like new technologies, education, on the job training, R&D, managerial skills, political stability and macro economic conditions of a country, structural changes and relative openness of an economy etc. In trying to identify the major determinants of TFP, the functional form of these determinants is written as:

\[ \text{TFP} = \eta_0 + \eta_1 (\text{HRD}) + \eta_2 (\text{Pop}) + \eta_3 (\text{MES}) + \eta_4 (\text{PS}) + \eta_5 (\text{Tr}) + \eta_6 (\text{FS}) + U_t \] (9)

Where

- \text{TFP} = \text{Total factor productivity}
- \text{HRD} = \text{Human resources development such as education, training, R&D, on the job training etc.}
- \text{Pop} = \text{Population growth rate}
- \text{MES} = \text{Macroeconomic stability}
- \text{PS} = \text{Political stability and social peace (a qualitative variable measured in form of a dummy variable)}.
- \text{Tr} = \text{Degree of openness of the economy (it includes exports, imports and flow of foreign direct investment)}
- \text{FS} = \text{Financial sector development}
- \text{U_t} = \text{Error term}
- \eta_0...\eta_6 = \text{Parameters of determinants}
3.4 Data and Variable Description

The above model for the measurement of macroeconomic determinants of growth and productivity, the measurement of technological change and technical efficiency, productivity index, and their impact on input demand of factors of production will be applied for Pakistan, based on following variables and data sources (data series will cover the period from 1972-73 to 2006-07). All the data is converted on 1980-81 constant market prices.

Value-added or GDP
Real GDP or real Value-added on constant factor cost of 1980-81 prices

Labour as an Input
Total number of employed workers/labour force in the economy

Measures of Human Capital
Total expenditure on education, health, R&D activities and other related expenditures on human resource development activities on the 1980-81 prices is used as a proxy to measure Human Capital.

Capital Stock
Capital stock is measured by using perpetual inventory method as per following equation:

\[ K_t = I_t + (1 - \varphi) K_{t-1} \]  
(10)

Where
- \( K_t \) = Capital Stock in current year
- \( K_{t-1} \) = Capital Stock in previous year
- \( I_t \) = Current Year Investment or Gross Fixed Capital Formation
- \( \varphi \) = Depreciation rate

For estimating the initial capital stock \( K(0) \), the method used by Nehru and Dhareshwar (1993) and Khan (2006) is being followed. The capital stock series will be generated in the following way:

\[ K_t = I_t + (1 - \varphi)^t K(0) + \sum_{i=0}^{t-1} I_{t-i} (1 - \varphi)^i \]  
(11)

Where
- \( i=0 \) to \( t-1 \)
- \( K(0) \) = initial capital stock in year zero.

Nehru and Dhareshwar (1993) and Khan (2006) used a modified Harberger (1978) method to estimate K(0). The value of investment for the first year is estimated by way of a linear regression equation of the log of investment against time. The estimated value of investment for the base or zero year is used to calculate K(0) as per following equation:

\[ K(0) = \frac{I_t}{(gr + \varphi)} \]  
(12)

Where
- \( gr \) = Compound GDP growth rate
- \( \varphi \) = Depreciation rate

Various depreciation rates have been used in empirical studies. Here 5% capital depreciation rate is assumed. Several other studies used 4 percent depreciation rate e.g., Nehru and Dhareshwar (1993), Collins and Bosworth (1997), Khan (2006).
Macroeconomic Stability
Inflation rate is used as a sign of macroeconomic stability. Moderate inflation is expected to have a positive effect on the economy and on TFP.

Trade and Foreign Direct Investment
Trade and foreign direct investment are expected to have a positive impact on economic growth and productivity. International trade or openness of the economy is measured by taking the sum of foreign direct investment, exports and imports as percentage of GDP.

Political and Social Stability
This is a qualitative variable and plays an important role, especially in developing countries like Pakistan, where frequent changes in the political scenario have many faceted effects on the economy. It will be measured by using dummy variables.

Financial Sector Development
Financial sector development has a positive impact on the growth of the economy and TFP. To measure its effects, the ratio of M2 definition of money to GDP is used.

Sources of Data
Data sources for Pakistan include the following:
- Pakistan Economic Survey (various issues)
- Labour Force Survey (LFS), various issues
- Annual Education Statistics
- Pakistan Statistical Year Book (various issues)
- State Bank of Pakistan’s Annual Reports
- Government of Pakistan, Islamabad
- Human Development Report, UNDP (various issues)
- World Development Report, The World Bank (various issues)

4. Empirical Findings
Measurement of major determinants of growth and TFP in pursuance of endogenous growth theories and the calculation of their relative and absolute shares to the GDP and TFP growth in Pakistan are presented in this section. A comparison of some other relevant empirical studies is also given.

4.1 Major Determinants of Growth (Discussion of Estimated Results)
4.1.1 Traditional Factors
Table 2 shows the OLS estimations for Cobb-Douglas Production function for the economy of Pakistan. All the results are according to theoretical expectations. Equation (1) in table 2 is estimated for the economy without trade variable, while equation (2) is estimated with international trade as an explanatory variable in order to measure the impact of openness of the economy. Estimated coefficients for capital are 0.70 and 0.66 in equation (1) and equation (2) respectively. These estimations are significant at 1% level of significance showing that physical capital plays a significant role towards the growth of the economy. The estimations for labour are derived from Cobb-Douglas restrictions and these are 0.24 and 0.18 for equation (1) and equation (2) respectively.

4.1.2 Human Capital
The estimated coefficients for human capital as an explanatory variable are 0.06 and 0.065 for equations (1) and (2) respectively. The results of both equations are according to theoretical hypotheses. Many empirical studies like that of Nelson and Phelps (1966), Lucas (1988), Romer (1986, 1990, 1994), Grossmann and Helpman (1991), Aghion and Howitt (1992), Young (1994), Maudos et al. (2003), Aiello and Cardamone (2005), Cervellati and Sunde (2005), Chen and Kee (2005) and others found that human capital stock for any country determines the speed of its economic growth. But unfortunately this factor has failed to play a significant role in the economy of Pakistan (as is clear from the estimated coefficients).

4.1.3 Technology
The estimated results for technological changes, in both equations, are according to theoretical expectations and are statistically significant. The estimated results support the earlier findings of Parente and Prescott (1994), Perelman (1995), Coe, Helpman and Hoffmeister (1997), Baily (2003), Keller (2004), Lee and Kim (2006), Mussard et al. (2006) who also that found technological changes and its spillovers as one of the important contributors towards TFP and growth in developed and in many developing countries.

4.1.4 International Trade
Equation (2) presents the impact of foreign trade and openness of the economy on GDP growth. The estimated coefficient is 0.094 and is statistically significant, showing a positive correlation between trade and GDP growth. The findings favour empirical results of Taymaz and Saatci (1997), Edwards (1998), Iqbal and Zahid (1998), Soderbom and Teel (2001), Eaton and Kortum (2002), Baily (2003), Keller (2004), Lipsey (2004), Diao et al. (2005), Fu (2005), Kim and Lee (2006), Mastromarco (2006) and others who argued that openness of the economy to international trade and technological spillovers play a significant contribution towards growth and development.

4.2 Contribution of Factor Inputs, Technological Change and Technical Efficiency to GDP Growth

The estimated results of the contribution of factor inputs i.e. labour, capital, human capital, technological change and technical efficiency are presented in table 3. Shares or weights for capital, labour and human capital are taken from estimated equations (1) in table 2. Weighted growth rates for capital, labour and human capital are 3.339%, 0.617% and 0.444% respectively. Total factor inputs growth share in GDP growth is 4.4%. The share of technological change and technical efficiency (TFP) in the GDP is the difference between the average GDP growth (5.24%) and total factor inputs growth rates (4.4%). The estimated technological change and technical efficiency or total factor productivity (TFP) contribution towards GDP growth rate is 0.84%. In percentage form total contribution of factor inputs was 84%, out of which the contribution of capital, labour and human capital are 64%, 12% and 08% respectively. The share of technological change and technical efficiency in GDP growth is 16%.

4.3 Measurement of Absolute and Relative Contribution of Major Determinants of Growth

Estimated values for absolute and relative shares are presented in table 4. The results for equation (1) show that the absolute shares of capital (K), labour (L) and human capital (HK) are 0.443, 0.059 and 0.013 respectively. The relative shares follow the same sequence. The largest share is attributed by capital followed by labour and human capital. The relative shares for K, L and HK are 1.571, 0.210 and 0.046 respectively. The measurement for equation (2) indicates that absolute shares for K, L, HK and trade variables are 0.418, 0.045, 0.014 and 0.018 respectively. While relative shares for these explanatory variables are 1.481, 0.159, 0.050 and 0.064 respectively. The highest share was contributed by capital followed labour, trade and human capital.

4.4 Major Determinants of TFP Growth

As mentioned earlier, human capital, openness of the economy and technological spillovers from abroad, population growth rate, labour force growth rate, financial sector development, political stability and macroeconomic stability are some of the major determinants of TFP growth. OLS estimates for these determinants are presented in table 5. Estimated coefficients of all the explanatory variables are according to theoretical expectations. Coefficient for Human Capital (HK) as an explanatory variable is 0.017. Though it is positive, and showing a positive correlation between TFP and HK, but is insignificant. This confirms our earlier findings that human resource has given secondary importance and as a consequence it contributes insignificantly towards GDP and TFP growth. Population growth rate has a negative coefficient (-0.0014) indicating that higher population growth rate has a negative impact on TFP. The other explanatory variables like trade, financial sector development and political stability have positive coefficients. Trade coefficient is 0.162 and is statistically significant. The financial sector development measured by M2 definition of money to GDP ratio is also significantly contributing towards TFP. In order to measure the impact of inflation rate on TFP, the variable is split into two sub-variables. One sub-variable (INF+) shows the values of inflation for those years where inflation rate was higher than the average inflation rate and the other sub-variable (INF-) shows the values of inflation for those years when inflation was less than the average inflation rate. The estimated results show that the impact of inflation on TFP was positive for the sub-variable which shows inflation rate higher than the average rate and vice versa. The estimated coefficients for INF+ and INF- are 0.0012 and -0.003 respectively. However, both of the variables are statistically insignificant.

The coefficient of political stability as an explanatory variable is also positive but is statistically insignificant. Some of our results support the findings of earlier studies while others contradict. Khan (2006) also measured the determinants of TFP in Pakistan. He found positive impact of inflation and M2 to GDP ratio on TFP. However, he measured a negative effect of education and trade on TFP.

4.5 Absolute and Relative contributions of major determinants to TFP

Absolute and relative contributions of explanatory variables towards TFP growth are depicted in table 6. The largest absolute share was contributed by M2/GDP variable (0.0870) followed by trade (0.0089), INF+ (0.0057), human capital (0.0017) and political stability (0.0016). While population growth rate and INF- have negative absolute impacts on TFP and their estimated values are -0.0015 and -0.0068 respectively. The estimations for relative contribution of explanatory variables on TFP followed the same sequence as that in case of absolute contribution. The largest relative share in TFP is contributed by M2/GDP and its value is 1.1493 followed by trade (0.1176), INF+ (0.0753), human capital (0.0225) and political stability (0.0211). INF- and population growth rate have negative relative shares towards TFP growth.

5. Summary and Findings

The main focus of the study was to analyze the macro determinants of growth and TFP in the context of endogenous growth theory. Results of the study show that Pakistan to a large degree still depends on traditional physical factors of production contributing around 75% to GDP.
growth over the sample period (1972-73 to 2006-07) with human capital only some 10%. The share of total factor inputs amounted to over 80%, with the share of technological changes and technical efficiency in GDP growth estimated less than 20%. Absolute and relative measures as to contributions of major determinants to growth further confirm Pakistan’s heavy dependence on the traditional factors. Contribution of TFP and human capital to growth in most of the developing countries ranges between 15 to 25%, while technological changes and technical efficiency brought about by human capital has been contributing over 50% in developed economies. Thus, human capital and technological changes including their spillovers turn out to be main drivers of income divergences between developed and developing countries.

Measures for major determinants of TFP growth in Pakistan reveal that financial sector development, macro-economic stability, openness of the economy, human capital development and political stability have a positive impact, while population growth a negative one. Financial sector development and trade were found to contribute more significantly, human capital, by contrast, rather insignificantly.

Against such background of empirical findings, the following macro-oriented recommendations and conclusions may be derived:

- Human capital should be given priority in allocating appropriate resources to education, health and other social improvements along with physical factors as having proved most important and conducive for sustained development; if neglected, as in case of many developing countries, it turns out to be a drag on growth with negative spillovers.
- Technical, vocational and professional education must be promoted and emphasized in order to trigger technological changes and technical efficiency.
- Developing a more efficient labour market information system for appropriate policies based on realistic data as guidance.
- Fostering economic openness and international interaction in such a way as to take advantage from technological change and its spillovers with enhanced trade constituting a significant macro determinant of growth.

In summing up, the long term perspective for solutions towards sustained economic and social development in countries like Pakistan very much hinges on pro-actively developing and effectively utilizing existing human resources by taking advantage of technological changes, technical efficiency and their spillovers including adequate integration into, and exposure to, international (global) markets.
NOTES

1. In exogenous growth theory, the steady-state growth rate is determined exogenously while in endogenous growth theory the rate of growth is determined by the (equilibrium) solution of the growth model itself; thus in endogenous growth theory technical progress is explicitly modeled, rather than being treated exogenously as “manna from heaven”.

2. Productivity growth in most of the developing countries is low as compared to developed economies due to their low base of human and physical capital.

4. AK model assumes a linear economy in the aggregate capital stock and an endogenous growth theory is one in which the rate of growth is determined by the (equilibrium) solution of the growth model itself.

5. Poor countries need only to adopt readily available technologies developed elsewhere in the world. Some countries, like Newly Industrialized (East Asian) Economies making full utilization of such factors have been quite successful in narrowing the efficiency and income gap.

6. Knowledge is a non-rival good as knowledge of one thing can simultaneously be used by several users without costing to others.

7. The impact of trade is measured by taking trade to GDP ratio. Trade includes exports, imports and foreign direct investment (FDI).

8. Several other empirical studies in the literature assume a 5% depreciation rate.

9. Trade (total exports plus imports and foreign direct investment) to GDP ratio is used as a measurement for the openness of the economy.

10. Growth rates of the explanatory variables like M2/GDP, HRD, Trade, Inflation, Population are used to measure TFP equation.

11. Political stability is measured for using dummy variables. Value of Dummy variable is assumed 1 for years in which there was change in the government are drastic change in policies like nationalization during 1970s and value 0 for the remaining years.

12. Relative share is unit free.

Abstract
Mergers, acquisitions, joint ventures and numerous forms of partnerships have necessitated the intercourse between people of diverse cultural background in the same work place. This has ultimately contributed to a considerable interest in the subject of cross-cultural learning. However, most studies in this area, though scanty, have addressed this subject from the organizational point of view. Thus, this study explores the area of cross-cultural learning from the perspective of the individual employee. The narratives of 7 Swedish managers are analytically explored to try to understand what individuals learn, if any, from a cross-cultural interaction in a work environment. The framework of analysis is based on the motivations for working on international assignments or projects (including expectations), how individuals cope with work in a different cultural environment (adjustment issues), and what influence, if any, this kind of experience has on the individual on completion of the assignment. It is observed that, by and large, there is no reciprocity with regard to learning in this nature of interaction. Most importantly, individuals simply revise and modify work practices, in view of prevailing circumstances, but not the thinking behind such practices. The basic framework of thought behind individual action, filtered through a set of cultural assumptions, remains unchanged.

Keywords: Cross-cultural learning, Interaction, Individual, Experience, Narrative, Knowledge.

1.0 Introduction
The twin concepts of Internationalization and globalization have contrived to encourage an increasing number of mergers, acquisitions, joint ventures and other forms of partnerships across national borders (Laurent, 1981). This trend has given rise to ways of working that ensure the coalescing of individuals from diverse backgrounds on the same project or assignment in a foreign environment. As the world gets “smaller”, more and more people are spending time living and working away from their home country, giving rise to greater face-to-face contact among people from different cultural backgrounds (Brislin, 1981). Such intercourse, therefore, serves as a kind of arena for, deliberate but sometimes unconscious, diffusion of significant and varied experiences among the interacting individuals. Consequently, there is a resurgence of
interest in the experiences of people who work in other cultures (Goodman, 1994; Ward and Kennedy, 1993). This study therefore sets out to explore such experiences.

1.1 Conception and Definition of Culture: A Persistent Dilemma
It is imperative that discussing the phenomenon of cross-cultural learning entails the proper understanding of the term culture. Nevertheless, it is worth noting that comprehension of the term culture has remained a long-standing dilemma; it is problematic in itself. This difficulty originates from the fact that, over the years, there has been no consensus on a comprehensive definition of culture. This is explicable in the sense that, the term culture is used in a wide range of social sciences, and therefore has different meanings in the different fields. Indeed, in the realm of management theory and practice, the concept of culture is an import from the area of ethnographic studies. Regardless of the fact that academicians and practitioners have increasingly acknowledged the importance of culture, a common understanding and agreement on the definition of the term culture (including variations of culture) has not yet been reached (Doherty and Groeschal, 2000). Similar sentiments have been expressed by Ajiferuke and Boddewyn (1970) when they suggest that culture is one of those items that defy a single all-purpose definition. They go further to argue that there are almost as many meanings of culture as people using the term. As though to sum up the dilemma, Hofstede (1983) maintains that there is no commonly accepted language to describe a complex thing such as culture. In the case of culture, such a scientific language does not exist, he further intimates. Be that as it may, we wish to contend, based on evidence from literature, that it is possible to identify a common theme in the various perspectives of culture that forms a constellation of issues that can be applied to characterize culture. Most of the contemporary definitions of culture claim descent from the earlier work of anthropologists Kroeber and Kluckhohn (1952) who list more than 250 different definitions. Sackmann (1991) reveals that the definitions as “discovered” by the two anthropologists include components such as ideas, concepts, ideologies, values, attitudes, goals, norms, learned behaviors, symbols, rites, rituals, customs, myths, habits, or artifacts such as tools and material representations. From a cross-cultural perspective therefore, we find it appropriate to view culture as a mental map, which guides us in our relations to our surroundings and to other people (Downs, 1971).

1.2. Learning in the Context of Cross-Cultural Interaction
Theoretically, the governing belief is that the learning process of individuals in a cross-cultural context requires the creative destruction of barriers to learning and the broadening of access to new sources of knowledge and experience (Starky, 1996). The ideal arena for access to new sources of experience can therefore be found in international assignments. Thus learning is viewed as the process of adjusting behavior in response to experience (Yeo, 2002). It is about making sense of issues and situations, of developing insight and understanding, and of seeing patterns in the environment (Cole, 1995; Sadler, 1994). From the vantage point of thinking and action, it should not escape our understanding that, one can change understanding resulting in changed thinking and talking but no noticeable change in routine behavior. Understanding the interplay of issues between the individual and the culture with which he/she is interacting is essential to the development of an interpretation of learning along the transitory stages the individual goes through in the process of interacting with the new culture. We therefore seek to explore learning by analyzing the interactional dynamics as experienced by individuals in a new environment.
1.3 Perspectives in Cross-Cultural Studies

A review of literature suggests that in essence, studies in cross-cultural learning represent a cognitive stance. We also observe that these studies provide little illumination into the playing out of broad cultural assumptions in particular cross-cultural work contexts. Cross-cultural learning is portrayed as a cognitive understanding of a relatively stable other culture. For example, the classic works of Hofstede (1980), Hall (1966), and Hall and Hall (1987) identify several hidden cultural dimensions that contribute to behavioral differences between cultures. However, it is evident that not every individual from a particular culture behaves similarly along these broad dimensions. Within any culture group exists a degree of individual heterogeneity with respect to cultural mindscape (Maruyama, 1994). In fact these intercultural variations should lead us to question what is meant by cultural differences. Nevertheless, such contestation lies outside the parameters of our present study. It should be observed that culture can be varied, contentious, and, in the making, unstable across time and place (Wagner, 1981). At the other end of the spectrum, authors like Prus (1997) espouse a critical stance on cross-cultural studies. This orientation gives primacy to generic social processes that highlight the interpretive features of association. They focus our attention on the activities involved in the “doing” or accomplishing of human group life. Culture is then something in-the-making that is experienced intersubjectively. Therefore, this view of culture situates culture not simply as a stable and homogenous structure but as a socially enacted, dynamic process involving the reproduction and revision of practices (Weisinger and Salipante, 2000). Indeed, the two authors call for new concepts of “cross-cultural knowing”, portraying cultural understanding as locally situated, dominantly behavioral, and embedded in the mundane and evolving social practices that are jointly negotiated by actors within specific contexts. In view of the above somewhat mutually polemical perspectives, we should approach this subject with a perspective that is integrative and takes cognizance of both the cognitive and behavioral aspects of cross-cultural learning. The details of this orientation shall be underscored in the theoretical framework.

1.4 Toward a Research Focus

Evidence in literature suggests that there is a proliferation in the adoption of international assignments as a corporate strategy to achieve co-ordination and control, creating international informal personal networks (Edström and Galbraith, 1977; Prahalad and Doz, 1981). Overtime, it has become of special interest to a parent company to identify and make use of “expatriates” who have proved themselves successful in handling relationships with head office, host-country relations and management of foreign subsidiaries (Selmer, 1998). The point of departure with previous research lies in the fact that, despite the growing importance of cross-cultural experience, anecdotal theorizing frequently characterizes studies on cross-cultural learning. Studies that have succeeded in documenting facts about the underlying issues in the experience of individuals in a cross-cultural context and the implications there from are particularly scant and hard to come by. We therefore wish to undertake an analytical exploration of individual experiences in this regard. Against this background, the focus of our curiosity is: What do individuals learn, if any, from working in a cross-cultural setting and what implications does this have on the management of cross-cultural interactions? In pursuance of a solution to the above problem, we broaden our scope by asking further questions. We believe that pursuance of the foregoing questions will offer a sound basis in framing the issues involved in analyzing the above problem:
Why do individuals work on international projects or assignments?

(Underlying motives, preconceptions, and expectations)

How do they cope with work in a different cultural environment?

What influence does this kind of experience have on the individual on completion of the assignment?

2.0 Literature Review

2.1 Why Individuals Work on International Assignments

Generally, people interested in international assignments want to travel and learn from other cultures. They think that international assignments represent an opportunity to have a cross-cultural and personal growth experience (Adler, 1986). Nonetheless, considerable research has shown that autonomy, responsibility, and job challenge are a major component of international assignments (Adler, 1981, 1986; Baker and Ivanovich, 1971; Torbiörn, 1982; Birdseye and Hill, 1995). Therefore, employees who expect to be more satisfied with the challenge, autonomy, responsibility, and opportunities to travel and learn from other cultures will be more interested in international assignments (Boeis and Rothstein, 2002). From a theoretical vantage point, however, an understanding of the motivation underlying the employees’ intention to accept such assignments is valuable. Intention is generally a good predictor of behavior. Specifically, there is some evidence that willingness to relocate is a good indicator of actual relocation decision. Fishbein and Ajzen’s (1975) theory of reasoned action provides the theoretical rationale for the use of an intention measure. According to their theory, attitudes will predict behavior through the influence of intentions. Thus, attitudes (and subjective norms) will predict intentions that will predict behavior. In this case willingness to relocate is the behavioral intention, which predicts the relocation decision (the behavior). In the same vein, Eby and Russel (1998) as well as Adler (1986) have suggested that employees’ general beliefs can be important in understanding their willingness to relocate. General beliefs concerning the instrumental values of domestic versus international assignments should affect their interest in an international assignment. Aryee et al. (1996) specify that the strength between career related variables and willingness to relocate would depend, in part, on the extent to which employees’ perceive expatriate assignments to be instrumental to their career. Thus, they suggest employees’ general beliefs may moderate the relations between career-related variables and employees’ willingness to relocate. However, regardless of their beliefs about international assignments, if employees are satisfied with the progression of their careers in the current location, they may not wish to go through the uncertainty associated with accepting international assignments. It is also suggested that, employees who are dissatisfied with their current work will be more likely take on an international assignment as an alternative. Boies and Rothstein (2002) postulate that dissatisfaction leads to thoughts of quitting, which leads to a search evaluation and behaviour (evaluation of alternatives). From this perspective, authors like Eby and Russel (1998), consider international assignments, to a certain extent, as a peculiar kind of turnover. Eby and Russel (1998) maintain the view that, since an international assignment represents a change in job characteristics such as co-workers, Supervisors, and location, it could be considered a “particular form of turnover.”
2.2 Pre-Departure Orientation

It is a norm, at least theoretically, for organizations to offer some kind of orientation to its employees posted for international assignments. This, it is assumed, will help the employee to grasp some important issues while working in the new environment. In literature (Odenwald, 1993; Black and Mendenhall, 1990; Zakaria, 2000), this kind of briefing is commonly referred to as cross-cultural training. For practical purposes therefore, we will use the term training in reference to the pre-departure briefing. Cross cultural training has long been advocated as a means of facilitating effective cross-cultural interaction (Bochner, 1982; Harris and Moran, 1979; Mendenhall and Oddou, 1986). Cross-cultural training may be defined as any procedure used to increase an individual's ability to cope with and work in a foreign environment (Tung, 1981). The importance of such training in preparing the individuals for intercultural work assignments has become increasingly apparent (Baker, 1984; Lee, 1983). A comprehensive review of literature by Black and Mendenhall (1990) found strong evidence for a positive relationship between cross-cultural training and adjustment. Zakaria (2000) argues that numerous benefits can be achieved by giving expatriates cross-cultural training prior to the departure for international assignments. The same author maintains that this kind of training can be seen as:

- A means for conscious switching from an automatic, home-culture mode
- to a culturally appropriate, adaptable, and acceptable one;
- An aid to improve coping with unexpected events or culture shock in a new culture;
- A means of reducing the uncertainties of interactions with foreign nationals, and;
- A means of enhancing expatriates’ coping ability by reducing stress and disorientation common with such relocations.

Underlining the complex nature of culture, however, the same author observes that, even as organizations try to equip the employees mentally, it is difficult to develop the appropriate mental frame of reference for dealing with different cultures worldwide. A frame of reference in this sense includes a basic awareness of cultural differences, which exist between the “home” culture and those with which people are doing, or would like to do business (Benders, 1996).

2.3 Cultural Immersion: How Individuals Fit In the Changed Work Environment

Working in a foreign culture entails, as a matter of necessity, interacting with an unfamiliar environment. Nevertheless, it is crucial for individuals to reconcile themselves with the dynamics of the new work environment. This process of trying to “fit-in” with the host culture is commonly referred to as adjustment. Torbiörn (1982) suggests that adjustment refers to the changes, which the individuals actively engender or passively accept in order to achieve or maintain satisfactory states within themselves. In the same vein, Church (1982) views cross-cultural adjustment as the degree of comfort, familiarity, and ease that the individual feels toward the new environment.

2.4 Models of Cross-Cultural Adjustment

The process of adjustment has been explained in many ways by different authors and over the years models have been developed to explain the process of adjustment in reaction to cultural immersion. Popular models in literature include “The U-curve of Cross-Cultural Adjustment”,

COPY RIGHT © 2011 Institute of Interdisciplinary Business Research
which is based on the work of Lysgaard (1955), and the “Cross-Cultural Cycle” (Zakaria, 2000). A brief review of these models should aid in the understanding of the dominant conceptualization in literature. On the basis of this, we should be able to derive our own understanding of the notion of adjustment.

2.5. Repatriation and the International Experience-The Influence of Cross-cultural adjustment on the returning employee:

Repatriation is the last phase of transition in the cross-cultural experience. It can be viewed as cross-cultural re-entry. Adler (1986) describes repatriation as the transition from the foreign country back into one’s own country. It is interesting to note that few studies have been done on this subject by exploring the experience of the individual employee. Repatriation of employees is not something that happens easily or naturally. Depending on how the process is handled, the result could be beneficial or costly and dysfunctional to the effective functioning of both the returning employee and the organization (Adler, 1991; Kendall, 1986). Successful repatriation means that employees acquire career and personal payoffs from the overseas experience and that the organization enriches itself through the addition of the international competencies of its repatriated employees (Solomon, 1995). In this sense, the experiences and knowledge of the employee need to be applied in the best interest of the organization and an individual’s overall career (Fish and Wood, 1993). Indeed, repatriates expect to return to a meaningful position back home, where they can use their new skills and knowledge (Hauser, 1998). However, upon their return employees often face organizations that do not know what the person has done for the past several years or how to utilize the skills and knowledge gained overseas in the most effective way for the organization and for the ongoing career of the individual employee (Bender and Fish, 2000). In some cases the organizations do not even care about the utilization of the gained skills and knowledge. To compound the problem, some organizations often fail to recognize that the returning employees have learnt anything. In consonance with the above predicament of the returning employee, Allen and Alvarez (1998) argue that organizations too often fail to reward or recognize the new skills and knowledge acquired in overseas positions. In the absence of tasks where the knowledge gained can be utilized, organizations may be confronted with a situation where such employees choose to leave the organization. It should therefore be observed that prior to leaving for offshore assignments, employees expect to meet unfamiliar situations, and however, on return they expect that the prevailing situation should be the same as they left it. To a large extent, therefore, their return is always marked by disappointments. They neither come back to the situation they left nor to the world are they expecting. While overseas the employee has changed, the organization has changed and the country has changed.

3.0 Exploring the Narratives Analytically

Before embarking on the task earmarked above, it should be stated that, the analysis is based on the narration of seven (7) individuals from three (3) different companies also in different industries. One company is in the automotive industry and has operations in Europe, N. America, Asia, and South Africa. The second company is a world leader in supply of mechanized welding and cutting equipment with operations in Europe, N. America, Asia, and the Middle East. The third company deals in health care products, specializing in surgical and wound care products. This company has operations in Europe and N. America. These companies have solid experience and a fairly long history in international operations. The individuals are aged between 31 years and 60 years. Most of them have served in more than one location and on more than one
assignment for a period of tenure ranging from 2 years (for the shortest) to 8 years (for the longest). These individuals held managerial and leadership responsibilities in their respective assignments. Our interaction with the narrators lasted between 1 hour (for the shortest time) and 4 hours (for the longest time). All the narratives were tape recorded and later transcribed for analysis. We also noted down important issues in the process of the narration for purposes of comparison and ease of analysis. The analysis of the narratives is executed thematically on the basis of issues identified as cogent, insights developed in our interaction with the narrators and derived from the theoretical framework. To forestall the possibility of creating a repetitive impression on the reader, within the paragraphs, we intend to limit direct reference to those statements that are inclusive of the views of all the narrators. However, related narrations are quoted and indented. Further, Confidentiality considerations oblige us to craft acronyms in reference to the narratives, viz: BVA, AEA, BMS, BMK, AES, JVL, and MMA. The following terms are quantified thus: All = 7 Most = 5 Many = 4 Some = 3 Few = 1-2 It is also imperative to proclaim, from the outset, that the narrative approach is not a commonly used technique, especially so, in the area of management studies. We are therefore obliged to introduce the concept at this point. Narrative is a mode of knowing that captures in a special fashion the richness and nuances of meaning in human affairs which cannot be expressed in definitions, statements of fact, or abstract propositions. It can only be demonstrated or evoked through story (Carter, 1993). It is therefore a more viable method in attempting to explore learning in a cross-cultural environment. This report therefore can be viewed as a “narrative of narratives.”

3.1. Why Individuals Work on International Assignments - Organizational Motives for sending people abroad From studies, organizations focus heavily on strategic international human resource expatriation-based staffing for managing the combined control and coordination needs between subsidiary and parent operations (Taylor et al., 1996). A subset of this view is that organizations want to be sure that its goals are clearly communicated and effectively carried out. An important element of control is the recognition by organizations of the need to secure their brand image through ensuring that the standard of their products are maintained throughout their production plants across the world, and also preserve their culture:

- BVA: “Our Company had a clear concept to introduce on board there, that this is the way we want to run the business.”
- JVL: “The only thing is that we must ensure that our own culture is being taken care of...For marketing reasons, we must be assured that communication in the local organizations are made in such a way that represents our company’s values...We had once somewhere ... an advertisement with a naked woman on our product, and that was of course, forbidden.”
- AES: “From the technical production point of view, organizations want to make sure that the standard of their products are maintained throughout their production plants across the world. They always want people to trust their product. Another consideration is the issue of security or a form of control.”
- MMA: “The Company wanted a Swedish person in the subsidiary organization’s research and development division to ensure that the company processes and procedures were implemented.”
- BMK: “I was told to implement the organization’s culture in the overseas company and also learn about the culture over there...The biggest assignment was to implement our
processes because we are a process-oriented company. Then we implement a new computer system and the third was to implement our culture and lastly, our financial report...I think in a new market even though you work with local distributors or you set up a new factory..., it’s very important for a company to have somebody from the head office with broad experience to help the local company to start up activities.”

Furthermore, in most cases, organizations seek to transfuse knowledge between subsidiary and parent company hence, the deployment of experts on integration for instance, from the head office. All the narrators agree with these viewpoints (BVA, AEA, AES, BMK, BMS, MMA) and a few of them (AES) explained this reasoning in the necessity by organizations to make a transparent accounting report as many are listed on the Stock Markets of countries around the world:

- BVA: “We found some key players in the Canadian company that came to Sweden to experience what we try to transport to Canada.”
- BMK: “My organization needed to send somebody to Mexico to carry out integration in the new company, so I was sent there and worked for eighteen months.”
- BMS: “Then I told my boss at that time whether it was not better that I go to Germany (that was considered a big market at that time) so that I work and stay there for a couple of years and report back about the needs and so on.”
- MMA: “My assignment is to carry out integration between Sweden and US research and development.”
- AES: “Another motive… is the issue of security or a form of control.”

In a reversal scenario, organizations send employees abroad to be able to have knowledge in areas that are not available locally: JVL: “We send people on assignments abroad because they have knowledge in areas that we can’t find locally.” Some organizations are conscious about the need to have a global outlook and ultimately view that a mix of culture has a potential to facilitating organizational learning. As BMS puts it: “… not only do Swedes have to move out to other local organizations; people from other markets have to come here to Sweden too”. He rationalized this reasoning thus: “People should be mixed such that they could bring other cultures and knowledge in here and take with them the organization’s culture.” One dimension to organizational motives of sending personnel on overseas assignments that we have not found in any literature is the issue of sending “rebellious” personnel out on overseas assignments. There are bound to be rebellious elements in most organizations. Much as management tries to influence certain people to change their work habits or interpersonal relationships amongst co-workers, some people simply fail to adhere. Therefore, such people are labeled rebellious. Even though management would prefer to dispense with their services, labor laws or high position in the company may be an inhibitor to this preference. Therefore, the choice open to management is to cleverly send such people on overseas assignments. Only BVA mentioned this dimension to organization motive for sending people abroad and one can hardly fault this claim due to the position this narrator held in the organization: BVA: “Sometimes, people are sent out because they make too much trouble at home, so they say, get rid of them. If we place them out there, it is safe for us at home.”

3.2 Mix of Organizational & Individual Motives

In a few cases, both organization and employees can have the same motive. The organization may have a motive for expansion or acquisition of other lines of business. Likewise, the individual in the organization may also be interested in working in the country where the
organization wants to expand and also the type of functions to be carried out in the overseas company or subsidiary. This situation serves as a contributor to expatriation success:

- **AEA:** “The initiative was both mine and the organizations. I went there in 1981 and I was told that the company was proposing to set up a business and apparently as I did a good job, so they asked my availability. A few months later, I was called.”
- **MMA:** “It was a choice made by the company and myself.”

### 3.2.1 Benefits and Cost of repatriation

A few of the narrators agree with the view that the process of repatriation can be rewarding for both employer and the organization. According to this narrator, it all depends on how the process is handled: **BMK:** “I think there are pros and cons when you are sent out.” It is very important for organizations to prepare well in advance for the repatriation of expatriates. There has to be a good come back position for these employees. While ignoring the fact that fellow employees at the head office, especially those who have made their career position there, may see returning expatriates as a threat. If an expatriate returned to the head office and was not properly absorbed by way of a new and challenging position, then it is most likely that such employee will leave the company out of frustration. For some of the narrators, (BMK, BMS, AEA) their organizations did prepare for their coming back while for a few, their organizations did not take account of this (AES, BVA):

- **BMK:** “The Head Office made a smart comment; “we think it’s very good for you to come back to catch up, to know where we are heading…I have indicated the areas that I am interested in and that are seen as important to the company.”
- **BMS:** “One good thing is that we have been a positive developing company and therefore, there has been some room for some sort of expansion.”
- **AEA:** “Yes, the company prepared for my coming back in a practical way”
- **AES:** “No, the company did not. Since my going was at my instigation, so was the case when I came back, I had to use my initiatives to do a lot of things.”
- **BVA:** “When I returned from the, it was difficult here to find a position because I had been through all the positions within the company in Sweden.”

Notwithstanding the issue of comeback position, non-recognition of expatriation knowledge by organizations and even fellow workers can be a major source of frustration and can lead to the exit of expatriates. Quite often, organizations are not really interested in new ideas. These types of organizations see these expatriates as dreamers and not realistic. In the case of co-employees, they may derive pleasure in hearing tales about expatriation experiences, but they may not consider those experiences as anything to reckon with.

- **BVA:** “You could be seen as a dreamer or not realistic enough. You are a little bit suspicious and the knowledge that you bring in is not seen as good enough or not really needed.” Sometimes, the issue of a comeback position may be beyond the purview of the organization. An instance of this is when an organization is engaged in a merger or an outright acquisition. One of our narrators once had this experience:
- **BMK:** “So, I was offered a position that wasn’t according to my expectations and at the same time, there was a merger between my company and another company, which ended in a position that was initially offered to me. In that case, there was never a good come back position for me.” In the same vein, an employee can make repatriation beneficial for himself/herself. Since some organizations do not prepare for the repatriation of their
expatriates thus, they are left alone to find their feet in the scheme of things. A non-proactive expatriate will ultimately become frustrated while a proactive one would put his experience into good use and devise new working methods and also influence cultural practices in the organization, given the latitude. We observe that most of our narrators fall into the category of proactive expatriates as they have come out successfully. One striking dimension to the adjustment of expatriates on return to the head office is the role of mentor. According to one of the narrators, his mentor played a significant role in his adjustment back to work strategy:

• AEA: “I think success depends on the type of guidance and mentors that you have. I had a good mentor with a very clever personality. He is an Irishman and has a political mind…I got advice from my mentor… to keep my mouth shut for at least six months when I returned to the head office. In those six months, I had fitted back into the organization.”

3.2.2 Problems Inherent in Expatriation

It is widely recognized by many of the narrators (BVA, AES, AEA, JVL) that many expatriates feel reluctant to repatriate basically because a lot of them lose autonomy and certain privileges that were hitherto enjoyed by them in the course of their overseas appointments. Some of the privileges recognized are enhanced pay packages, use of domestic servants for household chores, company cars with drivers, to mention but a few:

• BVA: “Even in some countries where the salary package of an average worker is low, the package of expatriates is much more. For example, I know that, they have a driver, a cleaning lady and cook. If you have three people working for you, when you return to Sweden, you will have none.”

• AES: “The local Managing Directors are like kings. But when they return to the head office, they are cut down to size. Aside from this, they lose all privileges.”

• AEA: “…live comfortable life and enjoy high income, and all these things which are part of expatriation situation, that makes it tough to come back.”

• JVL: “In Sweden, you know we very seldom have people helping you at home ironing clothes or doing daily chores. You know that we can find this kind of service everywhere else with a small amount of money and we don’t have it in Sweden. So, when people come back, they expect to be able to live to that standard…”

One other important repatriation problem identified by the narrators is relationships with social and family situations. In the observation of the narrators, the society that they left would have changed, as there could have been new rules and regulations, soaring crime rate and even some members of the family and friends could have relocated. Of course, the in conducive weather (especially in Sweden) could be another reason. Also, the family could have been disoriented about homecoming, as the children who most often attend international school would have made new friends and even the husband or wife, new acquaintances. These issues have the immense potential of generating despondency in the individual:

• AEA: “A lot of things happen in the society if you have been away for five years…All these things make you isolated.” JVL: “Sometimes, its easier going than coming back because you think that you will arrive into a society that was exactly the same as your memories only, to discover that your society and culture had changed … since you left.”
• BVA: “…the children are used to international schools, they are used to having friends from different parts of the world and in some countries, they are treated differently depending on color, background etc. So they have easier lives.”

A fundamental issue that has bearing on repatriation difficulties is the innate tendencies of expatriates to always be on the move i.e. to move from one country to another. This category of people is restless and it is the opinion of one narrator that they have tendencies comparable to railway builders.

BVA: “When railway workers have finished building rail tracks, they want to go ahead and build new ones, as they are not always willing to stay back and do the maintenance.” Staying too long overseas has been viewed as another reason that people find it hard to relocate. Often, prolongation of stay abroad can be at the instance of the employee or the organization. The narrators opined that this situation could lead to expatriates having difficulties in coming back:

• BVA: “If you are away for too long, you lose contact with the realities of the home country.”
• JVL: “If you have people out there for more than six years, they will never come back.”
• BMS: “I read about these things, not from our company, that having been away for a long time, there could be problems with coming back.”

3.4 Training Vis-à-vis Cross-Cultural Adjustment

Training has been identified, at least theoretically, as a critical factor in aiding the process of cross-cultural interaction and adjustment. Nevertheless, impressions from the narratives suggest that negligible or no training at all is given to the employees before embarking on their foreign assignments. Indeed, none of the narrators suggested having received training at least in the sense portrayed in most literature. What organizations normally do is to give the expatriate employees a briefing regarding practical issues concerning the assignment and what is generally required in the performance of the duty. The organizations are constrained in this aspect due to the fact that, in most cases, there is general lack of in-depth knowledge about, but also little interest in, the nitty-gritty of cultural issues surrounding the assignment at hand. This impression is summed up thus:

• JVL: “We thought …it should be more of technical knowledge.”

We further observe that, to a great extent, based on the narratives, the necessity for training is always forestalled by the fact that many of the narrators took up the assignments at their own instigation. More so, some even encouraged their respective organizations to start up the assignments in which they finally played a major role. A typical reflection on this situation is:

• AES: “If you want something to happen, you’ve got to do something about it.”

Such employees therefore turn out to be the link between the organization and the host culture. This situation therefore forestalls the necessity for such employees to receive some kind of training since he/she is deemed knowledgeable enough about the situation by virtue of his/her interest in working on the assignment. The experiences of most of the employees also question the potency of training with regard to cultural interaction. The significance of this concern is underlined by the fact that, by and large, interaction with another culture has an emotional aspect to it. That the feeling people experience when they interact with another culture cannot be trained into a person:

• BVA: “It is difficult to be taught how to feel about another culture.”
Feelings are generated through direct interaction with the culture rather than hypothetical statements made about how it is to interact with the culture physically. From the experience of the narrators and in consonance with Fish and Wood (1994), what seems useful is the possibility of a reconnaissance trip prior to the actual appointment to enable the prospective expatriate to “get a feel” for the new environment. In which case the employee then has the opportunity to physically interact with the environment and experience the culture from within even before moving for the assignment.

3.5 The Question of Adjustment

One distinctive feature of the expatriation experience lies in the fact that success in the assignment requires adjustment to the new culture as well as to the new tasks. We found out from the narratives that many of the narrators perceived their adjustment as conforming to the various levels identified by Black et al. (1991): adjustment to work, to interacting with host nationals and to the general work environment.

4.0 Conclusion

In the final analysis, it should be stated that the subject of cross-cultural learning is exceedingly important in light of the expanding horizons of business today. Indeed, the experiences of the narrators underline very significant issues with regard to cross-cultural interactions in the work setting. Of all the array of issues that emerge from these experiences, it is interesting to point out what is of enormous importance in this study. Whereas there are individual and organizational motives and expectations for the expatriate assignment, the latter seem to supersede the former in exerting influence on the actual performance of the task. Thus, individual motives hinge heavily on organizational motives that ultimately determine individual dispensation towards learning. The extent to which one culture is different from the other has a direct bearing on the extent to which individuals from different cultures will understand each other. We observe that, the nearer the “distance” between cultures, the better the understanding and the reverse is true, at least, during the initial phase of cross-cultural interaction. Knowledge, not only, of the business language but also of the local language (where a distinction exists between the two) is very crucial in facilitating the process of cross-cultural adjustment. We hasten to add that, this fact is not sufficient in itself to ensure successful adjustment. It is apparent that, as far as the assignment is concerned, individuals learn a lot of new skills and techniques to improve their work. At a deeper level, however, we are short of indications that the interaction yields any substantial. Experiences that is beneficial for the employee at a personal level and useful outside the confines of work. We wish to infer that, from a learning perspective, the objectives of the assignment(s) and the rationale behind these objectives need to be re-examined if the individuals and the organization are to reap the full benefits from the assignment. Our observation is that significant emphasis is invested in the technical aspects of the assignment and its accomplishment and this seems to be what matters most. It is important to reiterate that tasks are accomplished within a social context and a network of individual relationships. Understanding these issues is as fundamental to the assignment as the technical aspects of the assignment. At the rhetorical level, the importance of cross-cultural learning seems to be at the forefront of organizational objectives, practically, however, efforts in this direction appear ad-hoc and haphazard at best.

Abstract
Development of ICT is an achievement of communication revolution that has led to fundamental changes in operation and productivity. This article surveys the organizational processes of University of Sistan and Baluchestan (USB) that is the second University in Iran regarding the size and number of fields and students. Considering this fact, partial improvement in business and administrative processes could lead to significant increase in productivity of the organization. In this research the processes have been evaluated considering four aspects of financial, customer, internal processes and learn and growth applying balance score card model (BSC). Prioritizing the indices revealed that using information technology in educational processes improved these four aspects. Finally, effective recommendations have been suggested to improve performance using modern technologies.

Keywords: Information Technology, Productivity, Administrative Automation, Balanced Score Card

Introduction:
Nowadays, the importance of information technology is considered as an important source of strategic and operational tool in organization which leads to promote the value added [1], efficiency, control improvement and inner processes productivity [3]. Today, every organization somehow is forced to use IT as a way to rehabilitation in production competency, increase in completion and flexibility [2]. As some of scientists believe that economic performance (GDP) in USA has been increased to 4% during 1995 till 2002 the reason of which, according to researchers, is mostly the investment on the products and services of information technology which has led to increase the productivity and economic growth ([4], [5], [6]). There have been some studies recently on the effect of IT on productivity increase that have focused only on one or two dimensions ([7], [8], [9],...
Brief descriptions of some conceptions used in this research have been presented in the following.

**Information Technology:**
In modern world, information technology has provided the possibility of efficiency and beneficence of information. IT application has led to a widespread evolution on administrative issues and information systems; as it has enabled electronic transfer of data, documents, attribution and various communications through computer and telecommunication [12]. There are many definitions for information technology. It can be defined as the software and hardware applications in computation and telecommunication that has provided automatic facilities of information application ([13], [14], [15]). More than being a hardware system and a set of patterns, IT is an intellectual and cultural system which can be called the culture of information production. Without creating the culture of information production, the IT system is not able to survive. Therefore, what is important in IT is informational thought. Creating an integrated administrative system requires the actions that begin with service delivery model creation and lead to system documentation and operation execution [16].

**Productivity:**
Totally, productivity is the relation between produced product by produce or service system and the automation that is applied for production [17]. Thus, productivity is defined as efficient use of resources (labor, capital, land, materials, energy and information) in producing products and services. It is also defined as the relation between work result and time of execution. Time is often a good index [18], because it is general and is beyond the human control. The less the time for an operation, the more productive is the system. In a study conducted by McKenzie international institution, they found that innovation is the most important factor for accelerated development of productivity. Some of these innovations have been formed based on information technology and some other based on traditional communications [19].

**Administrative Automation:**
Setting goals to achieve a greater productivity via administrative automation can be done well through making or breaking strategic decisions [20]. Administrative automation contains all formal and informal electronic systems that are related to establish information communication among people inside and outside the institution and vice versa. The main word which differentiates administrative automation from data processing, management information system and decision support system, is communication. Administrative automation is in both types of verbal and written form in order to facilitate all kinds of communication [21].

**Balanced Score Card:**
In 1990s, the balanced score card model (BSC), was first introduced as a modern method of performance evaluation and then as a tool for achieving the strategy by Robert Kaplan, that contains four aspects: financial, customer satisfaction, internal process and growth and learn ability ([23], [24]). As it is found of the name of balanced score card, it is defined as a set of factors which cause balance “between short-term and long-term
objectives, between financial and non-financial actions, between lagging and leading economic indicators and between internal and external performance perspectives” ([25], [26]). The important point is that to use this technique in any organization, business unit and project is unique and has its own way. People who evaluate information technology projects in organizations, must note that implementation of balanced score card for each project has individual characteristics. In the other words, according to the type of project and its implementation strategy, each dimension of balanced score card can be extended, increased, decreased or combined [27]. Before design and implementing balanced score card, it must be noted that management of balanced score card implementation, is taken to project manager (probably one or two levels below the top management level) so that the organization really respects him/her and the professional project team which is formed of different units such as finance, human resources, information technology and operation, strongly support him [28].

**Research Objective:**

In order to facilitate the educational processes in University of Sistan and Baluchestan, a system called Golestan [22] has been employed, which is based on a three layered structure and web and personal computer-based. The so-called three layers are database server, web server and users of the system. Such design causes data security and accessibility in all places. Web-based design enables doing all issues in all places. For instance, the student registration or scores entry by professors from anywhere or any desired location can be mentioned. It is obvious that such affair requires an appropriate security mechanism to identify users and their allowable operations, but of course, the necessary counsels have been provided in the system [22].

In this research, four dimensions of financial, customer, internal processes and learn and growth have been evaluated in one of Iranian universities, applying balance score card model (BSC). The BSC method prevents different thoughts through translating the perspective and strategy of organization to understandable terms and also helps the successful implementation of strategy by aligning the individual and organizational objectives [11].

The main question of this research is:

Whether IT application has led to productivity increase in educational affairs in USB?

**Research Hypotheses:**

1- From financial aspect, IT application has led to productivity increase in educational affairs in University of Sistan and Baluchestan.

2- From inner processes aspect, IT application has led to productivity increase in educational affairs in University of Sistan and Baluchestan.

3- From learning and growth aspect, IT application has led to productivity increase in educational affairs in University of Sistan and Baluchestan.

4- From customer aspect, IT application has led to productivity increase in educational affairs in University of Sistan and Baluchestan.
Statistical Population:
The statistical population of this research includes the educational employees of University of Sistan and Baluchestan who have more than six years of work experience. The reason is that Golestan system was formally started to be used in this university since 2004. According to formal statistics, 61 educational employees with over six years of experience working in various colleges among which, 57 people answered the questions. 38.6% of respondents were men and about 61.4% were women. The following diagram shows the work experience of respondents and represents that most of them have between 13-19 years of experience.

![Experience Working Diagram]

Questionnaire Design and Test:
The questionnaire of this research has been prepared through library studies and interviews with relevant experts and professors. It is of bilateral Likret type (5 scores from very few to very much) in which the right column assessed the indexes before applying Golestan system and the left column evaluated the same indexes after applying the system. To determine the reliability, the primary questionnaire was distributed among 10 expert and experienced staff of educational department in university and obscure and irrelevant questions were reviewed fundamentally. Then in the second phase, the final questionnaire, with new edition, was codified and distributed. The reliability of this questionnaire was measured through Cronbach’s Alfa Coefficient via SPSS software was 0.89 that seemed very well.

Hypothesis Test and Results:
Table 1 shows the effectiveness of applying Golestan system on performance improvement based on four aspects.
Table 1: Effectiveness of applying Golestan system on performance improvement

</table>

Table (1) indicates it can be statistically found that implementation of Golestan educational system has been effective on performance improvement in four aspects and has been put in the same way of performance improvement.

Comparison of financial aspect indexes:

Table 2: Comparison of financial aspect indexes:

<table>
<thead>
<tr>
<th>Financial Aspect Indexes</th>
<th>Medium Before Implementation</th>
<th>Medium After Implementation</th>
<th>Medium Discrepancy</th>
</tr>
</thead>
<tbody>
<tr>
<td>1 - Rework Cost</td>
<td>2.35</td>
<td>3.86</td>
<td>1.51</td>
</tr>
<tr>
<td>2 - Paper Work and Bureaucracy</td>
<td>1.89</td>
<td>9.81</td>
<td>1.92</td>
</tr>
<tr>
<td>3 - Document Maintenance Cost</td>
<td>1.95</td>
<td>3.84</td>
<td>1.89</td>
</tr>
<tr>
<td>4 - Supply and Transport Cost</td>
<td>2.12</td>
<td>3.93</td>
<td>1.81</td>
</tr>
<tr>
<td>5 - Location Cost</td>
<td>2.19</td>
<td>4.04</td>
<td>1.85</td>
</tr>
<tr>
<td>6 - Information Exchange Cost</td>
<td>2.12</td>
<td>3.98</td>
<td>1.86</td>
</tr>
<tr>

<td>1.98</td>
</tr>
<tr>
<td>9 - Communication Cost</td>
<td>2.32</td>
<td>3.70</td>
<td>1.38</td>
</tr>
</tbody>
</table>

According to table (2), the 8th index is more different than others. Therefore, it can be resulted that Golestan system has had the most effect on this index that is time working cost from financial aspect. It was also observed that the least difference belonged to 9th index. Thus, Golestan system has had the least effect on this index which was communication costs. Finally it can be said that Golestan educational system has been effective on all indicators in this aspect.
Comparison of internal processes aspect:

<td>2.32</td>
<td>4.28</td>
<td>1.96</td>
</tr>
</tbody>
</table>
According to table (3), the medium disparity of 19th index is larger than other indexes. Hence, it can be resulted that implementing this system has had the most effect on this index based on the inner processes aspect. It was also seen that the least mean disparity belonged to 2nd index. Therefore, Golestan education system has had the least effect on this index namely decrease in time of decision making for managers and experts. Finally, it can be said that in this aspect, Golestan system has been effective on all indexes.

**Comparison of learning and grow indicators aspect:**

Table 4: Comparison of learning and grow indicators aspect:

<table>
<thead>
<tr>
<th>Learning and growth aspect</th>
<th>mean before implementation</th>

</tr>
<tr>
<td>11-providing opportunities for staff development and promotion</td>
<td>2.46</td>
<td>3.49</td>
<td>1.03</td>
</tr>
</tbody>
</table>

According to the table (4), it is seen that the mean disparity of 6th index was higher than others. Thus, it can be concluded that using this system has had the most effect on the so-called index from growth and learning aspect. It was also observed that the lowest difference was related to the 3rd index. Hence, system has had the least effect on this index. Finally it can be said that Golestan system has been effective on all indicators regarding this aspect.

**Comparison of indicators for customer aspect:**

Table 5: Comparison of indicators for customer aspect:

<table>
<thead>
<tr>
<th>Customer perspective</th>
<th>mean before implementation</th>
<th>mean after implementation</th>
<th>mean disparity</th>
</tr>
</thead>
<tbody>
<tr>
<td>1- increase in your satisfaction from relegated works</td>
<td>2.77</td>
<td>3.82</td>
<td>1.05</td>
</tr>
<tr>
<td>2-offering quick and logic services to the students</td>
<td>2.54</td>
<td>4.28</td>
<td>1.74</td>
</tr>
<tr>
<td>3-improvement of ability in responding the students</td>
<td>2.75</td>
<td>4.23</td>
<td>1.48</td>
</tr>
<tr>
<td>4-better understanding of student requirements (offering proper services)</td>
<td>2.68</td>
<td>4.05</td>
<td>1.37</td>
</tr>
</tbody>
</table>
According to table (5), it is seen that mean disparity of 7th index is more than other ones. Hence, it can be resulted that Golestan system has had the most effect on this index. It was also observed that the least difference was related to the first index. Thus, Golestan educational system has had the least effect on this one. Finally it can be said that based on this aspect, Golestan system has been effective on all indicators.

**Conclusion:**
The organizational processes of educational services in University of Sistan and Baluchestan are very much and complicated. Golestan educational automation software has been employed for almost 6 years in the university. In order to evaluate the productivity of this system, this survey research emphases to the hypothesis that IT application has led to increase in productivity in educational affairs. The study focuses on financial, customer, growth and learning and internal processes aspects. Analysis of the questionnaire indicated that the implementation of Golestan educational system has been effective on improving in performance of educational processes of this university based on so-called aspects. But it was shown that the least effect has been on internal process and the most effect has been on financial aspect.

Abstract
Women’s equal and full participation is extremely important for progress in cultural development of society. However, despite this visible formal representation, women participation remained low. A review of existing studies on the subject suggests that organizational (structural) factors account for women’s low participation. The study population consisted of women experts in three southeast provinces of Iran including; university teachers, researchers, employees and students. The major obstacles identified including, Organizational atmosphere, Organizational structure and human resources Policies respectively on the basis of TOPSIS technique. It makes some suggestion at the end.

Keywords: Cultural development, Women participation, Organizational factors, Human resources Policies, Organizational structure, Organizational atmosphere, and Styles and Preferences of management.

1. Introduction
Participation means women’s presence in all stages of development, including: needs evaluation, identification of problems, planning, management, implementation and evaluation. It’s not easy to get equal participation in a patriarchal society, such a matter requires participation of women in particular projects that they are somewhat beneficiary (Saadi and Arab Mazar, 2005). The theory of participation is the most important and popular academic theories to reach sustainable development. No society can rely permanently and constantly on unique force; i.e. patriarchy. Ignoring part or half of the workforce of a county and dominance of a group over another is a lesion which is not compostable in long term (Ebrahimnejad et al, 2011: 182).

The review of literature is shown that, Women were not visible in the First Development Decade. No explicit role was envisaged for them. The underlying development rationale was that
of the household division of labor with men as producers (sometimes assisted by the women) while women functioned mainly as housewives and mothers (Kabeer, 1994). A more people-centered approach was adopted in the Second Development Decade given its emphasis on issues of equity and redistribution as well as the meeting of the basic needs of people (Fonjong, 2001: 223). Development had compounded the work burdens of women and that as a result women were marginalized from the development process resulted in prescriptions for integrating women into the development process. Consequently in spite of greater attention to the institutionalization of women’s issues through women’s bureau, very little improvements occurred in women’s socioeconomic status.

Women constitute 54 percent of the population of Southeast provinces of Iran including; Sistan & Balouchestan, Kerman and South Khorasan, women play a very crucial role in the development of society at all levels. Unfortunately they function from a subordinate position inherent in both traditional and province institutions. Several factors could be obstacles for women participation to progress in social cultural goals. Research showed that one of the main obstacle for participating women in society is the organizational factors (Wang and Dai, 2010., Lehman, 1980., Lehman, 1981., Bower, 1985 Henry Makura, A, 2000; Howell, 2006; Shojaei et al, 2011; Evetts, 2000). Organizational (structural) factors refer to all aspects related to the institution where an individual works and how these affect the performance of the individual. Some of these include policy, style of management, mission statements, doctrine, leadership, atmosphere, organizational structure and so forth. It seems regarding to specific and different atmosphere in southeast organizations of Iran, organizational factors that origin from organizational rules, regulations, man manager’s styles, beliefs, preferences and as a whole; their views or attitudes about women’s worker and manager, types of organizational structure and so on, that refers to internal environment of organizations could be one of the important obstacles confronted women in mentioned provinces.

This study aims to develop an integrative review of structural (organizational) obstacles to women’s participation for progress in cultural goals in southeast provinces of Iran. Towards this end, we constructed research model based on the literature review in women participation in cultural development in order to identify potential antecedents of women’s participation in cultural goals and investigate them via statistical tests.

2. Research design and Procedures

Fig. 1 illustrates a research model for women’s participation in cultural development, consisted of; human resources Policies, Organizational structure, Organizational atmosphere, and Styles and preferences of management as a structural factors. Each of constructs have been
measured based on the appropriate indices. The construct of Policies related to human resources includes; job requirements for cultural affairs and women’s under population in cultural institutions., Organizational structure including of; rules and regulations, policies and procedures and communicational obstacles. Organizational atmosphere includes of preferences of women manager or man manager for cultural affairs at the same conditions, selection of women manager or man manager by organizational decision makers, the acceptance rating of women managers by superior managers, peers and blue-collar workers, women’s membership in organizational cultural committees, Assigning the responsibility of executing cultural plans to the women, existing of masculine atmosphere in the top level cultural decision making, the reluctance of men to women’s attending in masculine meetings. finally, Styles and preferences of management construct including; women forgiveness, women’s caution and lower risk acceptance of women, and women’s appreciation to the blue-collar worker.

In attention to above reasons, we constructed research model with mentioned constructs.

Fig.1. Research model

In this study the following seventeen hypotheses will be addressed:

$H_1$, human resources Policies have a positive effect on women participation in progress of cultural goals.

$H_{1.1}$, human resources Policies have a positive effect on women participation in progress of cultural goals in Sistan & Balouchestan province.

$H_{1.2}$, human resources Policies have a positive effect on women participation in progress of cultural goals in South khorasan province.
H1.3. Human resources policies have a positive effect on women participation in progress of cultural goals in Kerman province.

H2. Organizational structure has a positive effect on women participation in progress of cultural goals.

H2.1. Organizational structure has a positive effect on women participation in progress of cultural goals in Sistan & Balouchestan province.

H2.2. Organizational structure has a positive effect on women participation in progress of cultural goals in South Khorasan province.

H2.3. Organizational structure has a positive effect on women participation in progress of cultural goals in Kerman province.

H3. Organizational atmosphere has a positive effect on women participation in progress of cultural goals.

H3.1. Organizational atmosphere has a positive effect on women participation in progress of cultural goals in Sistan & Balouchestan province.

H3.2. Organizational atmosphere has a positive effect on women participation in progress of cultural goals in South Khorasan province.

H3.3. Organizational atmosphere has a positive effect on women participation in progress of cultural goals in Kerman province.

H4. Styles and preferences of management have a positive effect on women participation in progress of cultural goals.

H4.1. Styles and preferences of management have a positive effect on women participation in progress of cultural goals in Sistan & Balouchestan province.

H4.2. Styles and preferences of management have a positive effect on women participation in progress of cultural goals in South Khorasan province.

H4.3. Styles and preferences of management have a positive effect on women participation in progress of cultural goals in Kerman province.

H5. Organizational factors have a positive effect on women participation in progress of cultural goals in Sistan & Balouchestan province.

H5.1. Organizational factors have a positive effect on women participation in progress of cultural goals in Sistan & Balouchestan province.

H5.2. Organizational factors have a positive effect on women participation in progress of cultural goals in South Khorasan province.

H5.3. Organizational factors have a positive effect on women participation in progress of cultural goals in Kerman province.

H5.4. Organizational factors have a positive effect on women participation in progress of cultural goals in Southeast region.

4. Research methodology

The data were collected using mail questionnaire survey. First, this study used a cluster sampling frame based on the three provinces in southeast geographical direction of Iran, including: Sistan and Baluchestan (S&B), Kerman, and South Khorasan as a cluster. Within each cluster 349 respondents are selected randomly. Therefore we selected 1047 women among three provinces. 2000 questionnaires is sent via electronic mail between women. Then, 1047 usable responses of 1198 completed questionnaires were analyzed using t-student test. We have done K-S test for

72 Kolmogrove- smirnov test
confirming normal distribution of research data before applying t-test as one of the parametric statistical technique. To verify the construction of the research model and measurement instruments, several professors were also interviewed to modify the research model and the construction of the questionnaire.

4.1. Instrument development and pre-test
In order to measure the study variables, we adapted the measurement instruments from previous research. We had the instruments reviewed by women related research professionals (faculty members in the Sistan & Balouchestan university, and university of Shahid bahonare Kerman) to test the face and content validity of the instruments’ scores. Minor adjustments in the wording of five items in the organizational structure and styles and preferences of management instruments were recommended and made.

We calculated cronbach alpha coefficients to test the reliability of the scores. All the scales had a cronbach alpha of above 0.7 which is an acceptable level to declare reliability of scale scores (Nunnally, 1978) and the total reliability was equal to 0.965 that is acceptable. Table.1 shows the cronbach’s alpha for the scales.

4.2. Statistical analysis
This study used both of descriptive statistics and inductive statistics methods for data analyzing. Demographic profile of respondents are showed in table 3. we used the t-student test as one of the parametric statistics technique for averages comparison test. After recognizing obstacles to women participation in progress of social cultural goals, we use One Factor Inter Case Variance Analysis for study equality roles of recognized factors. Finally we use TOPSIS 73 (as one of the MCDM technique) for ranking of recognized obstacles. This study selected SPSS17 74 for hypotheses testing and Excel software for TOPSIS technique.

5. Findings and Discussions

5.1. Respondents’ profile
This section reports the analysis results. Regarding reliability, the survey had strong internal consistency with all multiple-item constructs achieving Cronbach’s alpha of 0.70 or higher. Moreover, regarding validity, previously validated measurements were used to ensure the validity of the measurements. Among 1047 usable respondents (profiled in Table 2), results show that Regarding age distribution, women ages between twenty-one and forty dominate among respondents (%64 in S&B; %63 in Kerman; %63 in south Khorasan). Moreover, regarding educational level, respondents who have technician or bachelors are dominant (%75 in S&B; %75 in Kerman; %76 in south Khorasan), married respondents outnumber unmarried and divorced women (%63 in S&B; %64 in Kerman; %57 in south Khorasan). Finally regarding employment status, governmental employed dominate among respondents vs. private employed and none-employed, (%61 in S&B; %56 in Kerman; %58 in south Khorasan). Therefore, we could conclude that married middle-aged women, with technician or bachelor degree, who employed in governmental sectors, were predominant among respondents in our study.

5.2. Finding
SPSS reports t-student, degree of freedom (d.f) along with sig-level for all specified paths in the research model. According the results which indicates the significance of measured test, when sig is less than 0.05, H0 is rejected and H1 is confirmed with %95 of confidence interval, on the other hand, research hypothesis have been accepted. Therefore, according to the results, because of the sig0.05 for the hypotheses, as a result we could say that, structural factors including;
human resources Policies, Organizational structure and organizational atmosphere have a positive effect on women participation in cultural development in southeast provinces of Iran.

Now, whether the inhibitor role of recognized factors are equal? we address hypothesis6 in order to answer this question. The result of H₆ testing by one factor within subjects variance analysis is shown in Table3.

Table 3. Mauchly’s test of Sphericity

<table>
<thead>
<tr>
<th>Within subjects effects</th>
<th>Mauchly’s W</th>
<th>Approx Chi-Square</th>
<th>df</th>
<th>sig</th>

</tr>
</tbody>
</table>

Because of sig < 0.05, the inhibitor role of four constructs in women participation aren’t equal. So, we prioritize constructs of structural factor based on TOPSIS technique as one of the multi criteria decision making(MCDM). Table.4 shows the result.

6.Conclusions

It can be inferred that to improve the status of women’s career advancement in the organizations with emphasis on cultural goals, it is essential to reduce the influence of dominated atmosphere at all levels of organization on women through a holistic approach of organizations, authorities, research and development institutions and society as a whole. Enhancing women’s participation in development through an enabling environment for achieving gender equality and the advancement of women(Report of the Expert Group Meeting,2005) Specific interventions in this regard include provision of requisite knowledge, developing specific skills, building alliances, networking and mentoring at the individual level and gender sensitivity training, advocacy, institutional alliances and linkages, enhancement of the devolution management skills, and research and documentation at the institutional levels for women. An enabling organizational environment presents women and men with the same opportunities and freedom of choices while securing the conditions for their well-being. This study noted the need to address institutional (organizational) factors in the creation of an enabling environment for women's enhanced participation in development. These factors range from policies, laws, rules, regulations and
resource allocation procedures of organizations, to the practices and attitudes of policy makers, based on their interpretations of these laws and regulations, their own capacities and vested interests. The enabling environment also includes the policies and practices of non-governmental and civil society organizations and private sector actors such as businesses.

Human resources Policies should include sustainable incentives for deployment of women staff to different levels of organizations. In addition, donor policies on the creating opportunities for the development of sustainable human resource programs for women. Governments should ensure the adoption of gender equality legislation that supports promotion and protection measures for women in the field of work in different organizations. institutions should provide legal recognition to women employees in all industries, fair conditions of work, social protection, and fundamental rights at work, for example, the right to organize. the private sector and relevant regulatory bodies should establish temporary special measures to overcome persistent gender barriers, such as quotas for women in decision-making in publicly owned or private companies; or favorable treatment for women who are starting or managing businesses.

Abstract
Empirical research to date on the relative effectiveness of Economic Value Added (EVA) and earnings per share (EPS) as measures of firm performance for stock valuation has been mixed. In this research, we examine their relative effectiveness in predicting future earnings and their role in enhancing the accuracy of analysts’ forecasts. Our results indicate that EVA contains information that is incremental to EPS in predicting future earnings. In addition, we find that despite this potential for EVA to add incremental value to analysts’ forecasts of future earnings, analysts do not use the information in reported EVA appropriately, but appear rather to overweigh it.

Keywords: Economic value added, Financial analysts’ forecasts, Earnings-per-share predictions

1. Introduction
In recent years, there has been increasing attention paid to new financial performance measures as substitutes for traditional accounting-based earning per share measures (Ittner and Larcker, 1998). One particular measure that has received substantial attention in the financial press and in the academic literature is Economic Value Added (EVA). It has been argued that many companies have adopted EVA as a measure of firm performance, as an analytical tool to make portfolio selection decisions, and as a management discipline (Teitelbaum, 1997).

A substantial proportion of academic research has focused on investigating the claim that EVA is a better measure of value than reported accounting earnings. Previous empirical research has shown mixed results relative to this claim. In this research, we examine the association between EVA and future earnings and subsequently its use by analysts’ in their forecasts of earnings per share.

The ability of EVA to predict earnings per share (EPS) is important for two reasons. First, despite the recent popularity of alternative firm performance measures, EPS remains a central focus in stock valuation. Indeed the Feltham-Ohlson framework for security valuation argues for the primacy of EPS as an input to valuation, and consequently, Bernard (1995) argues that empirical research on equity valuation should focus on the usefulness of earnings and non-earnings information in predicting future earnings rather than solely focusing on explaining stock
price changes. Second, investigating earnings predictions provides a bridge to allow us to examine how (if at all) EVA information is reflected in analysts’ published EPS forecasts. The study of analysts’ EPS forecasts is an integral part of the understanding of the capital markets’ valuation process. Although Ittner and Larcker (1998) argue that many analysts use EVA to evaluate and recommend firms, to our knowledge, ours is the first study to investigate the degree to which EVA is incorporated in analysts’ earnings forecasts.

We first discuss EVA and then describe and present results from empirical tests of two propositions that (1) EVA is useful in predicting one-year-ahead earnings, and (2) financial analysts fully incorporate one-year-ahead earnings-relevant information in EVA in their EPS forecasts. Finally, we summarize our findings and provide suggestions for further exploration in this area.

2. Background

Over the past ten years, Stern Stewart Company has been advocating the use of Economic Value Added (EVA) instead of earnings-based numbers to measure firm performance. They claim that the use of EVA has revitalized the financial performance of several U.S. companies such as Coca-Cola, CSX, SPX Corp, GE, and Chrysler (Tully, 1993; Walbert, 1994). Stern Stewart and Company argue that EVA drives stock prices (Stern Stewart advertisement in Harvard Business Review, November–December 1995, p. 20), creates wealth and explains changes in shareholder wealth better than any other performance measure (Stewart, 1994). Many companies have relied on this information and are using EVA as an internal and/or external performance measure. A 1996 survey performed by the Institute of Management Accountants (IMA, 1996) found that 35% of the respondents are currently using EVA and 45% expect to use EVA in the future. Given these claims, there have been numerous studies aimed at determining the extent to which EVA is superior to traditional accounting measures.

Results from empirical research regarding the claim that EVA is a more value-relevant measure than currently reported net income is mixed. For example, companies adopting EVA as an internal performance measure and as a basis for incentive compensation appear to exhibit significant investing, financing and operating improvements that have increased shareholder wealth (Kleiman, 1999; Wallace, 1997). In addition, Chen and Dodd (1997), using data based on ten-year averages, find a higher correlation between returns and EVA than returns and EPS. Lehn and Makhija (1997) also find that stock returns over a ten-year period are more highly correlated with average EVA than with several earnings based measures. However, several studies find evidence to the contrary. For example, Bao and Bao (1998) find a stronger association between percent change in price and price-deflated earnings changes than between percent change in price and price-deflated EVA changes. In addition, Chen and Dodd (1998), and Biddle, Bowen and Wallace (1997) find a higher association between returns and unexpected earnings than returns and unexpected EVA. Biddle et al. (1997) do, however, find that EVA is incremental to earnings in explaining market-adjusted returns.

These prior studies focus on EVA’s ability to measure shareholder value in a stock market setting. In this research, we examine the association between EVA and future earnings. Our investigation is motivated by the premise that EPS is still an information item of central interest in security valuation, and therefore, for a given measure to be effective as an input to valuation, it must have information about future EPS. More formally, the Feltham-Ohlson (e.g., Ohlson, 1995) framework develops a valuation framework wherein earnings are indeed primary
(Bernard, 1995). From that perspective, establishing the predictive usefulness of a given measure (such as EVA) is a necessary first step, and thus we begin our analyses by determining whether EVA is incrementally useful in predicting future EPS. We believe that we can gain important insight into EVA’s information content by taking a step back and looking at its ability to explain more primitive value determinants such as earnings. If our analyses reveal that EVA is incrementally useful as an earnings predictor, it follows that financial analysts’ who are motivated to make accurate predictions of future EPS would exploit the information in EVA in forming their forecasts. This would mean that in the cross-section, the average forecast error would not be systematically related to EVA. We, therefore, examine the association between EVA and analysts’ forecast errors in our study. If EVA and analysts’ forecast errors are correlated, then EVA can be used to explain analysts’ prediction errors and potentially improve upon the forecasts as earnings expectations.

Stern Stewart & Company (“Stern Stewart”) calculate EVA by first adjusting net income after taxes for what they view as “distortions” in these numbers due to accounting rules. From this adjusted profit amount they subtract the opportunity cost of both debt and equity capital. Therefore, EVA differs from accounting earnings in two ways: (1) EVA redefines GAAP income; and (2) EVA deducts the total cost of both debt and equity capital whereas accounting earnings deducts only the cost of debt capital (interest expense). In this study we primarily examine the first argued benefit—whether EVA measures firm performance better than GAAP earnings. Stern Stewart recommends up to 160 adjustments that firms can make to their accounting system to reduce GAAP distortions (Milbourn, 1997; see Stewart 1991, 113–117). For example, one adjustment made is to add back research and development costs to earnings since the expense can be seen as an investment that is expected to benefit the future. Other adjustments include the allowance for uncollectible accounts, LIFO reserve, and amortization of goodwill. Stern Stewart believes these adjustments enable earnings to more accurately reflect the firm’s profitability. Although they argue that these potential accounting adjustments remove the inherent distortions of GAAP accounting, they provide little evidence to support this claim. In focusing on the relative performance of EVA as a predictor of future EPS, the most relevant components of EVA are the accounting adjustments. We examine the association between EVA adjustments and future accounting earnings using Stern Stewart’s measure of EVA prior to the deduction of the opportunity cost of capital. For completeness, we also performed all our empirical tests using the final EVA measures obtained after deducting the cost of debt and equity capital and found that our results were robust to the use of aggregate EVA.

2.1. EVA as a predictor of future EPS

The first purpose of this study is to provide empirical evidence on the ability of EVA adjustments and earnings to explain and predict future earnings changes. We begin by examining the predictability of earnings using the following model:

\[ \Delta \text{EPS}_t = f(\text{EPS}_{t-1}, \Delta \text{EPS}_{t-1}, \text{EVA}_t, \Delta \text{EVA}_t) \]

Where \( \text{EPS} \) is earnings per share before extraordinary items and discontinued operations, and \( \text{EVA} \) is the \( \text{EVA} \) adjustment of \( \text{EPS} \), which is measured as the difference between \( \text{EVA} \) (prior to the deduction of the opportunity cost of capital) and \( \text{EPS} \). In words, earnings changes in period \( t \) are related to levels and changes of earnings in period \( t-1 \) as well as levels and changes of \( \text{EVA} \) accounting adjustments in period \( t-1 \). All components of \( \text{EVA} \) are defined by both changes and levels to capture predictions of earnings based on both random-walk and mean-reverting
models, consistent with the intuition in Ali and Zarowin (1992) for the returns-earnings relation. Prior research has indicated that funds-based earnings components have differing persistence with respect to future earnings (Sloan, 1996). Therefore, we decompose both the change and level of earnings into cash flows from operations and accruals, where cash flow from operations (CF) is defined as in prior research (see, for example, Ali, 1994). The accrual component of earnings (AC) equals earnings per share (defined as net income before extraordinary items and discontinued operations) less cash flow from operations per share.

Prior research has also shown that prior-year’s returns are useful in predicting earnings due to GAAP conservatism in reporting events that are known to market participants when they occur (Collins, Kothari and Rayburn, 1987; Beaver et al., 1980, 1987; Elgers and Murray, 1992). Therefore, we add prior-year’s size-adjusted return to the model. Size-adjusted return (SAR) is measured as the difference between the realized return on the firm’s common stock for the twelve months ended March 31 of year t and the mean return for all sample firms in the same size docile (where size is defined based on market value of equity at the start of the return accumulation period). We use size-adjusted returns as our metric to avoid estimation issues and bias introduced by market-model abnormal returns.

Combining all of the above and assuming a linear and additive functional form leads to the following empirical model:

$$\Delta\frac{EPS_t}{P_{t-1}} = \alpha_0 + \alpha_1\Delta CF_{t-1}/P_{t-1} + \alpha_2 CF_{t-1}/P_{t-1} + \alpha_3 \Delta AC_{t-1}/P_{t-1} + \alpha_4 AC_{t-1}/P_{t-1} + \alpha_5 \Delta EVA_{At-1}/P_{t-1} + \alpha_6 EVA_{At-1}/P_{t-1} + \alpha_7 SART_{t-1} + \varepsilon_t$$

Note that to mitigate the effects of scale (i.e., larger firm-years have larger values of both independent and dependent variables), all variables are deflated by price at the beginning of period $t-1 (P_{t-1})$. $CF_t$ and $AC_t$ are the cash flows from operations and accrual components of $EPS$, respectively, and other variables are defined above.

We expect the coefficient on change in accruals to be negative and significant due to the fact that accrual changes tend to reverse in future years because of the mechanics of accrual accounting. In contrast, we expect the coefficient on the change in cash flows to be positive, as cash flow changes are more permanent. The coefficient estimate on size-adjusted-return should be positive because it captures information available to market participants that is reflected in earnings in later periods. Assuming that the EVA adjustment removes GAAP distortions from EPS and allows for a more accurate and timely measure of firm performance, we expect the coefficients on the EVA adjustments to be positive.

The predictability of future earnings is dependent upon prior-year performance. Firms whose prior-year earnings change or returns are below the cross-sectional median in a given year have been shown to have more transitory earnings (Elgers and Lo, 1994). Therefore, we investigate the above regression after partitioning firms into two groups based on whether their previous year’s earnings change was positive or negative.

2.2. Analysts’ forecasts of EPS

If we find that EVA conveys additional information about future earnings beyond what is reflected in current earnings, cash flows and security returns the next logical step is to test if this incremental predictive content is reflected in analysts’ forecasts of earnings. If analysts’ do not fully incorporate the information in prior-year EVA changes or levels, then their forecast errors will be correlated with these EVA variables. Previous research has shown that analysts’ forecasts
contain predictable and systematic errors. Recent evidence indicates that financial analysts’ forecasts of earnings are biased (optimistic) and fail to incorporate fully the earnings-relevant information in prior-year earnings changes and prior-year security returns (e.g., Elgers and Lo, 1994; Ali et al., 1992). Elgers and Lo (1994) demonstrate that analysts’ forecasts are optimistic for firms with poor prior-year earnings or share price performance. This is attributed to a significant reversal tendency for earnings changes below the median, in which analysts predict significantly greater reversals than are exhibited by actual earnings. Ali et al. (1992) and Mendenhall (1991) find that analysts’ forecasts errors are positively serially correlated. In addition, their forecast errors depend upon the variability in earnings changes and the standard deviation of forecasts (Elliott et al., 1993).

To test whether analysts’ prediction errors are correlated with information in EVA, we must first control for these previously documented patterns. Therefore, we regress the forecast error on these previously documented inefficiencies in analysts’ forecasts after controlling for prior-year performance. We also decompose EPS changes and levels into their cash flow and accrual components for reasons described earlier. Lastly, we add EVA changes and levels. We control for prior-year performance by below estimating equation separately for firms with previous-year earnings increases and decreases.

\[
\frac{(EPS_t - FC_t)}{P_{t-1}} = \beta_0 + \beta_1 \Delta EVA_{t-1}/P_{t-1} + \beta_2 EVA_{t-1}/P_{t-1} + \beta_3 \left(\frac{EPS_{t-1} - FC_{t-1}}{P_{t-1}}\right) + \beta_4 SAR_{t-1} + \beta_5 \sigma_{(FC)} + \beta_6 \Delta CF_{t-1}/P_{t-1} + \beta_7 CF_{t-1}/P_{t-1} + \beta_8 \Delta AC_{t-1}/P_{t-1} + \beta_9 AC_{t-1}/P_{t-1} + \epsilon_t
\]

Where \(FC_t\) is the mean of all individual analysts’ forecasts made in March of year \(t\), \(\sigma_{(FC)}\) is the standard deviation of these forecasts, and other variables are defined above. If the forecast error in year \(t\) is positive, the standard deviation is kept positive; however if the forecast error is negative, the standard deviation is multiplied by \(-1.0\) (Elliott et al., 1993). The rest of the variables are measured as defined previously.

In this equation, an estimated \(\beta_0\) significantly less than zero indicates that analysts’ forecasts are optimistic, holding all other independent variables constant. The coefficients \(\beta_1\) and \(\beta_2\) indicate the role of EVA information in enhancing the accuracy of analysts’ forecasts. Estimates of \(\beta_1\) or \(\beta_2\) different from zero indicate that past realizations of EVA adjustments are associated with analysts’ prediction errors, consistent with the conjecture that analysts’ fail to fully incorporate the information in the EVA adjustments when making their EPS forecasts. An estimated \(\beta_3\) different form zero suggests that analysts’ forecasts do not fully incorporate information contained in past forecast errors, i.e., their forecasts of future earnings do not properly reflect the time-series properties of annual earnings. An estimated \(\beta_4\) different form zero indicates that analysts’ forecasts do not fully reflect past stock returns. \(\beta_5\) is expected to be positive in that larger variability of analysts’ forecasts for a given firm indicates greater dispersion of opinion and earnings that are likely harder to forecast, thus leading to larger forecast errors. Finally, estimates of \(\beta_6\), \(\beta_7\), \(\beta_8\), and \(\beta_9\) different from zero indicate that analysts’ forecasts do not fully incorporate information contained in past realizations of cash flows or the accrual components of EPS.

3. Sample selection

For the tests examining the predictability of earnings, we select firms that meet the following criteria:
1. Sufficient data are available from Compustat to calculate all required financial variables.

The above requirements resulted in a sample of 6,391 firm-years. Firm-years were deleted from this sample if either the absolute value of their price-scaled cash flow, accrual or EVA component changes were greater than 1.0 to avoid the excessive leverage of outliers on our (linear) estimation. In addition, all firm-years with negative EPS were deleted based on findings that loss firms have systematically different market responses to earnings than do profitable firms (e.g., Hayn, 1995), and because analysts’ incentives and forecast accuracy are likely to differ substantially for loss firms. Because of this deletion, our “good news” and “bad news” partitions consist of firms with only profitable earnings increases and decreases. Our final sample used to estimate equation (1) consists of 4,382 firm-years from 1991 to 2006, ranging from 232 to 362 firms per year.

To examine potential inefficiencies of analysts’ forecasts, the following additional requirements were added:

2. The I/B/E/S CD-ROM contains at least three forecasts of earnings made in March of year \( t \). The requirement of at least three forecasts is necessary to calculate a standard deviation of the forecasts.

Lastly, we eliminated firms with absolute price-scaled forecast errors greater than 1.0. In addition, to ensure analysts were familiar with EVA we used forecasts made starting in 1999. The above requirements limited our sample for the forecast error regression to 1,443 firm-years.

4. Results

Panel of Table 1 presents means of our analysis and control variables for the full sample, partitioned according to sign of earnings change in year \( t-1 \). The mean cash flow change for firm-years with earnings decreases in year \( t-1 \) (0.0165) is statistically indistinguishable from firm-years with positive earnings changes (0.0098). The difference in the sign of the earnings between these two sets of firms, therefore, seems to be driven by the accrual component as evidenced by the negative accrual change in \( t-1 \) (mean=−0.0636) for firms with negative prior earnings. The change in \( EVA \) adjustment in year \( t-1 \) is positive for both positive and negative prior earnings firms (mean=0.0082 (0.0006) for firms with earnings changes below (above) zero), indicating possibly that the computation of \( EVA \) cancels out some of the negative information in the accrual component for firms with negative earnings changes in year \( t-1 \).

Panel B of Table 1 presents correlations for the independent variables used in the earnings prediction tests. Based on the magnitude of these correlations, there is a potential for multi co linearity in several regression models. However, all of our inferences are based upon means and standard errors of annual coefficient estimates. Because we do not rely upon estimated OLS standard errors in our statistical tests, the potential multi co linearity is not of immediate concern. The most notable correlations are the positive correlation between \( EPS \) changes and \( EVA \) changes (0.7188), which we expect given that they are competing performance proxies, and the negative correlation between cash flow changes and accrual.

\[ \Delta EPS_{t-1} = (EPS_{t-1} - EPS_{t-2}) \] where \( EPS_{t-1} \) is the reported accounting earnings per share before extraordinary items and discontinued operations for the year ended December 31, \( t - 1 \).

\[ \Delta EVA_{t-1} = (EVA_{t-1} - EVA_{t-2}) \] where \( EVA_{t-1} \) is reported \( EVA \) prior to the cost of capital deduction for year ended December 31, \( t - 1 \).

\[ \Delta CF_{t-1} = (CF_{t-1} - CF_{t-2}) \] where \( CF_{t-1} \) is the cash flow from operations component of earnings for the year ended December 31, \( t - 1 \).

\[ \Delta AC_{t-1} = (AC_{t-1} - AC_{t-2}) \] where \( AC_{t-1} \) is the accrual component of earnings for the year ended December 31, \( t - 1 \).

\[ \Delta EVA_{t-1} = (EVA_{t-1} - EVA_{t-2}) \] where \( EVA_{t-1} \) is the difference between reported \( EVA \) (prior to the cost of capital deduction) and \( EPS \) for year ended December 31, \( t - 1 \).

\( P_{t-1} \) is the common stock price on March 31 of year \( t - 1 \).
SAR_{t-1} is the size-adjusted return for the year ended March 31 of year t.

Changes (−0.8887 and −0.8734 for firms with earnings changes below and above zero, respectively), which is widely documented in prior research. In addition, changes in the EVA adjustment and accrual component are negatively correlated (−0.0994 and −0.1233 for firms with earnings changes below and above zero, respectively), more so for firms with positive prior-year earnings changes. This suggests that EVA adjustments may undo certain accruals thought by Stern Stewart to be value-irrelevant.

4.1. Earnings predictions

The results of estimating equation (1) are reported in Table 2. Panel A, indicates that the prior-year’s level of cash flows and accruals is useful in explaining future earnings changes for all firm-years, as evidenced by the significance of α_2 and α_4 in both partitions of the data. Consistent with previous research, firm-years with prior-year earnings changes below zero tend to have positive earnings changes in period t, as evidenced by α_1 and α_3 (t = −2.07, p = 0.058 and t = −1.93, p = 0.076, respectively) for negative earnings change firms. For positive earnings change firms, this is not so—α_1 and α_3 are indistinguishable from zero. Both cash flows and accruals are significant in explaining future earnings changes for the poor performing firms, indicating reversal tendencies in both components for these firms. In addition, prior-year returns (coefficient α_7) are more significant for good performing firms. This finding is consistent with Basu (1997) who argues that conservatism in GAAP causes poor performance to be more quickly reflected in earnings.

The variables of primary concern in this study, α_5 and α_6, indicate that EVA accounting adjustments are incrementally useful in explaining earnings changes beyond that of cash flow, accruals and prior-year security returns. For firm-years with earnings decreases, the level of EVAA is significant (t = 2.47), and for firm-years with earnings increases, the change is significant at a 10% level (t = 1.97, two-tailed p < 0.07), but not at the 5% level we use in our significance tests. One plausible explanation for the differential results across partitions is that the ability of EVAA (and other variables in the model as well) to explain future earnings changes stems largely from its ability to identify and capture the effects of transitory components of earnings, which are likely more prevalent in the earnings decrease firm-years, because of the more temporary nature of earnings declines. We next examine the usefulness of EVAA using out-of-sample predictions of earnings changes. To determine the incremental value of including EVA information in the prediction model, we compare two predictions of earnings, one using information contained in EVA and the other excluding EVA information. These results are reported in panel B of Table 2. For firm-years with earnings declines, it appears that the incremental information in EVA does not help in predicting earnings changes as both the mean squared error, \[ \frac{1}{n} \sum (\text{predicted} - \text{actual})^2 \] (hereafter MSE) and mean absolute error, \[ \frac{1}{n} \sum |\text{predicted} - \text{actual}| \] (hereafter MAE) are actually higher when EVA is included. That is, predictions using EVAA are worse than those without EVAA. However, for firms with positive prior-year earnings changes, adding EVA information to the model does result in smaller prediction errors. Both the MSE and MAE are smaller when the EVA information.

### Description of regression variables:

\(P_{t-1}\) is the common stock price on March 31 of year \(t - 1\).

\(\Delta \text{EPS}_t = (\text{EPS}_t - \text{EPS}_{t-1})\) where \(\text{EPS}\) is the reported accounting earnings per share before extraordinary items and discontinued operations for the year ended December 31, \(t\).

\(S\text{AR}_{t-1}\) is the size-adjusted return for the year ended March 31 of year \(t\).

\(\Delta \text{CF}_{t-1} = (\text{CF}_{t-1} - \text{CF}_{t-2})\) where \(\text{CF}_{t-1}\) is the cash flow from operations component of earnings for the year ended December 31, \(t - 1\).

\(\Delta \text{AC}_{t-1} = (\text{AC}_{t-1} - \text{AC}_{t-2})\) where \(\text{AC}_{t-1}\) is the accrual component of earnings for the year ended December 31, \(t - 1\).

\(\Delta \text{EVA}_{t-1} = (\text{EVA}_{t-1} - \text{EVA}_{t-2})\) where \(\text{EVA}_{t-1}\) is the difference between reported \(EVA\) (prior to the cost of capital deduction) and \(\text{EPS}\) for year ended December 31, \(t - 1\).
The intertemporal mean is the average of the coefficients estimated in 16 annual cross-sectional regressions for the years 1991–2006.

The t-statistics are computed as the ratio of the means and standard errors of the 16 annual estimates of the regression coefficients. Probability values are two-tailed.

Significant at probability below 0.05.

Out of sample predictions are computed as the ratio of the intertemporal means and standard errors of 15 annual differences in calculated error metrics for the years 1992–2006. Significance is based on a two-tailed t-test at probability below 0.05.

Is included than when it is not. Only the difference in the MSE is statistically significant. These results support the argument that EVA is incrementally useful in predicting future earnings changes for firm-years with positive prior-year earnings changes.

4.2. Analysts’ forecasts of EPS

The results of regressing analysts’ forecast errors on components of EPS, the EVA adjustment, and the control variables included in equation (2) are reported in Table 3. Consistent

Description of regression variables:

\( P_{t-1} \) is the common stock price on March 31 of year \( t-1 \).

\( SAR_{t-1} \) is the size-adjusted return for the year ended March 31 of year \( t \).

\( EPS_t \) is the reported accounting earnings per share before extraordinary items and discontinued operations for the year ended December 31, \( t \).

\( FC_t \) is the mean of all individual analysts’ forecasts of earnings made in March of year \( t \), for the year ended December 31, \( t \).

\( \sigma_{FC} \) is the standard deviation of the March forecasts’ for the year ended December 31, \( t \).

\( \Delta CF_{t-1} = (CF_{t-1} - CF_{t-2}) \) where \( CF_{t-1} \) is the cash flow from operations component of earnings for the year ended December 31, \( t-1 \).

\( \Delta AC_{t-1} = (AC_{t-1} - AC_{t-2}) \) where \( AC_{t-1} \) is the accrual component of earnings for the year ended December 31, \( t-1 \).

\( \Delta EVA_{t-1} = (EVA_{t-1} - EVA_{t-2}) \) where \( EVA_{t-1} \) is the difference between reported EVA (prior to the cost of capital adjustment) and EPS for year ended December 31, \( t-1 \).

The intertemporal mean is the average of the coefficients estimated in 8 annual cross-sectional regressions for the years 1999–2006.

The t-statistics are based on the means and variances of the 8 annual estimates of the regression coefficients. Probability values are based on a two-tailed t-test.

Significant at probability below 0.05.

With results discussed earlier documenting the usefulness of EVA adjustments in predicting future earnings for firms with positive prior-year earnings changes, significant results are also
observed here for this subsample of firms. The EVA adjustment (coefficient $\beta_2$, $t = -2.13$) is significantly associated with forecast errors for this set of firm-years. One interpretation of this result is that for this subsample, analysts’ forecasts may not fully reflect information about future earnings changes contained in EVA in their forecasts. The negative and significant coefficient on $\beta_2$ for the firm-years with prior-year earnings increases is consistent with analysts’ forecasts overweighing the importance of the EVA adjustment in the previous year. That is, forecasts are too high subsequent to a positive EVA adjustment and too low subsequent to a negative EVA adjustment. However, for firms with negative prior earnings changes, the coefficients on the EVA components ($\beta_1$ and $\beta_2$) are not significant. This result is consistent with the earlier insignificant results reported in Panel B of Table 2 that indicated that EVA was not useful in out-of-sample predictions of earnings for firms with negative prior-year earnings performance.

Consistent with prior research, forecast errors ($\beta_3$) are positively serially correlated and positively associated with the standard deviation of analysts’ forecasts ($\beta_5$), independent of prior-year performance. However, in contrast to our expectations, analysts’ forecast errors are significantly negatively associated with the previous-period’s returns ($\beta_4$) for firms with earnings changes above zero in the previous year and insignificant for firms with earnings changes below zero in the previous year. For firms with good prior year performance, analysts’ forecasts appear to overweight the impact of this information on the subsequent year’s earnings. In addition, for firms with earnings changes below zero in the previous year, only the level of cash flow and accrual components of earnings ($\beta_7$ and $\beta_9$) are significantly associated with the analysts’ forecast error. However, for firms with earnings changes above zero in the previous year, both the level and changes in accrual and cash flow components of earnings ($\beta_6$, $\beta_7$, $\beta_8$, and $\beta_9$) are associated with the analysts’ forecast error. Lastly, a positive intercept ($\beta_0$) indicates that analysts are on average too conservative, holding all other variables constant.

5. Conclusion

In this paper, we adopt a new approach to evaluating the relative performance of earnings and EVA as measures of firm performance. Specifically, we first examine the relationship between EVA accounting adjustments and future EPS changes and find that EVA adjustments have incremental information in explaining future earnings changes over that of cash flow and accrual components of earnings. Based on this finding, we make out-of-sample predictions of EPS and find that the model containing EVA information leads to more accurate EPS predictions for firm-years with prior-year earnings increases. We also find a significant association between analysts’ forecast errors and EVA for these firms.

One interpretation of this result is that analysts’ forecasts appear not to fully reflect information in reported EVA for firms with prior-year earnings increases. One explanation for these results may be that EVA was relatively new for the sample period (1989–1996) used in the analysis of analysts forecast errors in this study. Therefore analysts, specially in the earlier years, may not have been fully familiar with this new performance measure and convinced of its usefulness for predicting future firm performance. In this study we have restricted our analysis to one contextual factor, prior-year earnings performance. Future research may want to include other contextual factors, which may cause EVA adjustments to be more or less useful in earnings and cash flow predictions. Also, future research may expand upon why EVA adjustments appear to be useful by systematically testing the specific adjustments EVA makes to GAAP earnings.
Notes

1. EVA is a trademark of Stern, Stewart Management Services. It is the firm’s proprietary adaptation of residual income valuation approach.

2. One reason may be that realized EVA may not outperform earnings in representing investors’ expected future cash flows. Since stock prices are theoretically the discounted present value of future cash flows to investors, stock prices change (i.e., investors earn a return) if investors’ expectations of these future cash flows change. Net income may provide a better proxy for the market’s assessment of the present value of future cash flows.

3. The question remains controversial, as evidenced by the a pair of articles by Biddle et al. (1999) and O’Byrne (1999) appearing in the same journal and drawing opposite conclusions about the value-relevance of EVA.

4. Calculating a cost of capital, as done by Stern Stewart & Company, may cause measurement error in EVA (Carr, 1996). In addition, there are already earnings-based numbers that implicitly consider the cost of capital to the firm, such as return-on-investment and return-on-assets. Therefore, we focus on the adjustments that Stern Stewart & Company make to earnings.

5. Chen and Dodd (1997) find that residual income and EVA explained stock returns equally well, suggesting the accounting adjustments are not priced by the market.

6. It is plausible that these are precisely the kinds of accounting adjustments that would be made by financial analysts when they attempt to determine the components of earnings that are persistent and those that are transitory. Accordingly, limiting our attention to the accounting adjustments is consistent with the objective of our tests using analysts’ forecast errors.

7. The results of sensitivity tests including other EVA components (available on request from the authors) are consistent with the inferences we draw from our tabulated analyses.

8. The relation is modeled in changes form to mitigate potential correlated omitted variables bias, to the extent that any omitted variables are stable across time.

9. This allows more accurate predictions for firms with extreme (transitory) earnings that are not well described by a random-walk expectation model. The transitory portion of earnings does not persist in subsequent periods, inducing a negative serial correlation in earnings changes (e.g., Brooks and Buckmaster, 1976).

10. Moreover, a levels and changes specification is econometrically equivalent to disaggregating changes—i.e., relaxing the implicit constraint that the components of prior year earnings change have equal and opposite coefficients. Specifically, $\Delta Et = \delta 0 + \delta 1 \Delta Et-1 + \varepsilon 1t$ leads to $\Delta Et = \varphi 0 + \varphi 1 Et-1 + \varphi 2 Et-2 + \varepsilon 2t$ when the constraint on $\delta 1$ is relaxed. But this is econometrically equivalent to $\Delta Et = \gamma 0 + \gamma 1 Et-1 + \gamma 2 \Delta Et-1 + \varepsilon 3t$, a levels and changes specification, where $\varphi 1 = \gamma 1 + \gamma 2$ and $\varphi 2 = -\gamma 2$.

11. Through 1986, CF is equal to total funds from operations less current accruals. After 1986, CF is equal to the working capital from operations (the sum of income before extraordinary items, equity in net loss (earnings) of unconsolidated subsidiaries, extraordinary items and discontinued operations, depreciation and amortization, deferred income tax expense, gains and losses from sale or disposal of assets, and other funds from operations) less current accruals. Current accruals equal accounts receivable+inventory+other current assets−accounts
12. We also partitioned based on the cross-sectional median value of prior-year earnings changes and SAR, however, our results are qualitatively the same.

13. This is around the time EVA became popular (Finegan, 1989).

14. Due to the potential bias in pooled t-statistics caused by cross-sectional correlations in the error terms, we present ‘intertemporal’ t statistics, computed as the mean of the 16 annual coefficient estimates divided by the standard error of the 16 estimates. In addition, variance inflation factors indicate the presence of multicollinearity in the pooled estimation, which also biases the pooled standard errors. Intertemporal t statistics are not subject to this bias.

15. The first is based on using equation (1) and therefore contains information in EVA useful in predicting earnings changes. To form these predictions we use the average coefficients obtained in equation (1) for all prior years. Our second prediction allows us to determine the incremental value of including EVAC in equation (1). To form these predictions were-estimate equation (1) without $\alpha_5$ and $\alpha_6$ (the EVA variables) each year. We then use the average of all previous-years’ coefficient estimates to form earnings predictions based on information excluding EVA. Therefore, our results now start at year 1982.

16. Statistical tests of the MSE and MAE differences across models are done using the mean of 15 annual differences divided by the standard error of the mean.

ABSTRACT
Educational philosophy depends on general or formal philosophy to the extent that the problems of education are of a general philosophical character. We cannot criticize existing educational policies or suggest new ones without considering such general philosophic problems as (a) the nature of the good life, to which education should lead, (b) the nature of man himself, because it is man who is educated, (c) the nature of society, because education is a social process, and (d) the nature of ultimate reality, which all knowledge seeks to penetrate. Teaching behavior depends at least on partly on philosophical presuppositions about nature of reality, knowledge and values. Education is the eternal philosophy of superior adjustment of the physically and mentally developed, free, conscious, human being to God, as manifested in the intellectual, emotional, and volitional environment of man. The objective of the study was to compare the philosophic views of teachers about education. The proposed study seeks to investigate the philosophical views of secondary school teachers about education. All the secondary school teachers of government schools located in Pakistan constituted the population of the study. The sample of study was consisted of 500 hundred teachers (250 male and 250 female), which was randomly selected. For the purpose of data collection, a 20 - item five-point scale questionnaire (appendix A) was used. The questionnaire was developed by Wiseman, (2005). The researchers visited the schools to get necessary information from the teachers. The obtained data were scored, analyzed and interpreted by means of appropriate statistical techniques of analysis such as Chi-square and Contingency Coefficient. The result of the study indicated that the philosophic views of secondary school teachers were found to be highly in favour of existentialism and least in favour of realism. However male teachers were tend to be inclined towards existentialism whereas Female teachers inclined towards idealism. Experienced teachers preferred existential ideas about education whereas less experienced teachers favored pragmatic outlook towards education. Teachers were more or less consistent in their philosophic views about education. They were more consistent in their pragmatic views about education and least consistent in their existential views about education.

Key Words: Idealism, Realism, Pragmatism, Existentialism.

INTRODUCTION
Allah has created man, superior to all living and non-living things. Man is superior to all things due to his wisdom and consciousness. In Platonic terminology, education is the training of each individual to do for what his talents particularly suit in such a way as to benefit the whole social group. Philosophy is the love of wisdom. For thousands of years, philosophers have been
wrestling with many of the same questions: What is most real—the physical world or the realm
of mind and spirit? What is the basis of human knowledge? What is the nature of the just
society? These and other philosophical questions influence education. Educators must take
stances on such questions before they can determine what and how students should be taught.
Since educators do not agree on the answers to these questions, different philosophies of
education have emerged. Although there are similarities, there are also profound differences in
the way leading educators define the purpose of education, the role of the teacher, the nature of
curriculum and the method of instruction.

According to Allya the main fields of philosophy are (1) metaphysics, including
cosmology and ontology (2) epistemology; (3) axiology, including ethics and aesthetics.
Metaphysics is the area of philosophy that is concerned with questions about the nature of
reality. Latterly metaphysics means” beyond the physical”. It deals with questions like: What is
reality? What is existence? Is the universe rationally designed or ultimately meaningless?
Metaphysics is a search for order and wholeness, applied not to particular items or experiences,
but to all reality and to all existence. Metaphysics is the attempt to find coherence in the whole
realm of thought and experience. Metaphysics also involves questions concerning the nature of
humans. Is human nature physical or spiritual? Does a person make free choices to or do events
and conditions force one determined decisions? The question in metaphysics, especially those
about humanity and the universe, are extremely relevant to teachers and students of education
(Allya et al, 1996). Metaphysics is concerned with the nature of reality. As such it includes
cosmology, which deals with the universe as an orderly system, and ontology, which focuses on
the nature of being. Metaphysics seeks to answer such questions as: What is the self? Is
existence only a physical reality, or does existence transcend the physical world? How “real” are
trees, the sky, and so on? (William.F, 1981). Metaphysics examines the nature of ultimate reality.
In speculating about the nature of reality and existence, metaphysicians have not developed a
single agreed – upon conclusions. Idealists see reality in nonmaterial or spiritual terms. Realist
sees it as an objective order that exists independently of humankind. For pragmatists reality is a
result of human experiences with the social and physical environment. In educational
philosophy, metaphysics relates to the particular conception of reality reflected in the subjects,
experiences, and skills of the curriculum. Much school learning represents the efforts of
curriculum makers, teachers, and textbook writers to describe reality to students. (Allan.
C, 1980). Epistemology is a branch of philosophy that examines questions about how and what
we know. What knowledge is true and how does knowledge take place? The epistemologist
attempts to discover what is involved in the process of knowing. Is knowing a special sort of
mental act; is there a difference between knowledge and belief; can we know anything beyond
the objects with which our senses acquaint us? Does knowing make any difference to the object
that is known? Because epistemological questions deal with the essence of knowledge, they are
central to education. Teachers must be able to assess what is knowledge to determine if a
particular piece of information should be included in the curriculum. How we know is of
paramount importance to teachers because their beliefs about learning influence their classroom
methods. Should teachers train students in the scientific methods, deductive reasoning, or both?
Should students study logic and fallacies or follow intuition? Teachers’ knowledge of how
students learn influences how they will teach. (Allya et al, 1996). Epistemology, which deals
with knowledge and knowing, is closely related to methods of teaching and learning. Again,
different philosophies hold different epistemological conceptions. Idealists see knowing, or
cognition, as the recall of ideas that are latent in the mind. For them the Socratic dialogue is the
most appropriate teaching method. In the Socratic method the teacher stimulate the student’s consciousness by asking leading questions, which bring forth the ideas hidden in the learner’s mind. For realists knowledge begins with our sensations of objects. Through abstracting these sensory materials, we form concepts that correspond to the objects in the reality. A teacher who used the realist formula of sensation and abstraction would develop classroom activities that utilize sensory stimuli. Pragmatists contend that we create knowledge by interacting with our environment; hence problem solving is the appropriate method of teaching and learning (Allan, C et al, 1980). According to William F, (1981) Epistemology is concerned with the nature of human knowledge and its limits. This category of philosophy is concerned with theories of knowledge and seeks to answer such questions as: What role do our senses play in giving us knowledge? Are there higher forms of knowledge than what we experience? What are the methods of validating ideas? Ho do we learn? Epistemology is the branch of philosophy that inquires into the nature of knowledge and truth. The problems raised in this area are “What are the sources of knowledge?; and “How reliable are these sources ?” , “What can one known?” , “What is the nature of truth?” The sources of knowledge are (1) authority; (2) common sense; (3) intuition; (4) reason); (5) controlled experience. There are four major theories concerning the nature of truth; (1) coherence; (2) correspondence; (3) pragmatism; (4) skepticism (Callahan et al, 1986). Axiology seeks to specify what is of value. Axiology is divided into ethics and aesthetics. Ethics examines moral values and the rules of right conducts; aesthetics deals with values in beauty and art. Teachers, concerned with forming values in students, encourage certain proffered behavior. Parents, teachers, and society reward or punish behavior as it conforms to or deviates from their conceptions of what is right, good, and beautiful. Idealists and realists subscribe to the objective theory of value, which asserts that the good, true, and beautiful are universally valid in all places and at all times. Pragmatists hold that values are culturally or ethically relative and depend on group or personal preferences that vary with the situation, time, time, and place (Allan C et al, 1984).

Axiology is the study of values, both in regulating both in human conduct (ethics) and in determining beauty (aesthetics). Ethics seeks to answer questions about what is right and wrong, or good and bad, both personally and socially. For example, what is the nature of morality? Is it absolute, or does the situation define what is correct behavior? Is it ever right to take another’s life, as those in the “right to Die” movement believe? or the moral principles universal and timeless, regardless of the situation? Aesthetics addresses questions about the nature of beauty in art, drama, literature, and music. Is beauty a matter of personal taste, or are there principles that determine what is beautiful? Does beauty change from generation to generation, or is it timeless? Is classical music really “classics”? Is today’s music really beautiful, or is it merely noise ( as many older people seem to think)? Or are such questions a matter of individual judgment? (William.F.,1981). There is a philosophy behind every school system, based on the views and values of the educators, as well as the society that is sponsoring the education. The philosophy starts with the view of reality and definitions of truth and goodness. From this, the mission of the schools and the emphasis of the instruction are established. There are four basic philosophies of education, namely, Idealism, Realism, Pragmatism, and Existentialism. Idealism is the school of philosophy that holds that ideas or concepts are the essence of all that is worth knowing. The physical world we know through our senses is only a manifestation of the spiritual world. Idealists believe in the power of reasoning and they de-emphasize the identific method and sense perception, which they hold suspect. They search for universal or absolute truths that will remain constant throughout the centuries (Allya et al,1996). The philosophic
idealists claim that ultimate reality is spiritual in nature rather than physical, mental rather than material. It is only the mind that is real. Therefore all material things that seem to be real are reducible to mind or spirit. On the universal level, finite minds live in a purposeful world produced by an infinite mind. Idealist agree that man is a spiritual being, but they disagree as to exactly how he is related to the ultimate spiritual reality from which he springs (Kneller, 1971).

In idealism, the aim of education is to discover and develop each individual's abilities and full moral excellence in order to better serve society. The curricular emphasis is subject matter of mind: literature, history, philosophy, and religion. Teaching methods focus on handling ideas through lecture, discussion, and Socratic dialogue (a method of teaching that uses questioning to help students discover and clarify knowledge). Introspection, intuition, insight, and whole-part logic are used to bring to consciousness the forms or concepts which are latent in the mind. Character is developed through imitating examples and heroes (LeoNora, 1999). The idealist educator prefers to order the curriculum so that ideas in various subjects relate to each other. Conceptually oriented systems such as mathematics, logic, Language, and aesthetics are stressed in idealist-oriented schools. The highest level of knowledge recognizes the interrelationships among the various subjects and seeks to integrate them (Allan C et al., 1980). In the idealistic philosophy, teachers are given due dignity. Philosophers advocating this view have said that the person, who has reached the level of self-realization, is fit for the post of a teacher. Every teacher should possess higher values of life. He will influence his students by his personality. The duty of the teacher is not to impart knowledge but to instruct the students. Every student should keep himself engaged spontaneously to pursue the truth. The duty of the teacher will be to assist him in that persuasion (Froebel, 2008). A teacher is like a director or superintendent and he should help the pupils to teach themselves. In other words, auto education must be encouraged. Authoritarian position of the instructors is now over-ruled. The teacher should be fit both physically and mentally to combat the variegated problems of learners. A teacher, in order to be an ideal helper must be well informed and should make him attractive both in speech and dress. Words should encourage students to go ahead and face the problems of life boldly. A strong and stout teacher with mental and intellectual efficiency is now an ideal teacher for the adolescents. The ready hand of a teacher would help to energize adolescents to their proper growth and for the attainment of manhood or womanhood (Blogger, 2008). Realism, like idealism, stresses objective knowledge and values, but the realist view of metaphysics and epistemology is different. A basic definition describes the essential doctrines of realism as follows: (1) there is a world of real existence that human beings have not made or constructed, (2) this real existence can be known by the human mind, and (3) such knowledge is the only reliable guide to human conduct, individuals and social. (Allan C et al, 1984). Realism is a school of philosophy that holds that reality, knowledge, and values exist independent of the human mind. In other words realism rejects the idealist notion that only ideas are the ultimate reality. Realist place considerable importance on the role of the teacher in the educational process. The teacher should be a person who presents content in a systematic and organized way and should promote the idea that there are clearly defined criteria one can use in making judgments. Curriculum has reflected the impact of these realist thinkers through the appearance of standardized tests, serialized textbooks, and a specialized curriculum in which the disciplines are seen as separate areas of investigation (Allya et al., 1996). Education, the realists would say, is the study of the subject-matter disciplines into which knowledge has been sorted and classified. History, language, science, mathematics- these are organized bodies of knowledge. If we know them we will know something about the world in which we live. This knowledge is our best guide in conducting our
daily affairs. (Allan C et al, 1984). The basic purpose of education, in realist educational theory, is to provide the pupil with the essential knowledge required for survival in the natural world. Such knowledge will provide the skills necessary to achieve happy life (Callahan et al, 1986). Character is developed through thinking in the rules of conduct (Conen, 1999). The realist classroom is teacher – centered. Subjects are thought by a teacher who is impersonal and objective, and who knows that subject fully. The teacher organizes and presents content systematically within a discipline, demonstrating use of criteria in making decisions. He or she must utilize pupil interest by relating the material to the pupil’s experiences and making the subjects matter as concrete as possible. He or she maintains discipline by rewarding efforts and achievements, controlling the attention of the child and keeping the pupil active (Callahan et al, 1986).

This American Philosophy like idealism and realism is also rooted in Greek thought. In fact, the word Pragmatism comes from a Greek word meaning ‘work’. Therefore, as a philosophical system, pragmatism is concerned with finding processes and the solutions that attain agreeable and appropriated results. Pragmatism has been known by a variety of names from ‘Pragmatism’ to instrumentalism’, ‘functionalism’, and ‘experimentalism’. The Principal themes of pragmatism are the reality of change, the essentially social and biological nature of man, the relatively of values and the use of critical intelligence (Kneller, 1971). For pragmatists, only those things that are experienced or observed are real. They maintain that the world is neither dependent or nor independent of man’s idea of it. The universe is dynamic and evolving or becoming Reality amount to ‘interaction’ of the human being with his environment. It is the sum total of what we experience. Man and his environment are coordinate; they are equally responsible for what is real. They believe that is the essence of reality (Kneller, 1971).

Education is an experimental process: it is a method of dealing with solving problems that arise as people interact with their world. Dewey argued that human beings experience the greatest personal and social growth when they interact with the environment in an intelligent and reflective manner. The most intelligent way of solving problem is to use the scientific method (Alan L, 1975). An Educated person, in the pragmatic sense, knows how to take information from various sources and disciplines and use that knowledge in an instrumental manner. The more traditional philosophical perspectives represented by idealism, realism, are suspicious of the interdisciplinary approach in education because they believe that a student must first master organized subject matter before attempting to solve problems. The school is a society’s agency for selecting and simplifying the cultural elements that an individual needs to participate in social life. As a selective agency, it transmits part if the cultural heritage and seeks to reconstruct other aspects of the culture. The school’s threefold functions are simplifying, purifying, and balancing the cultural heritage (Allan C et al, 1984).

All learning is dependent on the context of place, time and circumstances (Conen,1999). Teachers ought not to try to pour the knowledge they have into the pupil, because such efforts are fruitless. What each pupil learns depends upon his own personal needs, interest and problems. In other words, the content of knowledge is not at an end on it self but a means to an end, thus a pupil who faced by a problem may be able to reconstruct his environment so as to solve this need. To help him, the teacher must provide experiences that will excite motivation, assist the pupils in collecting the information pertaining to problem and evaluate with the class (Callahan et al, 1986). This system of philosophy is the newest to appear upon the intellectual scene. The important existentialist thinkers repudiate the very label which classifies them as belonging to this or any other group of philosophers. It is a philosophy of extremeindividualism(Cohen,1999). Reality is a matter of individual existence and is subjective and lies within the individuals. The physical world has no inherent meaning outside of human
existence. Individual choice and individual standards rather than external standards are central (Conen, 1999). Existence precedes essence in individual development. One exists, and then one becomes, each human being exists in a world that is without purpose and the life is that found in the meaning. Each individual human being lives authentically, who freely chooses for him and he is personally responsible for his choice. Choices are not final. These can be remade over and over again. When a person is aware of his identity as an individual and realizes this contingent nature of that is not the reason for his own existence, he suffers sense of anguish, despair and loneliness (Callahan et al, 1986). Since Existentialist choice-making is always personal, a curriculum stressing the effective domain of learning attitudes, feelings and emotions – would be encouraged. The students are deeply involved in choosing the curriculum. Subjects such as music, art, drama, literature, and film, which involve emotions and aesthetics, and attempt to portray the human condition, are most appropriate. These are the very subjects that idealists and realists would call “soft” (Allan C et al, 1980). Subject such as mathematics and science are less important to the existentialist, but they are permitted, since the students must have a choice in determining subject matter. Elective courses are pursued. Since school is a place that encourages choice-making and expression of one’s attitudes and feelings, students have the option not to conform and to rebel against the norms of school or society. In traditionally oriented schools, the student allows others to make choices for him and escapes the reality that choices are his own responsibility. The truly Existentialist students make his choices and lives with the consequences. Even the level of education, the type of schooling, and the subject studied are the choice of the student, especially at the secondary and college levels. Teacher’s view, the individual as an entity with in a social content in which the learners must confront other’s views to clarify his or hers own. Real answers come from within the individual, not from the outside authority. Examining life through authentic thinking involves students in genuine learning experiences. Existentialists are opposed to thinking about students as objects to be measured, tracked or standardized. Such educators want the educational experience to focus on creating opportunities for self direction and self actualization. They start with the student rather than no curriculum content (Conen, 1999). Educational philosophy depends on general or formal philosophy to the extent that the problems of education are of a general philosophical character. Teaching behavior depends at least partly philosophical presuppositions about nature of reality, knowledge and values. Little research appears to have been conducted on the topic of educational philosophy in Pakistan. The purpose of the study was to investigate the philosophic views of secondary school teachers about education. The objectives of the study were as follows:

**RESEARCH QUESTION**
To compare the philosophic views of experienced and in experienced teachers about education:

**RESULTS AND DISCUSSION**
This study was aimed to investigate the philosophic views of secondary school teachers about education in WahCantt. The information collected through the questionnaire regarding philosophic thought of teachers about education, was analyzed to determine their inclination for specific western schools of thoughts and to explore these views from the perspectives of gender and experience.
Table 1: Divergence of observed frequencies of secondary teachers about their Philosophy of education from equal probability hypothesis

<table>
<thead>
<tr>
<th>Idealism</th>
<th>Realism</th>
<th>Pragmatism</th>
<th>Existentialism</th>
<th>Combination of philosophies</th>

<td>103</td>
<td>140</td>
<td>63</td>
<td>500</td>
<td>20.6</td>
<td>&lt;.01</td>
</tr>
</tbody>
</table>

As the above table shows, there is highly significant divergence of observed frequency of secondary teachers about their philosophy of education from equal probability. The teachers tended to be most inclined towards existentialism and least inclined towards realism. The above frequencies are graphically represented in figure 1 below:

Figure 1: Observed frequencies of secondary teachers about their philosophy of education.

Table 2: Association between gender of secondary teachers and their frequencies on Philosophy of education

<table>
<thead>

</tbody>
</table>

As the above table shows, the value of contingency coefficient is .15. This indicates that there is some of association between gender of secondary teachers and their philosophy of education. Male teachers were found to be more inclined towards existentialism and female teachers were more in favor of idealism. The above frequencies are graphically represented in figure 2 below:
CONCLUSIONS
Conclusions of the study were as follows:
1. The philosophic views of secondary school teachers were found to be highly in favour of existentialism and least in favour of realism.
2. The male teachers were tending to be inclined towards existentialism whereas female teachers inclined towards idealism.

RECOMMENDATIONS
1. In-service training curriculum should include subject of educational Philosophies on priority bases.
2. Perspective teachers should be made abreast with the classical educational Philosophies.
3. Perspective teachers should be made trained to bring educational Philosophies into practice.
4. The subject of philosophy be taught through dialogue and discussion instead of lecture method only. This approach will help the teachers to philosophize and develop their own clear and consistent philosophy of education.

Abstract

Morality is a system of beliefs, values, and underlying judgments about the rightness or wrongness of acts. Morality has to do with a sense of right and wrong, and with what psychologists call the conscience. Research increasingly suggests that there are limitations to Kohlberg's theory of moral development. Gilligan, in particular, has observed that Kohlberg's theory considers abstract principled reasoning as the highest level of moral judgment, and penalizes those who focus on the interpersonal ramifications of a moral decision. Gilligan calls these orientations as justice and care orientations. She asserted that a woman's sense of moral development came from connections to other people, rather than separation from them. Her purpose was to find a second dimension for female moral reasoning by showing that previous studies were done predominately with males in mind.

The present study therefore sought to measure one orientation of care of the two orientations of Justice and care among university students by using MJS (Moral Justification Scale in Pakistan). The scale consists of six vignettes, of which two are justice oriented, two are care oriented, and two are mixed, incorporating both orientations. The collected data were scored, analyzed, and interpreted by using the statistical techniques of mean, standard deviation and t-test. The study results showed that female students were more care oriented than female students.

Keywords: Moral Orientation, Care Orientation, Moral Development, MJS (Moral Justification Scale), Vignettes, Dilemmas,

Introduction

Teaching reflects the values and social philosophy of the larger society. Teaching requires improvisation, spontaneity, style, pace, rhythm, and appropriateness to meet the challenges of the job. They must be able to help students to think for themselves, to act independently and collaborate with others, and render critical judgments.

Human development carries a wider and more comprehensive meaning. It implies the overall changes occurring in both the quantitative (increase in size, length, height and weight) as well as the qualitative (physical, mental, social, moral or any other) aspects. Human development is divided into three domains: (1) physical, (2) cognitive development, and (3) emotional and social development. These domains are not really distinct; they form an integrated whole.

Moral development is regarded as a matter of internalization: adopting societal standards for right actions as one’s own. Morality moves from society to individual, children acquire norms, or prescriptions for good conduct, widely held by members of their social group. The determinants
of morality can be found at both societal and individual levels. In all cultures, morality is promoted by an overarching social organization that specifies rules for good conduct. Moral individuals do not just do the right thing for the sake of social conformity or the expectations of authority figures. Instead, they have developed compassionate concerns and ideals of good conduct, which they follow in a wide variety of situations. (Berk, 2007)

Morality has roots in each major aspect of psychological makeup:

- **Morality has an emotional competent**

  Since powerful feelings cause us to empathize with another’s distress or feel guilty when we are the cause of that distress.

- **Morality has a cognitive component**

  Children’s developing social understanding permits them to make more profound judgments about actions they believe to be right or wrong.

- **Morality has behavioural component**

  Experiencing morally relevant thoughts and feelings only increases the likelihood, but does not guarantee that people will accord with them.

Traditionally, these three facets of morality have been studied separately: Biological and psychoanalytic theories focus on emotions, cognitive—developmental theory on moral thought, and social learning theory on moral behaviour. A growing body of research has revealed that all three facets are interrelated. Biological theories of human social behaviour suggested that many morally relevant behaviours and emotions have roots in our revolutionary history. Biological perspective reminds of morality’s adaptive value. Because the capacity to serve the self’s needs is present early, human, along with other highly social species, have evolved a brain-based moral substrate that counteracts self-centered motives and promotes concerns for others (de Wall, 1996) Current psychoanalytic theorists believe that superego children build from parental teaching consists not just of prohibitions, or “don’ts” but also of positive guidelines for behaviour, or “do’s”(Emde & Oppenheim, 1995). The social perspective does not regard morality as a special human activity with a unique course of development. Rather, moral behaviour is acquired just like any other set of responses: through reinforcement and modeling (Kochanska, 1999)

Cognitive—developmental theorists believe that neither identification with parents nor teaching, modeling, and reinforcement are the major means through which children become moral. The cognitive—developmental approach assumes that individuals, instead of internalizing existing rules and expectations, develop morally through construction—actively attending to and interrelating multiple perspectives on situations in which social conflicts arise and thereby deriving new moral understandings. In other words, children make moral judgments on the basis of concepts they construct about justice and fairness. These concepts become increasingly adequate with age, children experience them as having a rational basis and arrive at a deeper
understanding of morality—as something that must be true in the social world, just as conservation must be true in the physical world. (Gibbs, 2003)

Piaget’s early work on children’s moral judgments was the original inspiration for the cognitive–developmental perspective. To study children’s ideas about morality, Piaget relied on open-ended clinical interviews: He questioned 5 to 13 year old Swiss children about their understandings of rules in the game of marbles. In addition he gave children stories in which characters’ intentions to engage in right or wrong action and the consequences of their behaviour varied. From children’s responses, Piaget identifies two broad stages of moral understanding.

1. **Heteronomous Morality (About 5-10 years)**

   Heteronomous means under the authority of another. In this first stage children view rules as handed down by authorities. (God, parents, and teachers), as having a permanent existences, as unchangeable, and as requiring strict obedience.

2. **Autonomous Morality (About 10 years and older)**

   Cognitive development, gradual release from adult control, and peer interaction lead children to make the transition to the second stage, autonomous morality, in which they no longer view rules as fixed but see them as flexible, socially agreed-on principles that can be revised to suit the will of majority. (Berk, 2007).

Kohlberg extended the age range Piaget studied, including participants who were well into adolescence by administering the moral judgment interview to 10-, 13-, and 16-year-old boys. Then he followed the participants longitudinally, reinterviewing them at 3- to 4-year intervals over the next 20 years (Colby et al., 1983). Analyzing age–related changes in the boys’ moral judgments, Kohlberg generated his six-stage sequence. As with Piaget’s progression of development, Kohlberg’s first three stages characterize children as moving from a morality focused on outcomes to a morality based on ideal reciprocity. Inclusion of older adolescents yielded the fourth stage, in which young people expand their notion of ideal reciprocity to encompass societal rules and laws as vital for ensuring that people treat one another justly. On the basis of the moral judgment responses of small minorities of adolescents, Kohlberg extended his sequence further, positing the fifth and sixth stages. These stages have remained infrequent in subsequent research.

The stages are describes in the following manner (Berk, 2007):

1. **The Pre-conventional Level:** At this level morality is externally controlled. This level is further divided into progressive stages:

   - **Stage 1:** The punishment and obedience orientation. Children at this stage find it difficult to consider two points of view in a moral dilemma. As a result, they ignore people’ intentions and instead focused on fair of authority and avoidance of punishment as reasons for morally.
2. The Conventional Level: At this level, individuals continue to regard conformity to social rules as important, but not for reasons of self-interest. Rather, they believe that actively maintaining the current social system ensures positive human relationships and social order. This level consists of following stages:

- Stage 3: The “good boy-good girl” orientation. Individuals want to maintain the affection and approval of friends and relatives by being a “good person”—trustworthy, loyal, respectful, helpful, and nice.
- Stage 4: The social order maintaining orientation. The individual believes that laws cannot be disobeyed under any circumstances because they are vital for ensuring societal order and cooperative relations between individuals.

3. The Post-conventional Level: Individuals at this level move beyond unquestioning support for the rule and laws of their own society. They define morality in terms of abstract principles and values that apply to all situations and societies. This level consists of two stages:

- Stage 6: The Universal ethical principle orientation. Individuals typically mention such principles as equal consideration of the claims of all human beings and respect for the worth and dignity of each person.

Although there is much support for Kohlberg’s theory, it continues to face challenges. The most important of these concern Kohlberg’s conception of moral maturity and the appropriateness of his stages for characterizing the moral reasoning of young children.

A key controversy has to do with Kohlberg’s belief that moral maturity is not achieved until the postconventional level. Yet if people had to reach stages 5 and 6 to be considered truly morally mature, Gibbs (2003) argues that “postconventional morality” should not be viewed as the standard against which other levels are judged immature. Gibbs finds maturity in a revised understanding of stages 3 and 4. These stages are not “conventional,” or based on social conformity, as Kohlberg assumed. Instead, they require profound moral constructions—and understanding of ideal reciprocity as the basis of relationship between people (stage 3) and widely accepted moral standards, set forth in rules and laws (stage 4).

The influence of situational factors on moral reasoning indicates that like Piaget’s cognitive stages, Kohlberg’s moral stages are loosely organized. Rather than developing in a neat, stepwise fashion, people draw on a range of moral responses that vary with context. With age this range shifts upward as less mature moral reasoning is gradually replaced by more advanced moral thought (Fischer & Bidell, 1998).
Carol Gilligan is the best-known figure among those who have argued that Kohlberg’s theory—originally formulated on the basis of interviews with males—does not adequately represent the morality of girls and women. Gilligan believes that feminine morality emphasizes an “ethic of care” that is devalues in Kohlberg’s system. According to Gilligan, a concern for others is a different, not less valid, basis for moral judgment than a focus on impersonal rights (Berk, 2007).

Gilligan makes a powerful claim that research on moral development has been limited by too much attention to rights and justice (a “masculine” ideal) and too little attention to care and responsiveness (a “feminine ideal”). Some evidence shows that although the morality of males and females taps both orientations, females do tend to stress care, or empathic perspective taking, whereas males either stress justice or focus equally on justice and care (Jaffe & Hyde, 2000).

Moral reasoning theories indicate that justice and caring are not gender-specific moralities. Gilligan’s work has expanded the conception of the highly moral person. She opened new horizons for researchers to explore the world of moral development. A number of studies investigated moral reasoning. William, John and Lauren, 2008; Skoe 1994; Gilligan and Attanucci, 1988; Mary and Albert, 2000; Daniel Sprender, 2005; Miller and Fagley, 2004; Gibbs, 2003 have found gender differences, with males focusing on justice orientation and females focusing on care orientations. However, other studies have not found significant differences such as Keefer, Matthew and Olson, 2006; Soile Juujarvi, 2003; Nancy and Gwendolyn, 2003; Daniels, D'Andrea, and Hick, 1995; Roberta and Maclagan, 2007; Eisele, 1992; William and Friedman, 2003.

Beside this great deal of moral research but with mixed results, there is still need to investigate the different dimensions of moral development in Pakistan. Though educational research is on fast track now but less importance is being given to explore the world of moral reasoning. The present study will be a beneficial contribution to the field of moral education.

The objective of the study was:
1. To measure the care orientations among university students (Male and Female) by using the Moral Justification Scale.

It may be a reliable scale with the reasons that there hardly exists any type of valid instrument for identifying the moral orientations of the student and other people working in different sectors. Researchers may take help from the results of this study to further expand the purpose of the current study to make adolescents caring and justice in their moral judgments.

Procedure

Population

The population of the study consisted of the 1300 students (566 male and 734 female) of University of Wah.
Sample

The sample consisted 100 students comprising 50 male and 50 female university students.

Research Instruments

The Moral Justification Scale consisting of six dilemmas developed by Richard Baker and Samuel Roll,(Appendix A) was adapted to the Pakistani culture to measure the variables of care orientation. The MJS was a 10-point scale.

Design and Procedure

The study was a descriptive survey of university students’ moral reasoning in term of care orientation and justice orientation as postulated by Gilligan.

The study participants responded to six dilemmas, of the MJS.

RESULTS AND DISCUSSION

Table 1: Significance of the Difference between Mean scores of Male and Female students on care orientation

</table>

\[ df = 98 \]

\[ t \text{ value at } .05 = 1.98 \]

\[ t \text{ value at } .01 = 2.63 \]

Entries in the above table indicate that the actual difference of 24.38 in the mean care orientation scores of male and female students was found to be significant when tested through t-value which was 5.10 and found significant at .05 level. It was also found significant at .01 level. The difference goes in favour of female students who were found to be more care oriented than male students. The null hypothesis No 1 was therefore rejected.
Fig 1: Frequency Distribution of Care Orientation Scores of Male Students

Mean = 159.4
N = 50

Fig 2: Frequency Distribution of Care Orientation Scores of Female Students

Mean = 183.4
N = 50
DISCUSSION
One hundred students were selected for the purpose of main study. The small sample was taken due to the feasibility of the researcher’s time and finance and to complete the task well in time, as each participant has to respond six dilemmas which was quiet time consuming on the part of the researcher and the participant. Each participant took almost two hours to read each story and to complete the task of rating the statements given at the end of each dilemma.

During the main study, students received dilemmas in classes for their participation. They were briefed on the dilemmas to help them to answer the statements given at the end of each dilemma. The students showed their interest in the dilemmas as these dilemmas seemed to be of their interest with a new story on morality in each. Not only did the students rate the moral statements but also they gave their comments on the dilemmas and suggested that what the protagonist should do in related situations.

Though students showed a great deal of interest in participation but some of them were feeling uneasy as they could not fully understand the story of dilemmas in English. So the researcher remained available to help them wherever they needed it.

Care orientation scores of male students ranged between 95 and 204 whereas those of female students were between 105 to 234, thus female students were clearly ahead of male students. As far as the amount of overlapping between these groups is concerned, 14 percent male students scored at or beyond the girls median score of 184.5 on care orientation, thus a sizeable portion of male students were more care oriented than the average female student. The mean care orientation score of the female students was 24.38 higher than the mean score of the male group. The standard deviation score of the male group appeared to be higher than the standard deviation score of the female group. Coefficient of variation indicated that female students were 75 percent as variable as male students in their care oriented moral judgments. It means that the views of female students on care orientation were less diverse than male students.

CONCLUSION
The average female student was found to be more care oriented in her moral judgements. Care perspective dominated in females.

RECOMMENDATIONS
The average female student was found to be more care oriented in her moral judgments. Care perspective dominated in females perhaps due to their socialization. To improve the care perspective in male youth, steps may be taken to bring reforms in curriculum at all levels. Contents in the syllabus may be revised which may evoke moral orientations in male adolescents who may be care oriented and may be taught to care others.

The existing education system in Pakistan is not fulfilling its responsibilities in moral training of the youth in the present context of terrorism. Not only is the revision desired in context of curriculum but also in teacher education. Simple lecturing is not helpful for students. Teachers therefore must be trained on such pattern so that they can realize their students to respect feelings of others. Teachers may model moral behaviour through personal examples and expose students to other models. This will lead to a better and secure future devoid of injustices, intolerance and terrorism.

Master Student of Information Technology Management, University of Sistan and Baluchestan, Iran

Abstract
The privatization of governmental enterprises was embarked on in the late 70s in numerous countries worldwide (Great Britain in particular) as a solution to the dominant economical crisis and increase economy growth. After the centralized state economy ended in a fiasco in Eastern Europe, privatization soared up dramatically, most importantly due to the pressures enacted by the World Bank and the International Monetary Fund economic policies. These organizations have conditioned their financial aids to fundamental steps and measures towards facilitating privatization in these countries. Privatization in Iran started in 1989 as an economical balance policy and pursued nationwide. The privatization process started in the Regional Electricity Company Personnel in Zahedan city in 2003. In this study, the statistical population includes the Regional Electricity Company Personnel in Zahedan city (who have 7 years or more job experience in the company). In order to test the hypothesis, a sample with 184 peoples have been considered. The results of this research indicate that privatization in this company have remarkably increased the productivity.

Key words: The 44 Constitution, privatization, productivity, efficiency, effectiveness

Introduction
Privatization policy was enacted in the early 1980s as a part of a broad policy by a few industrial countries to adjust the economic structure. It, very soon, spread into other countries and economies including transiting economies; and now it is enacting in more than 110 countries. In the beginning of the 5-year economic, social, cultural and political plan in Iran, and after the imposed war, the privatization policy was raised as one of the basic factors of the economic policies and on the June 19th, 1991, the first legal permit passed on government meddling limitation in the economy. (Hosseini & Mehrara, 2001).

This research assesses the effects of the privatization on the electricity company’s subscribers in Zahedan which aims to increase the productivity, resources allocation and people involvement development in the different parts of the production and services. This paper also aims to achieve the ways in order to provide the subscribers with the services of a higher quality and productivity.

In the middle of the 1970s, improper application of a large number of governmental companies and organizations resulted in an international attempt e.g. using the private mechanism in public companies in the short term, midterm, and long term in order to achieve solutions to increase the governments' efficiency. Privatization is changing the dominant atmosphere on the different governmental parts while it keeps the main structure of activity at the same time. In this way, it
could be possible to evaluate the private sectors' mechanisms and motivations (Nassirzade, 1990: 63). The electricity power industry which is one of the fundamental and strategic industries and acts as a generator for the other industries can't be ignored. Since early in the 1970s, this industry has started changing in organizational structure and building independent and nongovernmental companies for electricity power distribution, electricity production management and some companies in administrative and contracting field, building and equipment field, consulting field, auditing field, computer and bill issuing field, network maintenance and repair field, and electric facilities. During four years ago, most of the mentioned companies have been given to the private sector through stock exchange and auction. In addition to the mentioned cases above, the Production, Transmission, and Distribution of Electricity Power Company in Iran has promoted its different administrative activities on the basis of plans done to achieve the goals of 44 constitution and providing a proper ground to form sound competitive market affairs and preserving the producers and consumers rights, and making the culture of the privatization and stimulating the private sector to join the electricity market (Weekly Peak Electric, 2007:3).

since 2003, the regional electricity company of Sistan and Baluchistan has given its subscribers' services to the private sector but the speed of performance was relatively slow. In 2005, along with the notification of the 44 Constitution, it was seriously followed and the electricity company decided to encourage the investors and grant the subscribers' services affairs to them and in this way it could increase the quality of services given to the subscribers accordingly. Nowadays you can find that all subscribers' services like electricity branch sale, counter reading and installation, bill distribution, account receiving, coding, revising and rebuilding have given to the private sector.

Literature review on privatization

Beesly and Little Child (1993) believe that if the minimum percentage of the governmental stocks is given to the private sector that would be possible to get the improvement in economic operation by increasing the role of market forces through privatization. Veljanovsky (1987) thinks that privatization is doing the economic activities by the private sector, or it is transferring the property ownership from government to the private sector. "The privatization is highlighting the role of market against the government's decisions as an economic agent." In fact, the meaning of privatization is something more than changing the ownership of manufacturing enterprises. The main thought in privatization is dominating the market mechanism on economic decisions by which the competitive circumstances can be created for the private sectors and in this way the enterprises' efficiency will be increased in comparison with the public enterprises sector (Behkish, 2001: 110). Privatization has recently moved towards the first front of the political and economical thought and become as an acceptable solution for increasing the production and achieving the economic growth in the less developed companies. In the 1980s, the population in the private sector has internationally increased and has broadly been reflected in many developed countries as giving services (Berg, 1987:23). A large number of countries have turned to privatization to get rid of giving services. Production of goods and services is transferred from public sector to the private one by privatization (Hanke, 1987: 110). Chuck Davis (2000) counts the following items as the goals of privatization:

1. Decreasing the size of government and public sectors

2. Creating the financial income for governmental sectors and getting rid of the financial pressure
3. Improving the economic efficiency

4. Raising the justice

5. Decreasing the governmental organization penetration

The general goals of privatization in Iran are:

1. Decreasing the government interference in economic activities and reducing the portion of the governmental management (decreasing the amount of government guardianship).

2. Cutting the government expenses (as the result of cutting subsidy)

3. Competition development and productivity improvement in the operation of economic enterprises.

So, the privatization of the governmental companies has always been as an alternative for increasing the productivity and efficiency, decreasing the bureaucracy, encouraging the managers for doing more efforts and taking more responsibilities, cutting the government meddling in economy, increasing competition and innovation and finally increasing the operation of organizations (Razaghi, 1997).

Although in the 1980s, the privatization policy was performed for increasing the efficiency, reinforcing the market mechanism, cutting the government penetration in economy, cutting the sustained loss by governmental companies, and improving the income distribution and product quality but it has been effected by some factors like the globalization of the financial methods of production and budget limitation, need to encourage investing, the emergence of new technology in some parts like telecommunication and energy; it is necessary to state that the mentioned factors don't have the same effect in different countries (Mahboodi, 2002; 45).

The effects of privatization depend on the various factors like the ways of using the income resources (Mackenzie, 1998; 365). Researches show that some of the positive effects of privatization are to increase the efficiency. Financial market development, decreasing the government size, the increase of production, and wealth and income distribution; but the result of researches does not show anything of the privatization effect on employment. It has also been revealed that the complete privatization is better than the partial privatization (Sheshinsky & Lopez, 2000: 25-26).

In this research, independent variable is “privatization" which is considered in 3 parts: production, transfer and distribution of electricity industry. We are going to evaluate the effects of privatization on the different parts of subscribers' services in the distribution field including "branch sale"," counter installation"," counter reading", "bill distribution", and "account receiving". "Productivity" is the dependant variable which is directly affected by the privatization. Considering the productivity is the sum of proficiency and efficiency, so it can be

---

75 Complete privatization means that the ownership of an enterprise is completely given to the private sector by government.

76 Partial privatization means that just some parts of an enterprise are given to the private sector by the government.
said that increasing or decreasing the efficiency and proficiency would result in decreasing or increasing in the productivity. Figure 1 shows the literature review on the privatization.

This research is based on 1 main hypothesis and 7 subordinate hypotheses.

Primary hypothesis:
The privatization of ZREC has resulted in productivity in the subscribers’ services field.

Subordinate hypothesis:
1. Privatization of ZREC has resulted in “efficiency” in the “subscribers’ services” field.
2. Privatization of ZREC has resulted in “proficiency” in the “subscribers’ services” field.
3. Privatization of ZREC has resulted in productivity in the “branch sale” field.
4. Privatization of ZREC has resulted in productivity in the “counter installation” field.
5. Privatization of ZREC has resulted in productivity in the “counter reading” field.
6. Privatization of ZREC has resulted in productivity in the “bill distribution” field.
7. Privatization of ZREC has resulted in productivity in “account receiving” field.

Methodology:
From the goal and question entity and point of view, the research is a kind of functional research and from the research methodology point of view, it is a descriptive and survey research. To accumulate the required data, we use the library method and questionnaires. The questionnaires have been used to evaluate the people's attitude in the statistic sample toward the
privatization. Regarding this issue that privatization in the “subscribers’ services” field has seriously been followed since 2005, so the population has been selected from the employees (with more than 7 years job records) of ZREC.

In 2010 the employees are 386 in number that 352 people of them have more than 7 years job records. To examine the hypotheses of the research we need to have a sample of 185 people. Having been distributed the questionnaires, 184 of them were gathered and then used as the base of analysis. The sampling methodology is coincidental and chain. To evaluate the productivity of the subscribers' services field of ZREC we use 24 measures, 12 measures represent efficiency and 12 measures represent proficiency. Table 1 shows the measures separately in different aspects of subscribers' services field.

Data analysis

According to the Alfa Method by Kronbakh, the reliability of questionnaires is 89.3% which exceeds functional researches (70%); to analysis the data, we use both perceptive and descriptive statistic. Firstly, the data resulted by questionnaires are evaluated by demographic variables (e.g. sex, age, education level, and employment type) then the statistic hypothesis analyzed by using
Testing of the secondary hypotheses:
Hypothesis 1: the research states that the privatization causes a high proficiency in giving services to the subscribers of ZREC. The hypothesis is stated in two following forms:

According to the given information in the table above, in the error limitation of 0.05, hypothesis $H_0$ is rejected and hypothesis $H_1$ is accepted. As a result, there is a meaningful difference between the proficiency of Electricity Company before privatization and proficiency after privatization. The effect of privatization on proficiency also tends to increase it.

Hypothesis 2: the research states that privatization has increased the efficiency of ZREC in the subscribers' services field.

To test this hypothesis we state it in the following forms:

$H_0$: The privatization has not increased the efficiency of ZREC in the subscribers' services field.

$H_1$: The privatization has increased the efficiency of ZREC in the subscribers' services field.

Table (4): the evaluation of proficiency variable before and after privatization

</table>

According to the given information in the table above, in the error limitation of 0.05, hypothesis $H_0$ is rejected and hypothesis $H_1$ is accepted. As a result, Privatization has increased the efficiency of ZREC in the "account receiving" field.

Testing the main hypothesis:
This hypothesis states that the privatization has caused an increase in productivity of ZREC in the subscribers' services field. To test this hypothesis we state it in the tow following forms:

$H_0$: Privatization has not caused any increases in the productivity of ZREC in the "subscribers' services" field.

$H_1$: Privatization has increased the efficiency of ZREC in the "subscribers' services" field.

Table (10): the evaluation of productivity variable before and after privatization in the "subscribers' services" field.

<table>
<thead>
<tr>
<th>Privatization</th>
<th>Average of proficiency</th>
<th>Standard Deviation</th>
<th>Test statistic(t)</th>
<th>Freedom degree</th>
<th>Error limitation</th>
<th>Acceptable limitation</th>

<td></td>
</tr>
</tbody>
</table>

The table shows that in the error limitation of 0.05, $H_0$ (the null hypothesis) is rejected in and $H_1$ (the alternative hypothesis) is accepted. As a result, the privatization has caused an increase in the productivity of ZREC in "subscribers' services" field.

Conclusion
It is necessary to remember that the question number 1 is marked inversely. It means that when we are entering the data resulted from the questionnaires in the "SPSS" we should enter the reversed data for question number 1( recode the question no.1). In this way, all questions will be put in the course of increasing efficiency and will be marked in this form: 1= little, 2= a little , 3= average , 4= much , 5= very much .

In the proficiency field,"the secondary costs of branch getting "with a mean of -0.342 and " the facility of taking electricity branch " with a mean of 0.142 have the least difference in the mean; it means that the privatization of ZREC has increased the secondary costs of taking branch and the subscribers have had to pay a lot for the wasted time and money because of the bureaucratic formalities. The measures of “subscriber’s consent of the methods of bill payment” with a mean
of 1.429 and "on time and regular bill delivery to the subscribers" with a mean of 0.869 have the biggest mean differences and it means that the privatization in ZREC has caused the highest increase in the subscribers' consent of the payment method and the best performance in "on time and regular delivery of bill payment".

**In the efficiency field**, the measures of "company advertisement effect on "the on time bill payment" with a mean of 1.043 and "the quality of services after sale" with a mean of 0.73 have the most difference in the mean and it means that the privatization in ZREC has resulted in the positive effect of advertisement on the "on time payment". The quality of the subscribers' services is also remarkable; but the measures of "responsibility of the officers who are in charge of giving branches to the subscribers" with a mean of 0.25 and "the clearness of the written information and prices on the bill" with a mean of 0.315 have the least differences in the mean; it means that the in charge officers are not so qualified to give the needed information to the subscribers; or the written information and prices on the bills are too vague to understand.

**In the "branch sale" field**, the measure of "the secondary costs of taking branch" with a mean of -0.342 has the lowest mean and it means that the mentioned cost has remarkably increased. regarding the inflation and time passing, a portion of this increase could be normal but may be the employees who filled out the questionnaires had considered to this issue; any way we have encountered a remarkable increase in the costs. The measure of "the facility of taking branch" with a mean of 0.142 shows that privatization does not have a good function in this field. You may consider that these two measures are related to each other and it means that the bureaucratic formalities have caused a difficulty in the "branch taking" field and an increase in the secondary costs. One of the ways to reduce the cost of taking branch and getting it faster is minimizing the subscribers' reference to the ZREC by using the updated technology and internet for selling the branches. Another solution for cutting the bureaucratic formalities is using the advanced systems, sound labour division and creating a proper culture for the subscribers and managers. The quality of subscribers' services has the best position with a mean of 0.571 in the "branch sale" field and so the privatization has resulted an improvement in serving to the subscribers along with the giving branches to them. This means that issuing bills, counter installation, monitoring, etc., are being done at a faster speed. To preserve and reinforce the situation, more budgets should be allocated to this project. According to the result of data analysis, the responsibility of the in charge officers is not positioned in a good rank(0.25) but it can be improved by entrusting more authority to them( it causes they feel that the company has trusted to them). Another solution is stimulating and rewarding them to create a kind responsibility in them and make it clear for them that the subscribers are part of the existence reasons of the company and they have no alternatives but being responsible to them.

**In the counter installation field**, the measure of "subscriber's consent of the installation place of counter" with a mean of 0.266 has the lowest mean difference and "the quality of the after sale services" with a mean of 0.730 has the biggest mean difference. So it can be said that the installation of counters by the private sector has a remarkable difference with the ideal circumstances; and it needs more control on some factors like reading possibility, testing, inspecting, height from the ground, probable mending, counter installation, considering about the weather situation e.g. light, warmth, humidity, wind, etc. by the ministry of power and electricity place through holding the training courses for the private sector and making an inspecting team to pretend the possible violations. The privatization has increased the measure of "the quality of giving services after sale" and the private sector in some parts like increasing or decreasing the power, transferring, changing the registry name of subscribers have acted well.
In the "counter reading" field, the measure of “the quality of giving information about the reading time and things that the subscribers need to do in case that the counter is not being read” with a difference in mean of 0.609 had the best function. By looking at the table above you can find out that before privatization the mean of this measure has been 2.570 that is so low but after privatization, it is 3.179 that shows a remarkable increase. You should remember that the advertisement has played a significant role. The subscribers are not satisfied by the time when the counter reading officer goes their home to read the counter. So, this measure has not a good status. Interview with the subscribers shows that the time of counter reading is not suitable and it is done in the afternoon when most of the people are taking a rest. The electricity company can have a good plan to resolve this problem. Any way the situation is much better than before privatization. The effect of “not being read” warning on the subscribers comparing with that before privatization is too much; so it shows an upward trend in this field.

Approximately all of the measures in the “bill distribution” field have relatively high means. “On time and regular delivery of bills to the subscribers” measure (0.869) done every other month has a rational regularity comparing with the period before the privatization. “The clearness of price and information written on the bill” showing the lowest mean difference of 0.315 comparing with the other means, states that the subscribers still do not have sufficient knowledge about some prices and information written on the electricity bill (e.g. subscription cost, taxes, the subscriber’s previous debt which is not already paid, and total debits, etc) and it may cause a difference their estimation of price and the real one. The private sector should be responsible about the clearness of the written information on the bill and be able to make clear the ambiguities created of this type. It can be done by exact calculation of price and printing enough explanations, required guidelines or referring them to the related units (departments) in the electricity company. “Befitting behavior of counter reading officer” measure does not have a remarkable difference between the means before and after the privatization. The measure of “being responsible of the counter reading officers about answering the subscribers’ questions” with a mean of 0.424 does not sound to be so perfect as well and it seems that there are some problems. So, the best solutions for the mentioned problem are stimulating the in charge employees of the counter and make it clear for them that answering the subscribers is the main task. Punishment, penalizing, and reprimand of the in charge employees seem to be suitable alternatives.

In the “account receiving field”, the measure of “the subscribers’ consent of the bill payment methods” has the best function. The difference between the means of this measure is 1.429. There is no need to mention that the “effect of advertisement” measure with a mean of 1.043 has had a good performance as well. Before the privatization, the payment method was paying the cost of the used electricity directly to the in charge officer at the door, when they gave the bill to the subscribers and the best way was payment through the banks. These ways needed to spend a lot of time and were costly. Nowadays, the costs of coming and going to banks have been reduced by using the privatization and accompanying the government with private sectors. These days various methods have been created to pay the bills, e.g. deducting form bank account and the most important method is paying the bills through the internet. These methods have some advantages like saving time and money, preventing the useless coming and going, decreasing the traffic and accidents, decreasing the use of fuel, and as a result reducing the air pollution.

Abstract
Human Resources for Health (HRH) is seen as the cornerstone of health care delivery system. This study then reviewed it in Nigeria, that is, the trend from independence, various cadres of the health workforce, production, and distribution at various levels of government. It also discusses the challenges including overall impact on health systems with appropriate recommendations. The methodology include detail desk reviewed of local, national and international documents and in-depth interview of desk officers in charge of HRH at National and State levels, some staff of various Ministries of Health and Stakeholders. As at December 2009, there were 28,531 medical doctors in the country; translating into a ratio of 19.3 medical doctors for every 100,000 population. The registry books of the Nursing and Midwifery Council of Nigeria (NMCN) indicates 137,198 Nurses Nationwide, translating to 92.7 Nurses per 100,000 population and 93,743 midwives. The density of medical doctor’s across the 36 state and federal capital territory (FCT) shows clear distribution imbalances. For the Nurses and midwives, there is a wide inter-sate disparity. Seventy –five percent of the medical training schools are located in the southern part of the country. It is seen that HRH development in Nigeria will require several actors others than those in the health sector, working together towards common purpose. Recommendations include intensify of staff education and training; performance management and improved working conditions. A strategy for the development of human resource for health information systems needs to the developed at national and adapted at the state levels.

Key words: Health; Human Resource Management, Doctors, Nurses, Midwives, Nigeria

1 INTRODUCTION
The term Human Resources in Health (HRH) refers to ‘the stock of all individuals engaged in promoting, protecting or improving the health of populations’ (WHO 2006). Human Resources for Health can also be defined as “those who promote and preserve health as well as those who diagnose and treat diseases. Also included are health management and support workers, those who help to make the health system function but who do not provide health services directly” (WHO 2006). This term is used synonymously as ‘health workforce, health workers, health
professionals’ and although it ideally encompasses doctors, dentists, nurses, pharmacists, technologists, community /primary care workers.

African countries have a very low density health workforce, compounded by poor skill mix and inadequate investment (Chen L et al 2004). Yet trained healthcare staff continues to migrate from Africa to more developed countries. The World Health Organization (2004) has estimated that, to meet the ambitious targets of the millennium development goals, African health services will need to train and retain an extra one million health workers by 2010.

It is therefore appropriate to state that any country that tends to have a low level of human resources for health (HRH) would not be on tract in reaching the health MDGs. Insufficient HRH capacity is definitely one of the key barriers to scaling up health services in Nigeria. The impact of the HRH shortage is greater in the developing countries as compared to the developed countries. This scenario is currently worsened by the diseases such as HIV/AIDS, TB and Malaria that are exacting greatest toll in these same countries most especially Nigeria.

HRH is not all about numbers. It involves distribution, quality and productivity. In essence HRH is concerned with getting the right number of staff, in the right places, at the right time, doing the right job, with the right motivation, at the right cost.

This study reviewed HRH in Nigeria the trend from independent, various cadres, of health the workforce, production, distribution; it also discusses the challenges including overall impact on health systems with appropriate recommendations.

The methods include detail desk reviewed of local, national and international documents and in-depth interview of desk officers in charge of HRH at National and State levels, some staff of MOH and Stakeholders.

The trend in Development of Human Resources for Health in Nigeria from Independence through Basic Health Service Scheme (BHSS) and various National Development Plans

Human Resources for Health Prior to BHSS Training as ‘Local Health Visitor’ began in Nigeria as early as 1949 when girls with Middle II schooling who were Grade II midwives were trained for the new Rural Health Centers in Western Nigeria. This then evolved into the idea of ‘community nurse’, an auxiliary health visitor, receiving six months’ or a year’s training in a health auxiliary training school, based on Grade II Midwifery background (Schram, 1971). By 1958, with the assistance of the WHO, training facilities were expanded and the Ibadan Health Auxiliary Training School which by now had replaced the old school trained all categories—public health inspectors, community nurses, family visitors, leprosy inspectors, dispensary attendants, and health overseers, and organized refresher courses. Similar trainings were offered in the Medical Auxiliary Training School in Kaduna and School of Hygiene in Kano in Northern Nigeria, as well as the School of Hygiene in Aba and Oji River Rural Health Training School in the East. Various categories of health workers existed in different parts of Nigeria before the BHSS.

With the introduction of the BHSS in 1977, the need arose for streamlining the recruitment, training and utilization of these health workers.

Consequently the federal government through the Basic Health Services Scheme Implementation Agency (BHSSIA) of the Federal Ministry of Health decided to regroup them in 1977 (some after retraining) into four cadres of “core” polyvalent workers and these have remained the core primary health workers in Nigeria’s PHC system. See table 1

In 2009 MSS scheme was introduced
STOCK OF HEALTH WORKFORCE IN NIGERIA

It has been observed that apart from Egypt and South Africa, Nigeria has one of the largest stocks of human resources for health in Africa. Table 2; gives the analysis of different workforce in Nigeria from 2004-2007. The number of registered doctors is about 58,325; this translates into a ratio of 39.4 medical doctors for every 100,000 population. The “in good standing” counting approach features individuals who are still engaged in the provision of health care services broadly defined, and are unlikely to be deceased, emigrated, or retired, as is possible with the general historical registry books on the cadres. As at December 2009, there were 28,531 medical doctors in the country; translating into a ratio of 19.3 medical doctors for every 100,000 population. Even going by this conservative figure, Nigeria has a much higher comparative ratio of doctors than the sub-Saharan African’s average of 15 doctors and 72 nurses per 100,000 populations (WHO 2006).

An additional number of 467 foreign medical doctors had renewed their license with the medical and dental council of Nigeria (MDCN) in 2009 and were practicing in the country. It should also be noted that the dentists’ workforce was estimated at 1,239 Nigerians and 18 aliens.

As at December 2009, the registry books of the Nursing and Midwifery Council of Nigeria indicate that there were 137,198 nurses nationwide, translating into 92.7 nurses per 100,000 population; a much higher ratio than the sub-Saharan African’s average of 72 nurses per 100,000 population. The registry books report also a cumulative figure of 93,743 midwives.

2.1 Health worker density

Following the Joint Learning Initiative (JLI) report that demonstrated a positive correlation between the density of health workers and improvement in basic health indicators including infant, under-5 and maternal mortality; the World Health Organization (WHO) in 2006 suggested that a minimum of 2.3 health workers per 1000 people (counting only doctors, nurses and pharmacists) is required to attain adequate coverage of some essential health interventions and core MDG-related health services (WHO,2006). Table 3 indicates that even when considering the registry counts, the doctors, nurses and midwives workforce density is only 1.95 per 1,000 population and falls slightly short of the WHO recommended threshold of 2.28 per 1,000 population needed to ensure the adequate coverage of essential health services. There is even most likely a lesser workforce if counting only health workers in good standing.

The density of medical doctors across the 36 states and FCT presented in figure 1 show clear distributional imbalances. The density ranges from 1.1 doctors per 100,000 populations (Adamawa state) to 44.8 doctors per 100,000 populations (Kwara State). Seven of the 36 states that have fewer than 3 doctors per 100 000 inhabitants happen to be located in the north eastern (Adamawa 1.1; Bauchi 2.2; Yobe 1.3/100,000 population) and north western (Jigawa 1.2; Zamfara 1.7; Katsina 2.3; Kebbi 2.6/100,000 population). While the states that have more than 30 doctors per 100,000 are located in south western (Lagos State 33.4; Osun 40.1/100,000 population); and northern central (FCT 32.0; Kwara 44.8/100,000 population).

The nurses and midwives density to population was calculated based on professionals that are in good standing with the Nursing and Midwifery Council of Nigeria (NMCN). These ratios should be therefore treated with cautious since it is known that only few health workers renew their license due to the fact that states do not make it mandatory for practicing in their health facilities. The Figures 3,4 and 5 however provide an idea of the nursing and midwifery staffing pattern in all the 36 states and FCT.
There is a wide inter-state disparity ranging from 5.2 nurses and midwives per 100,000 population in Jigawa state (or 1 nurse for 19,230 people) to 59.1 nurses and midwives per 100,000 population (or 1 nurse for 1,692 people) in Enugu state. Many of the states having the lowest density of nurses and midwives are located in the North-Western geopolitical zone (Jigawa; 5.2/100,000; Zamfara 6.7/100,000; Kebbi 9.5; Kano 10.1/100,000 population) and in the North East (Bauchi 10.4/100,000 population). Highest density of nurses and midwives are rather reported in South Eastern (Enugu 59.1/100,000) South Western (Lagos 57.8/100,000) and South South (Akwa Ibom 55.8/100,000; Bayelsa 51.3 per 100,000 populations).

HEALTH WORKFORCE PRODUCTION AND DISTRIBUTION WITHIN THE COUNTRY

Nigeria has a relatively good number of health training institutions. In 2009, there were 27 accredited medical schools, 7 accredited dental schools, 89 approved schools of nursing, 76 approved schools of midwifery, 15 medical lab schools, 41 medical laboratory technicians/assistants schools, 8 schools of physiotherapists, 6 schools of radiography, 10 schools of pharmacy, 19 schools of pharmacy technology, 44 schools for health records officers, 14 schools of community health officers, 50 schools of community health extension worker, 4 schools of dental technology, 4 schools of dental therapists, 5 schools of dental health technician, 5 schools of dental surgery assistant, 1 school of dental nurse, and 3 schools of optometrists. However there is a poor distribution of these training institutions with majority (75%) of them being located in the southern parts of the country (see figure 2 below). Even though each state of the federation has at least one nursing and midwifery schools, figures below indicate distributional imbalances of nursing and midwifery schools. Majority of the schools are concentrated in the southern parts of the country with some states hosting up to 6 schools (Imo state, Osun) or 5 schools (Anambra state, Oyo state).

Box 1: Poor Health Status despite large stock of human resources

Fertility Rate in Nigeria remained at high level over the last 17 years from 5.9 births per woman in 1991 to 5.7 births in 2008
IMR is 75 deaths per 1,000 live births, while the U5MR is 157 per 1,000 live births. The NMR is 40 per 1,000 births.
MMR is 545 maternal deaths per 100,000 live births.
Stunted 41% (short for their age), 14 percent are wasted (thin for their height), and 23 percent are underweight.
In 1991, the average life expectancy was 53.8 years for women and 52.6 years for men (UNFPA, 2005). The 2007 estimate had fallen to 50 for women and 48 for men (WHO, 2009) population.

Source: Political Economy of the health sector in Nigeria
**Imbalanced distribution**

As shown in Figure 6, the distribution of health workers by level of care reveals that CHOs and CHEWs are the predominant category of staff at the primary care level. Only 19% of doctors are found at this level. The corresponding figures for other categories of health workers are: nurses and midwives 31%, lab staff 42% and pharmacy staff 38%.

This indicates that the staffing pattern in the public sector is skewed in favour of secondary and tertiary care. This can be explained partly due to the complexity of services at this level and also the urban location of most of these services – urban location being a strong pull factor for health workers.

On the average an urban resident has access nearly twice or three times more health worker compared to a rural resident. The only exception is the category of community health officers (CHO) and Community extension workers (CHEW), who are more numerous in rural areas.

Finally, another type of imbalance that is usually overlooked is **gender imbalance** see figures 8&9, *a case study of Katisna and Yobe States*. This has been seen where certain categories of staff are disproportional males or female – Available data shows that 20% physicians and dentists across the country are women.

**Migration**

This is fuelled by certain conditions (push factors) that encourage health professionals to leave the country - such as low pay, poor career prospects, lack of opportunity for professional advancement, adverse social and political conditions. Added to these are equally attractive conditions (pull factors) that entice these professional to go to industrialised countries – these include promises of better remuneration, better work environment, and better prospect for career development.

Migration of health staff out of the country is an important issue. Highly qualified nurses and Specialist doctors have been mainly involved in migration to other countries. Research into migration of health workers is ongoing with funding and technical support from partners. In the year 2005, two thousand six hundred nurses migrated to UK, 2050 migrated to USA. Other countries of importance to migration are Ireland, Australia, and Canada. Some nurses have migrated to other parts of Africa. Data from nursing and Midwifery council shows that they received a request from 3194 nurses in 2008 for seeking employment outside Nigeria. See Table4

A large number of medical doctors have migrated to UK, USA, Ireland, Denmark, Australia. The trend of migration is more towards USA, UK, then other parts of Europe. Data from American Medical Association revealed that in 2003, 2855 Nigerian Doctors were registered with the American Medical Association out of which 44% of were specialist in internal medicine. It is difficult to have a total number of actual migrants, however using proxy data like requests for certificate of good standing, it appears that 2,985 Nigerian doctors migrated in the year 2006 and 2,341 migrated in 2005. In 2007 the number of doctors migrated increased to 3,567. See Table 5

**4. HRH RESEARCH AND HRIS**

Currently there are very few HRH- specific research programmes. There is very little fund available for such research. Efforts are on way to process funds to carry out research on human resources for health. Some of the research issues include the migration of health workers, motivation of health workers and so on. Similarly HRIS is fragmented, often there exists discrepancy in the number from register and that obtained from professional regulatory bodies.
5. CONCLUSION

From the foregoing it can be seen that human resource development in Nigeria required several actors other than those in the health sector, working together towards a common purpose. But most importantly, it requires the cooperation between Federal and State Ministries of health and other health care providers, universities, other educational institutions, and professional associations.

In addition, the new landscape of health care provision require more from health professionals other than acquiring new skills or working in multi-disciplinary teams. It also demands new attitudes, finding creative ways whereby health professionals can engage in effective partnerships with both patients and organizations that purchase health care on their behalf.

Finally, human resource development executes these functions in a coherent manner. It requires a good understanding of the numerous and complex issues as identified above. It also requires the capacity to incorporate coordination mechanisms in the policy-making process. This is essential in order to avoid nullifying the benefits of one policy by the negative effects of another.

However, in order to undertake this human resource development function properly and effectively a national strategy for the development of human resources for health needs to be developed and adapted at the State and LGA levels. This should be linked to a comprehensive National health strategic development plan (NHSDP) with well defined targets. As much as possible the plan should encompass those of the states and local government areas.

6. RECOMMENDATIONS: Strategies for Addressing HRH Challenges

The following is an outline of some ideas for strategies to help tackle HRH challenges in Nigeria on the basis of the findings of this review.

1. Shortage of Health Manpower; This can be dealt with by increasing the availability of staff. Some strategies that can be used include:
   
i. It should be reminded that the numbers of health workers matters a lot. States having less than the sub-Saharan average of 15 doctors per 100,000 populations (24 out of the 36 states or the 2/3) should develop a recruitment plan to address the critical shortages of doctors hampering service delivery in their respective states.
   
   ii. Given the critical role played by nurses and midwives in the provision of health care to people, states facing acute shortages of these cadres should invest in expanding gradually its workforce to reach at least the sub-Saharan average density of 75 nurses for 100,000 populations or 1 nurse for every 1,333 people.
   
   iii. Raising the productivity levels of existing staff. This can be achieved by reducing absenteeism, introducing incentives to better motivate staff, reviewing how tasks are divided and organized and using more efficient technology.
   
   iv. Reviewing employment regulations. This would involve incorporating elements such as raising retirement age, introducing flexible employment (contracts, part-time), and mechanisms for re-entry for people who left the sector temporarily.
   
   v. Creation of new cadres. The Nursing and Midwifery Council of Nigeria should approve the training of community midwives to meet the demand for trained assistance at birth. Another cadre worth considering are surgical technicians to assist doctors in operating theatres in order to increase access to emergency obstetric care.
vi. Increasing the production of new staff. All newly established medical schools and other health professionals training institutions needs to be properly monitored to ensure quality and avoid surplus.

2. Geographical Imbalances. This can be addressed through a variety of measures. They include:
   i. Specific recruitment for rural areas with incentives such as training, special financial package or rapid promotion.
   ii. Decentralization of hiring – by delegating the function to district health authorities or hospitals
   iii. A period of rural service other than national youth service as a condition for private practice.

3. Education and Training;
   I. Efforts should be invested by the less endowed states to expand their in-service training capacity to the level of the southern states that produce enough midwives for their deployment in rural facilities to address the pressing MCH needs.

II. After graduation continuing medical education should become mandatory as a condition for the renewal of practice license. Finally, accreditation of training institutions should be seen as mechanism to sustain continuing improvement rather than a process of periodic evaluation. FMOH collaborates with some local universities concerning the in-service training of health manpower in the following areas: Health Planning & Management (Universities of Benin, Ilorin and Maiduguri), Health Information Management (Ilorin), and Health Economics (Abia State University). Plans are under way to commence training programmes in Health Financing at the University of Calabar and Ahmadu Bello University, and Women in Health at the Obafemi Awolowo University, Ile Ife. This effort should be sustained.

III. Human Resource Research and Human Resource Health Information Systems; Many health regulatory agencies could not report on skill mix parameters; they will need to improve their database in order to report on these crucial indicators susceptible to guide decision making.

This research is on the basis of self finance.

Abstract
This study examines the relationship between financial variables and corporate governance particularly the board of director’s effectiveness in Pakistani listed companies. Logit analysis is used to investigate that the whether board of directors is influenced by financial variables: firm Size, Profit, Turnover, D/E, ROE, Sector (financial or non-financial), and type of firm (local or international). This empirical analysis for board effectiveness, composition and size is done on the cross-section of the 50 firms for the year 2009 to examine how the cross firm differences in the type of firm, the sector to which firm belongs, the size, profitability, capital structure of the firm influence this crucial corporate governance component board composition and effectiveness in Pakistan. Most of the results of the study reveal that financial variables are less likely to influence the board effectiveness. The performance (ROE and Turnover) of the firms have significant association with large board size. Moreover, firms with high performance in terms of ROE conduct more board meetings.

Keywords: Determinants; Board Effectiveness; Logit Model

1. Introduction

Good Corporate Governance enhances the performance potential of an organization and increase organizations’ chances to attract outside capital, this in turn results in a stable and progressing economic development. Role of good corporate governance is even more important in emerging markets where many public policy objectives are achieved through corporate governance. Like; it helps in reducing transaction and capital cost and move towards development of capital market; it helps in overcoming financial crises and support to strengthen property rights. Corporate Governance gives importance to relationship among all stakeholders for producing better results. Stakeholders include major shareholders, management of the company, its Board of Directors and other shareholders etc. Corporate Governance is an important area for research in corporate sector and it is more even important after its publication by Securities & Exchange Commission of Pakistan as code of conduct under banner of Corporate Governance Code 2002 for the companies which are listed on Stock Exchange.

SECP introduced code of Corporate Governance in early 2002, it is main step towards corporate governance reforms in country. Many recommendations included in
this code are aligned with good practices followed internationally. There are two main area of enforcement one; Reforms of BODs to make the board responsible and answerable to all shareholders and second; ensuring better disclosure for the companies with internal & external audits in improved manner. Guidance regarding risk management, internal controls and board is not available and code’s limited provision on independence of directors remains voluntary.

Various studies based on corporate governance find that countries having weakest investor protection have less developed debt and equity markets than those having strongest investor protection (La Porta, et al. (1997), Demirguc-Kunt and Maksimovic (1998), Javid and Iqbal (2010) for Pakistan). These studies come to one important implication that external control mechanisms are vital to keep a balance between interest of managers and those of shareholders, but the question arises what happens in the absence of these mechanisms as in case of Pakistan. According to Javid and Iqbal (2010) and La Porta et al., (1998), minority shareholders do not participate heavily in those financial markets where their rights are not well protected; however, researchers provide concentrated ownership a key factor. The reason behind is monitoring of management generally by large shareholders.

The main focus of this study is to find out the relationship between corporate governance and financial variables particularly the board of directors’ effectiveness on Pakistani listed companies for 2009. In Pakistan, where ownership tends to be centrally concentrated, agency issues or problems can be settled/solved by way of using Boards to watch and keep an eye on top-level management, ensuring legally protected rights of minority investors and an active market to exercise corporate control over it. In developed countries, corporate governance rely more upon investors outside and capital markets. However, contrary to that in Pakistan corporate sector efficiency is achieved through more reliance of corporate governance on financial institution and on inside investors with large investments. In this particular situation, relatively smaller outside investors are exposed to the risk as chances are increased that the wealth flow to large shareholders.

1.1 Problem Statement

Impact of firm size, Performance measures (ROE), Capital Structure, Profit, Sector and Type of Industry on Board Effectiveness in KSE listed companies.

1.2 Objective of the Study

The main objective of the study is how board composition (board size, independent directors, and no. of BOD meetings) audit independence is influenced by sector to which the firm belongs (financial or non-financial), type of industry to which firm belongs (local or international) and capital structure (D/E) after controlling for size and profitability of the firm.

- To measure the board of directors effectiveness and composition of Pakistani firms.
• To explore empirically which financial factors (size, profit, capital structure, ROE) more strongly influence board composition characteristics.
• To examine the relationship between firm’s financial variables and overall corporate governance compliance.

1.3 Significance of the study

The current study has twofold significance. At one end it will educate the investors and management practitioners about the existence of Corporate Governance practices in Pakistani companies regarding Boards. On the other end, SECP is going to revise corporate governance code so this study would highlight the importance of board in revision. This study addresses some of the underline factors that promote efficient boards and examine some of the strengths, weaknesses, and economic implications related to board composition.

1.4 Organization of the Study

Rest of the study is organized as follows. Section two provides literature of corporate governance. The methodology and data is discussed in section three. The empirical results are discussed in section four and last section concludes the study.

2. Literature Review

Corporate governance has attained the attention of practitioners as well as academic researchers (Bebchuk and Cohen 2004). The need to improve corporate governance practices for effective financial reporting process has been highlighted in the literature (Levitt 1998, 1999, 2000). In Sarbanes-Oxley Act 2002, efficacy of the audit committees has been emphasized and responsibility to ensure the authenticity of financial reports is on management and board of directors. Audit committee and Board of Directors have been focal point for the accounting profession and earlier research. For example corporate governance was defined by Public Oversight Board as "those oversight activities undertaken by the board of directors and audit committee to ensure the integrity of the financial reporting process". A narrowed view of Corporate Governance, however, made its scope limited to monitoring of activities only and this may undervalue the role of Corporate Governance and thus the potential remain unused. Relationship among various actors and mechanisms within Corporate Governance arena is an important thing to consider. E.g. To achieve a quality full financial reporting and effective governance crucial factors on the scene are interaction among the internal auditors, audit committee, external auditor, the management and the board (Sarbanes-Oxley Act 2002). Management considerably influenced these parties; as revealed from an interview based study with experienced auditors (Cohen, et al.2002).

La Porta, et al. (1997) studied forty nine developing and developed countries and found that the countries having weakest investor protection have less developed debt and equity markets than those having strongest investor protection. These findings have significant insinuation for corporate governance study in economies outside U.S and other advanced economies. External control mechanisms, for example, are vital to keep a balance between interest of managers and those of shareholders, but the question arises
what happens in the absence of these mechanisms? La porta et al. (1998) concluded evidence that shareholders with minor and branched out investments are not likely to take part actively and on big scale in financial markets of countries where their rights are not protected due to concentrated ownership. For this, there is a simple explanation, dominant shareholder with large investments/shareholding are more active to observe the management at the cost of disadvantageous diversification. This claim is supported by Empirical evidence; in countries dominated by French Civil Law, ownership tends to be concentrated as compared to Common Law countries. Bhagat & Black (2002) studied the firm performance affected by independent Directors. They found that companies with low profit are more tend to increase independent directors on the board, without even having concrete evidence whether or not this strategy works for them. For this common belief that performance can be improved through independent board, no statistical support or data was available. In this particular study, data for 934 firms was used for the period 1985-1995. Denis and Sarin (1999) also considered a long period from 1983-1992 on boards and they used data from 583 during the above mentioned period of study. They found from the study that ownership and changes in board have strong relationship with corporate events such as turnover of top executive and stock performance in a period, whereas, the same have weak relationship with threats to corporate control. Impact of size of board on firm’s performance is another important factor that has been area of interest for the research. Yermack (1996) studied a sample of 452 large firm in United States for the period 1984 to 1991 and found that size of board have negative relation with firm value. His study suggested that small size boards are more likely to dismiss CEO for poor performance and they set compensation of CEO in relation with firm performance.

Cheema, et al. (2003) suggested that In Pakistan, if the Corporate Governance system come in line with the goal of increasing external equity through capital markets, then foreign Direct Investment can be attracted and Pakistan increase saving through capital. Mainly, corporate structure, here in Pakistan, is characterized as family concentrated management, related directorships. Then there are pyramid structures and there are cross-shareholdings. The main objective of the reform is to protect minority shareholders that may reduce profit-maximizing incentives for families. Optimizing both the objectives, i.e. protection of minority shareholders and keeping the profit maximization incentive intact for family controlling hands is the challenge for policy makers. Progressive companies have to take initiative and contribute towards efforts for Corporate Governance Reforms. Rais and Saeed (2005) analyzed corporate Governance Code 2002 under Regulatory Impact Assessment (RIA) framework and its application and enforcement to comprehend the dynamics of public decision-making and consider the usefulness of the regulations of SECP in the area of corporate governance. The study showed that although the listed companies are making themselves prepared to adopt the code, yet there are reservations about the draft and enforcement of code and there too are some constraints. Ghani, et al. (2002) studied the impact of business groups on corporate governance in Pakistan for non-financial firms for 1998-2002. Evidence of the study showed that business groups are viewed by the investors as a mechanism to walk off with wealth of minority shareholders. On the other side, results of comparative financial performs showed that, In Pakistan- business groups are proficient economic arrangements substituting the missing or uneconomical/inefficient outside markets and institutions.
Ashraf and Ghani (2005) found in their study that rights protection, legal inefficiencies, and fragile enforcement mechanisms are the key factors in clearing up the state of accounting in Pakistan.

Corporate governance refers to how companies should be run, directed, and controlled (Gompers et al., 2003). The corporate governance is concerned with the relationship between the internal governance mechanism of corporations and society’s idea of the scope of corporate responsibility (Deakin & Hughes, 1997). The board size has been a well known significant antecedent of corporate governance effectiveness in theoretical studies (Lipton & Lorsch, 1992; Jensen, 1993). Jensen (1986) found that with high leverage ratios have a larger board size. On the other hand, in Berger et al. (1997), debt level is lower when there is a larger board size. The limited board size will also limit the no. of independent directors available to serve on the audit committee and reported evidence that the audit committee independence increases with the board size (Beasley & Salterio, 2001; Klein, 2002). Experimental research has concluded that size of Board and number of meetings of Boards of Directors may have relation with performance and results of a firm (Eisenberg et al., 1998).

3. Methodology

To test the hypothesis that the role of the board of directors is crucial, when the shareholders are not well protected because of less developed financial markets. (La Porta, et al., (1997); Javid & Iqbal (2010)). The board composition and dynamics is modeled following Hermalin and Weisbach (1998). Logit analysis is used in a multivariate setting to investigate that the whether board of directors is influenced by financial variables: firm size, profit, D/E, ROE, turnover and sector (financial or non-financial), type of firm (local or international). The logit model is used in this study to test the determinants of board effectiveness.

The multivariable logistic response function is given by

\[ E(Y_i) = \frac{e^{\beta_i X_i}}{1 + e^{\beta_i X_i}} \]

The log-likelihood function is given by (Neter et al., 1996)

\[ L(\beta) = \sum_{i=1}^{n} Y_i (\beta_i X_i) - \ln(1 + e^{\beta X_i}) \]

The maximum Likelihood estimation technique is used. The model becomes:

\[ Y_i = \beta_i X_i + \varepsilon_i \]

Where \( \beta_i \) is vector of coefficients and \( X_i \) consist of set of explanatory variables and \( \varepsilon_i \) is random error term.

Compositions of Boards brings in autonomy of boards, ensure structure and results in effectiveness. To measure autonomy many indicators of boards’ independence can be used like independent and outside directors on board, making two different slots
of CEO and Chairman to keep them apart, a CFO looking financial affairs. Autonomy enhances board’s capability and increases its ability to make right judgments and execute them properly. It assesses executive directors critically and by having on board non-executive members, influential control of management over boards reduces considerably. Also, more the number of outside directors on the board, higher the company performance will be. A smaller board, due to factor of social cohesion potential, can easily be taken under control and is manageable for CEO (Shaw, 1981). In case of large Board of Directors, CEO requires more time and has to put more efforts to get consensus of Board on different matters and decisions. Thus, a larger board enjoys more independence as CEO’s influence become weak and his dominance over the board is more difficult to achieve. Larger boards have some evidences in their favour. Chaganli, Mahajam and Sharma (1983) studied relationship between size of a board and chances of bankruptcy of the firm. They found that non-financial firms inclined to have large size of board than the board size of financial firms. Larger boards enjoy more autonomy and independence and that is why larger boards are related with higher performance. The dependent variable consists of following:

Board Size (DBS) =1 if member in board is greater than 6
               =0 otherwise

Independent Directors (DIND) = 1 If there are independent directors
                             = 0 otherwise

No. of BOD meetings (BOGM) = 1 If there are meeting more than 4
                            = 0 otherwise

Audit Independence (DAUDIT) =1 if audit committee is independent
                           = 0 otherwise

The set of explanatory variable includes
Sector (Sec) = 1 if the firm is financial firm (bank or other)
              = 0 otherwise (energy, textile, chemical, food and miscellaneous)

Size = log (total asset)
ROE = Net return/Total equity
D/E = Total debt/ Total equity
Turnover = No of shares traded
Profit = log (net earnings)
TYPE = 1 if firm is international
       0 otherwise

Therefore, the model becomes:

\[ Board_i = \beta_0 + \beta_1 SIZE_i + \beta_2 TO_i + \beta_3 Profit + \beta_4 TYPE_i + \beta_5 SEC_i + \beta_6 ROE_i + \beta_7 D/E + \epsilon_i \]
4. Results and Discussion

This empirical analysis for board effectiveness, composition and size is done on the cross-section of the 50 firms for the year 2009 for examine how the cross firm differences in the type of firm, the sector to which firm belongs, the size, profitability, capital structure of the firm influence this crucial corporate governance component board composition and effectiveness in Pakistan. Most of the results of the study reveal that financial variables are less likely to influence the board effectiveness.

First, the study examines the board size and six numbers of board members are taken as benchmark following the empirical literature on this area (Goodstein et al; 1994). The board size is the characteristic of corporate that measures the board’s ability to monitor. The results reported on Table 1 indicate that financial firms are more likely to choose large boards. The performance (ROE), D/E and Turnover have a significant association with large board size. Therefore, the firms having high ROE, D/E and Turnover are more likely to have reasonably large boards. The findings regarding board size are mixed, for example, Goodstein et al (1994) argued that smaller board from four to six might be more effective because they make timely strategic decisions, while large board are capable of monitoring decisions of the top management. Yarmack (1996) found smaller boards are more efficient. Whereas, other financial variables including Profit, size and Type of Industry do not matter in determining the Board size for this sample.

The result of Table 2 reveals that the firms which are financial and international with high performance (ROE, Turnover) has more probability to include more independent directors in their boards. The numbers of independent directors are more, firms are less likely to rely on debt because the outside directors keep an eye on the managers and debt reliance is reduced. The same result is found by Wen et al (2002) and opposite results is found by Jensen (1986), Berger et al (1997) that the firms with more outside directors have high level of debt.

Board meetings are important because boards do on the behalf of the company and there is process of board acting collectively. Mode of acting collectively is by passing resolution on board meetings. More meeting means more chances of considering different decisions by the boards and quickly reaching to final results. Board meetings are less likely to depend on financial characteristics of firms, however the firms which are financial and international and have high performance in terms of ROE has more probability of holding more meetings as shown by results of Table 3. The findings regarding BOD meetings are consistent with the study of Gonzalez and Garay (2003).

As regards the extent of independent audit committee the results of Table 4 indicate that the performance (ROE, Turnover), debt to equity ratio is positively associated with it. The Local and non-financial firms have more probability of having independent audit committee. These results are similar to the larger board size because larger board assures independent committee for audit. Jensen (1986) and Berger et al (1997) find the same result.
5. Conclusion

Good corporate governance contributes to sustainable economic development by enhancing the performance of companies and increasing their access to outside capital and reducing vulnerability of the financial crises, reinforcing property rights; reducing transaction cost and cost of capital and leading to capital market development. In Pakistan, where ownership tends to be centrally concentrated, agency issues or problems can be settled/solved by way of using Boards to watch and keep an eye on top-level management, ensuring legally protected rights of minority investors and an active market to exercise corporate control over it. In developed countries, corporate governance rely more upon investors outside and capital markets. However, contrary to that in Pakistan corporate sector efficiency is achieved through more reliance of corporate governance on financial institution and on inside investors with large investments. In this particular situation, relatively smaller outside investors are exposed to the risk as chances are increased that the wealth flow to large shareholders.

This study indicates that financial firms are more likely to choose large boards. The firms having high ROE, D/E and Turnover are more likely to have reasonably large boards. Moreover, the international and financial firms whose profitability is high have more independent directors that reduce debt reliance of their firms. Financial and international firms with high performance in terms of ROE conduct more board meetings. The local and financial firms in relation to financial and international firms mostly rely on independent audit committees that are positively related to performance. At the same time, larger board size assures to have more independent committee for audit.

5.1 Limitations and Recommendations

In this study different Boards characteristics like Inside Directors, Board Ownership, DCEO Duality, managerial ownership and Corporate Governance Compliance have not employed due to non-availability of data for full sample set. Future research can be conducted by considering all these variables. The current study has been conducted on small sample size i.e. 50 for 2009. The future research can be carried out on a more informative sample.

5.2 Policy Implications

Above findings have important implications for researchers, policy makers and corporate Boards: Efforts to improve Corporate Governance should focus on reasonable large board because it assures independent committee for audit. Boards should also consider the extent of independent audit committee since it is positively related to performance (ROE, Volume), and Capital Structure.

Abstract
Over the past few decades stress is emerging as an increasing organizational issue, especially the banking personnel’s are under great deal of stress due to lots of stress factors such as role ambiguity, work overload, lack of feedback, role conflict, keeping up with rapid technological changes in dynamic corporate environment. This study examines the impact of stress on job performance of employees working in banking sector of Pakistan. The data were collected from 112 bankers including managers, customer service officers (CSOs) and business development officers (BDOs) of well reputed conventional as well as Islamic banks of Punjab. The collected data through questionnaire forms then analyzed using SPSS 16. A significant and negative correlation of stress was found with job performance. The results suggests that financial institutions should employ effective stress management practices such as division of work and supportive workplace culture to increase satisfaction and overall job performance of bankers.

Keywords: Stress, Job Performance, Banking Sector, Pakistan

Introduction
Stress is a universal phenomena experienced by employees around the globe. It has become major problem for employers particularly in developing nations where the employers don’t realize the impact of stress on employees’ job performance which ultimately results in critical managerial dilemmas. High rates of mergers, acquisitions, increasing economic interdependence among different nations due to globalization, technological development, and restructuring have changed the organizational work over the last few decades have resulted in time pressure, excessive work demand, role conflicts, ergonomic insufficiencies and problematic customer relationship are causes of stress (Pincherle, 1972).

Stress has been defined in different ways over the years. (Selye, 1974) first introduced the idea of stress in to the social sciences. It is something about an organizational role that produces adverse consequences for the employees (Kahn, Wolfe, Quinn, Snoek, & Rosenthal, 1964). Originally, it was conceived as pressure from the workplace environment, then as strain within the individual. It is the psychological and physical

COPY RIGHT © 2011 Institute of Interdisciplinary Business Research 1982
state that results when the resources of the individual are not sufficient to cope with the demands and pressures of the situation (Robbins, 1996). Thus, stress is more likely in some situations than others and in some individuals than others. However, stress is not always negative or harmful and indeed, the absence of stress is death. Moreover stress can’t be eliminated as it serves as a driving force if kept at a certain level, so it needs to be managed in order to perform well on the job.

In Pakistan every year nearly 10000 students graduate as business professionals who strive for their career in the banking sector which is one of the largest economic backbone of the country, but it is observed that for past few years there are some serious changeovers in career orientations which made the banking as one of the most stressful professions and pointed out the necessity of considering and investigating occupational stress, since performance declines under stressful situations. Therefore, stress at workplace has become a major concern to the financial institutions of today. Several authors attributed the lack of progress in the area of stress research in organizations to the fact that stress seemed to be related to such a large number of conditions which prevented a systematic focus. Much of the research on job stress has been conducted in developed countries. Relatively little research has been carried out elsewhere in the world. The current research study contributes theoretically and empirically to the literature on job stress by examining the impact of workplace stress on job performance of employees working in banking sector of Pakistan.

**Literature Review**

Over the past few decades stress is emerging as an increasing organizational issue in both organizational research and practice. A mainstream group of employees articulated that their employers did not care for its employees and sometimes employees don’t like to work with their organizations indicating high levels of stress among them. Misfit with employers in the capacity of no part in decision making was reported main source of job stress as well no control over workplace environment, personality characteristics, lack of relaxation along with ambiguous organizational rules affect employees’ job performance (Anderson, 2003; French, & Caplan, 1972; Pincherle, 1972). Better managed human resources are more cooperative and productive and serve as assets for an organization and when their stress is ignored by the organization, the results are increased absenteeism and cost; low productivity and motivation and usually legal financial damages (Jamal, 1984). Stress is a universal experience in the life of each and every employee, even executives and managers. It has been estimated that every year about 100 million workdays are being lost due to job stress and nearly 50% to 75% diseases are caused by stress. Caplan (1994) stated that job stress results in high portion of absenteeism and loss of employment. The ratio of stress affectees’ in financial institutions are increasing day by day on alarming rate which effects both the employee performance and goal achievement. Caplan and Jones (1975) examined that job is a prominent source of stress in bankers’ life but reduced workload, improve management and supervision, supportive workplace culture, better pay, benefits, and vacation times can reduce the stress among them.

Job stress is considered as a part of both social and concrete sciences by the organizational researchers all around the globe. However, Stress is a universal experience in the life of each and every employee, even high level executives and managers. This research study discloses the impact of job stress on bankers regardless of any
discrimination of male and female employees, kind of financial institutions and
department. Stress is basically is a mental strain from the internal or external stimulus
that refrains an individual to respond towards its environment in a normal manner. These
stress levels can be internal or external for the bankers, from their personal lives or
professional lives (Brook, 1973). Further researched that banking sector has to face
usually large amount of stress. Stress among bankers is high as the banking profession is
suffering from increased stress, but most of the attention has been focused on young
bankers and their excessive hours of work (Caplan, 1994). Bankers in the field of sales
usually have to face a lot hurdles and one the most evident factor which originates and
impacts directly their personal and professional lives is job stress. Low job satisfaction
associated with contemplation of giving up work due to job stress, bankers especially
business development officers (BDOs) are more likely to have lower job satisfaction
scores if they feel unable to remain competent in their field of work (Rose, 2003).
Stress exists in every organization either big or small and it has significant effects over
the employees job performance (Anderson, 2003), especially the banking personnel’s are
under great deal of stress due to lots of stress factors such as role ambiguity (French, &
Caplan, 1972; Kahn, Wolfe, Quinn, Snoek, & Rosenthal, 1964; Beehr, 1976), work
overload (Franch, & Caplan, 1972; Caplan, & Jones, 1975), lack of feedback (Adams,
1980), perceived job insecurity Stamper, & Johlke, 2003), role conflict (Beehr, Jex,
Stacy, & Murray, 2000; Margolis, Kroes, & Quinn, 1974; Caplan and Jones, 1975; Kahn,
Wolfe, Quinn, Snoek, & Rosenthal, 1964), keeping up with rapid technological changes
in dynamic corporate environment (Anderson, Coffey, & Byerly, 2002). Apart from
above discussed job stressors, there are also some real life events which create stress
among bankers when they are on jobs such as family conflicts (Anderson, Coffey, &
Byerly, 2002) more specifically divorce and bereavements (McCubbin, & Figley, 1983;
Adams, 1980).
According to Rose (2003), bankers have tendency towards high level of job stress
regarding the time constraints as working for longer hours reduces their urge for
performing better. Moreover proper management support helps in reducing or increases
stress among bankers apparent organizational assistance, management support work as a
cushion which acts positively in decreasing job related stress among bankers (Stamper, &
Johlke, 2003). One of the major reasons of job stress identified by (Beehr, Jex, Stacy, &
Murray, 2000; Stamper & Johlke ,2003) is that if the organization does not appreciates its
employees for their hard work or contribution toward the organization, it creates stress
and mostly creates intention to leave. Ivancevich and Donnelly (1975) studied the
association between anxiety stress with satisfaction and performance of employees that
lower anxiety stress improves employees’ performance which he studied in different
managerial level of an organization. Beehr, Jex, and Murray (2000) found a
negative relationship between occupational stress and the performance of employees of
an organization. Jamal (1984) also examined a negative association between job stress
and job performance of bankers. They argued that stress on job can be stated as the
outcome of an individual due to the workplace environment from which he feels
unsecured.
The importance of job stress is highlighted nowadays by the financial institutions to
manage and reduce stress through practical guidelines in private sector but not
significantly in public sector Positive correlation of flexing working hours, division of
work, supportive organizational climate and monetary incentives has been shown by the previous literature with job performance (Beehr, 1976; Beehr, Jex, Stacy, & Murray, 2000; Franch and Caplan, 1972; Caplan, & Jones, 1975; Ivancevich, & Donnelly, 1975; Jamal, 1984) as all these factors are related with satisfaction of employees, however every time the case is not same, non-monetary incentives such as career advancement, prestige as well as public recognition can also enhance employees’ job performance because low morale, high turnover, and interdepartmental struggle were baselines of many cases (Anderson, 2003; McCubbin, & Figley, 1983).

Research Methodology

Questionnaire based survey method used for this one-shot research study. The survey was conducted on banking sector of Pakistan where highly qualified bankers including managers, customer services officers (CSOs) and business development officers (BDOs) were the sample of the study. Job stress scale was adopted from the short form of Depression, Anxiety and Stress Scales (DASS) developed by Lovibond and Lovibond (1995). DASS included 21-items, 7 items for the measurement of depression, anxiety and stress each, whereas we used only 7-items stress scale in order to measure the job stress experienced by the bankers. On the other hand, job performance was measured by using 5-item self developed appraisal form based on the previous research on the topic (Brown, 1996; Borman, & Motowidlo, 1997), the scale was pilot tested and Alpha values was found to be 0.81. All the scales were of five point likert type. The questionnaire form also included a demographic section to collect the basic information from the bankers regarding their, gender, age, work experience as well as type and nature of bank they are working in. For the study, data were collected from 112 bankers across Punjab and subsequently analyzed through Microsoft Excel and SPSS 16. The theoretical framework of the study is as follows:

![Figure I: Research Model of the Study]

Hypothesis of the study
Numerous studies are available in the existing literature on “The Impact of Stress on Job Performance” (Beehr, Jex, Stacy, & Murray, 2000; Ivancevich, & Donnelly, 1975; Jamal, 1984). On the basis of such literature the following hypothesis was proposed by us:

“There is significant and negative relationship between stress and job performance”

Data Analysis and Interpretations
Table I below provides the demographical distribution of the respondents with regard to various categories.

As shown by the table I, out of a total of 112 subjects, 83.1% of the subjects were belonged to private banks and only 16.9% were from public banks; 90.2% were working in conventional banks and just 9.8% were serving in Islamic banks; 58.9% were belonged to manager cadre and remaining 41.1% were non-manager cadre bankers. Further, majority of the subjects were male i.e. 80.3% while only 19.7% were female. Subjects were also inquired about their qualifications and 55.4% of them were post graduates, 32.1% were graduates, while remaining 12.5% did some professional certifications like C.A, ACCA, and CFA etc.

Moreover respondents were aged between 20 years of age to 58 years having job experience ranging from 1 year to 27 years in the banking sector of Pakistan.

</table>

Table II describes the summary statistics about the dependent and independent variables used in this research study. Job stress being the independent variable whereas job performance as dependent variable. The mean score of job stress is 3.74 along with the standard deviation of 0.651 which indicates that personnel’s in the banking sector experience stress in their respective jobs but at moderate level. On the other hand, mean value of job performance is 3.56 with standard deviation score of 0.53 indicating that bankers in the industry are average performers.

Table III: Correlation

** sig at level 0.01

Table III shows the correlations analysis of the dependent variable i.e. Job stress with independent variable i.e. job performance. All the variables can be considered significant at 1% level of significance. Coefficient sign of the correlation between job stress and job performance is negative (r= -.180, p<0.01) as expected. Thus we accept hypothesis of the study that there is significant and negative relationship between stress and job performance. Our findings support the studies conducted by (Beehr, Jex, Stacy, & Murray, 2000; Ivancevich, & Donnelly, 1975; Jamal, 1984) who also found significant negative association between stress and job performance.

Discussions/Conclusions/Limitations/Future Recommendations

The purpose of this study was to find out the association between job stress and job performance of employees working in banking sector of Pakistan. According to the
hypothesis of the study, job stress is significantly and negatively associated with job performance of employee that stressful job circumstances effect bankers’ job performance negatively (Ivancevich, & Donnelly, 1975; Jamal, 1984; Beehr, Jex, Stacy, & Murray, 2000) that lower the job stress it enhances the job performance and the same indicated by the findings of this research study. In Pakistan banking jobs seem to be too hectic as heavy workloads, time constraints, role conflicts and role ambiguity create stress among bankers which resultantly decreases their level of job performance. One basic cause of stress in banking sector of Pakistan is non-stop 9am to 5pm banking which means there may be no lunch breaks and it is not enough, even in small local banks of Pakistan it is evident that they also facilitate their big customers after the banking hours i.e. after 5pm. So bankers have to work longer hours as compared to other related jobs which is also a major reason of concern.

No doubt stress is necessary for keeping the employees motivated and enhancing their subsequent job performance but up to a certain level (Ivancevich, & Donnelly, 1975). When stress occurs beyond a certain limit it reduces the employees’ job performance (Rose, 2003). So one of the strategies of financial institutions of 21st century must be employment of effective stress management practices such as division of work, time management and supportive workplace culture to increase satisfaction and overall job performance of bankers.

The current research study was conducted as one-shot study and hence may be affected by some recency affects. Moreover this study was conducted in only one sector i.e. banking sector and only with highly qualified graduate and postgraduate bankers such as managers, customer service officers (CSOs) and business development officers (BDOs), in order to generalize the results of current research study, this study should be replicated in other sectors irrespective of the level of job and qualifications of the respondents in future.

Mumtaz Anwar
Assistant Professor, Department of Economics
University of the Punjab, Lahore, Pakistan.

Abstract
Most of the developing countries are becoming more aid dependent with the passage of time. This bleak reality provokes debate on aid effectiveness. This paper analyzes the effectiveness of aid on the health sector of Pakistan over the period 1973-2008. The study focuses on the health sector in the light of Millennium Development Goal; reducing child mortality. We estimate an econometric model to test the short and long run relationship between foreign aid and infant mortality rate in the health sector. In this context, different tests i.e. Augmented Dickey Fuller test, Johansen Likelihood Ratio test and Vector Error Correction Method are used. The results indicate that there is short run and long run relationship between foreign aid and infant mortality rate. The results show that one percent increase in foreign aid will decrease the infant mortality rate by 0.4 percent. This study suggests that an increase aid in this sector will result in better health conditions.

Key Words: Infant Mortality rate, Millennium Development Goal, Foreign Aid

JEL Classification: F35, I10, O12, O19

I. INTRODUCTION
Most of the developing countries are dependent on foreign aid to expand the productive capacity of their economies due to the lack of internal resources. In this context, the World Bank has provided a large amount of aid for projects in health, nutrition and population. It has observed that World Bank has allocated average annual commitments of 2.9 billion dollars in fiscal year 2009. This amount is a threefold increase over the previous year’s commitments.

This paper used Official Development Assistance (ODA) that is a subcategory of foreign aid and account for all official aid in different sectors. According to the World Bank, ODA comprises flows that meet the Development Assistance Committee’s (DAC) definition of ODA and are made to countries on the DAC list of aid recipients. This study contributes to the discussion on the effectiveness of foreign aid by focusing on the fourth MDG i.e. reducing child mortality. In this context, policies like National Plan of Action like “Health For All” (HFA) has been initiated to achieve these goals.

Although most of the developing economies has increased their spending in the health sector because the role of human capital is vital in the development of a nation but in Pakistan, inspite 8 per GDP growth rate in 1991-92, only 0.2 percent of GDP was spent on this sector. Even the other countries in the region like Bangladesh, Sri Lanka...
and Nepal spent more than 4 percent on this sector, which was higher than the spending on health in Pakistan.

Therefore, it seems that the health care system of Pakistan is inadequate and inefficient. The poor conditions in the health sector may be recognized by a number of factors like high population growth rate, inadequate allocation of resources in the health sector and poverty etc. While examining the effectiveness of foreign aid in the health sector of Pakistan, the following question arises; Does foreign aid affect infant mortality rate in Pakistan?

This paper comprises five parts. Section II reviews the literature. Section III explains the description of data and the specification of the model to be estimated. The results regarding the long run and short run relationship among variables are discussed in section IV. Section V concludes the findings of the study and policy implications emerging from the study.

II. REVIEW OF LITERATURE

Importance of aid in the health sector may be justified, as it can be helpful to increase investment in this sector of the recipient countries. In developing countries, the infrastructure is poor and it is required to enhance the budget of the government for providing resources for building hospitals, hire and train staff, free medicines etc. while reviewing literature, we find that income has significant effect on health status while the ratio to GDP of public spending on health and the share of public outlay in total health care spending has no significant effect on the variables in the health. The following studies discussed the aid effectiveness on different variables related with health sector.

Filmer and Pritchett (1997) run the cross-country regression using UNICEF data. They analyzed the relationship between child mortality and some social indicators like GDP per capita, income inequality and female education etc. They found that these indicators explained more than 90 percent of variation in child mortality. They found that public expenditure on health has very little effect on child mortality.

Gupta et al (1999) used cross sectional data for fifty developing countries. They concluded that expenditure allocation in health and education sectors has improved the attainment in these sectors. They suggested that the size and efficiency of allocation matter in social sectors and they found that this has strong effect in education sector as compare to the health sector.

Baldacci et al (2004) found a positive and significant impact of government spending on social indicators especially in the health and education sectors. According to the results, there was an immediate effect of health spending on health indicators. The study found significant role of policy interventions. They concluded that improving governance and budget deficit were also helpful for the countries to achieve Millennium Development Goals.

Thiele et al (2006) analyzed whether the donor countries has allocated aid in the line of MDGs or not. They used sectoral disaggregated aid data and discussed its impact on different variables reflecting these sectors in the recipient countries. Their results revealed that there was a considerable gap between desire of donor and actual aid allocation. It led to the conclusion that large amount of aid would not had the desired effects unless the targeting of aid is improved. They concluded that without allocating the aid in the right direction, it would be difficult to achieve the targets of MDGs.

Wolf (2007) examined the effectiveness of aid on education, health and water & sanitation. The study also included some social sectors like freedom of press and decentralization. Although the study has found a positive significant relation between health aid and its outcomes, however, it concluded that aid has mixed impact so it could not be the only solution for improved social indicators to achieve the goals set by MDGs.
Mishra and Newhouse (2007) estimated the relationship between aid for health and infant mortality rate. They performed a cross-country analysis using 118 countries. They used time series data between 1973 and 2004 and found that the relationship between these two variables was statistically significant. They concluded that by doubling per capita health aid was associated with a 2 percent decrease in infant mortality rate. Moreover, the results showed that the effect of health aid was relatively small and it was not sufficient to achieve the targets envisioned by the MDGs.

After reviewing the studies on the effectiveness of aid on the health sector, we conclude that multiple factors are responsible for infant mortality rate in Pakistan. This study will contribute in an important way that it will capture the short run and the long run behaviour of foreign aid in this sector.

III. THE EMPIRICAL MODEL AND DATA

The literature presented in section II shows that many factors are responsible for the status of health sector. The main factors that are identified for health sector are GDP per capita, foreign aid for health, adult literacy rate and health expenditure. For the purpose of selection of variables, this study followed Wolf (2007) and Mishra & David (2009). One of the important variable, maternity & child health care centers has also included in the study because it has significant role in this sector in the economy of Pakistan.

The study covers the period from 1973 to 2008. The choice of the period is based on the availability of data. Data for social indicators has been taken from various issues of Pakistan Economic Survey and World Development Indicators and the data on foreign aid for health and education sectors are taken form OECD’s Creditor Reporting System (CRS) that contains information on the sectoral allocation of aid. This study used the amount of aid commitments at current prices in million US Dollar. Although the data based on disbursement should be preferred but information on disbursement by sector is available only from 1990 onward so due to unavailability of data, aid commitment is used in this study.

The Model

In regression equation representing the health sector, infant mortality rate is our dependant variable. It is used to assess the progress in health sector towards achieving the goal of reduction in infant mortality rate. The functional form of the model is written as follows:

\[
IMR = f\left( {GDP, FAH, PSH, ALR, MCH} \right)
\]

Or

\[
Z_t = f\left( {W_{1t}, W_{2t}, W_{3t}, W_{4t}, W_{5t}} \right)
\]

And the econometric model is presented as:

\[
Z_t = \beta_0 + \beta_1 W_{1t} + \beta_2 W_{12} + \beta_3 W_{13} + \beta_4 W_{14} + \beta_5 W_{15} + e_{2t}
\]

Where:
- \( Z_t \) \( \Rightarrow \) IMR = Infant Mortality Rate
- \( W_{1t} \) \( \Rightarrow \) GDPpc = Gross Domestic Product per capita
- \( W_{2t} \) \( \Rightarrow \) FAH = Foreign Aid for Health
- \( W_{3t} \) \( \Rightarrow \) PSH = Public Spending on Health
- \( W_{4t} \) \( \Rightarrow \) ALR = Adult Literacy Rate
- \( W_{5t} \) \( \Rightarrow \) MCH = Maternity and Child Health centers
- \( e_{2t} \) \( \Rightarrow \) Error Term
- \( t \) \( \Rightarrow \) 1, 2, 3, ..........
Econometric Methodology

For the estimation purposes, three steps methodology has been employed i.e. checking the stationarity of the data, estimating the long run function and estimating the parsimonious error correction model along with the stability and other diagnostic tests. First, we have applied Augmented Dickey Fuller (1979, 1981) tests to each of the variables and determine the stationarity property in their level as well as in their differences and all the variables found to be integrated of the same order. In order to find the long run relationship among variables, Maximum Eigenvalue test and Trace Statistic are used. Finally, parsimonious Vector Error Correction Model (VECM) is used to determine the short run relationship between these variables.

IV. EMPIRICAL RESULTS

In the previous section, we have developed an econometric model that gives us the determinants of health sector in Pakistan. In this section, the estimation of the model and empirical results of the study are presented. The model is estimated by using annual time series data for the period 1973 to 2008. It provides a framework to clarify mainly the effectiveness of foreign aid on infant mortality rate in the economy of Pakistan that is the objective of the study. The estimated function asserts the long run as well as short run relationship between these variables.

Testing of Unit Root

We employed Augmented Dickey Fuller (ADF) Unit Root Test to check the stationarity of the variables. The results are presented in the following table. The results show that null hypothesis of unit root is accepted for all variables in the level form. However, it is rejected for all variables in the first differenced form. Our test results show that all variables are I(1). These results are discussed in table 1. The results of ADF allow us to move to the co-integration method to estimate the long run relationship that is presented in the next section.

The Long-run Function: A Co-integration Analysis

As the objectives of the study is to analyze the long run relationship between variables of health sector in Pakistan, so we estimate the cointegrating relationship between infant mortality rate and its determinants. Before we run cointegration test we need to specify the lag structure. For this purpose, we employed Akaike Information Criterion (AIC) and Schwarz Bayesian Criterion (SBC), as suggested by Enders (1995) and Davidson (1998) to investigate the optimal lag length. It is important because an appropriate lag structure may over parameterize and it can reduce the power of cointegration test. The appropriate lag length of the VAR is two. To find the long run relationship, Johansen cointegration procedure is used. The results from the Johansen cointegrated test (both Trace test and Max Eigen value test) are presented in tables 2 and 3. All the variables included for the test have the same order of integration.

The empirical results in tables 2 and 3 show that there exists a long run relationship between infant mortality rate and its determinants. Significance of the variables confirms their validity in the model. The results of estimated function are presented in the following equation.

\[ Z_t = 136.3684 - 0.021588W_{it} - 0.004255W_{2t} - 0.0000664W_{3t} - 0.859730W_{4t} - 0.000525W_{5t} \]

[T-Value] \[16.865\] \[2.377\] \[3.495\] \[20.523\] \[0.8104\]

The estimated equation indicates that infant mortality is determined by the GDP per capita, foreign aid for health, public spending on health, adult literacy rate and the numbers of maternity & child health care centers. The estimated model shows that the
impacts of all the independent variables are statistically significant except MCH in the long run. The estimated co-efficient of the GDP per capita \((W_{1t})\) is 0.02159 \((t = 16.865)\) that is also negative and significant. This result shows that due to increase in GDP per capita, the purchasing power of the people will increase and they would be able to receive the health facilities and consequently the infant mortality rate will decrease. The cointegration analysis indicates that the estimated coefficient of foreign aid for health \((W_{2t})\) is 0.004255 \((t = 2.377)\) that is negative and significant. It shows that with one million dollar increase in foreign aid, the infant mortality rate will decrease by 0.004 units. In the long run, foreign aid in this sector can anticipate the decrease in infant mortality and therefore increase the health status of the economy. The analysis also shows that there is negative and significant long run relationship between public spending on health and infant mortality rate. The estimated coefficient of public spending \((W_{3t})\) is 0.0000664 \((t = 3.494)\), which is significant. It indicates that public spending also plays an important role in determining the infant mortality rate in Pakistan. Increase in public spending implies that infant mortality rate will reduce in the long run. The estimated coefficient of adult literacy \((W_{4t})\) is 0.859 \((t = 20.523)\), which shows negative relation between literacy rate and infant mortality rate and is highly significant. It implies that the importance of adult literacy in determining the infant mortality rate in Pakistan. Increase in adult literacy reduces the infant mortality that increases the health status of the people. The analysis indicates that there is negative long run relationship between infant mortality rate and the number of maternity & child care centers (MCH). The estimated coefficient of MCH \((W_{5t})\) is 0.000525 \((t = 0.807)\) that is insignificant indicating that MCH has no significant role in determining the infant mortality rate in Pakistan. It is due to deficiency in data because there is decreasing trend in data from 1992-93 when there was exclusion of family welfare centers from MCH structure in NWFP.

The Short-Run Dynamic Model for Health Sector

To determine the short run relationship between variables, we used VECM followed by Hendry’s approach known as “general to specific.” we include different lags of explanatory variables from top to low and first lag of Error Correction Term (ECT). The following Error Correction Model (ECM) is established using the two lags structure as suggested by AIC and SBC.

\[
\Delta Z_t = \beta_0 + \beta_1 \Delta Z_{t-1} + \beta_2 \Delta Z_{t-2} + \beta_3 \Delta W_{1t} + \beta_4 \Delta W_{1t-1} + \beta_5 \Delta W_{1t-2} + \beta_6 \Delta W_{2t} + \beta_7 \Delta W_{2t-1} + \beta_8 \Delta W_{2t-2} + \beta_9 \Delta W_{3t} + \beta_{10} \Delta W_{3t-1} + \beta_{11} \Delta W_{3t-2} + \beta_{12} \Delta W_{4t} + \beta_{13} \Delta W_{4t-1} + \beta_{14} \Delta W_{4t-2} + \beta_{15} \Delta W_{5t} + \beta_{16} \Delta W_{5t-1} + \beta_{17} \Delta W_{5t-2} + \lambda_2 ECT_{t-1} + e_{2t}
\]

After estimating the above model, we gradually eliminate the insignificant variables using the general to specific approach in order to get a parsimonious model. The results of the preferred model are presented in the following table.

The results in the following table show that the estimated value of Error Correction Term (ECT) is (-0.36) with \((t = -2.008)\) which is significant with theoretically correct sign. It indicates that 36 percent of the di-equilibrium in the determination of infant mortality rate is corrected immediately i.e. in the next year. It suggests a high speed of convergence to equilibrium if there appears di-equilibrium in the system.

In the estimated dynamic error correction model, the coefficients of lagged changes in infant mortality rate \((\Delta Z_{t-1} and \Delta Z_{t-2})\) are negative and significant at 4% and 17% successively which show that the changes in successive previous periods in infant mortality negatively affect on short-term changes in infant mortality. It may reflect
that the phenomena of infant mortality cannot be treated as the result of present period decision only.

The coefficients of foreign aid with two period lags ($\Delta W_{2t-1}$ and $\Delta W_{2t-2}$) are significant with negative sign, which show that change in foreign aid for health in the previous periods has negative effect on, the current changes in infant mortality rate. However, the effect of foreign aid for health in the current period has no significant effect on Infant Mortality. The results of the analysis suggested that the impact of changes of foreign aid on the determination of infant mortality works through transmission lags.

Another finding of the analysis is that the previous period’s changes in public spending on health ($\Delta W_{3t-1}$) also affect the infant mortality negatively in short run. This may be due to the reason that the increase in volume of the health spending increases the infrastructure and health facilities. So as a result of rise in health facilities, the infant mortality rate may decrease significantly.

The estimated coefficient of the MCH ($\Delta W_{5t}$) is negative and significant in the short run; however, over the long run it has insignificant impact on infant mortality rate. These health centers are established to provide the emergency health facilities to the public so the facilities received by the peoples from these health centers in the short run are significant.

Diagnostic Tests for Short Run Model in the Health Sector

The results of standard diagnostic tests are presented in table 4. The high probability values of all the diagnostic tests mentioned in the table below show that the model specification is appropriate and parameters of the model are stable. Moreover, the high probability value of different tests for heteroskedasticity and serial correlation prove that these problems do not exist in the model. Similarly, CUSUM and CUSUM of square tests show that there is no instability in the model.

V. CONCLUSION AND POLICY IMPLICATIONS

This study has been attempted to analyze the effectiveness of foreign aid on the health sector of Pakistan. In this regard, one of the MDGs; reduction in infant mortality rate is analyzed. Considering the theoretical developments and empirical evidence, an econometric model was developed for the health sector, containing the wide range of determinants. In the end, the dynamic functions were specified to analyze the short run and the long run behaviour of the determinants in the health sector of Pakistan. For estimation of the model, we applied the co integration technique. We have employed the Augmented Dickey Fuller tests to each of the series of data and determined the time series property of each variable. After confirming the order of integration of each variable, Johansen Likelihood Ratio tests were used to determine the long run equilibrium relationship among the variables. Finally ECM was estimated to study the short run dynamics. These econometric models were estimated for Pakistan over the period 1973-2008 using annual data series. The cointegration analysis in the health sector show that there was negative long run relationship exists between infant mortality rate and foreign aid in Pakistan. Increase in foreign aid creates significant affects on infant mortality rate in the opposite direction. In ECM, short run relationship has been proved and the error correction coefficients are highly significant with theoretically correct sign, which show that the economy will converge to its equilibrium within one year if there appears a dis-equilibrating situation.

In view of commitments to the achievement of MDGs, the Government of Pakistan has developed a National Plan of Action on Education For All and Health For All for the period 2001-2015. The gap in financial resources required to implement this plan is enormous and will have to be met from external assistance. The results show that with one million dollar increase in foreign aid, the infant mortality rate will decrease by
0.004 units. It has a significant effect in the health sector so it is recommended that efforts should be made to increase aid in this sector. The data shows that public spending in this sector is very low and lowering with the passage of time. It is, therefore, suggested that all efforts should be made to enhance the budgetary allocation in this sector otherwise it would not be possible to achieve the MDGs by 2015.

## Millennium Development Goals and Targets

### Goal 1: Eradicate extreme poverty and hunger

**Target 1**: Halve, between 1990 and 2015, the proportion of people whose income is less than one dollar a day.

**Target 2**: Halve, between 1990 and 2015, the proportion of people who suffer from hunger.

### Goal 2: Achieve universal primary education

**Target 3**: Ensure that by 2015, children everywhere, boys and girls alike, will be able to complete a full course of primary schooling.

### Goal 3: Promote gender equality and empower women

**Target 4**: Eliminate gender disparity in primary and secondary education, preferably by 2015, and in all levels of education no later than 2015.

### Goal 4: Reduce child mortality

**Target 5**: Reduce by two-thirds, between 1990 and 2015, the under-five mortality rate.

### Goal 5: Improve maternal health

**Target 6**: Reduce by three-quarters, between 1990 and 2015, the maternal mortality ratio.

### Goal 6: Combat HIV/AIDS, malaria and other diseases

**Target 7**: Have halted by 2015 and begun to reverse the spread of HIV/AIDS

**Target 8**: Have halted by 2015 and begun to reverse the incidence of malaria and other major diseases.

### Goal 7: Ensure environmental sustainability

**Target 9**: Integrate the principles of sustainable development into country policies and programmes and reverse the loss of environmental resources

**Target 10**: Halve, by 2015, the proportion of people without sustainable access to safe drinking water and basic sanitation.

**Target 11**: By 2020, to have achieved a significant improvement in the lives of at least 100 million slum dwellers.

### Goal 8: Develop a global partnership for development

**Target 12**: Develop further an open, rule-based, predictable, non-discriminatory trading and financial system.

**Target 13**: Address the special needs of the least developed countries.

**Target 14**: Address the special needs of land locked developing countries and small Island developing states.

**Target 15**: Deal comprehensively with the debt problems of developing countries through national and international measures in order to make debt sustainable in the long term.

**Target 16**: In cooperation with developing countries, develop and implement strategies for decent and productive work for youth.

**Target 17**: In cooperation with pharmaceutical companies, provide access to affordable essential drugs in developing countries.

**Target 18**: In cooperation with the private sector, make available the benefits of new techniques, especially information and communications.

Abstract
This is a conceptual study that tries to draw attention on the importance of shared leadership in systems thinking perspective, focusing more on holism, i.e. whole is greater than the sum of parts (Senge, 1990), thus emphasizing on team work and avoiding the individualistic approaches to management. The paper inculcates opinions of various scholars, who specialize in the field of leadership in general and shared leadership in particular.

Keywords: Leadership, Shared leadership, Team, Systems thinking, Holism

1. Introduction.
“Great Leaders plant trees whose shade they know they will never sit in (Translated Greek Proverb)” (Clegg, Kornberger, & Pitsis, 2009, p. 132).

The term leadership has always been a debatable issue and defined by scholars in several ways. Although there is no general definition of leadership (Lussier & Achua, 2007), however many scholars have defined the term in different ways. Dr. M. L. Monga in his paper on “Leadership Archetypes” cited some scholars defining leadership as “the process by which an agent induces a subordinate to behave in a desired manner (Bennis, 1959), the presence of a particular influence relationship in two or more persons (Hollander & Jullian, 1969), an interpersonal relationship in which others comply because they want to not because they have to” (Monga 1969, p. 148). Leadership refers to power relationship between leaders and their followers that want real changes and outcomes which reflect their shared purposes (Daft, 2002). It can be viewed as a product of one’s position, personality traits, and observable behaviors, dependent upon the situation in which it is exercised and conditional to how the leader and his followers react and interact with each other (Clegg, Kornberger, & Pitsis, 2009).

In management perspective, leadership can be viewed as influencing of leaders and followers to achieve organizational objectives through change (Lussier & Achua, 2007, p. 6). It involves directing, controlling, motivating, and inspiring staff towards the achievement of organizational goals (Clegg, Kornberger, & Pitsis, 2009). In a traditional model of organizational leadership, a leader is an individual with maximum authority and with vision for productive performance, who communicates organizational policies and ensures institutional control (Wood & Fields, 2007).
The modern day competitive environment brings the need for a more innovative and systemic approach. Today organizations are faced with an exceptional rate of environmental change due to pressures from globalization, swift conversion and dispersion of technologies, and progress toward market-based socioeconomic systems (Schneider, 2002). This brings the need for advanced level of research on team innovation and performance, as organizations approach shift to more sophisticated ways of management with creative solutions to multifaceted problems (Bligh, Pearce, & Kohles, 2006). The increasing attention on team-based knowledge work has resulted in expansion of the traditional models of solo leadership to a further advanced model like shared leadership (Houghton, Neck, & Manz, 2003). Implementation of cross-functional and self-managed work teams has created new challenges, especially among organizations that have conventionally rewarded vertical leadership involving individualistic approach to innovation and performance (Bligh et al., 2006). This directs the focus of attention to an alternate leadership approach which involves a team of individuals working together towards one common goal, referred to as collective or shared leadership. In alternative leadership approach each of the team members assume some responsibility for the elements needed for leading a work group. This may give the team members the feeling as part of an entity where each one jointly participates in helping the team through diverse circumstances (Wood & Fields, 2007). Shared leadership is defined as “a dynamic, interactive influence process among individuals in groups for which the objective is to lead one another to the achievement of group or organizational goals or both” (Bligh, Pearce, & Kohles, 2006, p. 297). Shared leadership is a management model based on the shared governance philosophy (Jackson, 2000, p. 166).

In this study we try to draw attention on the importance of shared leadership in the perspective of systems thinking. The study involves holistic approach towards management, emphasizing on team work and avoiding the individualistic approaches to management.

2. Literature Review

According to early organization theories (Ashby, 1952), an institute's existence is greatly dependent upon its adoption of the environmental changes (Schneider, 2002). In the past, the sharing of leadership and responsibility was of advantage to any organization, whereas today it has become extremely significant for the overall existence of the same. Without it, the entire organization may fail in achieving the desired objectives. (Jackson, 2000; Merkens & Spencer, 1998). Leadership plays an important role in the success or failure of every organization (Kocolowski, 2010). Superior organizational performance is not a matter of luck; it is determined largely by choices leaders make (Daft, 2002, p. 471).

Ensley et al. are of the opinion that shared leadership is conducted by the team as a whole, instead of an individual. To this end, shared leadership benefits from the knowledge of a collective (Ensley, Hmieleski, & Pearce, 2006). While vertical leadership involves a team leader responsible for the team operations and performance (Cox et al., 2003), shared leadership emphasizes on sharing of leadership among the team members (Wood & Fields, 2007; Cox, Pearce, & Perry, 2003; Pearce & Conge, in press).
In a community, leader is one among many equals. Decentralization is an essential aspect of true community, and decisions are reached by consensus (Daft, 2002, p. 261). Scholars argue that solo leadership is no more sustainable for any organization’s survival (Duignan & Bezzina, 2006). Kocolowski (2010) cited Sally (2002), pointing out that shared leadership has existed since ancient times: “Republican Rome had a successful system of co-leadership that lasted for over four centuries. This structure of co-leadership was so effective that it extended from the lower levels of the Roman magistracy to the very top position, that of consul” (Sally, 2002; Kocolowski, 2010, p. 23). Shared leadership refers to the phenomenon in which leadership is shared between the team members (Carson, Tesluk, & Marrone, 2007). While citing Avolio et al. (2009) Kocolowski states that the term shared leadership has been extensively defined by Conger and Pearce (2003) as “A dynamic, interactive influence process among individuals in groups for which the objective is to lead one another to the achievement of group or organizational goals or both”. Conger and Pearce added, “This influence process often involves peer, or lateral, influence and at other times involves upward or downward hierarchical influence” (Avolio, Walumbwa, & Weber, 2009; Kocolowski, 2010, p. 24). Pearce (1997), Yukl (1998), Pearce and Sims (2000), and Pearce and Conger (in press) all suggest that shared leadership stems from the members of teams and not from solo team leaders (Pearce & Sims, 2002; Pearce C. L., 1997; Pearce & Conger, in press; Pearce & Sims, 2000; Yukl, 1998).

Meindl et al. state that the conceptualization of leadership from an individual to a team requires most modern and innovative approach to acquire the essence of shared leadership at the level of teams as a whole (Meindl, Mayo, & Pastro, 2002). He cites Yukl (1998) who mentions that “viewing leadership in terms of reciprocal, recursive influence processes among multiple parties in a system context is very different from studying unidirectional effects of a single leader on subordinate, and new research methods may be needed to describe and analyze the complex nature of leadership processes in social systems (Meindl at al., 2002; Yukl, 1998, p. 459).

Shared or distributed leadership arises from within a team (Ensley et al., 2006). It is a concept that insists that leadership can be efficiently shared or distributed among the team members (Wood & Fields, 2007; Pearce & Conge, in press). Shared leadership is facilitated by an overall team environment that consists of three dimensions: shared purpose, social support, and voice (Carson et al., 2007, p. 1222).

The commonly known successful cases of firms managed by co-CEOs include Research in Motion, Twitter, California Pizza Kitchen, and Motorola (Arnone & Stumpf, 2010). Similarly, co-CEOs Dave Pottruck and Charles Schwab at the investment firm who partnered for five years gathered recognition and was made possible only because of their complementary talents and shared vision. This successful collective management made a great example of benefitting from the potentials of differing leadership strengths of a co-CEO structure (Arnone & Stumpf, 2010). However, companies like Enron, Adelphia, Global Crossing, Tyco, WorldCom etc were destroyed due to problems with corporate governance (Sims & Quatro, 2005, p. 34) which was, one way or the other, affected due to individualistic leadership approach and decision making. McKinsey survey (Felton & Watson, 2002) noted that 44 percent of corporate directors could not completely understand the organizations they managed (Sims & Quatro, 2005).
3. Systems Thinking Perspective

Systems thinking is a conceptual framework, developed to make the full patterns clearer and to accommodate bringing effective change in them (Senge, 1990). It is based on the idea of systems philosophy which states that an individual’s activity is affected by the environment (Vickers, 1970; Palamia & Skarzauskiene, 2010). Systems thinking involves seeing the larger interactions that bring a good knowledge of the big picture (Palamia & Skarzauskiene, 2010). It is a way of observing reality in such a manner that accentuates the relationships among the parts, instead of the parts themselves (Sterman, 2000).

Productive decision making and learning in an increasingly competitive and complex business environment requires leaders to become systems thinkers in-order to build tools to understand the structures of complex systems (Skarzauskiene, 2010). Peter M. Senge in his book “The Fifth Discipline” emphasizes on individuals capacity in an organizations or teams towards successful fulfillment of their common objectives with a motive of constantly learning together (Senge, 1990). The Fifth Discipline blends it into theory and practice, turning the whole of an organization more productive than the sum of its parts (Senge, 1990).

Developing learning organizations involves training individuals to observe as systems thinkers with their personal mastery and mental models. Given the influence of organizations in today's world, this may be one of the most powerful steps toward helping us "rewrite the code," altering not just what we think but our predominant ways of thinking (Senge, 1990, p. 342). One of the reasons, for corporate failure of Rover, noted by Oliver et al., in their paper on “the death of a car company”, was the individualistic approach of the engineers of Rover who were resistant to subsequent changes to the products besides the market demands. For instance, Issigonis was resistant to replacement of the original sliding windows on the Mini, and King did not agree upon a four-door model to the Range Rover series instead of only two doors for many years (Oliver, Holweg, & Carver, 2008).

4. Limitations

This study does not ensure that Shared Leadership can be taken as a final solution to any management problems. There are many scholars who are of the opinion that shared leadership itself may be a problem towards making management decisions. Despite the advantages of shared leadership approach, the inherent limitations found in the research cannot be overlooked. Resistance to the approach of shared leadership or as a matter of fact resistance to change can make its execution extremely difficult (Kocolowski, 2010). Sharon Buckmaster is of the opinion that besides the fact that there is a serious need for new methods of leadership in the rapidly developing and growing business environment, there are intrinsic disagreements in the adaptation of the shared leadership practices (Buckmaster, 2004). The author further states that

“One of the challenges that I have often faced as a consultant trying to move people towards more collaborative ways of functioning is to deal with the fears and concerns that individualism as well as individual effort and reward will vanish entirely. I don’t think we have adequate answers to these concerns yet and until we
do, resistance to shared leadership is likely to continue and rightfully so” (Buckmaster, 2004, p. 19).

Carson et al. are of the opinion that shared leadership relies on team members’ collective assessments of sharing of leadership responsibilities, a system that may not become successful to acquire the relational nature of the blueprints of shared control in teams (Carson et al., 2007).

5. Conclusion

Senge (1990) while discussing systems thinking, draws emphasis on phenomena like personal mastery, mental models, shared vision, and team learning. The modern day competitive environment requires all the progressive managers to follow the four important tools mentioned by Senge (1990). In case of Shared Leadership, leaders through their collective knowledge and understanding can reach to a better conclusion than people with individual management approaches. Most of the scholars, mentioned earlier, emphasize on team work, team management, and team learning, thus following the concept of “whole is greater than the sum of its parts”.

Though, the research on shared leadership is its very early stage, however significant benefits and limitations have emerged from the few studies that have been conducted (Kocolowski, 2010). Leaders can materialize on their individual strengths (Miles & Watkins, 2007), and organizations can harvest from the multiplicity of thinking in decision making process (Kocolowski, 2010). Leaders like William Hewlett and David Packard have left good examples of collective / shared leadership. However, as mentioned earlier, the concept of shared leadership is still in its early stages and requires more research.
References

---

**Personal mastery**: It is the discipline of continually clarifying and deepening our personal vision, of focusing our energies, of developing patience, and of seeing reality objectively. **Mental models**: These are deeply ingrained assumptions, generalizations, or even pictures or images that influence how we understand the world and how we take action. **Shared Vision**: If any one idea about leadership has inspired organizations for thousands of years, it's the capacity to hold a shared picture of the future we seek to create. The practice of shared vision involves the skills of unearthing shared "pictures of the future" that foster genuine commitment and enrollment rather than compliance. In mastering this discipline, leaders learn the counter productiveness of trying to dictate a vision, no matter how heartfelt. **Team Learning**: The discipline of team learning starts with "dialogue," the capacity of members of a team to suspend assumptions and enter into a genuine "thinking together." The discipline of dialogue also involves learning how to recognize the patterns of interaction in teams that undermine learning. Team learning is vital because teams, not individuals, are the fundamental learning unit in modern organizations.
Software Firm Growth and Associated Factors in Pakistan
Software Developing Industry: Some Preliminary Findings

ABSTRACT
This study tests the association between factors that influence growth of software developing firms. Firm growth is measured using five criteria namely output, sale, employment, profit and clientele. The data for analysis is collected using survey questionnaires from 60 software developing firms from major cities of Pakistan i.e. Lahore, Karachi, Islamabad, Rawalpindi. The firm growth associated factors are categorized into entrepreneur related, firm related and exogenous factors. The strength of association between growth indicators and influencing factors is tested using statistical techniques. Overall results reveal strong affiliation between growth indicators and the associated factors.

Keywords: Entrepreneurship, Software Developing Firms, Firm Growth, New Economy.

1. Introduction
Software industry saw its evolution during the 60s and 70s in developed countries. Since then the impact of software industry has been multifarious. One example of which is term ‘New Economy’ tossed in mid 1990s. Behind the increasing demand for software there is process of computerization of industries and production processes. Consequently, there is a growing share of software production in national product of countries around the world. Owing to low initial cost and quick product-development, these software producing enterprises can increase production in developing countries by overcoming the capital scarcity. Out of entire software industry, this study chooses Software Development Houses (SDHs) which form a significant portion of total software industry in Pakistan (PSEB, 2005).

In Pakistan, Software industry remained deprived of policy attention till mid-1990s. Pakistan Software Export Board (PSEB), Computer Society of Pakistan (CSP), Pakistan Software Houses Association (PASHA) and Pakistan Electronic Media Regulatory Authority (PEMRA) are some bodies for the uplift of software industry in Pakistan. Developed countries outsource their software development processes to developing countries one of which is Pakistan due to availability of cheap and skilled labor. Therefore, growth of Pakistan software industry considerably depends on outsourced software development. This area of research has been under-researched.
2. Previous Literature
Schumpeter (1942) considers innovation as dominant determinant for fostering the growth of firm but it destroys the dominance of market which is already established. It leads stiff competition in market. Whereas Steindl (1952) believes that to gain quick advantages some firms adopt technologies and reinvestment their extra profits so called ‘internal accumulation’. Javanovic (1994) found that firms with entrepreneurial ability and moderate risk have a good pace to grow. For instance, George (1996) proved that technological innovation and firm size has positive relation, it causes growth in technology-based firms and technology determines market structure and R&D intensity that substantially increases innovation rate and causes ‘creative destruction’ (Schumpeter, 1942). Whereas, some firms gain quick advantage by adopting the technologies, by internal accumulation of funds and by the optimum utilization of available resources (Steindl, 1952). But empirical evidence shows that businessman has no aspiration for achievement and growth its take us into an entrepreneurial paradox and the complexity of paradox is increasing due to multifacetedness (Storey, 1994; Wiklund, 1998; Delmar 2003). From the point of view of developing countries, Crafts & (2001) points that these nations have started using Information Technology (IT) as an enabler of growth in all walks of life which fosters their overall productivity and hence growth. Since software industry has a pivotal role in determining the level of Information Technology, It will be of significance to find out the factors that are associated with software firm growth. Wiklund (1998) & Delmar et al. (2003) find growth as a multifaceted phenomenon that one can’t measure using single variable. So it is difficult to precisely measure firm growth and its dynamics.

4. Scientific Approach to Analysis
4.1 Software firm Growth and Associated Factors
Inspired by Storey (1994) growth of firms, here, is considered as multifaceted phenomenon by using sales trend, employment trend, output trend, profit trend and customer trend as indicators of software firm growth. It should be noted that definition necessitates that a firm develops software. Value added resellers and system integrators are not included in the sample.

Associated factors are divided into three categories; entrepreneur-related factors, firm-related factors and exogenous factors. Entrepreneur-related factors include ‘age of entrepreneur’, ‘willingness of entrepreneur to grow’ and ‘willingness to adopt technology’. Firm-related factors include ‘employment at the beginning of time period’, ‘employment at the end of time period’, ‘way firm responds to market crunch’ and ‘type of customers’. While exogenous factors include ‘market saturation’ and ‘change in technology’. In current study these variables have been used to scrutinize their association with firm growth. The feature of this study is inclusion of a new variable ‘market saturation’. To author’s knowledge, this trait of market has not been empirically tested as a factor of firm growth in the existing literature.

4.2 Data and Sample Size
Data is collected using the survey questionnaires, major part of which is conducted through telephonic conversation and personal visits depending on the convenience of respondent from software industry. Since most of the variables are qualitative in nature,
Likert scale technique is used to quantify them, which are then subjected to statistical analysis. This study uses convenient sampling due to lack of identification to the software firms and selects 60 software houses. 29 software houses were surveyed from Lahore while total number of software house in Lahore is 105 (27.62%). Similarly, 17 software houses from Karachi out of 129 (13.33%), 13 from Islamabad and Rawalpindi out of 79 (16.46%) and 3 from other cities. Right and left panel of the diagram explain the decomposition of software industry and firm growth in relation with associated factors, respectively.

Figure 1: Segmentation of Software Industry and Classification of Associated Factors

Source: Authors’ own compilation

5. Empirical Findings
For inquiring the existence of association between firm growth and internal and external factors that are suspected to influence firm growth, chi-square is used. Moreover, the coefficient of contingency is also calculated to find the relative strength of association. Level of sales, profit, employment, output and clientele are five measures of firm growth that are used in this study. These proxies of firm growth are tested for their association with internal and external factors.

5.1. Entrepreneur-related Factors
5.1.1 Age of Entrepreneur
5.1.1.1 Customer Trend

Hₐ: There is association between Customer Trend and Age of Entrepreneur.
‘Customer Trend’ includes three categories (increase, decrease and fluctuating) and employment at the end of time period is in quantitative values. From the chi-square table it is found the H₀ is rejected and the two variables are associated with χ² value as 20.278. For the strength of association, coefficient of contingency ‘C’ is estimated which in this case reveals ‘strong association.’

5.1.1.2 Output Trend

Hₐ: There is association between Output Trend and Age of Entrepreneur.

‘Output Trend’ includes three categories (increase, decrease and fluctuating) and employment at the end of time period is in quantitative values. From the chi-square table it is found the H₀ is rejected and the two variables are associated. The χ² value is 23.034 and coefficient of contingency ‘C’ is also estimated which reveals ‘strong association’.

<table>
<thead>
<tr>
<th>Firm Characteristic</th>
<th>Output Variable</th>
<th>Chi-square (χ²)</th>
<th>Coefficient of Contingency (C)</th>
<th>( \frac{(q-1)}{q} )</th>
</tr>
</thead>
<tbody>
<tr>
<td>Age of Entrepreneur</td>
<td>Customer Trend</td>
<td>20.278</td>
<td>0.519</td>
<td>0.816</td>
</tr>
<tr>
<td></td>
<td>Output Trend</td>
<td>23.034</td>
<td>0.519</td>
<td>0.816</td>
</tr>
</tbody>
</table>

5.1.2. Willingness of Entrepreneur to Grow

5.1.2.1 Sale Trend

Hₐ: There is association between ‘sale trend’ and ‘willingness of entrepreneur to grow’.

‘Sale trend’ includes 10 categories including; increase (ranging from 1-200% with slabs; 1-10%, 11-20%, 21-30%, 31-40%, 41-50%, 51-60%, 61-100% and 101-200%), decrease, and not mentioned and willingness to grow contain ‘two’ values (yes or no). From the chi-square χ² table it is found the H₀ is rejected and the two variables are associated. The χ² value is 17.636 while the association between the variables is strong as per coefficient of contingency ‘C’ criteria.

<table>
<thead>
<tr>
<th>Entrepreneurial Characteristic</th>
<th>Output Variable</th>
<th>Chi-square (χ²)</th>
<th>Coefficient of Contingency (C)</th>
<th>( \frac{(q-1)}{q} )</th>
</tr>
</thead>
<tbody>
<tr>
<td>Willingness of Entrepreneur to Grow</td>
<td>Sales Trend</td>
<td>17.636</td>
<td>0.371</td>
<td>0.70711</td>
</tr>
</tbody>
</table>

5.1.3 Willingness to Adopt Technology

5.1.3.1 Employment Trend

Hₐ: There is association between ‘employment trend’ and ‘willingness to adopt technology’.

‘Employment Trend’ includes three categories (increase, decrease and fluctuating) and willingness to adopt technology contains two values (yes or no). From the chi-square table it is found the H₀ is rejected and the two variables are associated. The χ² value is
8.212 which shows the significant association between above mentioned variables and the
degree of association is weak as per coefficient of contingency criterion.

5.1.3.2 Profit Trend

Hₐ: There is association between ‘profit trend’ and ‘willingness to adopt technology’.
‘Profit Trend’ includes 3 categories (increase, decrease and fluctuating) and willingness
to adopt technology contains two values (yes or no). From the chi-square table it is found
the H₀ is rejected and the two variables are associated. The $\chi^2_c$ value is 6.89 which shows
the significant association between above mentioned variables.

Hence it is found that there is a relatively weak association between the variables
according to coefficient of contingency criterion.

5.1.3.3 Sale Trend

Hₐ: There is association between ‘output trend’ and ‘willingness to adopt technology’.
Output Trend includes three categories (increase, decrease and fluctuating) and
willingness to adopt technology contains two values (yes or no). From the chi-square
table it is found the H₀ is rejected and the two variables are associated. The $\chi^2_c$ value is 7.292 and strong association is found using the coefficient of contingency.

<table>
<thead>

</tbody>
</table>

5.2. Firm Related Factors

5.2.1 Employment at the Beginning of Time Period

5.2.1.1 Customer Trend

Hₐ: There is association between ‘customer trend’ and ‘employment at the beginning of
time period’.
‘Customer Trend’ includes three categories (increase, decrease and fluctuating) and
employment at the beginning of time period is in quantitative values. From the chi-square
table it is found the H₀ is rejected and the two variables are associated. The $\chi^2_c$ value is 96.451 which shows the significant association between above mentioned variables.

5.2.1.2 Output Trend

Hₐ: There is association between ‘output trend’ and ‘employment of the firm now’.
‘Output Trend’ includes three categories (increase, decrease and fluctuating) and
employment at the beginning of time period is in quantitative values. From the chi-square
table it is found the H₀ is rejected and the two variables are associated. The $\chi^2_c$ value is 84.436 which shows the significant association between above mentioned variables.
5.2.2 Employment at the End of Time Period and Customer Trend

5.2.2.1 Customer Trend

\( \text{H}_A: \) There is association between ‘customer trend’ and ‘employment at the end of time period’.

‘Customer Trend’ includes three categories (increase, decrease and fluctuating) and employment at the end of time period is in quantitative values. From the chi-square table it is found the \( \text{H}_0 \) is rejected and the two variables are associated. The \( \chi^2 \) value is 105.854 which shows the significant association between above mentioned variables. Moreover, this association is strong.

5.2.2.2 Output Trend

\( \text{H}_A: \) There is association between ‘output trend’ and ‘employment at the end of time period’.

‘Output Trend’ includes three categories (increase, decrease and fluctuating) and employment at the end of time period is in quantitative values. From the chi-square table it is found the \( \text{H}_0 \) is rejected and the two variables are associated. The \( \chi^2 \) value is 106.512 which shows the significant association between above mentioned variables Moreover, this association is strong.

<table>
<thead>
<tr>

<td>0.765</td>
<td>0.8165</td>
</tr>
<tr>
<td></td>
<td>Output Trend</td>
<td>96.451</td>
<td>0.765</td>
<td>0.8165</td>
</tr>
</tbody>
</table>

5.2.3 Way Firm Responds to Market Crunch

5.2.3.1 Employment Trend

\( \text{H}_A: \) There is association between ‘employment trend and the ‘way firm respond to market crunch’.

‘Employment trend’ too have 3 categories and ‘way firm responds to market crunch’ includes 5 categories (leave market, take crunch as opportunity, stay steady, change business and others). From the chi-square table it is found the \( \text{H}_0 \) is rejected and the two variables are associated. The \( \chi^2 \) value is 12.201 which shows the significant association between above mentioned variables, which is relatively strong.

5.2.3.2 Sale Trend

\( \text{H}_A: \) There is association between ‘sale trend’ and the way ‘firm responds to market crunch’.

‘Sale Trend’ includes 10 categories including; decrease, increase (ranging from 1% to 200% with slabs) and not mentioned and ‘way firm responds to market crunch’ includes 5 categories (leave market, take crunch as opportunity, stay steady, change business and others).
others). From the chi-square table it is found the $H_0$ is rejected and the two variables are associated. The $\chi^2$ value is 49.602 which shows the significant association between above mentioned variables, which is relatively strong.

<table>
<thead>
<tr>
<th>Entrepreneurial Characteristic</th>
<th>Output Variable</th>
<th>Chi-square ($\chi^2$)</th>
<th>Coefficient of Contingency (C)</th>

<td>Sales Trend</td>
<td>49.602</td>
<td>0.673</td>
<td>0.81649 Strong Association</td>
</tr>
</tbody>
</table>

5.2.4 Type of Customers

5.2.4.1 Output Trend

$H_A$: There is association between ‘output trend’ and ‘type of firm customers’.

‘Output Trend’ includes three categories (increase, decrease and fluctuating) and types of customers include seven categories (only individuals, only firms, only companies, only govt., firms & corporate, corporate & govt. and all of them). From the chi-square table it is found the $H_0$ is rejected and the two variables are associated. The $\chi^2$ value is 8.859 which shows the significant association between above mentioned variables.

<table>
<thead>
<tr>
<th>Entrepreneurial Characteristic</th>
<th>Output Variable</th>
<th>Chi-square ($\chi^2$)</th>
<th>Coefficient of Contingency (C)</th>
<th>$\sqrt{\frac{q-1}{q}}$ OR $\left\lceil \frac{\left{\left\lceil \frac{q-1}{q} \right} \right} - c \right\rceil$</th>
</tr>
</thead>
<tbody>
<tr>
<td>Type of Customers</td>
<td>Output Trend</td>
<td>8.859</td>
<td>0.554</td>
<td>0.816496 Strong Association</td>
</tr>
</tbody>
</table>

5.3. Exogenous Variables

5.3.1 Market Saturation

5.3.1.1 Employment Trend

$H_A$: There is association between ‘employment Trend’ and ‘market saturation’.

‘Employment Trend’ includes three categories (increase, decrease and fluctuating) and ‘Market Saturation’ contains 4 values (Highly saturated, moderately saturated, low saturated and not saturated). From the chi-square table it is found the $H_0$ is rejected and the two variables are associated. The $\chi^2$ value is 24.075 which shows the significant association between above mentioned variables and the strength of association is high as well as given in table.

5.3.1.2 Sale Trend

The feature of this study is inclusion of variable ‘market saturation’ as a determinant of firm growth.

$H_A$: There is association between ‘sale trend' and ‘market saturation’

‘Market Saturation’ contains 4 values (Highly saturated, moderately saturated, low saturated and not saturated) and ‘Sale Trend’ includes 10 categories including; decrease, increase (ranging from 1% to 200% with slabs) and not mentioned. From the chi-square table it is found the $H_0$ is rejected and the two variables are associated. The $\chi^2$ value is
42.146 which shows the significant association between above mentioned variables. This is an achievement of this study to explore this new factor that matters for firm growth.

<table>
<thead>
<tr>
<th>Market Condition</th>
<th>Output Variable</th>
<th>Chi-square ($\chi^2_c$)</th>
<th>Coefficient of Contingency (C)</th>
<th>$\left(\frac{q-1}{q}\right)^{1/2} = \sqrt{\frac{1}{q}} - c$</th>
</tr>
</thead>
<tbody>
<tr>
<td>Market Saturation</td>
<td>Employment Trend</td>
<td>24.075</td>
<td>0.535</td>
<td>0.816496 Strong Association</td>
</tr>
<tr>
<td></td>
<td>Sales Trend</td>
<td>42.146</td>
<td>0.642</td>
<td>0.816496 Strong Association</td>
</tr>
</tbody>
</table>

5.3.2. Change in Technology

5.3.2.1 Customer Trend

$H_A$: There is association between ‘customer trend’ and ‘effect of change in technology’.

‘Customer Trend’ includes three categories (increase, decrease and fluctuating) and change in technology contains 5 values (yes: positively, negatively, both & context dependent, and no effect). From the chi-square table it is found the $H_a$ is rejected and the two variables are associated. The $\chi^2_c$ value is 16.285 with strong association.

5.3.2.2 Employment Trend

$H_A$: There is association between ‘employment trend’ and ‘effect of change in technology’.

‘Employment Trend’ includes three categories (increase, decrease and fluctuating) and change in technology contains 5 values (yes: positively, negatively, both & context dependent, and no effect). From the chi-square table it is found the $H_a$ is rejected and the two variables are associated. The $\chi^2_c$ value is 61.538 with strong association.

5.3.2.3 Output Trend

$H_A$: There is association between ‘output trend’ and ‘effect of change in technology’.

‘Output Trend’ includes three categories (increase, decrease and fluctuating) and change in technology contains 5 values (yes: positively, negatively, both & context dependent, and no effect). From the chi-square table it is found the $H_a$ is rejected and the two variables are associated. The $\chi^2_c$ value is 23.205 and degree of association is high as per coefficient of contingency.

5.3.2.4 Profit Trend

$H_A$: There is association between ‘profit trend’ and ‘effect of change in technology’.

‘Profit Trend’ includes three categories (increase, decrease and fluctuating) and change in technology contains 5 values (yes: positively, negatively, both & context dependent, and no effect). From the chi-square table it is found the $H_a$ is rejected and the two variables are associated. The $\chi^2_c$ value is 22.623 while coefficient of contingency reveals strong association.

<table>
<thead>
<tr>

</tbody>
</table>
6. Conclusion
Overall findings are in favor of expected association between firm growth and associated factors. Since growth, in this paper, is considered to be a multifarious process therefore five dimensions of firm growth were used, viz.; sales trend, employment trend, output trend, profit trend and customer trend. Most of the factors (entrepreneur-related, firm-related and exogenous) show strong association with firm growth variables. Weak association lies between ‘willingness to adopt technology’ and ‘employment trend’ & ‘profit trend’. This not only verifies the suitability of selected growth influencing factors but also conforms to findings of previous researchers.

7. Recommendations for Future Research
This research has opened new avenues for research by highlighting the factors that have affiliation with growth of software developing firms. One of the areas of further research is to investigate the association using more sophisticated statistical techniques. Moreover, the scope of this research can be extended to entire software industry by included software firms other than software developing firms for others countries than Pakistan.

GC University Lahore Pakistan

Abstract

This study explores the traits of software developing firms in Pakistan. Data is collected using survey questionnaires from 60 software developing firms from major cities of Pakistan i.e. Lahore, Karachi, Islamabad and Rawalpindi. This study tries to fill the gap of knowledge of software industry in Pakistan. The traits of software developing firms scrutinized in this study are clustered into six main categories; i.e. entrepreneurial, firm, strategic, exogenous, market condition, growth variables. Descriptive approach is used to scrutinize the state of these traits. Analysis reveals a considerable amount of potential for growth as well as areas where policy attention is required.

Keywords: Entrepreneurship, Software Industry, Firm Growth, New Economy.

1 Introduction

Information revolution is now being touted as the major force of Economic Growth. One of the amazing inventions of information era during the last millennium is software. The impact of software on the economic and social lives is evident. Software production comprises a considerable share of national output of countries around the world. For instance, software (virtual products) has crowded out many physical products due to their comparatively efficient performance and reliability (for example from analogue machines to digital machines).

Software industry has played miracles in the history of developed countries like USA. When in 1990s, USA witnessed high growth in employment, the term ‘New Economy’ was incepted. One the other hand, less capital intensive SMEs are advocated to be a major source of production in developing countries. Collecting the two arguments, software firms are usually SMEs in terms of employment and capital requirement, among other criteria. Suitably, this thesis investigates the traits of software developing firms in Pakistan.

Recently, development of software is also embraced by developing countries like Pakistan. Development of software is quite cost effective, since it requires low initial cost and development of software is a quick process, hence overcoming the capital scarcity in developing countries. Software developing firms are in fact a fraction of the entire
software industry, which are different from other firms such as ‘software traders’, ‘software value adders’ and ‘IT service providers’. Software developing firms being at the top of skill pyramid has highest importance in overall software industry. Accordingly, this thesis selects these firms from this segment.

1.1 Software Industry in Pakistan
In Pakistan, Software industry did not get much attention of policy makers till mid-1990s. Over time Pakistan Software Export Board (PSEB), Computer Society of Pakistan (CSP) and Pakistan Software Houses Association (PASHA) came into being that are designed to support the software industry in Pakistan. Developed countries outsource their software development to developing countries like Pakistan and India due to availability of cheap and skilled labor. Therefore, Pakistan software industry mainly depends on outsourced software development.

2. Previous Literature
Literature for Pakistan’s software industry is scarce, both empirical and otherwise. This area of research has remained underworked because of the lack of proper database of software industry. As Pakistan Software Export Board (2005) in an exploratory study of software industry term Pakistani software industry a totally uncharted territory as far as the structure, management practices, technical ability, and the industry dynamics are concerned. Information technology has brought revolutionary changes in many walks of life. Consequently, this study tries to fill the gap of knowledge of software industry in Pakistan by highlighting the important traits of software firm growth.

3. Objectives
The study aims at:
- Conducting analysis of the traits of software developing industry in Pakistan, related to their structure, management practices, technical ability, and the industry dynamics.

4. Research Methods
4.1 Framework of Analysis
This article selects a certain segment of software industry that produces (develops) software. Such firms are called ‘software development houses’ or ‘software developing firms.’ This segment is different from similar segments of industry such as ‘software traders’, ‘software value adders’ and ‘IT service providers’ that require low-level of software developing skills. Software developing firms being on the top of skill pyramid has highest importance in overall software industry.
4.2 Data Collection
60 software houses are surveyed, out of which 29 software houses are surveyed from Lahore while total number of software house in Lahore is 105. Similarly, 17 software houses from Karachi out of 129, 13 from Islamabad and Rawalpindi out of 79 and 3 from other cities. Survey is conducted through telephonic conversation and personal visits depending on the convenience of respondents (mostly entrepreneurs and/or CEOs) from software industry. Since most of the variables are qualitative in nature, Likert scale technique is used to quantify them, which are then subjected to statistical analysis.

5. Descriptive Approach
5.1 Overall Sample
60 software developing firms had participated in the data response process for study which is almost 5.126% of total IT industry. Rate of participation from various cities are: 47% from Lahore (25), 27% form Karachi (17), 19% from Islamabad (12), 2% from Faisalabad, 2% from Rawalpindi and 2% Quetta. There is common perception in the industry that more than 50% of the IT firms are ‘software traders’, value adder or IT service providers and 25% to 30% of IT industry is developing software. Sample used in this study is approximately 20.54% of the software development industry. The proposed sample size was more than 80 firms but security issue in city of Karachi is the main hurdle in limiting the sample size to 60.

5.2 Status of the Respondents
From total, 24% CEOs (15), 24% Project manager (15), 15% Human resource manager (9), 11% Operational manager (7), 8% Team lead (5), 8% Senior software engineer (5), 5% Senior developer (3) and 3% Sale manager (2) have participated for research.

Figure 1: Segmentation of Software Industry

Source: Author’s own compilation
5.3 Entrepreneurial Variables

5.3.1 Experience of Owner
90% of the owners of software firms had the software industry experience prior to their current entrepreneurship, 5% had of some other industry and 5% had none. Category of 90% might be due to lack of intrapreneurial culture in software firms. In turn, this lack can be attributed to the infancy of software industry in Pakistan. Consequently, Red Ocean\textsuperscript{13} strategy is being followed by majority of entrepreneurs in software industry.

[Insert Figure 3 about here.]

5.3.2 Owner’s Knowledge about Software Development
Majority (83.61%) of the owner’s knowledge in software development verifies that software developing industry is skill intensive. While 16.39% of the entrepreneurs have no knowledge of software development, such entrepreneurs invest in the industry with the collaboration of skilled team and establish firms.

[Insert Figure 4 about here.]

5.3.3 Education and Firm Growth
50% of the sample entrepreneurs ‘strongly agree’, 21% ‘agree’, 21% ‘average’, 5% satisfactory level of impact and only 3% of sample ‘disagree’ that education has an impact on firm growth. They believe opportunity, trained work force and market relations are only essentials that trigger growth at national and international level.

[Insert Figure 5 about here.]

5.3.4 Age of Entrepreneurs
It is found that most of the software owners are of middle age i.e. 76% of the total sample consists of the entrepreneurs with the age from 26 to 35 years. Entrepreneurs of age from 20 to 25 years & from 36 to 45 years are 24% of the sample. It also shows the trend of university graduates to enter into the Service industry right after getting degree and proper experience in software developing firms (SDF). Hence, young entrepreneurship is found to be a trait of IT industry of Pakistan as depicted in figure 6.

[Insert Figure 6 about here.]

5.3.5 Qualities of Entrepreneurs
These the qualities of successful entrepreneurs as perceived by the interviewed sample entrepreneur. 58% perceive ‘effective management’ is the key quality of an entrepreneur, 34% ‘sense of change in market’, 6% ‘supervision’, 65% ‘technically sound’, 61% ‘capacity to convert opportunity into profit’, 44%’ good policy maker’, 2% ‘Pro-activeness’, 5% ’leadership’ and 3% others. They assume that a good manager and technically sound persons can mitigate risk of loss in future. But we can’t deny the importance of dynamism and leadership as their entrepreneurial quality in the e-markets where technology changes over a tick of clock.

[Insert Figure 7 about here.]
5.3.6 Reasons to Start New Business
Out of these reasons ‘market profit’ has the highest frequency (47%) followed by ‘sole control or independence’ (32%), ‘other reasons’ (21%), ‘govt. special incentives’ (5%), and ‘family in business’ (2%). High level of profits due to relaxed tax policy till 2015 and the lucrative earned revenue that is usually earned in dollars through software exports are the reasons to start new software firms.

5.3.7 Type of Risk Taker
Our analysis finds 65% of firms as ‘moderate risk taker’, 18% as ‘high risk-taker’, 13% as ‘very high risk-taker’, 3% as ‘low risk-taker’ and 2% as ‘very low risk-taker’. Highest percentage of ‘moderate risk takers’ imply that entrepreneurs are technically and literary sound. Moderate risk with an appropriate profit is the base of long run strategy for firm success and most of the entrepreneurs in Pakistan software industry are following this.

5.3.8 Willingness to Adopt New Technology
89% of the sample firms want to adopt new technologies on their penchant. 33% of the sample firms like to adopt ‘Agile Scrum’, ‘Flex’ of Flash (5% of the sample), ‘DotNet Framework 4.0 (30% of sample)’, and ‘Capability Maturating Model Integration, CMMI’ (20% of the sample) etc. as development technologies. It is noticed that most of the developer want to use Agile Scrum or CMMI and entrepreneurs that work on flash used Flex.

5.4 Firm Variables
5.4.1 Samples from Cities of Pakistan
Samples from various cities were derived mainly of two reasons; their relative concentration in the city and ease in access. Thereby the share of software firms is plotted in Figure 12.

5.4.2 Age of Firms
Pakistan software industry evolved in 1995. Accordingly, the data reveals that about 23 firms, out of sample, are in infancy stage. Responses reveal that only one software firm bore loss due to crunch in international market and remaining firms gained profits. It is clear that frequency of age of firm is increasing for newer firms, which means encouraging environment for software firms. But the frequency of firms with age 1 – 3 years has declined as compared to previous (4 – 6 years). This might indicate possibility of saturation in the software industry or this decline can be due to international financial crunch, since major share demand for software is from financial sector and financial sector is a direct victim of international financial crunch.
5.4.3 Autonomy of Software Firms
Data reveals that 71% of the software firms are subsidiary of some international software firm. These firms, through these linkages, get well-organized and have predefined setup and internal nimble culture. While remaining 29% firms have to strive for survival and progress using their local resources.

[Insert Figure 14 about here.]

5.4.4 Competitive Resources
6% of the entrepreneurs consider physical resources as their strength, 48% reputational resources, 37% organizational resources, 10% financial resources, 79% intellectual resources and 74% technological resources. Jay Barney (1991) argued that the firms get sustained competitive advantage over others if the advantage is based on reputation, organizational and intellectual resources, as they are inimitable. But it is found that in software firms, people develop their comparative advantage on reputation, intellectual and technological resources which may prolong for longer period of time. They neglect the importance of organizational resources at a considerable level.

[Insert Figure 15 about here.]

5.4.5 System Software Developing Firms
Since developing ‘system software’ requires high competency in software development, therefore, very few firms are developing device drivers, operating system (OS) and windowing systems. Firms developing ‘utility programs’ are higher in number. Such shows a potential for improvement in expertise of software development.

[Insert Figure 16 about here.]

5.4.6 Programming Software Developing Firms
Due to low demand of programming software, its development is low in number. Few exceptions are NetSol, Systems International and AOS that are developing programming software for international market. 5% of the sample firms are developing device drivers, 4% operating system, 18% utility programs, 4% windowing system and 54% firms are not developing programming software.

[Insert Figure 17 about here.]

5.4.7 Firms that are Developing Application Software
82% of sample firms are developing customized software, 25% Industrial automation, 8% video gaming, 7% image editing, 23% Science software, 35% telecom software, 68% databases, 13% office software, 28% educational software, 17% web application, 8% security tools, 3% military software and 32% are developing decision making software. The variety in developing software is evident.

[Insert Figure 18 about here.]

5.4.8 Type of Financing
79% of the sample firms do equity financing, 6% Debt financing and 15% both. It is the most common mode of starting a business and there are many firms who use debt source of financing to fulfill their financial needs. It shows that investors’ trend to this industry.
Most of international firm capitalize their own financial resources for establishing soft-venture and to gain pervasive benefits.

5.4.9 Firm Staff
Skill level of staff in software development firms is quite context dependent, since large organizations like Rozee.com, NetSol etc. have trained and accommodated fresh graduates. While some like Systems International accommodate experienced professionals. Almost all organizations have a blend of professionals. This blend for the overall sample is composed of 56% professionals, 2% part timers & beginners and 35% regular employees. Overall majority of professionals confirms, again, the finding that software developing industry is skill intensive in nature.

5.4.10 Ownership of firms in Sample
Most of firms working in the software industry are companies (90% of the sample) and have very few sole ownerships and partnerships (8.06% and 1.61% respectively).

5.4.11 International Standards
According to Pakistan Software Export Board, 15 companies have achieved Capability Maturity Model Integration (CMMI) level but in the sample of 60, there are 19 firms that have achieved ‘CMMI’ level. 27% of the sample firms have achieved ‘ISO 9000:2008 certification’, 30% of sample firms are ‘MS Gold Partner’. There are 43% of sample firms which do not want to achieve any standard since they are satisfied with their existing performance and consider the pursuit of such standards as a cost to their growth.

5.5 STRATEGIC VARIABLES
5.5.1 Growth Strategy
Many firms adopt a blend of growth strategies but most of the firms focusing on developing customer base (66% of the sample) and product line development (63% of the sample) and remaining are working on developing differential products (24% of the sample) through geographical extension (34% of the sample) and cost leadership (16% of the sample). Few firms are concentrating on the few fixed customers and most of them are developing software that is used as an input to the output of the same firm.

5.5.2 Decision by Consulting
Most of the firms consult their decision with ‘consultants’ (79% of the sample), with ‘employees’ (36% of the sample), with ‘friends’ (3% of the sample) and with ‘all (consultant, employees & others)’ (13% of the sample). This shows that majority of the firms are investing in making guided decision making.
5.5.3 Motivation Factors of Employees
74% of the entrepreneurs in sample firms consider ‘salary’, 56% (of the sample) consider ‘internal learning’, 26% (of the sample) consider ‘entertainment’, 21% considers ‘other factors’, 13% consider ‘recognition’ and 6% consider ‘educational allowance’ as key factor in motivating employees. The dominant factor (salary) is a common trait of private sector and software developing industry in Pakistan is composed of private sector.

[Insert Figure 25 about here.]

5.5.4 Means to Market their Product
Majority (65%) of sample firms consider advertisement as the best way to market the product, 38% ‘personal references’ and 17% ‘agents’. To get government projects, entrepreneurs must have strong personal relation with the government officials along with their market credibility. 18% of sample use other modes of marketing i.e. billboards, business letters, TV commercials etc. for the promotion of their product.
[Insert Figure 26 about here.]

5.5.5 Marketing Strategy
52% of sample use ‘word of mouth approach’, 47% ‘advertising in journals’, 37% ‘attending trade conferences’, 47% one-on-one customer links, 37% use pre-establish network and 19% depends on captive clients.
[Insert Figure 26 about here.]

5.5.6 Funds Allocation in Firms
As found earlier, most of the firms are sophisticated by nature and are international subsidiaries so they are bound to use the funds with a formal plan. Accordingly, 76% of the sample firms are found to abide by formal plan and rest (24%) manage their affairs informally. More a firm formalizes its setup the more it gets mature.
[Insert Figure 27 about here.]

5.5.7 Management Controlling Style
50% of the samples firms are following centralized control policy; that implies full managerial and financial control of owner over their firm. Most of the entrepreneurs are working outside the Pakistan so they follow the decentralized mode of management but there are 32% of samples who have entrepreneurial and intrapreneurial culture within their organization. Internet is used to manage the affair of firms from abroad
[Insert Figure 28 about here.]

5.5.8 Innovation
Only well-organized firms (21% of the sample) have tried to develop new routines and procedures based on software engineering technologies. Due to lack of ability to invest in R&D, 79% of sample firms have not tried to make new routines/procedures for software development methods.
[Insert Figure 29 about here.]
5.5.9 Channels to detect Market Opportunity

Majority (70%) of the sample firms resort to ‘market research’ to detect market opportunity. 19% of the personnel have skills to perceive market opportunity through spying on internet, Google hacking, data trimming and mining etc. 13% have formed marketing teams that work for firm and craft opportunities for them.

[Insert Figure 30 about here.]

5.5.10 Firm Behavior in Market Crunch

As per this study, in face of crisis, 61% of the entrepreneurs opt to stay in market, 35% take crunch as an opportunity, 2% change the type of business, 2% other (miscellaneous strategy) and no firm wishes to leave.

[Insert Figure 31 about here.]

5.6 Exogenous Variables

5.6.1 Barriers to Growth

35% of sample firms indicate market barrier to firm growth, 44% satisfied with prevailing state of market. Market barrier are excessive due to lack of knowledge of public about ICT, reliable infrastructure, trust on electronic transactions etc. Out of the rest, almost 13% of firms consider external barrier (e.g. government barriers) and internal barrier (e.g. control barriers) as hurdles in firm growth.

[Insert Figure 32 about here.]

5.6.2 Impact of Technology

The expectations of the respondents from software development firms about the impact of technology are as follows; 31% of the sample firms consider technology conducive for firm growth, 21% either conducive or detrimental, 2% negative, 6 % others and 40% context dependent due to non-technology factors.

[Insert Figure 33 about here.]

5.7 Market Condition Variables

5.7.1 Customers of Firm

Software is developed for individuals, firms and company and non-mobile software for government (used in large project e.g. real estate automation). These firms have international clients which are normally companies that outsource development and production process to reduce the development cost. 63% of firms have companies as their client, 53% have firms, 18% work for government projects and 26% for individuals. 21% sample firms are those firms who work for all type of businesses or organization.

[Insert Figure 34 about here.]

5.7.2 Modes of Receiving Orders

Most of the orders that firms receive from internet are for package software (46% of sample), web application (25%) and customize software (20%), embedded solutions (2%), system software (3%) and 30% others customized software, embedded software (2% of sample) and system software (3% of sample) is more complex but it need complete team and strong competency in the market to get orders and market opportunities.
5.7.3 Market Saturation
3% entrepreneurs perceived that market is ‘highly saturated’, 23% ‘moderately saturated’, 49% ‘saturated’ and 25% ‘not saturated’. Ten years before there were very few software developing firms in the market. The untapped profit margin has attracted investors and in last five years, many new firms entered the market that has led to moderate saturation.

5.7.4 Startup Condition of the Firms
Software industry being a relatively new industry has had much capacity for investors. 2% of entrepreneur perceive that there were very bad condition in the beginning of firm, 10% bad, 35% normal, 37% good, 13% very good and 3% excellent.

5.8 Growth Variables
5.8.1 Profit, Output and Customer trend
Firm growth is a multi-faceted phenomenon as found through empirical literature, see for example (Davidsson and Wiklund, 2000; Delmar, 1997; Delmar et al, 2003; Weinzimmer et al, 1998). Similar holds for software industry. Considering the existing literature a combinations of variables are analyzed (No. of customers, output, employment and profit trends). Collected data reveals that there is an increase in no. of customers of 74% firms, output of 66% firms and profit of 61% firms. It shows the strength and investment worthiness of the software firms. Few firms can find that there are two or three firms who lost their customer, output and profit but there employment generation capacity is increasing.

7. Conclusion
The trait variables are clustered into ‘6’ main categories; i.e. entrepreneurial, firm, strategic, exogenous, market condition, growth variables. Over analysis verifies the expect conclusion that high level of skills in software industry in Pakistan. Most of the entrepreneurs in software industry have relevant experience before starting their own firm. It shows that major concentration in the industry is of experienced entrepreneurs. Majority in sample entrepreneurs agree that education has strong impact on growth. Most of entrepreneurs are willing to grow although they are in a stiff competition. Many entrepreneurs are satisfied with current business state but market barriers limit firm growth.

Most of the software firms are subsidiary to international firms and are formed under the company’s ordinance 1984. There are many firms that were formed from 2000 to 2010. Attractive aspects of entry are market profit and independence in control. Product line
development and developing customer base are the most common strategies followed by entrepreneurs. It is also found that entrepreneurs are moderate risk takers and take all decisions by consulting employees and professionals.

Software firms in Pakistan are developing almost every type of software but in major they are developing utility program in system software, linkers in programming software and business & database in application software. Most of sample firms are not willing to achieve any standard or certification but it can be found that CMMI and MS Gold Partner certification is common among software firms. Incentives, bonuses and internal learning are the key motivation factors for employees. It is originated that in market crunch firms should stay steady and takes crunch as an opportunity.

Package software, customized software and web application development are the product for which orders are received from internet. Most of the software houses are using their funds formally because they are centralized. Agile Scrum, .net\(^{16}\) framework 4.0 and CMMI levels are the standards firms want to achieve. Firms in software industry are achieving good number of customers, high profits, increasing employments and output shows the rapid growth in firm.

Further research can be directed towards the inferential analysis of these traits especially growth determination of the software firms should be focus of future research.

Overall health of the software developing industry is found to be good, mainly due to IT boom that occurred in Pakistan during 2000’s, along with high volume of FDI. Sustaining this friendly environment will be required to ameliorate the condition of software developing industry in Pakistan.

Tazeem Ali Shah
International Islamic University, Islamabad.

Abstract

This study investigated the attitudes of Pakistani consumers towards non local (imported) products. Country of Origin (COO) effect was the main thing to find out. A survey questionnaire was distributed among 200 respondents in the twin cities Islamabad and Rawalpindi. The questionnaire contained the measure of, quality of the products, social status, and unavailability of local substitutes; admiration for EDCs life style, consumers’ ethnocentrism and attitudes towards non local products. Nine hypotheses were designed and tested by Pearson correlation and simple regression analysis by using SPSS 15 version. Analysis of the data showed that consumers in the developing countries like Pakistan considered the imported products as of high value and they feel a pride when having the products of the developed countries. The moderating impact of admiration for EDCs life style and consumers’ ethnocentrism was also confirmed by this study. The research findings suggest for the MNCs to go for a joint venture with a local firm or set up a foreign subsidiary to control the effect of ethnocentricity which is extremely important to cope with. Local producers and marketers should focus on the quality of their products to compete with multinational corporations in their domestic markets and survive with a rising head. This research showed that if the imported products are of high quality, more reliable and of reasonable price then ethnocentrism can not become hostile to them.

Keywords: Consumers’ Attitudes ; Non-local Products; Empirical; Evidence ; Pakistan

Introduction

Marketing practices in the global market and consumers’ attitudes towards foreign products have been rich topics in the literature of country of origin and are widely discussed by the renowned researchers of marketing (Bannister & Saunder, 1978). Businesses are spreading through out the world with a very high pace and accordingly the customers are becoming rational, which is of a great importance to the local and non local producers (Shahid, 1997).

Due to the impact of globalization businesses are becoming cross national and international with a fast pace, so it is strongly recommended to find out some valid and reliable parameters for gauging the consumer attitudes towards domestic and imported products (Netemeyer, et al
1991). Literature shows that in the developed countries consumers prefer their home country products as compared to the foreign products (Bilkey et al 1982). The products of those countries which have cultural similarities with countries; where they market their products; will be preferred by the consumers (Crawford & Lamb, 1981; Heslop et al, 1998; Wang & Lamb, 1983). Products with foreign brand names are associated with the country of origin and many firms have used the association of brand name with the country of origin for the competitive advantage in marketing of goods and services (Papadopoulos et al, 1993). Yet there are some product categories which can not be associated with any country of origin image as in the case of car industry where it is difficult to market global brands such as “Mercedes” “Toyota”, for which brand images have developed apart from their country of origin and they do not use their national country of origin association in their promotion and marketing strategies (Kinra, 2005).

This research is very much linked with the country of origin literature and the most important objective of this research is to investigate the Pakistani consumers’ preferences and attitudes towards imported products. In addition to this it is also to find out the degree of ethnocentrism and its effect on the consumers’ attitudes towards foreign products. The findings of the research will be of a great value to the local producers and marketers in the formulation of their production and marketing strategies. The local producers and marketers will be offered some better suggestions that how they can compete with their non local competitors in their home market after this research.

Background of the Study

Research on the country of origin suggested a sound framework for the international marketers, on how to compete effectively in the global market to get sustainable competitive advantage (Batra et al, 2000). An ample research on how consumers perceive their local and non local brands is conducted in the developed countries. A research conducted by Batra et al (2000) in India explored that Indian consumers prefer to the brands having non local country of origin on the basis of high quality and esteemed social status. Pakistan is one of the growing economies of the developing world. Its population is approximately 180 millions. Pakistan has not the potential to make all kinds of products for the local consumers so its market is of extreme importance for the multinational companies. This research will be considered as important to the local and multinational firms in understanding that how they should deal with Pakistani consumers, having a strong Islamic background and a distinct culture. The detailed view of the research on the country of origin is presented in the literature review section of the research.

Objective of the Study

The main focus here in this research is on the perceptions and awareness of consumers’ towards “local” versus “non local” brands of different products categories in Pakistani market. It is to explore that why consumers prefer to buy non local products as compared to local products. Pakistan is an Islamic country. Most of the people have strong religious background. This research is aimed to explore that Pakistani consumers are high or low ethnocentric and also its impact on the relationship between independent and dependent variables.
The Authors’ Contribution

Past researches conducted in the developed countries on the country of origin revealed that consumers give preference to the non-local country of origin products on the basis of quality and price as mentioned in the literature review. This research shows in the context of Pakistan that what consumers do when local substitutes are not available in contrast of foreign products? In addition to this, the study explores that how admiration towards the EDCs lifestyle and consumers ethnocentrism influence the association between independent and dependent variables as shown in the schematic diagram of the theoretical framework of the study.

Literature Review

Country of origin has been an important topic of research since the last three decades. Products made in one country are preferred more by the consumers than those of the other countries (Papadopoulos et al, 1987). The perceptions of Chinese consumers towards the products of highly industrialized countries are more positive as compare to those of the newly industrialized countries (Ahmad & d’Astous, 2004). It is also explored by most of the researchers that consumers’ preferences are positively related to the economic development of the country of origin; having the concept in their mind that good quality is the sign of economic development (Bumpkin and Crawford, 1985). Consumers of the developing world are very much inclined towards the products of the developed world because of the good quality and as a sign of high social status (Batra et al, 2000). The admirers of the economically developed countries’ lifestyle will prefer to use the products made by them as compare to the Indian products (Batra et al, 2000).

It is also evident from the literature that the high ethnocentric people are expected to avoid buying non-local products because they think that this activity would be considered as unpatriotic and will kill the domestic jobs (Shimp & Shirma, 1987). If both local and non-local products are of the same quality and of the same price, consumers will go for local products, even they will be ready to pay a higher price for their local products but they are not ready to compromise on quality (Knight, 1999). A study conducted by Kinra (2005) in India at the city of Lucknow revealed that although consumers rating on the ethnocentrism scale are high but they have no prejudice against the foreign brand names. Brand origin is considered as important attribute by Indian consumers. The customers associate the brands with their original producers rather than the current producing country (Jin et al, 2006). It is also become evident from the research that the association of brand with its original producers become weaker with the passage of time as the brands started to be produced locally (Jin et al, 2006). Another astonishing thing becomes evident from the research conducted by Watson and Wright (2000) in New Zealand regarding a specific situation, when no domestic alternatives are available.

What happened was that consumers gave preference to the products of those countries which were similar in culture to their home country. Country of origin information becomes advantageous in case of unavailability of domestic substitutes for those who imports from culturally similar countries (Watson and Write, 2000). In the developing countries like India and Saudi Arabia foreign brands are not only preferred because of the quality but are preferred because of status enhancing reasons (Sklaire, 1994). Bangladeshi consumers give preference to the western products because of a high quality and durability in contrast of the domestic products but there is a difference across the product classes and degree of suitability of sourcing countries (Kaynak et al, 1999). It is discovered that products originated from the developed countries are associated with very similar characteristics such as high quality,
good workmanship; reliability etc. and the products from the developing world are perceived to be of low quality (Kaynak et al, 1999). It is also important to note that level of education also influence the consumers’ perceptions towards non local products. Highly educated people are in the favor of imported products as compare to low educated people (Sklair, 1994)

Theoretical Framework

The dependent variable “attitude towards non local products” can be explained by the three independent variables; (1) high quality (2) high social status (3) unavailability of the local substitute. Consumers of the developing countries will go for non local products because they are generally deemed as of high quality. Products of economically developed countries are considered as a sign of high social status; so consumers tend to go for non local products. Lastly when there is no local substitute available for consumers, they have no option other than to go for non local products.

Two moderating variables (1) high admiration to EDCs (economically developed countries) lifestyle (2) consumers’ ethnocentrism are taken into account in this study. These moderating variables will change the relationship of the independent and dependent variables. If consumers have a strong admiration towards the life style of economically developed countries, then it will positively moderate the relationship between independent and dependent variables. If consumers of the developing countries are highly ethnocentric then the relationship between the independent and dependent variables will be change with the presence of this moderating effect.

Figure 1: Schematic diagram for the theoretical framework
Variables
Independent variables:

- Quality of the products
- Social status
- Unavailability of local substitutes

Dependent variable:

- Attitude towards non local products

Moderating variables:

- High admiration to EDCs lifestyle
- Consumers’ ethnocentrism

Hypotheses:

H1: Quality of the products and consumer attitudes towards non local products are positively related.
H2: Consumers will prefer the products manufactured by a foreign owned company because it adds to the social status of consumers.
H3: when no local substitutes are available consumers will automatically go for foreign products.
H4: Admiration to EDC life moderates the relationship between quality of product and attitude toward nonlocal product.
H5: Admiration to EDC life moderates the relationship between Social Status and attitude toward nonlocal product.
H6: Admiration to EDC life moderates the relationship between unavailability of local product and attitude toward nonlocal product.
H7: Consumer ethnocentrism moderates the relationship between quality of product and attitude toward nonlocal product.
H8: Consumer ethnocentrism moderates the relationship between Social Status and attitude toward nonlocal product.
H9: Consumer ethnocentrism moderates the relationship between unavailability of local product and attitude toward nonlocal product

Methodology
Data Collection

Data were collected from the respondents by using the convenience sampling technique. Due to the time and cost factors this specific sampling technique was adopted for this research. The respondents were from the twins cities of Islamabad and Rawalpindi. Non local products are of high quality and of relatively high prices, so all the sample subjects were from the middle class. Total of 200 survey questionnaires were distributed among the respondents. Drop off and picked-up technique was adopted due to short time in the data collection. The respondents were of the three categories, Govt. servants, private job holders and business men respectively. Majority of the respondents had the college or university degree. Their age ranged from 20 to 60 years.
Measures
The items used in this study were drawn from the scales which had been validated by the previous literature. The questionnaire of the research was consisted of 27 statements, focusing on the products attributes, consumer’s ethnocentrism, admiration for economically developed countries lifestyle, social status, unavailability of local substitute and consumers perceptions and attitudes towards using and buying non local products. The number of statements related to the product attributes were twelve. Within these twelve statements the first eight were that of the “central products attributes” and the remaining four were “peripheral products attributes” (Darling and Wood, 1990; Douglas and Craig, 1983). The five statements related to consumers’ preferences towards using and buying of foreign country products were taken from Shahid (1997) research. “Consumers ethnocentrism is a psychological construct representing how consumers view products made in their own country markets as an object of pride and identity versus those from other countries market” (Kinra, 2005). This was measured through ethnocentrism scale, CETSCALE (Shimp and Sharma, 1987) which had been validated by several past studies (Batra et al, 2000; Supphellen and Rittenburg, 2001; Watson and Wright, 2000). These items used strongly agree and strongly disagree endpoints. Admiration of the developed countries’ lifestyle was measured through a single item scale adopted from the paper of Batra et al (2000). This statement is adapted as “I admire the lifestyle of the people living in the developed countries”. Items of the social status and unavailability of local substitutes were taken from the research of Batra et al (2000). Five items of consumers’ attitudes towards buying and using non local products were taken from the research of Shahid (1997). As this study focused on the consumers attitudes towards foreign countries’ products so the respondents chosen were mostly educated people. The survey instrument was administered in English because it is a widely used business language in Pakistan and was easy for the respondents to cope with.

Results and Discussion
Reliability of the items used in the research was checked through the SPSS 15 version. Cronbach alpha values for the items of central products attributes, peripheral products attributes, social status item, attitudes towards nonlocal products and consumers ethnocentrism were 0.74, 0.78, 0.73 and 0.86 respectively which are considered as quite reliable and valid. Descriptive statistics of the variables are presented in table # 1. All of the variables except the peripheral products attributes items have a higher means which shows that imported products have better quality and they do not have just outward appearance.

H1: Our first hypothesis is proven by the result, which shows the relationship between the quality of products and consumers attitudes towards non local products. The correlation between these two variables is positive. Value of the relationship is (0.23) and the significance level is (0.01). Peripheral products attributes have negative correlation with attitudes towards nonlocal products which shows that products of the economically developed countries are not having only outward appearance but they have fine workmanship and are considered as technologically the best, its value is (-218) and the significance level is (0.01).

H2: Like the previous research by Batra et al (2000), it is proven by the results of this study that people prefer to buy the products of the developed countries because having that; people will consider them as of high class in the community. Social status and attitudes towards non local products are positively correlated. The correlation value is (0.58) and the relationship is significant at the level of (0.01).

H3: The third hypothesis was also supported by the results, which shows that when no local substitutes are available, consumers will go for non local products. The correlation between these two variables is positive and the value is (0.38) and the relationship is significant at the level of (0.01). All of the independent variables are correlated with the dependent variable. Quality of the products, social status and unavailability of the local substitutes are positively correlated with the attitudes towards non local products. Peripheral products attributes are negatively correlated with attitudes towards non local products. The detail is presented in table # 2.

H4, H5 and H6:
Simple regression analyses were used to test these hypotheses. Moderation is confirmed if the product of independent and moderator has significant effect on the dependent variable, controlling for the effects of independent and moderator variables (Baron and Kenney, 1986).
The earlier hypotheses (H1, 2 and 3) showed that there is a correlation between independent and dependent variables. We have checked the moderating effect of admiration towards EDCs lifestyle on the relationship between independent and dependent variables. Table 3 shows that quality of products ($\beta = .08, p < .05$) social status ($\beta = .15, p < .05$) and unavailability of local substitute ($\beta = .20, p < .05$) are significantly related with attitudes towards non-local products. The interaction term involving admiration towards economically developed countries lifestyle and quality of product ($\beta = .11, p < .05$) social status ($\beta = .22, p < .05$) and unavailability of local substitute ($\beta = .29, p < .05$) are significantly related to attitudes towards non-local products. Hence H4, 5 and 6, are supported by results.

H7, H8, and H9:
These hypotheses predicted the combined effect of ethnocentrism with quality of products, social status and unavailability of local substitutes. Consumer ethnocentrism has a negative significant relationship ($\beta = -.25, p < .05$) with attitude towards non-local products. Results of moderated regression analysis presented in table 4 shows that consumers’ ethnocentric moderated the predicted relationships. The results show that high ethnocentric people express biasness towards imported products and are ready to compromise on quality as well. The interaction impact of consumers’ ethnocentrism have decreased the original Betas of independent variables from (quality of product, $\beta = .08$, social status, $\beta = .15$ and unavailability of local substitutes $\beta = .20$) to ($\beta = .04$, $\beta = .07$ and $\beta = .16$) respectively. Hence these hypotheses are also supported by the results.

Overall the results of the study are quite in the direction of the past researches. It is also proven by other researches in the developing countries that consumers give preference to the products of the economically developed countries like Japan, USA and European countries. The moderating impact of the admiration for economically developed countries’ life style is significant as it is evident from the above analysis. The moderating effect of consumers’ ethnocentrism is also important to note, which shows that people who scored high in ethnocentrism will be biased favorably towards their domestic products as compare to those who are low in ethnocentrism.

**Conclusion**

This research is an important contribution in the country of origin literature. It is unique in the sense that it tested the moderating impact of two important variables of high admiration to EDCs life style and consumers’ ethnocentrism. The study concluded that consumers of the developing countries have a strong and positive image about the products of the developed countries. They feel a personal pride when having the products of these countries. When local substitute will not be available for the consumers; it is likely that they will automatically go for imported products which are proven by the results as well. It does mean that those who admire the life style of economically developed countries will tend to prefer their products. Highly ethnocentric consumers have a favorable biasness toward their local products. They are even ready to compromise on quality of the products as well.
Limitations and Future Research Directions

Nothing is perfect in the social sciences research so this research also has some limitations which should duly be kept in mind while generalizing its results to the wider population. First important limitation of this study is the convenience sampling technique which is considered as a strong limitation for the generalizability of the study results. Second limitation of the study is that it was a cross-sectional study. Longitudinal study is advised for the future researchers for the detailed and somewhat perfect relationship of the constructs discussed in this study. Third limitation of the study is the small sample size and the future researchers are directed towards a big sample size to increase the validity and reliability of the study. Last and the most important thing is the culture which play a key role in the personality development of the people. Its impact should always be considered in mind while conducting research; it is advised to replicate the study in other cultural settings.

Abstract
This study seeks to investigate the relationships between employees’ perception of psychological contract breach on employees’ satisfaction level, their commitment to the organization and intentions to quit. The study also attempts to find out whether or not employees’ perceptions of justice in the organization play a moderating role in these relationships. The data were collected from 147 respondents working in the telecom industry of Pakistan. The results indicated that there is a negative relationship between employees’ perception of psychological contract breach and their satisfaction level, commitment, and a positive relationship with turnover intentions. The results also revealed that the relationships between their perceived psychological contract violations and various employee level outcomes are further strengthened, if employees perceive lack of justice in the organization.

Keywords: Interactive effects ; Psychological Contract ; Violations ; Employees' Perception ; Justice ; Various Job Outcomes

Introduction:
Psychological contract can be defined as “a set of reciprocal obligations or promises related to the employment relationship between an organization and individual” (Rousseau and Tijoriwala, 1998). Guest and Conway (2002) explored it is an important employment relationship between employer and employees at individual level. Employees’ affective commitment has positive association with Perceived organizational support and the later led to lower turnover intentions (Addae et al, 2006). Affectively committed employees are more likely to think about quitting their jobs when they perceive psychological contract breach from the organizational side (Addae et al, 2006). Psychological contracts are of two distinct types: transactional and relational contracts (Rousseau, 1990). Transactional contracts are short term oriented, narrow in scope and having economic exchange between employee and employer (Rousseau, 1990) and have reduced association between employer and employee (Raja et al, 2004). On the other hand relational contracts are open ended, have no economic exchange base and having a broad scope and definition (Rousseau, 1990). Psychological contract fulfillment/breach is a key factor in the construct of psychological contract theory in order to understand its relationship with outcomes (Rousseau, 1990). Psychological contract fulfillment has positive relationship with job satisfaction, Organizational Citizenship Behavior (OCB) organizational commitment, and performance; while negative association with intention to quit (Robinson, 1996; Robinson and Rousseau, 1994; Turnley and Feldman, 2000 Noonan and Elron, 1994; Robinson and Morisson, 1995). The direct impact of psychological violation on individual’s attitudes and behaviors has been frequently studied as discussed above. However it is not necessary that psychological contract violation always
leads to adverse reactions among employees (Rousseau, 1994). There are some important situational moderators which may impact the association between psychological contract violation and negative attitudes and behaviors of employees. For example, it was explored that the relationship between psychological contract violation and trust in organization is moderated by careerism (Robinson and Rousseau, 1994). When there is procedural, distributive and interactional justice prevailing in the organization, then employees are unwilling to commit adverse reactions in response psychological contract violation (Turnley and Feldman, 1998). In addition to the direct relationship between psychological contract violation and employees’ responses (turnover, in-role performance, and reduced extra-role performance) this study is to explore the empirical support to the moderating impact of justice on the direct relationship between psychological contract violation and employees responses.

**Literature Review and Hypotheses Development:**
Conway and Briner (2005) and Rousseau (1995) defined psychological contract as “individual beliefs, shaped by the organization, regarding terms of an exchange agreement between the individual and their organization”. The theory of expectancy motivation, originally developed by Vroom (1964), is a theory to explain the process by which individuals choose to use a variety of behavioral decisions. For any act, action or task forces are driving the three different cognitive functions: life expectancy, instrumentality, and price. Driving force is the force that guides the behavior of another specific behavior that is one of the options, the recommended decision. Expectancy theory has a general empirical support (Vansteenkiste, 2005; Field, 2000), considered as one of the most popular theory of motivation (Heneman, Schwab, 1972; Campbell and Pritchard, 1976; Mitchell and Biglan, 1971 years).

Draw on social exchange theory (Blau, 1964; Gouldner, 1960), exchange theory, leaders-members exchanged their efforts, resources and support based on the differentiation of both forms of exchange (Dansereau, Graen, and Haga, 1975; Graen and Ur - Edge, 1995; Liden, 1997). Improve the quality of leadership member exchange similar to what is beyond the community in a formal job description specified in the extension (Liden and Graen, 1980; Liden, 1997). Because of the high confidence, interaction, support and reward characteristics of the relationship between well, there are obligations on the part of subordinates mutually beneficial relationship, a better perception (Di nesch and Liden, 1986). However, similar to pure economic exchange, low-quality relationship is limited exchanges to take place under the employment contract. These relations are characterized by low trust, interaction, support and incentives (Dienesch and Liden, 1986).

The literature has shown a strong organizational justice has a positive correlation with organizational citizenship behaviors (OCB) and the commitment of the employee. Norms of reciprocity, if the manager of equity and employee loyalty, in return, they treat them the same attributes as the staff prepared to go beyond their organizations and better fulfill the obligations and miles of the organization(Folger and Konovsky, 1989; Alexander and Ruderman, and 1987; Folger and Greenberg, 1985).

Social identity theory, individuals assigned to different social groups, such as gender, nationality, age, etc. (Tajfel and Turner, 1985), social. Social identity is assigned to a group perspective; organizational identity is a social acceptance that people define its members (Lee, 2004) the terms of its specific forms. Organizational identity literature shows that individuals who identify with their employing agency that they will do these activities with the identity of the organization and consistency of values, no such activities in violation of organizations (Ashforth and Mael , 1983) to sovereignty. This study has a strong recognition of the organization and external role behavior, cooperative behavior, and positive relationship
intend to remain in the organization that employs him (like Abrams, 1998; Mael and Ashforth, 1995).

The concept of psychological contract is originated from the social exchange theory, which is based upon the mutual exchanges between employees and their organization (Suazo et al., 2009). Psychological contract breach can be defined as “the cognition that the organization has failed to meet one or more obligations within the scope of the psychological contract whereas the employee has fulfilled his or her obligations” (Morrison and Robinson, 1997). The terms psychological contract violation and psychological contract breach have been used interchangibly by the researchers for the unfulfilled contract of employees. Morrison and Robinson (1997) tended to accommodate this interchangeable use of both the terms in their well accepted distinctive statement: “PCB refers to the cognitive perception of an unfulfilled psychological contract and PCV refers to the intense negative affective response that can arise from PCB”. PCV “is an emotional experience, yet it arises from an interpretative process that is cognitive in nature” (Morrison and Robinson, 1997, p. 230). Psychological contract violation is the feeling of anger and betrayal that employees feel when they believe that the organization has failed to keep its promises (Robinson and Morrison, 2000; Morrison and Robinson, 1997).

Turnley et al (2003) explored the association between psychological contract breach and various performance dimensions, and less empirical attention is given to the processes through which contract breach leads to work performance. Social exchange is used as an explanatory framework by psychological contracts researchers. Social exchanges between employee and organization is a long term state variable which shows that how psychological contract breach influence subsequent behaviors. Psychological contract breach occurs when it is perceived by employees that the obligations contained in the psychological contract are not fulfilled by the organization (Rousseau, 1989). Once it occurs, employees may express feelings of anger, resentment and betrayal (Rousseau, 1989) as well as behavioral and attitudinal reactions such as reduction in productivity and commitment (Zhao et al, 2007). Prior researchers have found that employees’ perceptions of psychological contract violation are related to reduced work performance, increased turnover and reduced willingness to engage in organizational citizenship behaviors (Robinson, 1996; Robinson and Rousseau, 1994; Robinson and Morrison, 1995). Similarly increased turnover and reduced organizational commitment are the significant outcomes of psychological contract violation (Guzzo, 1994). Another important study conducted by Turnley and Feldman (1998) explored that psychological contract violation leaded to reduced performance on both in-role and extra-role behaviors and increased turnover. Strong association was explored between job satisfaction and organizational justice (procedural and interactional) suggesting that equitable treatment and fair procedures causes people to enjoy their work (Pate et al, 2003). The literature explored that generally psychological contract violation is correlated with lower job satisfaction. When contract terms violation is experienced by employees, their satisfaction decline both with organization and job (Robinson and Rousseau 1994). A major source of dissatisfaction between employees and their supervisors is the discrepancy between promised and actual terms. Secondly when employer failed to comply with his/her promised obligations employees may become dissatisfied (Cassar, 2000). Employer should tend to fulfill the promised inducements otherwise it may become very difficult for employees to obtain satisfaction from doing their job (Porter and Lawler, 1986). Environment is correlated with organizational effectiveness, by developing a sound working environment it is believed that organizational effectiveness can be achieved; where employees tend to identify themselves with their organizational values, goals, and objectives; develop positive attitudes towards their jobs, and identify themselves with supervisors and their occupation or functional group (Boshoff and Mels, 2000). The relationship between
organizational factors and work outcomes such as commitment and job satisfaction is mediated by psychological contract (Guest and Conway, 1997; Marks and Scholarios, 2001). The concept of psychological contract and social exchange theory are very much similar, the whole philosophy of which is “that employees are motivated by a desire to maintain a reciprocal and equitable relationship with their organization in terms of benefits and contributions” (Blau, 1964). Fair and long term relationship between employees and employer is duly undermined by psychological contract violation (Rousseau and Parks, 1993). Employees’ perceptions of unfulfilled obligations by employer leads to a number of negative outcomes such as higher level of turnover, absenteeism, distrust, and dissatisfaction (Conway and Briner, 2002; Deery et al, 2006). On the basis of above discussion we have developed the first hypothesis of our study as follow:

Hypothesis 1: There is a significant impact of Psychological contract violation on employees’ job satisfaction.

Psychological contract rooted from the social exchange theory, Mutual exchanges between employees and their organization (Sauzo et al, 2009). When employee fulfills his or her obligations and organization failed to meet one or more obligations of psychological contract then psychological contract breach occur (Morrison and Robinson, 1997). Contract violation resulted into reduced commitment, trust, OCB and satisfaction (Robinson and Rousseau, 1994). Robinson (1996) proposed that prior trust moderates the relationship between psychological contract breach and subsequent trust, therefore after the breach; low initial trust employees will have less inclination towards trusting their organizations. Dean et al, 1998 explored that cynicism is the additional outcome of psychological contract violation. It is the belief of employees that their organizations lack integrity; criticize their organizations behavior severely and have negative emotions towards the organization. It is conceptualized that employees commitment has been based on exchange framework as compare to performance and loyalty which are material based (Cassar, 2000). It can be argued that commitment will decrease because it is then unlikely that the employer will fulfill his or her promise. Commitment has been conceptualized from the perspective of affection; it is focusing on employees’ sense of identification, attachment and affiliation (Mowday et al, 1979). When the organizations met the psychological contract expectations, it is more likely that they will be relationally oriented towards their organizations and thus are affectively committed to the organizational goals and values (Addae, et al, 2006). The other extreme is that psychological contract violation declines the employees’ satisfaction, trust and commitment with the organization. On the basis of above discussion the second hypothesis of the study is developed:

Hypothesis 2: There is a significant impact of Psychological contract violation on employees’ commitment.

It is a proven fact that voluntary turnover of employees is harmful both in work disruption and replacement costs (Addae, et al, 2006). Intention to leave an organization is an important predictor of employees’ turnover; having a strong empirical and theoretical support (Tett and Meyer, 1993). Griffeth et al, (2000) conducted a meta-analysis and explored that intention to leave is the strongest single predictor of actual turnover. It is evident from the literature that psychological contract violation decreases employees’ level of trust, commitment and satisfaction which in turn increases employees actual turnover rate (Cassar, 2000). Raja et al, (2004) investigated that PCV is a mechanism through which employees’ perceived breach is translated into outcomes such as low commitment, low job satisfaction, and intentions to quit. Lewicki and Bunker (1996) identified three effects of breach on the employer-employee relationship.
1. **Relationship restoration:** “This refers to the situation where the relationship is strong enough to withstand the psychological contract breach and therefore the nature of the relationship remains unchanged”. Such type of breach has little or no influence on mutual relationship, and in turn psychological contract reshape easily.

2. **Relationship recalibration:** “It suggests that after perceived breach the relationship has altered, however the relationship is still more or less intact but the spirit has been altered”.

3. **Relationship ruptures:** “Finally relationship ruptures refers to the significant change in the nature of the relationship, leading to strong feelings of perceived violation”. “The concept of violation is emotional and attitudinal state that follows when obligations are not fulfilled by the organization”, (Morrison and Robinson, 1997). Some important potential benefits are predicted by the impact of psychological contract like, organization citizenship behavior, job satisfaction, productivity and high levels of organization commitment (Coyle-Shapiro and Kessler, 2000; Cavanaugh and Noe, 1999; Robinson and Rousseau; Turnley and Feldman, 1999). Psychological contract violation results range from a negative impact on employees’ work behaviors and attitudes to their voluntary turnover. In light of the above review of literature the following third hypothesis of our study is developed.

**Hypothesis 3:** Psychological contract violation has a significant impact on employees’ turnover intention.

When organizations become unable to comply with their promised obligations then employees perceive contract violation, and it is highly expected that these discrepancies may result into injustice (a situation in which employees believe that the outcomes they receive are unfair and inequitable). However, it is also confirmed by the previous researches that procedural and interactional justice perceptions also influenced the individual interpretations and responses towards unfavorable outcomes. Specifically, researchers like (Moorman, 1991; Skarlicki and Folger, 1997; Brockner and Wiesenfeld, 1996) suggested that individuals’ reaction towards unfair actions will be less severe if they have the perceptions that the decision taken was based upon fair treatment (procedural justice) and if they perceive that the interpersonal treatment they receive as courteous and respectful (interactional justice). In addition, it is important to note that justice have a considerable influence upon employees’ response to perceived psychological contract violations (Turnely and Feldman, 1998). On the basis of above discussion the fourth hypothesis of our study is developed as follow.

**H4 (a):** Perception of Justice moderate the relationship between Psychological contract violation and job satisfaction

**H4 (b):** Perception of Justice moderate the relationship between Psychological contract violation and organizational commitment

**H4 (c):** Perception of Justice moderate the relationship between Psychological contract violation and turnover intention.

**Research Methodology:**

**Sample and Data Collection:** Survey questionnaire was used for data collection from seven different organizations of both private and public sectors. Self administered Questionnaires were distributed among supervisory level and middle level managers. Total of 180 survey questionnaires were distributed among employees and we got back with 155 questionnaires. 8 of the returned questionnaires were not filled properly and were possible to disturb our results so were excluded from the sample and the sample size curtailed to 147 (response rate 81.66%). Age group of the respondents was 25-48 with average age of 30.36 years and Standard Deviation (S.D.) was 3.77 years. Gender distribution was 55.1% male and 44.9% female, experience of the respondents reported between 1-25 years with the average
experience of 12.64 and with Standard Deviation of 5.97 years. Education level of employees was mostly university graduates.

In order to measure the direct and indirect (moderating) effect of justice in the hypothesized model, a hierarchical regression analysis as recommended by Cohen & Cohen (1983) was used.

**Measures:** All responses were acquired through self-reported measures in which the responses were taken on 5-point likert-scale ranging from 1 = strongly disagree, 2 = Disagree, 3 = neither disagree nor agree, 4 = Agree, and 5 = strongly agree.

**Psychological Contract Violation:** Five (5) items scale of psychological contract violation were used to measure the psychological contract violation adopted from Robinson and Morrison (2000). The reliability of the data collected for this study was ($\alpha = 0.84$) for 5 items scale of psychological contract violation.

**Perception of Justice:** Justice was measured by using six (15) items version adopted from Niehoff & Moorman (1993). Each question of the instrument was measured on five point likert scale. The reliability of the data collected for this study was ($\alpha = 0.77$) for 15 items of procedural justice scale.

**Organizational Commitment:** Six (6) items scale of Mayer Allen and Smith (1997) was used to measure the commitment of employees with organization. Each question of the instrument was measured on five point likert scale. The reliability for organizational commitment on the data collected was ($\alpha = 0.89$).

**Turnover Intention:** Turnover intention was measured by using four (04) items version, from (Becker, 1992). The alpha reliability for turnover was ($\alpha = 0.88$). Pervious study had a good reliability i.e. $\alpha = 0.77$.

**Satisfaction:** Satisfaction was measured by using three (03) items version, from (Cammann et al., 1983). Each question of the instrument was measure on five point likert scale. The alpha reliability for satisfaction was ($\alpha = 0.87$).

**Results and Discussion:**

**Descriptive Statistics:**
Table No 1 shows descriptive statistics of variables used in this study. The means and standard deviations of variables are also given in the table. The mean for Psychological contract violation was 2.6 (S.D = 0.88) and the mean of three outcome variables (Organizational commitment, Turnover intention and employees’ satisfaction) were 3.3 (S.D = 0.85) and 2.4 (S.D = 0.93). The mean of the mediating variable (justices) was 3.4 (S.D = 0.99).

**Table No 1:** Reliability, Descriptive Statistics and Coefficient correlation

* Significant level (p value) 0.05.
* * Significant level (p value) 0.10

PCV = Psychological Contract Violation, OC= Org. Commitment, TI = Turnover Intention, SAT = Satisfaction
Hypothesis 1, 4 (a) and 4(b):
The table # 2 shows the outcomes of testing hypotheses 1, and 4 (a). In order to test the influence of psychological contract violation and satisfaction, Psychological Contract Violation (PVC) is first regressed upon the satisfaction. The value of beta is -0.45 so this shows that one degree increase in PCV will bring 45% decrease in satisfaction. Thus hypothesis 1 is supported that PCV has a significant impact on satisfaction. In second step the justice regressed upon with depend variable satisfaction. The beta value is 0.29 having p-value is less than 0.05. In third step the interaction term of (PCV*PJ) is regressed upon satisfaction. The beta value for this moderation effect is -0.04 (p<.10). As the beta value change from -0.45 to -0.04 which 0.41, so this confirms a high level of change in relationship between PCV and satisfaction in presence of justice in organization. The change in beta value 0.41 which is high level increase in the relationship of PCV and satisfaction of the employees’. Thus hypothesis 4(a) is supported by confirming that justice has a positive influence on the relationship between psychological contract violation and satisfaction of employees’.

The value of R provides a measure of how well satisfaction can be predicted from the set of independent variables’ scores. All of the positive values of R in table # 2 for variables PCV, justice and PCV*Justice are 0.516, 0.474 and 0.582 which confirm that psychological contract violation along with moderator of justice can best predict satisfaction. The value of R square, is a measure of how much of the variability in the satisfaction (dependent variable) is accounted for by the psychological contract violation, and justice. The value of R square for psychological contract violation, justice and PVC*justice are 0.266, 0.222 and 0.337 showing their respective variations in predicting satisfaction.

Hypotheses 2, and 4 (b):
In order to test the influence of psychological contract violation and organizational commitment of the employees, Psychological contract violation is first regressed upon organizational commitment. The beta value of -0.30 (p<.05) shows that one unit change in psychological contract violation will bring 30 % decrease in organizational commitment of the employees’.

</tbody>
</table>

* Significant level (p value) 0.05.
** Significant level (p value) 0.10
Thus in this way a negative impact of psychological contract violation and organizational commitment of employees’ is confirmed by supporting hypothesis two. In second step justice is regress with organization commitment. The beta value is 0.28 having p-value is less than 0.05. In third step the interaction term of (PCV*Justice) is regressed upon organizational commitment. The beta value for this moderating effect is -0.10 (p<.005) so this confirms a high level of change in relationship between psychological contract violation and organization commitment of employees’ by addition of justice. The beta value change from -0.30 to -0.10, the decrease in the beta value is 0.20. Thus hypothesis 4(b) is supported by confirming that justice has weaken the relationship of psychological contract violation and organizational commitment of employees’. The results of interaction terms indicate that justice act as a moderating variable in relationships of PCV and organization commitment.

The results of interaction terms indicate that justice act as a moderating variable in relationships of PCV and organization commitment.

Hypotheses 3, and 4 (c):

In order to test the impact of psychological contract violation and turnover intention, psychological contract violation is first regressed upon the turnover. The value of beta in table # 2 is 0.31 (p<0.05) so this shows that one degree increase in psychological contract violation will bring 31% increase in turnover intention of employees’. Thus hypothesis no.3 is supported that psychological contract violation has a positive impact on turnover intention. In second step justice is regress with turnover intention. The beta value is 0.39 having p-value is less than 0.05. In third step the interaction term of (PCV*Justice) is regressed upon turnover intention. The beta value for this moderation effect is 0.17 (p<.05) so this confirms a high level of change in relationship between psychological contract violation and turnover intention in presence of organizational justice. The beta value change from 0.31 to 0.17, the decrease in the beta value is 0.14. Thus hypothesis 4(c) is supported by confirming that justice has a moderating effect on the relationship between psychological contract violation and turnover intention of employees’. The results of interaction terms indicate that justice has weakened this relationship.

The positive value of R in above table for variables PCV, justice and PCV*Justice in order to measure turnover intention are 0.487, 0.290 and 0.572 respectively which confirm that psychological contract violation along with moderator of justice can best predict turnover intention. The value of R², for the psychological contract violation, justice and PCV*justice is 0.320, 0.187 and 0.395 respectively showing their respective variations in predicting turnover intention.

Conclusion:
Psychological contract is a belief individuals hold about the terms and conditions of exchange agreement between themselves and their organizations. It reduces uncertainty, shapes behavior and gives people a feeling about what happens to them in the organization. It can be seen as the foundation of the relationship originating during the recruitment phase and further developed for the first few months after entry. If the organization succeeds to meet the beliefs the employees hold regarding the working relationship, the psychological contract is in a good state which in turn leads to job satisfaction, higher levels of commitment and increased intentions to remain with the organization. On the other hand if employees perceive that the organization has failed to fulfill one or more obligations comprising the psychological contract, violation occurs.

It is recommended that organizations should ensure that human resource strategies, policies and procedures are reflective of distributive, procedural and interactional justice; and that organizations communicate honestly and openly with employees in order to minimize misunderstandings that may result in perceived violations. These principles of justice should be deemed as valuable for the better performance of the organization and should be reflected throughout all human resource activities and functions.

Secondly organizations should emphasize on the career management of their employees which requires in time trainings and developments. Most of the time, employees may seems satisfied and continue to work on their present job, but they are ready to quit the organization if they have no chances of their development in their present organization. So employees’ career development should be handled carefully for the retention of talented employees. For this purpose, enterprise should offer career consultation, developmental opportunities and different projects for workers for the utilization of their potentials. It is considered as an important means to control knowledge workers’ turnover as viewed from employees’ psychological contract.

Future research and managerial practices should continue to focus on employees’ perceptions of the organization’s promises and fulfillment of such promise; selection of right candidates and retaining good staffs is very important to help employees reduce their intent to quit while the psychological contract is even breached.

Strategically Managing the Business Units of Firms Operating in and from Islamic World

Dr. Muhammad Mohtsham Saeed
Assistant Professor, International Islamic University, Islamabad, Pakistan.

Abstract
In today’s highly competitive business environment, the question of how a firm sells has become more important than what it sells. Due to the rapidly changing conditions and highly unpredictable business environment, the correct choice of strategy is considered at least five times more important than the correct choice of industry (Hinterhuber, 2005). The performance of any firm operating in any part of the world mainly depends on its strategy. There are always some good minds behind every good strategy. Religion on the other hand has a direct impact on human perceptions, interpretations and actions which subsequently influences organizational decision making and performance. This impact is even bigger in Islamic countries. Islam which is the second largest and fastest growing religion in the world is often thought to be a misconstrued religion. Contrary to this, it is a complete code of conduct which provides guidance about all facets of life including business. Unfortunately, top managers of the firms operating in Islamic world often fail to differentiate between a firm’s vision, mission, objectives or strategies. In other words, those who are supposed to define a clear vision and set a common line of action for their workforce are not sure themselves about what exactly is their strategy. This creates confusion in the minds of the people (Line of sight) and as a result leaves a devastating impact on their discretionary behaviors/actions. This paper is aimed at specifically addressing the strategy related issues in various business units of the firms operating in or from Islamic world and providing them necessary guidance in their own religious, cultural and organizational context as to how an effective business unit strategy can be developed, how it needs to be implemented and how it can make a significant contribution towards value addition process and the overall business growth.

Business Unit Strategy

“Always and in everything strive to attain at the same time what is useful for others and what is pleasant for oneself.” (Nasreddin)

Since Islamic business approach considers ethical performance of a firm i.e. service to the society, as important as its financial performance i.e. profitability, the biggest challenge for the managers in Islamic firms is to assure a reasonable profitability for the business without compromising on greater interests of the society. Where a firm's financial performance is inevitable for its future growth and expansion, consistent contributions for society are important to meet the requirements of a responsible corporate citizen. All this is not possible unless managers at all business units of the firm know how to use a firm's core competencies for obtaining and sustaining the competitive advantage position in the market and how to develop an atmosphere suitable for developing excellent business ideas, devising effective strategies and creating innovative products or services for the customers. As discussed earlier, strategy is the evolvement of the originally guiding principle according to the continuously
changing circumstances. This guiding principle could be an innovative business idea or a core competency which can give a firm some sort of competitive advantage over its competitors.

The Core Competency: According to Hinterhuber (2005) a core competency is an aggregation of such integral resources, capabilities, processes, technologies and attitudes available to a firm which:

- customers perceive as valuable,
- are unique compared with those of competitors
- are difficult to imitate
- are without substitutes
- provide potential access to new markets

The Competitive Advantage: Competitive advantage is a firm's ability to outperform its competitors by consistently offering greater value to the customers either through its lower prices or greater quality products/services (Hinterhuber, 2005).

The Strategic Business Unit
In a diversified Islamic firm, a strategic business unit is a semi autonomous unit within a firm which produces and sells a specific group of products and/or services, operates in a specific market segment, adds value for specific segment of customers and competes with specific competitors. Normally a strategic business unit develops its own strategies owns the key functions of marketing, R&D and production and is responsible for its own decisions such as choice of products, fulfilling needs of the customers beyond their expectations, discovering and exploiting new opportunities etc.

The SBU Managers of Islamic firms are responsible to keep redefining the future competitive space on regular basis (new customers, new products and services, new technologies, etc.) and devise such a strategy for their respective units which can get them a return above industrial average or at least equal to their cost of capital.

The Strategic Business Unit Strategy
SBU Strategy can be defined as an integrated concept for gaining competitive advantages in specific product markets or segments (Hinterhuber, 2005). The strategic business unit strategy of an Islamic firm is devised in accordance with the broader corporate strategy of the firm and is usually aimed at how a business unit can outperform its competitors in a particular market segment. It basically deals with questions such as:

- Which customers to serve,
- Which markets or market segment to target,
- What products/services to offer,
- What technologies and vehicles to use,
- What differentiators are possible,
- In how much time
- How to assure economic value addition.

Developing a Business Unit Strategy for an Islamic Firm
As shown in the figure 11 below, in order to formulate an effective business unit strategy, a careful analysis of external factors e.g. industrial conditions, market conditions, environmental changes, political and economic conditions as well as internal factors e.g.
shared values, good will, capabilities, shortcomings etc is very important. Where an analysis of external factors will enable the SBU managers of an Islamic firm to explore any opportunities available, a review of internal factors will help them identify their core strengths and weaknesses. A comparison of these two afterwards will make them certain strategic alternatives available. In the entire process, the role of leadership and mental models of managers remains very crucial from analyzing the entire environment and identifying the strategic options to evaluating and selecting the final strategic option for implementation.

Unfortunately in many Islamic firms, leaders don’t really give necessary importance to vision mission or corporate strategy and most of them take it as mere bookish formalities required for a corporate entity. They often forget that no business unit strategy can work in an Islamic firm if it is in conflict with its vision or mission statement. The successful leaders therefore give due weightage to needs of the society reflected in its vision as well as mission while defining or selecting a strategic option.

Figure 2: Development of Business Unit Strategy for an Islamic Firm
Strategy which cannot be measured cannot be controlled; strategic evaluation is the next important stage where leaders try to decide if their selected strategic initiative is contributing enough towards achievement of firm's mission or if there are any alternations needed to keep it inline with greater firm's objectives.

Selection of the Right Strategy for Islamic firms

The most crucial part in strategic management of any firm is the selection of the right strategy according to changing needs of the time. Since choice of a strategy depends mainly on industrial attractiveness and Competitive advantage, in order to ensure selection of the right strategy for their firms, Islamic managers need to carry out a detailed analysis of the industrial conditions as well as competitive advantage positions. Although SWOT and Porter’s 5 forces model are commonly used frameworks for industrial analysis but these carry certain limitations too. This makes it difficult for Islamic managers operating in 21st century to apply these tools in highly globalized and competitive business environment of today. For this purpose, Hinterhuber, (2005) presents a beautiful set of parameters which doesn’t only help managers in correct assessment of industrial attractiveness but it also fits in the specific context of 21st century and takes into account all the related developments/risks emerging in the field from time to time.

In the table 6 below, various factors which are crucial for industrial assessment have been given a certain percentage of weightage according to their related significance. In a highly competitive world, element of rivalry between firms is the most important determinant of whether or not an entry to a specific industry will be useful for the firm. This is why it has been given the maximum weightage i.e 25%. Similarly Market factors and any possible threats of new entrants have been given 15% each and so on. Managers in Islamic firms are supposed to rate all these factors individually on a rating scale of 0 to 100 where zero reflects that a particular factor is totally unfavorable for profitable business growth or expansion and 100 shows that the concerned factor is highly favorable for carrying out a thriving business. Multiplying the scores of all these factors with their respective percentage weightage assigned to them will provide managers the weighted average score in respect of each of these factors. Islamic managers can then use an aggregate weighted average score as a guide to assess the level of attractiveness for a particular industry. Similarly a similar analysis can be made for all related industries and a comparison between all of them will help managers decide which industry has got how much potential for profits as well as business expansion.

</table>

Table 1: Assessing level of Industrial attractiveness for an Islamic Firm
(Source: Hinterhuber, 2005)

Similarly, for correct selection of the strategy, managers in Islamic firms need to have a correct assessment of a firm's competitive advantage position too. Table 7 given below provides a set of guidelines for managers operating in Islamic environment to truly assess their competitive advantage position in relation to those of their competitors. In order to have a generalized view on a firm's competitive position, the competitiveness level is assessed in five different dimensions i.e. Market, Products/Services, Production, R&D and Organization. All these dimensions have been assigned a certain weightage on the basis of their respective levels of significance. Looking at on ground realities, Islamic managers can rate their own position as well as those of their competitors. The Multiplication of their rated scores in respect of each of these dimensions with their respective weightage will provide them a weighted average score for each dimension. An aggregated weighted score of all these dimensions for both firm and its competitors will give managers a clear picture of where they stand in respect of competitive advantage position. This will also enable them to see at which dimensions the firm is already stronger than its competitors and on what aspects it needs to concentrate further in order to leave its opponents behind and whether there is a need for a shift in policies or focus.

Table 2: Assessment of Competitive Advantage Position of an Islamic Firm
(Source: Hinterhuber, 2005)

After a careful analysis has been carried out regarding both industrial attractiveness and competitive advantage position of an Islamic firm, the managers of Islamic firms can then take a decision following a “sails” approach as to which strategy can be more helpful in truly capitalizing on their core competencies and making best of the available opportunities. Since strategy analysis is an analysis of the total firm, we need such a management tool for Islamic firms, which can provide necessary guidelines about all related aspects; a model which can help SBU managers of Islamic firms in answering all possible questions related to a strategy such as:

- What are the objectives of the SBU and how do they relate to the company objective?
- Which of the customer problems will be solved through this SBU Strategy?
- What are the competitive advantages the SBU will achieve, with what type of activities and when?
- What will be the impact on other SBUs. Which other SBU’s will be strengthened or weakened by the SBU strategy and action plans?
- What potential for the future will be created today by the SBU strategy?
- What are the strategic issues that can be anticipated?
- How does the SBU strategy contribute towards improvement in the firm’s overall position?

Strategic Planning System for Islamic Firms (At SBU Level)

Strategic business units are supposed to work as strategy planning centers for Islamic firms. Since a strategy defined by SBU’s has to be the main source of guidance for regulating the work of all the managers working for Islamic firms, there is always a need for such an excellent strategic planning system within an Islamic firm which can help managers at all levels in correctly understanding and solving unanticipated problems occurring from time to time. Hinterhuber (2005) presents such a comprehensive strategic planning system which doesn’t only help managers in devising the right strategies for Islamic firms, it also provides guidance about how to deal with any unexpected developments and risks which may emerge in the specific social, cultural and religious context of Islamic countries.

Figure 3: Strategic Planning System for SBU,s in Islamic Firms
(Adapted from Hinterhuber, 2005)
As shown in the model above, in Islamic countries, there is always a high impact of religious, cultural and societal norms on the lives and mental models of the people. As a result, firms operating in these lands cannot remain indifferent of such impact. The vision of an Islamic firm (which is the first and the most important ingredient of any strategic management system) is always influenced by the societal/religious norms and preferences. As a result, fulfillment of society’s needs becomes the prime focus while developing a vision for an Islamic firm.

In the light of Islamic vision, necessary inputs are received from corporate strategy, culture and identity on one side and all important stakeholders on the other. Based on which, firm's mission statement is defined.

Keeping in view both a firm's vision as well as mission, the SBU managers are supposed to set their targets for the next year(s) which cannot be done without a correct assessment of the present position of the firm in relation to its competitors. A comparison of present position with the desired/targeted one will help managers define their main strategic goals. Based on the firm's core competencies, the SBU’s managers will define such milestones which can lead their firm to the heights of excellence. Since strategic management is all about change management and the change is always followed by resistance, a detailed discussion is absolutely necessary on various strategic issues which the managers may have to face in the course of executing their strategy. In the light of their findings, the next task for SBU managers in Islamic firms is to devise their functional policies and actions plans such as Marketing, Production, R&D etc. For this purpose they can take help from various surveys, reviews, analysis etc carried out from time to time in order to assess the customer’s satisfaction level, competitor's strategic moves etc. Since the business environment in Islamic lands is highly unpredictable, the SBU managers working in Islamic firms must not forget that all of their moves will have certain risks associated with them and they need to keep a contingency plan ready to deal with any unexpected developments or unforeseen events. This will not be possible unless they analyze in details before hand all types of risks which the firm may have to come across (such as technology risk, social risk, financial risk etc) as a result of their strategic moves. In order to make strategy successful, where careful selection and efficient execution are considered crucial, performance measurement is also equally important which needs to be done on regular basis. For this purpose, the managers need to have excellent controlling system which can monitor’s their performance and see what contributions and achievements the SBU has made in respect of each of the firm's stakeholders e.g Shareholders, employees, customers, creditors, society etc.

Conclusion & Future Research Possibilities
Strategic management is seen as being influenced by a complex interplay between local and global cultural/religious contexts. Religion indeed has a direct impact on human behavior, social interactions and relationships (Abuznaid, 2006) and subsequently on organization’s life and performance. This impact is dominant in Islamic countries. Islam has its own distinctive code of business ethics (Wilson, 2006). Since Islamic business system approach stresses the embeddedness of firms in the home country’s institutional, cultural and religious contexts, thus giving rise to specific Islamic connotations of strategic management, through this particular research attempt, we have tried to address strategic management issues from an Islamic perspective and provide the business leaders of Islamic firms necessary guidelines in their own religious and cultural context as to how an effective business unit strategy can assist them in making best utilization of their available resources.

Parallel to this work, future research can concentrate on devising a purely indigenous strategic management model for Islamic world and comparing the results achieved with those obtained through implementation of this model developed in this work.

How culture of an Islamic society impacts an organizational life – A review of the relevant literature & Implications for International business

Dr. Muhammad Mohtsham Saeed
Assistant Professor, International Islamic University, Islamabad, Pakistan

Abstract
Religion has always left a considerable impact on human perceptions, interpretations and actions which subsequently influence organizational decision making and performance. This impact is even stronger in Islamic countries. Islam which is the second largest and one of the fastest growing religions in the world is often thought to be a misconstrued religion. Contrary to this, it is a complete code of conduct which provides guidance about all facets of life including business. The main unifying force of Islam plays an important role in creating a common culture among Muslim nations spread all over the world. Although there can be some tiny differences within the Islamic nations but since Muslim world as a whole shares a common literature, architecture, historical religious and socio cultural backgrounds, Islamic nations have many commonalities in their cultural norms and practices. These common characteristics shared by all Islamic nations differentiate them from the rest of the world. This paper is specifically aimed at conducting a detailed review of the previous literature, identifying the distinctive cultural characteristics shared by many Islamic societies all around the world and discussing their implications for firms (both multinational and domestic) operating in and from Islamic societies. Where the study will help non Muslims (especially the multinational/foreign companies having their operations in the Muslim countries) to better understand and correctly interpret the environment in which these firms operate, this would also be helpful for the local firms of Muslim world itself in exploiting their true potential and (as a result) accelerating their business growth by creating a right Organization – Environment Fit.

Keywords: Culture ; Islamic Society Impacts ; Organizational Life ; Review ; Relevant Literature ; Implications ; International Business

Introduction
Managers and leaders as well as the people they work with are part of national societies; if we want to understand their behaviors we have to understand their societies (Hofstede, 2003).

The main unifying force of Islam plays an important role in creating a common culture among Muslim nations spread all over the world. Although there can be some tiny differences within the Islamic nations but since Muslim world as a whole shares a common literature, architecture, historical religious and socio cultural backgrounds, Islamic nations have many commonalities in their cultural norms and practices. These common characteristics shared by all Islamic nations differentiate them from the rest of the world. A brief overview of these attributes is given hereunder.

High Group Orientation/Collectivism
A vast majority of the people in our world live in such societies where interest of the group prevails over the interest of the individuals (Hofstede, 2003). These societies are called...
collectivist societies. Islamic societies as a whole can also be described as highly group oriented or collectivist societies.

In Islamic societies, the children start feeling themselves as a part of a group i.e family right from their birth. With the passage of time, this group becomes a kind of identification for them for the rest of the world. Resultantly an individual develops within himself or herself an irrevocable loyalty for his or her group.

Contrary to individualist societies where every one looks after himself or herself, the ties between different members of a group are very strong in Islamic societies and each individual is supposed to look after the entire group and not just one’s own self. In Islamic societies, being obedient and respectful to parents, getting their financial support and giving it back to them when they are old are the commonly shared features.

Researchers have found a strong relationship between a country’s national wealth and the degree of individualism in its culture. Islamic countries which are highly collectivist societies are mostly developing or underdeveloped economically. Hofstede (2003) found that out of 74 countries, Pakistan a collectivist Islamic society (which is a model country for this work too) stands at 68 as compared to United States a highly individualist society ranked as No.1.

In Islamic countries, collectivism is not only confined to ones family or household setup, as a cultural characteristic it is present outside house as well including one’s work place. While working on a well renowned project of GLOBE, Kabasakal & Bodur (2002) have found a strong preference not only for family collectivism (5.61) but also for the institutional or organizational collectivism (5.08) in the Islamic regions.

For people of Islamic societies, family or other group relationships are very important. They feel protection and great dedication towards their groups. These groups can be based on many factors such as being from the same city or region, school, workplace, cast etc and most of the times attachment to one’s group proves to be very helpful in the various daily life aspects. In Islamic lands, if a person holds a superior position and finds someone from his own group, he is expected to do everything he can for solving his problems. Providing help in finding a job, getting admitted to a hospital or a school, removing hurdles from official procedures and sorting the things out with Police department etc are some of the examples. Similarly the group also plays an important role in the social as well as economic life of individuals such as making arrangements for marriages or funerals, lending money or helping otherwise when a member of the group is in a financial crises etc. Such network of interdependent relationships reduces the level of individualism in the society and the people prefer to live more like a group than as individuals.

**Power Distance**

Power distance can be defined as the extent to which the less powerful members of institutions, organizations or society as a whole expect and accept that power is distributed unequally (Hofstede, 2003).

Islamic societies are high power distance societies which indicate a high degree of acceptability for unequal distribution of powers between various members of the family, organizations and the whole society at large. The theorists believe that the hallmark of the Islamic world is the greater inequality of power in the society (Gupta et al, 2002) and Islamic
countries are found to be distinct from other clusters of the countries included in renowned project “GLOBE” due to their stronger desire for high power distance (Kabasakal & Bodur, 2002).

**Male Dominance / Role of Women**

Basic features of an Islamic society include some practices which may give a reflection to some of the theorists of external world that Islam advocates for a masculine society in which the men have a monopoly and rights of the women are transgressed. Contrary to this, Islam is a religion which changed the structure of Arab society altogether and unified the people, reforming and standardizing their gender roles. If we look at the pre Islamic Arab world, women could not inherit land or wealth; holdings were usually considered the property of the tribe she was born or married into. There were also patterns of homicidal abuse of women and girls, including female infanticide whereas with commencement of Islamic civilization all these evils started to vanish. Islam determined the girl’s share in the heritage and declared the birth of a girl as a blessing from God.

Islam is a complete code of conduct. It clearly defines the roles that men and women are supposed to fulfill. Since Islam encourages men to look after the matters related to the outer world and women to look after the household stuff, some theorists believe that Islamic propositions create a masculine society. No doubt, under Islamic philosophy, men are responsible for the well being of the family due to which they may assume the role of heads of the family too, but here we must not forget that it is not only the religion, sometimes cultural values of a particular region are even more stronger than the religion. If we look at the customs and traditions of Islamic societies, a lot of instances can be found which have nothing to do with Islam but are still considered inevitable for different types of family celebrations. The male dominance therefore should not be linked to a particular religion. It is more concerned with the cultural and societal values of a particular region. For example, if we observe the element of male dominance in Pakistan, we shouldn’t relate it to Islam; from a broader perspective, we need to take into account the entire region. The cultural and societal norms of the entire region irrespective of their religions are almost similar. In India, the neighboring Hindu country, the situation is even worse. The men are considered to carry in-born characteristics that grant them the right to be in superior roles. The customs like burning and killing the widows with their diseased husbands, treating the women as sexual objects are some of the examples. Although it cannot be generalized but in most parts of this region irrespective of their religions, a woman typically grows up learning that her survival lies in observing the commands of her father in her childhood, of her husband and in laws after she is married and of her own children once they grow up.

This is further evidenced that not all the Muslim countries have the same level of masculinity in their society. The degree of gender inequality is different in different Islamic countries (Moghadam, 1993). For example, the modern south Asian view of women seems to be one of a person with outside accomplishments but with very strong ties to the family (Gupta et al, 2002). The Islamic magazines in Indonesia portray an ideal woman as a wife and mother who has successfully pursued an academic or professional career after marriage but has also put her children and husbands needs before her own self (Woodcroft, 1983). Similarly, Turkish women who obtained the right to vote even before many western women are in more commanding positions as compared to women of other Islamic countries. The women here enjoy a significant amount of power in family as well as business world. On the other hand in the countries like Afghanistan, the historical role of women seems to continue in modern
times as well. Although, this trend of confining the women to household activities is more visible in rural areas and less in urban population but this cannot be generalized for all Islamic countries as in Grameen Bank of Bangladesh (a splendid example of microfinance business), more than 97% of bank’s borrowers are rural women who are running their houses and small businesses both very successfully.

**Tolerance of ambiguity / Uncertainty Avoidance**

The difficulties and uncertainties are everywhere in the world, but Kabasakal and Bodur (2002) have recorded an exceptionally high level of uncertainty avoidance (4.99) in Islamic countries. The people living in these countries prefer to avoid ambiguities as much as possible. They tend to be more traditionalists, they idealize the past and distrust the future and they prefer the tried and true to the untried (Kaseem, 1989).

**Limited Emphasis on Planning / Future Orientation**

Unfortunately in most of the Islamic countries, people give no or very limited emphasis to planning about the future. Due to the presence of a highly volatile situation in most of the Islamic lands, lack of planning and research activities and a high element of uncertainty/risk avoidance in the society, people whether in the organizations or outside their work premises are usually a bit reluctant to try innovative ideas which affects the future orientation factor adversely.

**Population Growth**

The population growth rate of Islamic countries is much higher than other parts of the world. The main reason behind this is a common belief of all Muslims that Allah has taken the responsibility to take care of His creatures needs. One doesn’t have to worry about the well being of the kids born; one who creates them will arrange for them their bread and butter too. Other reasons may include poor education of women, lack of awareness about family planning and an expectation that more children will be able to support their parents better in old age. Near some conservative Muslims, it is also considered sinful to use family planning or birth control methods.

**Human Development**

Generally speaking, the Islamic societies reflect a medium level of human development. The human development indicators such as the living standard, education, health and life expectancy etc vary from country to country with majority of the Muslim nations living at a medium or lower level of human development index. Although the countries like Kuwait or Qatar are categorized among high development societies but such countries are exceptions and do not represent a vast majority of Muslim statesf.

**The Concept of Fate**

The concept of fate in Islam has been a topic of debate among different social or religious circles. As some authors consider it as a factor influencing the future orientation negatively (Kabasakal & Bodur, 2002), others advocate the idea of free will given to the human beings by Islam. Since the concept of fate in Islam has become very complicated, one needs to understand the real spirit of Islamic teachings in this regard.
No doubt, believing in God and His being omnipotent and omnipresent are among the basic principles of Islam and it is a common belief throughout the Islamic world that not a leaf can move without Allah’s willingness but at the same time Islam has told clearly what Allah wills or expects from the believers.

*There is nothing for a human being except what he struggles for (Holy Quran, 53:39)*

Islamic teachings clearly explain the importance of human being's responsibility and choice of their actions. A human being has been shown both right and wrong paths and it is left to him which one he chooses for himself. Islam doesn’t create any hurdle or hindrance in the way of future orientation. As Iqbal (A renowned Islamic scholar and poet) said:

*Fate of the nations is in the hands of individuals; each individual is a twinkling star of the fate of its nation.*

Although normally Islamic societies portray practices that attribute a low significance to planning and influencing the future which are associated with the low scores in future orientation (Kabasakal & Bodur, 2002) but linking their low future orientation scores with Islamic concept of fate will be a little unjustified.

**Different Classes of the Society**

Inequalities are everywhere in the world. Some people are more powerful than others; some are more intelligent and smarter than others. Similarly due to the unequal distribution of wealth in almost all societies of the world, some people have more wealth in their hands than others. However it is true that this gap between rich and poor is smaller in developed western societies as compared to third world countries or the Islamic societies. Sometimes merely based on ones possession of wealth, some people are given a better status or more respect than others. Although Islam strictly discourages the inequalities in all forms but unfortunately just like other parts of the world, different classes of society (upper, middle and lower class) can be seen in Islamic societies as well. However, these divisions of the society on the basis of one’s status do not necessarily remain the same forever. The lower class parents often have middle class ambitions for their children whereas middle class parents want their kids to be in upper middle class at least if not the upper class. These ambitions don’t necessarily convert into realities but it is not that difficult either to see such things happening in our surroundings.

**Schooling**

Due to the large power distance situation in Islamic countries, there are great inequalities between kids and their parents or the kids and their teachers. A teacher is considered to be a spiritual father in Islamic lands and is treated with a lot of respect. It is very common for students especially those in public sector to stand up in the respect of their teacher whenever he or she enters the classroom. Although, parallel to their unquestionable respect, the teachers in Islamic countries do try to motivate the students to ask more and more questions but sometimes this moral distance between students or their teacher creates hindrances for free expression of one’s opinion especially if a student wants to disagree with the teacher. In public sector schools or universities, most of the times communication is one way and there are hardly any differences of opinion from the students side. Despite being told to ask
questions, students hesitate to do so, mainly due to the element of shame i.e. what other fellows will think of him or her and the strict/teacher centered environment of the classroom. The main drawback of such a system is that a student’s capabilities are highly dependant on their teacher’s capabilities and due to a single incompetent teacher; the talent of hundreds of students remain unrefined. But at the same time in such a strict environment, a competent teacher is also able to leave a squad of highly capable individuals. This element of respect for the teacher is not only limited to one’s school, even outside the educational institution the teacher is equally respectable and honorable. Due to greater inequalities between kids and their parents, a warning to involve a child’s parents, works very well to sort out any misbehaving students.

In the collectivist Islamic societies usually the children are not left alone. They are surrounded by their immediate family members or friends all the times. As a result when these students come to western world for studies, it is a bit hard for them to adjust in an environment where everybody wants to have his or her own private life. It can be something surprising for western people to see the whole family which may include parents, brothers, sisters, uncles, aunts and cousins coming to the airport just to see off a member of their family leaving his country for a few years’ studies but for people of Islamic societies this is something very normal and expected. Many emotional scenes such as crying etc can also be observed on such occasions. Where it reflects the strong family ties and emotional attachment of the people with each other, it also shows the beauty of the altruistic relationships hard to see in relatively a more self centered and materialistic world of today.

**Education and Knowledge Management**

Recently there has been a growing emphasis on the process of knowledge management in an organizational setup (Renzl et al, 2006). Unfortunately, Islamic states have realized its significance much later than other parts of the world. However, this realization is now leading Muslim countries around the world to invest on the education of their future generations at a massive scale. As universities are primary source of knowledge, Islamic states are beginning to invest heavily in the education sector and knowledge management (Beekun/Badawi, 2004). If we take the example of Pakistan (a model country for this work) there has been a significant increase in the budget for the higher education sector during the last few years. The total budget allocated for higher education has jumped from PKR 4.28 billion in the year 2002-03 to PKR 28.78 billion in the current year. These continuous increases are in line with the decision of the present government to transition Pakistan from an agriculture-economy to a knowledge-based economy. As a result of this heavy investment in the education sector, thousands of students have been sent to top universities abroad for higher studies. The infrastructure of existing universities is being improved and an emphasis is being placed on providing education which is relevant to the socio-economic development of the country. Similarly, faculty development has received special attention through R&D funding, post-doctoral fellowships and enhanced opportunities for students to present their research at international seminars and conferences. We can also see some highly prestigious achievements by the Muslim people in the recent past. Where Dr Ferid Murad has been awarded a noble prize for Physiology/Medicine in the year 1998, Muhammad Younas of Grameen Bank has won the Noble Prize for peace in the year 2006.
Customs and Traditions/Marriages and Funerals etc

Since family ties are so strong in Islamic societies, fulfilling one’s obligations towards his or her family is considered very important. These obligations can be traditional, ceremonial as well as financial. Being part of the family celebrations such as weddings, engagements, funerals, birthdays etc are not supposed to be missed. Especially participating in the funerals in case of a member’s death is considered a must. Although, in Islamic countries an individual is expected to be a part of all sorts of celebrations and grievances but not participating at the occasions like funerals is considered to be something simply unforgivable and condemnable unless there is some justified reasons beyond one’s control.

As far as selection of the life partner is concerned, both love marriages and arrange marriages are possible despite of the fact that most of the marriages which take place in Islamic countries are arranged by one’s parents. Personal likes or dislikes are important but consent of the parents is also equally important. The marriage is said to be a contract between two families instead of two individuals and compatibility of families with each other is given a great importance at the time of such decisions. Since it has become very difficult to find matching partners, the business of marriage bureaus is also progressing rapidly in these lands. However in some exceptional cases, mostly in rural/tribal areas, both future bride and groom don’t even get to see each other before they are married. But this doesn’t mean at all that arranged marriages are not successful. Research has shown that divorce rate in these societies where arranged marriages are preferred, is much lesser than western world where people take years to get to know each other before they are married. In a survey about role of love in marriage, students from eleven different countries were asked a question:

*If someone had all the other qualities you desire, but you don’t love him/her, will you still marry him/her.*

The results showed that only 4% students in United States answered in yes compared to over 50% in the Islamic Republic of Pakistan (Hofstede, 2003).

**Clothing**

Different types of dresses are popular and worn in different Islamic countries despite of the fact that dress designs in most (if not all) Islamic countries seem to be under a greater influence of Islamic teachings. Popularity of different types of dresses varies from region to region and is basically dependent on the country where the dress is worn. There is also a difference in the dress sense of the urban and the rural population of the same country. Where the people who belong to rural areas prefer to dress traditionally, the urban population especially professionals seem to be greatly influenced by the western style of dressing.

On the other hand, veil and scarf are the important parts of a Muslim woman’s dress and are considered to be a source of protection and a symbol of distinction for them. However in the western societies sometimes the people take it as a symbol of lack of freedom or a woman’s exploitation.

**Food**

Muslims throughout the world are fond of eating. Restaurants and food markets are examples of the very few types of businesses running very successfully in these countries. However
due to the religious as well as legal restrictions, sometimes such businesses have to suffer. For example, in the month of Ramadan, Islam requires fasting all day. During this month, eating or drinking anything in public is strictly forbidden by the national laws of almost all Islamic countries and even if a country’s national law doesn’t put any such restrictions, the majority of people themselves consider it as highly sinful not to fast.

Similarly, since use of pork meat or alcohol is not allowed in Islam, no business involving purchase or sale of alcohol/alcohol made products or pork can be legally carried out in most parts of the Islamic world.

Language

Since Islam started in Saudi Arabia, the original language of Islam is Arabic. A vast majority of Muslims in all parts of the world is quite familiar with this language mainly because near them, reciting the Holy Quran (which is in Arabic) is considered as one of the important religious obligations.

Muslims and especially Arabs are more conscious of their language than many people in the world. Arabic seems to be a factor that creates a feeling of identity and underlies behavioral similarities among all members of the Arab population regardless of their race religion tribe or region.

Although the Arabic language seems to be a factor that creates a sense of unity and brotherhood among the Muslims, but apart from Arab world, every country has its own language. Sometimes in addition to the national language, we can also see a number of regional languages spoken in different parts of the same country. For example, in Pakistan, the national language is Urdu whereas there are many provincial or regional languages too such as Punjabi, Pashsto, Sindhi, Balochi, Saraiki etc which are very popular in their respective regions.

Hospitality

Hospitality is one of the old traditions of Islamic societies. Guests and visitors are received with open heart and are considered as sources of blessings from God in most of the Islamic countries.

The Concept of Inshallah

The concept of “Inshallah” (God willing) is very popular throughout Islamic world (Deresky, 2004). Where some Christians used to say “Deo Volente” in relation to some future events, the word “Inshallah” is still one of the very few words which are used so frequently both within and outside the firms operating in Islamic lands. In the light of Islamic teachings, the word is rightly used if one has put the best of his efforts, after which he exhibits his trust in Allah by saying “Inshallah” for the outcome of the desired results. Quran gives very clear instructions in this regard by saying that there is nothing for a human being except what he or she struggles for. On the other hand, it is also true that not all the people who use this word truly understand the real spirit behind it. Sometimes, the term is also used to deceive/wrongly satisfy one's own self by providing a ground for one's laziness or inability to do something. This is what affects the future orientation in the Muslim societies adversely.
Elements of Shame Honor and Pride

Honor, pride and dignity are at the core of Islamic societies. The elements of shame pride and honor provide the basis for social control and motivation in Islamic world (Deresky, 2004).

Contrary to the western societies where everyone feels guilty for one's wrong actions in his or her individual capacity, in Islamic societies it is totally opposite. If an individual deviates from the social or ethical norms of the society, it is considered as a matter of shame for all members of the group he or she belongs to.

Although in most of the cases, this element of a collective shame is helpful in stopping an individual to do any such things which he thinks can bring a bad name to his or her group but at the same time, if someone violates any of the social or ethical principles, it can also make it difficult for all the members of his group to speak truth since people in these societies prefer to avoid showing any weaknesses or shortcomings which may cause any bad reputation to the group as a whole.

Indirect and Implicit Ways of Communication

The typical communication style of the people living in Islamic lands is implicit and indirect. Refusing someone straightaway or turning down a request/favor is also considered embarrassing in these societies. People hesitate to be straightforward and try to use other indirect approaches instead such as delaying tactics etc.

Self Advertising

Contrary to the Islamic teachings, the element of self advertising exists in Islamic societies to the extent of pretentiousness. Especially at workplace, many things which are totally unreasonable and unacceptable according to Islamic teachings e.g. leg pulling, self advertising and hypocrisy etc can easily be observed in these societies.

Social Politeness and Hypocrisy

The overall primary concern of most of the Islamic societies is to maintain social politeness. People hesitate to criticize anyone on his or her face. Here they seem to follow the American approach of smiling at others but criticizing them behind their backs (Hitt et al, 1997). Although it is true for most sections of the society but still the statement cannot be generalized as we can find such people in these societies too who consider such practices as totally wrong and inappropriate.

Avoiding Direct Confrontation

Just like other collectivist societies, direct confrontation with someone is not considered desirable in Islamic lands too. Unlike western societies, denying a request straight away is considered immoral and impolite in Islamic countries. Usually the people here follow a more indirect approach to refuse someone e.g. using the delaying tactics, making ambiguous statements just to get rid off someone such as we will think about it, yes you may be right, lets see what we can do about it etc.
Usage of Time

The most of the people in Islamic countries are not good at effective utilization of the time available to them. Due to lack of awareness about time management, it is a general practice both within and outside organizations to prolong the matters, until their deadline is reached. Likewise, there is no specific time for a specific job either; many things can be going on at the same time.

Trust

In Islamic states, the personal relationships and trust play an important role in the process of finalizing business deals. Where traditional literature believes that long term relationships result in trust development, Islam considers that trust development results in building and maintaining long term relationships (Saeed, 2005). Similarly, where in western world, businessmen prefer to deal with firms instead of persons; Islamic businessmen prefer to do their business with the persons not firms. Since business deals in Islamic countries are mostly based on trust, most contracts are oral. Sometimes when the parties don’t trust each other, a third party’s intervention is considered necessary who is trustable for both.

Some Precautionary Measures to be taken in Islamic States

Deresky (2004) has beautifully outlined some dos and don’ts recommended for Saudi Arabia. The same are true for most of the Islamic countries. The list given below includes actions (including those recommended by Deresky, 2004) which can cause an offence to the people in Islamic societies if not taken care of:

- Giving any sort of comments about a man’s wife, daughter or any other female relatives is not liked by Muslims
- Informal comments can be taken as invasion of privacy.
- Engaging into conversation about politics or political parties
- Engaging into conversation about Israel
- Engaging into religious debate or a discussion about different sects of Islam
- Engaging into discussions about the concept of fate
- Using swear words of any sort even in a humorous way.
- Bringing gifts of alcohol or alcoholic products.
- Compelling someone to reply you in a simple yes or no as it is considered impolite to refuse someone directly.
- Shaking hands too firmly
- Pointing fingers at someone
- Showing sole of your feet when seated
- Extending feet in the direction of Qibla (The holy place of Muslims)
- Not saying “Salam” before starting a conversation or not replying back
- Criticizing someone on his face for his wrong actions
- Not offering any refreshments as a host or refusing to have them as guest
- Including some “Haram” items in the menu such as Pork etc.
- Open discussions about sex especially in the presence of female members which may be considered as immoral or unethical.
- Using a direct or explicit style of communication. Indirect or implicit way is preferred.
• Insisting for written agreements, as most of the business deals that take place in Islamic countries are oral and based on mutual trust.

**Conclusion and Future Research Possibilities**

This study has tried to review the literature relevant to the social, cultural norms and values being practiced in Islamic part of our world and in light thereof present some concrete recommendations regarding how organizations can take the best out of people living in these societies. Since this value system leaves an enormous impact on the mental models of the people, understanding the perceptions, interpretations and living patterns of these societies therefore becomes indispensable in order to understand the human behavior in organizations working in these lands.

The study is not only going to help managers of multinational/foreign companies having their operations in the Muslim countries in correct interpretation of the environment in which these firms operate, this would also be helpful for the local firms of Muslim world itself in exploiting their true potential and inducing some synergetic effects in their overall performance by creating a congruence between their people and organization.

However since Islamic world can further be divided into various groups e.g Arab and Non Arab world etc, Future researchers should therefore attempt to study each of these clusters separately in order to provide a greater insight into each of these clusters as this study has taken a gestalt approach addressing the cultural issues of entire Islamic world in general.
