Editorial Board

IJCRB is a peer reviewed Journal and IJCRB Editorial Board consists of Phd doctors from all over the world including USA, UK, South Africa, Canada, European and Asian countries.

Prof. Renee Pistone
*Harvard University*, Lifetime Fellow - Harvard URI.
706 McCormick Dr Toms River, New Jersey USA
Voice: 732.668.4533

Lord David K
*Oxford University*, St Catherine's College, Oxford, OX1 3UJ www.stcatz.ox.ac.uk/, www.ox.ac.uk/ Phone: +44 1865 271700, Fax: +44 1865 271768

Dr. Kenan Peker
Department of Agricultural Economics, University of Selcuk, http://www.selcuk.edu.tr/
University of Selcuk, 42079 Konya, Turkey, Tel: 90-332-231-2877

Dr. A. Sathiyasusuman
Senior Lecturer, Dept. of Statistics, University of the Western Cape, South Africa

Dr Mahdi Salehi
Assistant Professor, Accounting and Management Department, http://www.znu.ac.ir/
Zanjan University, D.N 1 Nagilo Alley, Hidaj City, Zanjan Province, Zanjan, Iran, Tel: 98-9121-425-323

Dr Heryanto
Regional Development Bank of West Sumatra
Jalan Pemuda No. 21 PO Box 111 Padang 25117 West Sumatra Indonesia
Tel: +62-8126771699

Dr. Dave Hinkes
Assistant Professor of Management & Marketing
Sam Walton Fellow, Lincoln Memorial University, Harrogate, TN, UK
Tel 423.869.6441

Dr. Francis A. Ikeokwu
Sr., Ph.D., MAC, MBA, CFC
Adjunct Professor, American Intercontinental University http://www.aiuniv.edu/

Dr Charles C. Dull
Sr. MBA, Ph.D.
American Intercontinental University http://www.aiuniv.edu/
Dr Cara Peters  
Assistant professor of marketing, Winthrop University, Rock Hill, South Carolina.  
PhD in business administration, University of Nebraska  
Peer-reviewer of the Journal of Consumer Psychology; Consumption, Markets, and Culture; and  
Journal of Academy of Marketing Science.

Dr Mahmoud M. Haddad  
PhD in Finance  
214 Business Administration Building  
University of Tennessee-Martin, Martin, TN 38238 Tel No +1731-881-7249

Dr G.A. Abu  
Department of Agricultural Economics, College of Agricultural Economics, Extension and Management Technology, University of Agriculture, P.M.B.2373, Makurdi, Benue State, Nigeria.  
Phone: +234-803-607-4434; fax: +234-44-534040

Dr Rashid Rehman  
Associate Professor, College of Business Studies  
Al Ghurair University, Dubai, UAE.

Dr Ebrahim Soltani  
Lecturer in Operations Management  
Kent Business School University of Kent, UK

Dr Pu Xujin  
Business School, Jiangnan University, Jiangsu Wuxi, P.R. China, 214122  
Tel: (86510) 85913617, FAX: (86510) 62753617, Mobile: (86) 13616193600

Dr. E. B. J. Iheriohanma  
Ph. D. Sociology  
Directorate of General Studies, Federal University of Technology, Owerri Imo State Nigeria.  
Tel +2348037025980.

Dr Etim Frank  
Department of Political Science-University of Uyo-Akwa Ibom State-Nigeria  
Phd (Political Science/Public Administration) University of Calabar

SL Choi  
University Teknologi Malaysia  
School of Business Management Southern College Malaysia

Dr. Nek Kamal Yeop Yunus  
Senior Lecturer, Department of Business Management  
Faculty of Business & Economics, Universiti Pendidikan Sultan Idris, Tanjong Malim, Malaysia.
Dr. S. I. Malik  
PhD Bio Chemistry & Molecular Biology (National University of Athens)  
NHEERL. Environmental carcinogenet division  
RTP Complex NC 27713, US Environmental protection Agency , 919-541-3282

Dr. Bhagaban Das  
Reader, Department of Business Management Vyasa Vihar, Balasore-756019 Orissa

T. Ramayah  
http://www.ramayah.com  
Associate Professor , School of Management, University Sains Malaysia,  
Tel 604-653 3888

Dr. Wan Khairuzzaman bin Wan Ismail  
Assoc. Professor International Business School, UTM International Campus  
Jalan Semarak 54100 Kuala Lumpur, MALAYSIA

Zainudin Hj Awang  
Faculty of Information Technology and Quantitative Sciences, MARA University Technology  
MARA Kelantan 18500, Malaysia ,Tel: 60-9-9762-302

Ravi Kiran  
Associate Professor, School Of Management & Social Sciences, Thapar University.

Dr. Suguna Pathy  
Head, Department of Sociology, VNSG University, Surat

Birasnav M  
Assistant professor, Park Global School of Business Excellence, Kaniyur, Coimbatore

Dr. C.N. Ojogwu  
Phd Education Management - University of Benin, Benin City, Edo state, Nigeria. Senior lecturer - University of Benin.

Dr. Nik Maheran Nik Muhammad  
General Conference Co-Chair, GBSC 2009, www.nikmaheran.com

Dr. A. Abareshi  
Lecturer, School of Business IT and Logistics  
RMIT University, Melbourne, Australia  
Office: +61 3 99255918

Dr Ganesh Narasimhan  
Lecturer, Management Sciences, Sathyabama University  
Board of Advisor - AN IIM Alumina Initiative & International Journal Economics, Management, & Financial Markets Denbridge press, New York, USA

Abstract
With the fast growth of Chinese tourism industry, sustainable development catches more and more attention of professionals. Starting from the basic concept of sustainable development, this paper, using China as examples, analyzes the inter-impact of sustainable development and tourism industry in different aspects. Strategies to improve sustainability of one of famous Chinese tourism destination are introduced.

Keywords: Sustainable development, Tourism, Chinese, Strategy

1. Introduction
Nowadays, "Sustainable" has become one of the newest hot topics. The term came into widely use in 1987 with publication of Our Common Future, the report of the World Commission on Environment and Development (WCED), and then be spread to all over the world in different industries. Tourism, as an industry which is one of the largest economic sectors internationally and depends a lot on the destinations’ environments (natural, socio-cultural, and/or economic), must be taken into account of the sustainable development issues. The concept of sustainable development has becoming a catchphrase in tourism research and in the international development community. This paper will concentrate on the sustainable development of tourism from three aspects, environmental, socio-cultural, and economic, according to its definition from World Tourism Organization (WTO). It includes the relationship between sustainable development issues and tourism industry and the strategies to improve its sustainability situation.

1.1. Concepts and Definitions
Generally speaking, "sustainability" represents an idealized state of society where people live to satisfy their needs in environmentally sound and socially just ways so as to not compromise the ability of other human beings from doing the same now and in the future (WCED 1987).

In the tourism field, the sustainable tourism was defined by Bramwell and Lane (1993 p.2) as “A positive approach intended to reduce the tensions and friction created by the complex interactions between the tourism industry, visitors, the environment and the communities which are host to holidaymakers… (it) is not antigrowth, but it acknowledges that there are limits to growth (which) vary considerably from place to place, and according to management practices.” The WTTC et al.’s definition (1995 p.30) is “sustainable tourism development meets the needs of present tourists and host regions while protecting and enhancing opportunity for the future. It is envisaged as leading the management of all resources in such a way that economic, social, and aesthetic needs can be fulfilled while maintaining cultural integrity, essential ecological processes, biological diversity, and life support systems”. In Buckley definition (2002), “sustainable tourism means tourism at any scale with practical and proactive design, engineering, and management to reduce environmental impacts". And from the latest definition from WTO (2004), "Sustainability principles refer to the environmental, economic and socio-cultural aspects of tourism development, and a suitable balance must be established between these three dimensions to guarantee its long-term development.”
2. The Impacts between Sustainable Development & Tourism Industry

Tourism industry is arguably the biggest industry in the world in terms of employment and revenue. As the main source of foreign capital in many developing and transition countries where have rapid growth on tourism related activities, tourism has been considered as an important economic factor there. A sustainable tourism becomes more and more critical for these areas’ long-term development.

But there is a contradiction between the sustainability and tourism. On the one hand, sustainable development is definitely good for tourism. It can stretch the destination’s lifecycle, enhance its competition. On the other hand, in some sense, developing tourism means exploiting, consuming, and even polluting resources, some of which are nonrenewable, especially those in the destination. The direct result of this is destroying the sustainability. That’s two-way relationship between them.

The following will discuss the relationship from environmental, socio-cultural, and economic aspects according to the latest definition of sustainable development of tourism.

2.1 Environment Issues

Sustainability in environmental aspect of tourism means making optimal use of environmental resources that constitute a key element in tourism development, maintaining essential ecological processes and helping to conserve natural heritage and biodiversity (WTO, 2004). For the natural-based destinations, the fresh air, clear water, blue sky with sunshine, etc. the beautiful natural scenery is what attracts tourists. So protecting environment should be one of the tourism’s obligations, even for their own benefits. Unfortunately, as a matter of fact, the development of tourism does have some negative impacts on its dependent environment.

Pollution

When we talk about tourism pollution issues, there was a consensus of travelers’ consumption in transportation, mainly road and air transportation. It is said that the use of road transport by travelers contributes significantly to greenhouse gas (GHG) emissions. And air transport, not as much as road, made more and more GHG emissions, too. The effect of that is the climate change. Temperature rises, sea level rises, flood, storms and sea surges, all of these will in turn put tourism at risk. Tourism in seaside and mountain regions are the two very sensitive areas to climate change. The global mean sea level rose by between 10cm and 20cm during the twentieth century and current predictions suggest a rise of 20cm to 100cm, with a mid-estimate of 50cm, during the twenty first (Jones, 2003). Some of the beautiful beaches and even small islands will be regressing or disappeared, as a result of that. Tourism destinations then will find themselves without attraction. Similar thing will happen in mountain regions. Mountain region especially those that attract tourists by snow or glacier will suffer the shrinking snow cover because of the temperature rises. Using Tibet of China as an example, according to the surveys performed by a group of 20 scientists from China and the United States over a 40-month period, “Tibet's glaciers have been receding over the past four decades due to global warming, …most of the plateau's glaciers will have disappeared from the face of the Earth by the turn of the next century, … global warming was causing China's highland glaciers, including those covering Mount Everest, to shrink by an amount equivalent to all the water in the Yellow River - China's second biggest - every year.” That will not only damage the tourism industry there, but also destroyed the lives of nearly 300 million people. (YaoTongdong, 2004)
Another pollution problem is the litter issue. That is a problem especially in the remote or poverty area. I have been to Tibet, which is called the world last pure place. I was shocked by the nice people and fantastic scenery, extremely blue sky, transparent water, and the marvelous snow mountain. The picture below can show a little of its beauty. Is it amazing? But can you imagine. There are also some disappointed scenes there just outside the picture. More and more tourists make there more and more dirty. Cans, bottles, toilet papers, you can see these litters almost everywhere. The local restaurants are still using the so-called “white wastes” canteens, and they are thrown directly to the nature after used. Local residents seem not care about the environment. Nobody responds for cleaning and treating the rubbish. Yes, Tibet did make money since more and more visitors there. But I do worry about the future of its tourism industry. If current situation continued, we might not maintain the “world last pure land”. The tourism there will be damaged a lot.

Water shortage and land desertification
Tourism is also a huge resources consumer. The evidence shows that tourists' water consumption was far in excess of that of local residents and that deteriorates water stress in regions and areas which already suffer from water shortages (Djerba Conference, 2003). Western China is a typical water-scarce area. In order to improve its tourism industry, the resorts, hotels and restaurants have to give full time water service for their visitors, including 24-hour showing water, although they have totally about 10 million people who met drinking water difficulties.

Nowadays, many natural resorts are threatened by water shortage and desertification. Lijiang, China, which attracts hundreds of thousands of visitors because of its beautiful landscape of mountain and water, now is “tired”. In several months, especially from September to next February, water shortage makes boats have difficulty to navigate in the river.

Another heart-struck example is shrinkage of crescent moon spring, Gansu, China by desertification. According to the native’s introduction, in the recent decades, the crescent moon spring actually is shrinking by the astonishing speed., the current crescent moon spring water surface is only 1/3 of 1960’s, and the water depth also dropped from 7 - 8 meters to today’s about 1 meter. If that continued, this well-known tourism destination would disappear from this planet.

2.2 Socio-Culture Issues
Cultural tourism is about movements of people motivated by cultural intents such as study tours, performing arts, festivals, cultural events, visits to sites and monuments, as well as travel for pilgrimages, and enjoyment of the lifestyle of the local people, the local area and what constitutes its
identity and character (WTO, 2004). The development of cultural tourism is regarded as an effective way to alleviate poverty.

Sustainable cultural tourism development requires tourists “respect the socio-cultural authenticity of host communities, conserve their built and living cultural heritage and traditional values, and contribute to inter-cultural understanding and tolerance” (WTO, 2004).

But the exploiting cultural tourism and sustainable tourism development are a pair of contradiction. Arguably, a destination that dedicates maximum efforts to conserving its unique cultural heritage instead of exploiting it for tourism would fail in business terms. On the contrary, a destination with few strategies for cultural heritage conservation but maximum business goals of developing tourism based on its cultural heritage would see the loss of its culture and tradition in the development process (Wight, 1994). It is well known that Xi’an, China is a destination which is rich in cultural heritage. Millions of visitors from all over the world come to experience the long history of China. Tourism, therefore, become the city’s backbone. But sustainable problems are met during exploitation. Many cultural relics, such as “Terra Cotta Warriors and Horses”, were buried beneath the earth for thousands of years. So as soon as they are excavated, they begin facing the danger of erosion. Exploitation and destroy happen simultaneously.

Another example is the Lugu Lake, which is the only existing matrilineal society in China. Tourists go there because of its special customs and its original village. But in order to attract more visitors, the residents used to build modern architectures, like dancing hall, Kara OK, etc. These buildings are not harmonious with its culture. That definitely badly impacted the tourism there. So not long later, they were removed.

2.3 Economic Issues

“Ensuring viable, long-term economic operations, providing socio-economic benefits to all stakeholders that are fairly distributed, including stable employment and income-earning opportunities and social services to host communities, and contributing to poverty alleviation” is the WTO’s latest definition for economical sustainability of tourism.

Tourism is believed the world's largest and fastest growing industry, accounting for 5.5% of the global Gross National Product and 6% of the employment (Glasson, Godfrey, & Goodey, 1999). It is an important economic asset for some countries and regions, and the main way to alleviate poverty in most of the underdeveloped countries. The countries of greatest need in the fight against poverty are also areas with massive tourism opportunity. They abound in culture, nature and tradition that tomorrow's tourists are seeking. All developing countries have tourism export potential -- it is already one of the top sources of investment and foreign exchange. And the good news is that over the past decade tourism to poor countries grew at twice the rate of OECD states (New York Beacon, 2004).

When the tourism makes money for the destinations, it also brings potential damage for them. As this paper mentioned above, the development of tourism has had so much bad impacts on environment, culture, etc. If this continued, the result would be that the lifecycle of tourism is shortened, and eventually, the economic development is stagnated and decline.
Another economic negative effect on sustainable tourism is that part of the visitors’ spending flowing out of local destination. According to the World Bank, as much as 55 percent of the developing world's tourism revenues leak back to the developed countries in the form of imports. So, sustainable tourism development entails retaining the money as much as possible.

3. Strategies to Improve Sustainability
Sustainable tourism is a big issue which concerns many aspects, such as environment, culture, and economy. The development of it needs supports from different dimensions.

3.1 Strong Support Politics
Governments play an essential role in the tourism development through establishing regulations and policies, ensuring their enforcement, guaranteeing stakeholders’ participation, and monitoring environmental quality. In order to protect the natural and socio-cultural environment and at last get sustainable development, many countries and regions issued support policies, such as Polluter Pays Policy, Carbon Dioxide Laws, etc.

For example, Huanglong National Scenic Area, China, which became one of the first protected areas in the Asian Pacific region to receive Green Globe 21 Certification, is a destination which established good policies. The policies include almost all-side of sustainable tourism, and are modified yearly.

Environment Protection
From 2000, coal usage has been replacing with electricity and gas. Waste is sorted and collected then treated outside of the valley. No waste water is allowed to be released in the main sightseeing area; a waster water treatment plant is used to treat waste water released from the administration and service area. In order to control the noise pollution, all motor vehicles are forbidden in the sightseeing area and buses are forbidden to sound their horn at the entrance. Tree cutting, Chinese medicine collecting, wild animals hunting, mining etc. are strictly forbidden.

Social and Cultural Management and Economic Benefits
Most of the staff are local people. That gives them more employment opportunities. Shops have been built and run by local people to promote culture and products. Financial assistance is provided yearly to support local community.

3.2 Hi-tech Technology
Every development needs technology’s help, sustainable tourism is not an exception. Nowadays, the applications of technologies in sustainable development of tourism are focusing on reducing energy consumption and environment protection.

Energy Control
Intelligent energy management is a method to reduce energy consumption. It’s a hi-tech management, which starts off from defining the optimum site, taking into account architectural construction features and finally leading to new energy technologies. Renewable technology is another attempt to improve current energy situation. Solar energy is a green renewable energy which has already been used in some tourism destinations, like solar street...
lamp, solar toll phone, etc. Wind electricity generation, water recycle, human beings try to find a best way to replace the usage of current non-renewable energies.

**Environment Protection**

Environment protection technologies encompass a broad range of technologies, such as sewage treatment, waste recovery, waste gases elimination and so forth. Biotechnology, micro-technology and nanotechnology, many hi-tech are experimented and try to be used in this area. However, the application of these technologies also exits risks. Nanoparticles, for example, maybe released into the environment to clean up existing contaminants, they may also serve to become a new kind of non-biodegradable pollutant that also remain in the environment.

### 3.3 Increased Public Awareness

If government policies and technologies are tools to achieve sustainable development of tourism, the increasing of public awareness is the foundation to eventually realize it. Raising the industry's awareness is a global issue, since almost every country has a tourism sector. It is important to ensure that all related aspects of the society understand the relationship between sustainability with their lives and their behaviors with the sustainability.

**Stakeholders**

Sustainable tourism seeks a balance of liberal markets in which the industry can thrive economically and generate jobs, and protecting and enhancing the cultural and natural environment. To achieve this balance strong support and investment are necessary. That requires strong partnerships of all interested stakeholders. Continuing investments are needed in technology to diminish negative environmental impacts and in training and education to heighten environmental awareness. The stakeholders especially public and private sectors provide the expertise to establish, market and operate economically sustainable tourism enterprise, play important role in the development, adoption of environmentally appropriate technologies, managing, planning, and educating people.

**Local communities and local people**

Local communities maintain cultural identity and social fabrics, and provide local cultural opportunities for tourists and local economic opportunities for residents. Locale residents are who live, operate and eventually enjoy or suffer the outcomes from the development of tourism. It is essential to let local people realize that they are the primary stakeholders in the expansion and maintenance of a successful tourism industry. They are participating in the environmental conservation of the destination and benefiting economically from tourism. Environmental (natural and cultural) sustainability directly relates their lives, health, and economy. All the understanding requires ongoing community participation and educational programs at all levels that explain the role of tourism vis-à-vis the environment and their lives.

**Tourists**

Tourists are another party taking part in the interaction of nature and human beings in the destination, apart from local people. As mentioned above, tourists utilized a big portion of energy, bigger than native residents; Mass tourism led to pollution in destinations; Bad tourism behaviors deteriorated scenes which used to be clean and beautiful. So it is also very critical to increase tourists’ awareness on the sustainable tourism. They need to be aware that they are a part of the earth, they will also endure the results of their behaviors on tourism industry.
4. Conclusion
Tourism, as the world foremost economic activities, has its unique dependency on the environmental, social and cultural properties of tourism destinations. So it has a vested interest in ensuring sustainability. But there are contradictions between sustainability with tourism development, reflecting on culture, environment and economy aspects. Some of famous resorts have suffered the consequences of non-sustainable development. In order to achieve sustainable tourism, human beings have been trying many strategies, like carrying our strong support policies, applying hi-tech technologies and increasing public awareness. Currently, sustainable development of tourism has been put on the way, and be paid high attention to. Hopefully, tourism can be an evergreen industry in the world.

Work Values of Information Technology Personnel and Their Antecedents

Faculty of Economics, Seikei University, Musashino, Tokyo 180-8633, Japan

Abstract
Previous studies on organizational citizenship behavior (OCB) expected that information technology (IT) personnel particularly tend to exhibit OCB differently from other jobholders owing to their job characteristics. This article discussed workers’ work values that are closely associated with their tendency to exhibit OCB. Data collected from 6,500 workers (218 of whom were IT personnel) were analyzed to examine how the work values of IT personnel differed from those of other workers. The empirical result showed that IT personnel had a significantly stronger challenging job and weaker identification with the organization and contribution to society. Furthermore, overall satisfaction and skill evaluation positively influenced some of the work values. Some implications for future studies were also proposed.

Keywords: IT Personnel, Work Values, Organizational Citizenship Behavior

1. Introduction
Many researchers in the field of organizational behavior have focused on organizational citizenship behavior (OCB) ever since the pioneering articles of the research group headed by Dennis W. Organ, Indiana University, were published in the 1980s (Bateman & Organ, 1983; Smith, Organ, & Near, 1983). Although it is true that almost any worker exhibits OCB to some degree, the frequency of OCB varies across workers. One of the important goals of OCB research is to identify the factors that produce differences in individual workers’ OCB. Past researchers have detected not only the effect of attitudinal or dispositional factors of individual workers but also the effect of contextual factors related to these workers, such as task, leadership, and reward systems in the organization, on OCB. However, one of the themes less explored in OCB research is to identify a different tendency to exhibit OCB among various jobholders. Although this is an important topic, it would require researchers to collect a large amount of data from various jobholders in order to compare the characteristics of OCB among them; this makes the research very difficult and costly.

Among various job categories, those in the field of information technology (IT) are considered as one of the most important jobs in the modern information-centric society. Although no empirical research has hitherto focused on OCB of IT personnel, some researchers expected that IT personnel particularly tend to exhibit OCB owing to their specific job characteristics.

For example, Ueda (2007) estimated that job characteristics of IT personnel influence their OCB; however, they could possibly have both positive and negative effects. As reviewed by Summer and Niederman (2003–2004), an IT job has high role ambiguity and role conflict, which, in turn, have been shown to have a negative impact on job satisfaction. Further, Moore (2002) pointed out that IT personnel were prone to burnout syndrome. Antecedents like job dissatisfaction and burnout syndrome negatively influence OCB (Cropanzano, Rupp & Byrne, 2003; Organ, 1988; Organ et al., 2006). However, the job of IT personnel is also said to have high autonomy. High job autonomy is considered to have two opposite effects on OCB. It makes workers more responsible and motivates
them to deal with almost every aspect, including OCB, related to task accomplishment (Organ et al., 2006). Furthermore, owing to job autonomy, workers tend to believe that they play an important and meaningful role in an organization, which in turn encourages them to perform a wider range of jobs than usual (Cardona et al., 2004). On the other hand, job autonomy occasionally makes workers underestimate the importance of other functions in an organization or their relationship with those functions. In this case, their insensitivity to others’ needs might reduce their OCB (Pearce & Grageren, 1991).

Data that allows us to directly examine the OCB of IT personnel is not available. Therefore, we focus on the work values of IT personnel instead. As discussed later, work values are considered to have a close relationship with OCB; hence, focusing on the work values of IT personnel help us understand their OCB more closely. The objective of this article is to investigate the relationships between work values of IT personnel and attitudinal factors in order to forecast their OCB.

2. Extraction of Six Work Value Dimensions

We used secondary data from the Survey of Working Persons (2008) that was originally collected by the Works Institute Recruit Co. Ltd. (hereinafter WIR). The WIR offered this data to the Social Science Japan Data Archive (Center for Social Research and Data Archives, Institute of Social Science, the University of Tokyo) in order to give qualified academic researchers the opportunity to use it. The data were collected from 6,500 workers in the Tokyo metropolitan area in Japan in the summer of 2008. From this group, 218 were classified as IT personnel.

Values play an important role in influencing people’s perception, motivation, and behavior. People’s values comprise various subsystems of specific values that are associated with the judgment regarding whether more specific objects are good or bad. Work values can be considered a part of these values. They are defined as “beliefs about the desirability of specific outcomes of working” (Hattrup, Mueller & Joens, 2007, p. 481) and are considered to influence the behavior and orientation of workers.

By conducting an exploratory factor analysis of responses of 29 out of 32 items on the importance of objects that workers expected to acquire through work, we extracted the following six work value dimensions (Ueda & Ohzono, 2011). The value Challenging job (rotation sums of squared loadings [RSSL] = 6.131) reflected the belief that something new should be acquired or produced through work. Self-actualization (RSSL = 6.249) referred to the quest for the ideal self. Extrinsic rewards (RSSL = 4.194) indicated the desire for extrinsic rewards such as good pay, a good workplace, and timely promotion. Power and authority (RSSL = 4.316) referred to the desire for authority and power in an organization. Identification with the organization (RSSL = 4.194) reflected the desire to have a strong sense of belonging to the organization and good relationships with coworkers. Contribution to society (RSSL = 4.506) referred to the desire to help and contribute to society.

Furthermore, while many OCB researchers have proposed various sets of OCB constructs, Organ et al. (2006) tried to organize various OCB constructs into the following seven dimensions: helping, sportsmanship, organizational loyalty, organizational compliance, individual initiative, civic virtue, and self-development. Each of the above six work values is associated differently with some of these OCB dimensions. First, challenging job and self-actualization are considered to be associated with self-regulation of workers in and around the organization. A challenging job and stronger self-
actualization encourage workers to perform their job responsibly and positively, and therefore, they actively exhibit the impersonal aspects of OCB, such as organizational compliance, individual initiative, civic virtue, and self-development. However, workers with stronger work values might be conscious of their elite status, and therefore, they might take little notice of other workers’ needs and exhibit less interpersonal-type OCB.

Second, workers with a stronger sense of identification with the organization try to care about other workers in the organization and form close relationships with them. They exhibit positive interpersonal-type OCB, such as helping, sportsmanship, and organizational loyalty. Third, contribution to society is reflected through a strong feeling of fellowship beyond the organizational context. Because OCB is meant to be a contribution to the organization or its members, it is conceptually different from contribution to society; it indicates the degree of a worker’s motivation or eagerness in helping somebody else. Considering the findings of some researchers who broaden the concept of OCB to include service to customers beyond formal responsibility, contribution to customers is closely related to this work value.

It is difficult to estimate how workers with stronger extrinsic rewards and power and authority exhibit OCB. Superficially, these extrinsic work values seem to be less related to voluntary contributions like OCB, but some workers do exhibit OCB positively on the basis of their motive of impression management. From a conservative perspective, workers’ extrinsic work values tend to inhibit their OCB based on their pure and ethical motives.

3. Work Values of IT Personnel
How many of these work values do IT personnel have, or how different are their work values from the averages of the whole sample? In the original data, workers’ jobs were divided into more than two hundred categories, and we considered that the following job categories should be classified as jobs of IT personnel (N = 218).

---Insert Table 1 around here---

We chose the factor scores of only IT personnel and calculated their averages. Figure 1 displays the cobweb chart of the averages of the work values of IT personnel. Further, we examined whether these scores were statistically different from zero (the averages of the whole sample) by one sample t-test, as shown in Table 2.

--- Insert Figure 1 around here---
---Insert Table 2 around here---

According to Table 2, IT personnel had significantly higher values of challenging job and lower values of identification with organization and contribution to society. This result is consistent with previous estimates about their OCB. Specifically, the higher value for challenging job than the average of the whole sample meant that IT personnel tended to regard their jobs as autonomic, important, and meaningful. These characteristics encouraged them to exhibit impersonal-type OCB, but it might have decreased interpersonal-type OCB. On the other hand, their lower identification with organization and contribution to society showed that they tend to think that they work independently of others in and around the organization. This tendency might prevent them from
considering others in and around the organization and inhibit them to exhibit interpersonal-type OCB.

4. Antecedents of Work Values of IT Personnel

On the basis of the average work values of IT personnel, they might be expected to exhibit more impersonal-type OCB but less interpersonal-type OCB. However, as workers’ factors have been found to influence their OCB, these individual factors are also considered to have some effect on their work values. In other words, even though the averages of work values of IT personnel generally differ from those of the whole sample, the actual work values of each IT worker differ across people, and the work values of each person depend on his/her attitudinal factors.

In this study, we considered the effect of the following attitudinal and perceptual factors.

Satisfaction: Satisfaction is known as one of the most typical antecedents that positively affect OCB. The original questionnaire of WIR had four questionnaire items regarding satisfaction with the current job, employment status, workplace, and organization, such as “Are you satisfied with your current job?” The average of the responses to these items was used as a measure of overall satisfaction (α = 0.855). We assumed that when workers are satisfied with work, they will be more aware of their work and have more unequivocal work values. Hence, the following hypothesis was proposed.

Hypothesis I: Overall satisfaction will positively influence work values.

Skill evaluation: Workers are aware of their competency in the workplace. One of the factors affecting this competency is skill evaluation; that is, how talented they consider themselves in terms of the skills necessary for performing their jobs. When they highly evaluate their skills, they are more aware of something they can obtain through work; this clarifies their work values.

The original questionnaire by WIR had 12 items on skill evaluations. We excluded one item because it was inappropriate for this study, and we then divided the remaining 11 items into problem-solving skills and human relations skills. Problem-solving skill evaluation referred to the degree to which a worker considered s/he had the skill and knowledge necessary to appropriately handle a job and make accurate decisions. We measured it with seven items and used their average as the measure of this aspect of skill evaluation (α = 0.824). Exemplary items were “skill to formulate a good plan to solve a problem” and “systematic knowledge regarding your current job.” Human relations skill evaluation indicated the degree to which a worker considered s/he had the skill necessary to appropriately resolve problems in human relations. We measured it with four items and used their average as the measure (α = 0.720). Exemplary items were “skill to develop peaceful human relationships” and “skill to control your own emotion.”

Of the six work values, extrinsic rewards and power and authority were considered as extrinsic work values, and challenging job, self-actualization, identification with the organization, and contribution to society were regarded as intrinsic work values. Generally, workers who highly evaluate their skill tend to be more sensitive to rewards that they can acquire through their skill if they tried, and in turn, this tendency encourages them to inculcate more work values related to these rewards. However, while problem-solving skill is the basic one that is associated with work values, human relations
skill is specifically related to a sense of belonging and affiliation behavior, and it does not always promote the development of extrinsic work values. Therefore, we proposed the following, different hypotheses concerning the effect of skill evaluations.

**Hypothesis II:** Problem-solving skill evaluation will positively influence both extrinsic-type work values (extrinsic rewards and power and authority) and intrinsic-type work values.

**Hypothesis III:** Human relations skill evaluation will positively influence only human relations-type work values (identification with the organization, and contribution to society).

All of these items were measured with a Likert-type four-point scale, wherein larger numbers indicated a higher degree of respondents’ conviction.

Some demographic factors were considered to affect work values, and we controlled the effect of those factors to clarify the pure effect of attitudinal antecedents on work values. We chose gender (male = 1, female = 2), age (real), annual income (real, units of 10,000 Japanese yen), and employment status (fulltime employment = 1, part-time employment = 2) as demographic factors.

The actual analysis was conducted as follows. After correlations between variables were calculated, we conducted a hierarchical regression analysis to examine the additional effect of attitudinal factors after controlling demographic variables. First, four demographic factors were compulsorily entered into the equation, followed by three attitudinal factors.

It should be noted that these attitudinal factors might not be antecedents of work values but their consequences. For example, we assumed that high satisfaction would lead to high work values, but people who originally have a clear set of work values might work hard and, as a result, obtain higher satisfaction. Rigorous analysis such as structured equation modeling (SEM) might reveal a reasonable causal relationship between work values and attitudinal factors, but because of the limited sample size in this study, we believed that simple hierarchical regression analysis will be an important first step for focusing on the relationship between them.

5. Result
5.1 Basic Statistics and Correlations
Table 3 shows the means, standard deviations, and inter-correlations of the variables. Gender had a significant negative correlation with annual income, which shows that female IT personnel received less income than their male counterparts. The significant correlations of age with annual income and problem-solving skill showed that older IT personnel were more confident of their problem-solving skill and earned a higher income despite the rapidly evolving IT scenario. However, the insignificant correlation between age and human relations skill evaluation was not as expected because, particularly in the Japanese society, senior persons are generally expected to be better at dealing with problems in human relations. Significantly negative correlations of employment status with two skill evaluations confirm that most of the part-time workers were employed as unskilled workers. They were given less income, but the insignificant correlation between employment status and overall satisfaction might mean that part-time workers are not always unsatisfied with their work scenario. Overall satisfaction had a significantly positive correlation with problem-solving skill evaluation but not with human relations skill evaluation.
--- Insert Table 3 around here

5.2 Hierarchical Regression Analysis
Table 4 shows the result of the hierarchical regression analysis. First, overall satisfaction had a significant positive effect on self-actualization, challenging job, identification with organization, and contribution to society. Therefore, Hypothesis I was partially supported. Problem-solving skill evaluation had a significantly positive impact on challenging job, self-actualization, and extrinsic rewards. On the other hand, human relations skill evaluation positively influenced power and authority and contribution to society. Although all significant effects were positive, and no significantly negative effects were found, the results showed that Hypotheses II and III were only partially supported. Furthermore, the effect of human relations skill evaluation on power and authority was unexpected.

--- Insert Table 4 around here

6. Discussion and Conclusion
This study revealed specific characteristics of work values of IT personnel and the relationships between these work values and individual factors. Although no findings were contradictory to our initial hypotheses, the effect of these factors on work values might be more complicated than we had anticipated. In future studies, we should investigate the relationships between work values and individual factors in more detail. Furthermore, the empirical result showed a positive impact of human relations skill evaluation on power and authority. In fact, we simply regarded this work value as one of the extrinsic work values that was only slightly associated with human relation skills. However, congenial human relationships are particularly emphasized in Japanese society, and such skills might be considered important and necessary for gaining strong power and authority in Japanese organizations.

Although this study presented several important findings on the work values of IT personnel, it had some limitations that should be resolved by future studies. First, as already described, this study regarded individual factors as antecedents of work values, but it might be possible to consider that workers’ work values influenced their attitude toward work. Future studies should collect more data and adopt a more rigorous statistical method to accurately examine the causal relationship. Second, this study used data that were initially collected by other institutions that did not consider concrete hypotheses and empirical studies. Therefore, most questionnaire items were not developed, and little consideration was given to the measures of previous related studies.

Nonetheless, this study revealed that jobs of IT personnel had specific work values, as was initially expected. Researchers interested in human resource management of IT personnel should pay further attention to the jobs of these personnel by concentrating on the various aspects of their job characteristics. Further, because it is important to investigate work values by job categories, a similar study should be conducted for identifying the specific characteristics of various job categories other than those of the IT personnel.

Determinants of Performance Management System in South East Asia

Nur Naha Abu Mansor
Head of HRD Panel, Faculty of Management and HRD
Universiti Teknologi Malaysia, Malaysia.

Ananya Raka Chakraborty, Tay Ke Yin, Zeynep Mahitapoglu
Faculty of Management and HRD, Universiti Teknologi Malaysia, Malaysia.

Abstract
The main purpose of this study is to identify the relationship between determinants influencing the implementation and effectiveness of performance management system (PMS) in South East Asia. This study specifically examines organizational factors influencing PMS as well as effectiveness of the system. A total of 123 questionnaires were distributed to academic members across a higher education institution. Factor analysis was conducted using Principle Component Analysis (PCA) technique to identify the construct validity of factors influencing PMS and descriptive statistics was used to examine the effectiveness of PMS. Pearson correlation method was used to determine the relationship between organizational factors and effectiveness of PMS. The results of the study demonstrated that three organizational factors influenced PMS and its effectiveness at a moderate level. In addition, among the three organisational factors, performance oriented culture (POC) has the strongest relationship with effectiveness of PMS.

Keywords: Performance Management System (PMS); Performance Appraisal, Organizational Factors, Effectiveness of PMS

1. INTRODUCTION
Organizations today are continuously facing external and internal forces that drive them to change due to the world are more competitive in times. External forces such as new industries in the market and rapid changes in information technology are among the factors that shape the approach on how organizations handle their businesses (Gunasekaran et al., 2005).

In order to be competent and stay updated, many organizations have reorganized and merged into chain, clusters, networks, and strategic alliances to cope with the external forces (Burns and Vaivio, 2001; Lukka and Shields, 2001). In that situation, PMS is one of the key issues that could help organizations to cope with the current business flow.

Johnson and Kaplan (1987) clarified that there is an urgent necessity to have new management approach to manage the performance of organizations as the traditional ways have lost their relevancy. Therefore, PMS was developed for managing the performance within organizations. The

1 Corresponding author
new PMS must be able to produce specific, timely and relevant information for planning, decision making and control purposes (Otley, 1999).

According to Economic and Social Council of United Nations (2003), performance management and measurement systems developed as a means of monitoring and maintaining organizational control, which is the process of ensuring that an organization pursues action plans that lead to the achievement of overall goals and objectives. These goals should in turn be direct manifestation of the mission and strategic orientation of an organization. Performance management, as related to human resource management (HRM), is the process of delivering strengthened success to organizations’ by improving capabilities of individuals and teams. Organizations should develop employee competencies in a manner aligned with the organization’s business purposes because the ultimate competitive asset of any institute is its people. This can be succeeded through Performance Management System (PMS), which act as both behavioral change tool and enabler of PMS improved organizational performance through being instrumental in driving change.

With the aim of being able to do so the PMS must have the ability to capture the internal and external changes or factors of the organization. Many organizations claimed that their PMS implementation are somehow effective in a way that they have conduct and inserted all relevant and needed steps in their PMS. The effectiveness of implementation of PMS in organizations is still under ambiguity as the effectiveness of implementation depends on variety of factors that are interrelated to the implementation success in organizations.

According to San and Wong (2001) study, “Performance Management: a study of current and future practice in Malaysia”, recent report indicated that employees in Malaysia seldom use PMS except forced through obligation by organizations. Therefore, there is a need to find out how far is the effectiveness in implementation of PMS in organizations.

2. BACKGROUND

Cardy (2004) reviewed that performance management is a crucial aspect for the extreme of organizational effectiveness. It is considered the “Achilles Heel” of managing human capital because it is the key process through which work is accomplished and should therefore be a top priority for managers to review (Lawler, 2008).

According to Pettigrew (in Sole, 2009), culture can be thought of as the sum total of beliefs, ideologies, behaviors and values prevalent in organizations, which can influence organization power relationship and their response to change. It could have a great impact on its success if the employees are involved and motivated during the development of the performance measurement and management system. Experience in performance management and measurement systems will affect the system implementation and also its end results (Sole, 2009). Another variable that has been getting an increase in attention as one of the key determinants of performance is employee engagement (Macey et al., 2009). Mone and London (2010) suggest that designing the performance management process to foster employee engagement will lead to higher levels of performance.

The effectiveness of HR systems is, in part, a task of the degree to which they are matching with both organizational and individual goals (Stone et al., 2006). According to Lawler (2003), there are a great number of design features that potentially can influence the effectiveness of a performance management system, and many of these have been empirically studied to clarify their impact.
2.1 Purpose of Performance Management System (PMS)

The purposes of performance management systems are of three kinds: strategic, developmental, and administrative (Cieri, and Kramar, 2005). In terms of strategic purpose, performance management system should link employee activities with the organization’s goals. It has been found that in order to achieve their strategic purpose, effective performance management systems exhibit five characteristics. These are: (i) The alignment of employee performance with organizational objectives, (ii) A clear articulation of the desired work culture, (iii) A clear specification of the results and competencies- that is, the ‘how the results are to be achieved’, (iv) The management behavior and style that encourages discretionary effort, (v) The simple processes and documentation that enable line managers and employees to see performance management as part of their daily workplace.

According to Dougherty and Dreher (2002), performance data are used in making decision about employees, including promotion to higher-level jobs, size of annual base salary adjustments, performance bonuses and commissions, lateral transfers, and terminations. Feedback, counseling, performance improvement and evaluation of organizational programs are the other purposes of PMS. According to Dougherty and Dreher (2002), in a PMS, performance measures are also used as the basis for providing employees with feedback and counseling to improve their performance. Another major use of performance measures centers around the evaluation of organizational programs. Performance measures can serve as criteria for assessing the effectiveness or, or “validating” employee selection measures, employee training programs, work-family programs, or any other intervention design to improve employee productivity or organizational working.

2.2 Factors Influencing PMS

Sole (2009) explained that there are two basic factors which influence performance management systems in public organization. Those are internal and external factors. Internal factors include leadership and internal management commitment, internal resources, performance-oriented culture, employee engagement, and maturity of PMS. Leadership is important in designing and developing effective performance measurement system and internal management commitment brings formality to the performance management reviews and as a consequence could influence employees’ commitment to achieving targets and improving performance. Measurement and management systems may require a lot of time and effort, especially at the beginning of the process as internal resources. According to Pettigrew (in Sole, 2009), culture can be thought of as the sum total of beliefs, ideologies, behaviors and values prevalent in organizations, which can influence organization power relationship and their response to change. It could have a great impact on its success if the employees are involved and motivated during the development of the performance measurement and management system. Experience in performance management and measurement systems will affect the system implementation and also its end results.

External factors include citizens and elected officials, labor unions, legal requirements. In particular, employees view performance-monitoring systems as systems intended to force them to work harder, and managers see such systems as efforts to put increased pressure on them to produce added results. All these elements sustain the role of a performance-oriented culture as a factor influencing the implementation of performance measurement and management systems in public organizations. In terms of time limitation and cost, the important variables for implementation of PMS are the internal factors.
2.3 Effectiveness of PMS

Lawler (2003) also support that there are an amount of reasons for believing that systematically tying rewards to the outcome of a performance management system will make the performance management system more effective with respect to motivation, but there are also some that suggest it will make it less effective with respect to development.

Helm et al. (2007) noted that the following four metrics were used to evaluate the effectiveness of the performance management system: (i) A performance management survey, (ii) An institutional employee opinion survey question, (iii) The distribution of performance ratings, and (iv) The distribution of merit compensation.

PMS can be described as the set of metrics, or performance measures, used to quantify both the efficiency and the effectiveness of actions. Performance evaluation supposes the need for tools to analyze the measurements taken according to these two dimensions of efficiency and effectiveness (Lauras et al., 2010).

E-performance management systems will be more likely to produce incomplete criterion data on incumbent behavior than traditional systems. According to Armstrong and Baron (1998) performance management system helps employee to do their job better, and develop their skills and potential. Employees might be satisfied with the useful feedback from PMS. If they think that the assessments of performance are consistent, fair and unbiased, they feel more motivated after review meetings. PMS helps them to know how their objectives relate to the business needs of the organization. If the information disclosed in performance reviews is used sensitively and productively by the organization, the employees, employee will feel more motivated and this affects their performance positively.

Through the review, the main purpose of this study is to identify the relationship between factors influencing the implementation and effectiveness of performance management system (PMS) in an Educational Institution in South East Asia. This study also determines the organizational factors influencing PMS as well as effectiveness of PMS. The following review leads to these research objectives which are:

i. to identify the organizational factors in implementation of PMS
ii. to examine the perceived effectiveness of PMS
iii. to identify the relationship between the organizational factors and perceived effectiveness of PMS

3. METHODOLOGY

Data was collected using a set of questionnaire as it is the most prominent method to gather the demanded information. The information gathered from an interview was also beneficial for this research. A set of specifically customized questionnaire was developed to accommodate this research. This entire questionnaire consisted of 41 questions among 3 sections, including a demographic information section, factors influencing implementation of performance management system, and perceived effectiveness of performance appraisal. The questions were a six point scaling format and an open ended question, plus a demographic section. Section A is related to demographic information, which consists of 4 questions focusing on information about lecturers’
personal background such as years of experience in UTM, age, gender and marital status. Section B consists of 5 basic components with a total of 23 items are related with those components. Based on Chapter 2, there are five different organizational factors, which are leadership, internal management commitment, internal sources, performance-oriented culture, and employee engagement. Section C consists of 14 items on perceived effectiveness of performance appraisal. The questionnaire consisted of 14 items, which were adopted from Armstrong and Baron (1998) research. Based on the research objectives, an interview session on an SME from the Human Capital Development department consisting of 9 questions had been developed and used for the SME interview.

Cronbach Alpha is a method to measure the reliability of a questionnaire. A pilot test was conducted consisting of 34 lecturers from the Faculty of Electrical Engineering to test the reliability of the instrument. The Cronbach’s Alpha value through the reliability analysis revealed through the pilot study a value of 0.843 for organizational factors and for effectiveness of PMS was 0.822. The findings from the questionnaire answers and interview were documented and content analyzed for subjects in terms of suggestions for future changes, problems inherent in the system, and problems encountered in using the system. In analyzing the data, it was divided into quantitative and qualitative research. “Principal component analysis” technique of factor analysis was used to explore the main components in research question 1.

In identifying the second objective, descriptive statistics was used with a mean score to determine the level of perceived effectiveness of PMS in three levels; high (ratio of 4.34 -6.00); moderate (ration of 2.67 – 4.33); and low (ration, 1.00 – 2.66).

The correlation method was used to show the level of relationship between organizational factors influencing PMS and effectiveness of PMS. Pearson correlation would be computed to determine if there is important relationship between organizational factors and perceived effectiveness of PMS. Pearson correlation coefficients (r) can only take on values from “-1 to +1”, whether there is a positive correlation (as one variable increases, so too does the other) or a negative correlation (as one variable increases, the other decreases) (Gravatter and Wallnau, 2004; Ho, 2006; Pallant, 2007; Tabachnick and Fidell, 2007). The strength of negative or positive correlation is considered weak if it is ranging from .10 to .29; normal .30 to .49; and strong .50 to 1.0 (Pallant, 2007).

According to table 1, KMO value of 0.72 specified that the required satisfactory sample size was achieved as KMO is > 0.05, patterns of correlation were compact and distinct and reliable factors were deferred. Bartlett's test was found to be very significant (p < 0.05). Therefore, there was a relationship between the observed variables, showing that factor analysis was appropriate.

Table 2 displays the total variance of 68.0% was explained by three extracted factors. Eigenvalue for factor-1 is 4. 87 % with total variance explained value of 40.6 %, eigenvalue for factor-2 is 1. 80 % with total variance explained value of 15.0 % and eigenvalue for factor-3 is 1. 49 % with total variance explained value of 12.6 %. It indicates that the factors were explaining the variances above acceptable level of 40%. Accordingly, the eigenvalues determined that the factor explained adequate variance for it to be a constructive factor.

The Scree plots test was used to verify the number of extracted factor. The plot is illustrated in figure 4.1. It shows that the Scree plot where we can see at the 3 factors solution are having an eigenvalue greater than 1. The eigenvalues for the first variables drop hastily and the following factor declines in the eigenvalues gradually levels off. The thunderbolt in Scree plot shows the point on the curve which is less than the eigenvalue 1.0.
Table 3 shows that Cronbach alpha values of 0.84 was found for all 5 items which belongs to factor-1, and the value of 0.81 extracted 4 items which belongs to factor-2. Similarly, CA value of 0.81 was found for another 3 items in factor-3. Cronbach alpha values (> 0.70) showed that all of the items are reliable. Thus, the entire test is internally consistent. Next, items for each factor are presented accordingly Factor-1 (employee involvement) consist of E2, E1, E3, IMC3, IMC4 and factor-2 (performance oriented culture) contain P1, P2, P3, E5. L4, L5, IMC2 belongs to factor-3 which is management commitment. The analysis of factors and reliability using Cronbach alpha test showed that the instrument has content and face validity as well as reliability.

Table 4 elaborates the descriptive statistics for each component of the three organizational factors and for the overall mean, SD and specific for each item within the variable.

3.1 Effectiveness of PMS
Table 5 shows the level of effectiveness of PMS in UTM which was acquired by descriptive statistics. The overall mean is 3.65. According to table 3.3 (chapter 3), we can conclude that the PMS in UTM has a moderate level of effectiveness because table 3.3 illustrated that moderate level of effectiveness is between 2.67 - 4.33. In addition, the overall reliability of effectiveness of PMS was measured by conducting Cronbach’s Alpha Test with a reliable value of 0.7.

3.2 Relationship between Organizational Factors and Effectiveness of PMS
Based on table 6, for Employee Involvement factor, the value of Pearson \( r \): 0.518 for n:100 at p < .000(2-tailed) indicated that there was moderate level of relationship between factor-1 (Employee Involvement) influencing implementation effectiveness of PMS. Similarly, for factor 2- Performance Oriented Culture, the value of Pearson \( r \): 0.603 for n:100 at p < .000(2-tailed) indicated that there is a moderate relationship between this factor and effectiveness of PMS. Lastly, for factor-3 which is Management Commitment, it has a value of Pearson \( r \): 0.341 for n:100 at p < .001(2-tailed) indicated that there is a low relationship between factor-3 and effectiveness of PMS.

Further qualitative data through an interview was used to add richness to the existing quantitative data. Table 7 depicts the main interview questions and answers.
4. DISCUSSION

As mentioned earlier, 5 internal factors were presented by Sole (2009) that influenced PMS in public organizations are leadership and internal management commitment, internal resources, performance-oriented culture, employee engagement, and maturity of PMS. In conducting this research, the authors have eliminated one of the factors presented by Sole (maturity of PMS) due to irrelevancy with the situation in UTM. However on the findings in this study, three main organizational factors were found more significant that influenced the implementation of PMS. These organizational factors were merged into another factor as they were found interrelated. The first factor is employee involvement. Employee engagement and strong internal management support is relatively important as pointed out by academic staffs to ensure the PMS is implemented successfully. These findings are also in line with the statement by Mone and London (2010) whom suggested that designing PMS processes that is able to foster employee engagement will lead to higher level of performance.

Second important factor that had been outlined in this finding is performance-oriented culture. Pettigrew (in Sole, 2009) stated that culture could be thought of as the sum total of beliefs, ideologies, behaviors, and values prevalent in organizations, which can influence organization power relationship and their response to change. Third critical factors that have been narrowed down by the analysis is management commitment. As stated by Sole (2009), leadership is important in designing and developing effective performance measurement system and internal management commitment brings formality to the performance management reviews and as a consequence, could influence employees’ commitment to achieving targets and improving performance.

It is seen that the level of effectiveness of PMS in UTM is at moderate level, as the mean of effectiveness is at 3.65. There is no evidence that shows the PMS should be eliminated due to moderate level of effectiveness. Furthermore, the system is still new to UTM as had only been implemented since the last two years till now. Although the system is still new, many improvements have been made by the coordinators for the last two years to ensure that the system is friendly and has a high commitment of system users.

The researchers used Pearson r to investigate the relationship between the three factors that have been narrowed by “Principal Component Analysis” for answering research question 1 and the effectiveness of PMS which was analyzed using descriptive statistics. Significance of two tailed have been used in this analysis. For the first factor, employee involvement, it shows that there is a relationship between this organizational factor and the effectiveness of PMS, but at moderate level. Employee involvement is very important in PMS. This is because employees have to be motivated towards being involved in PMS whereas they need to learn about the system. Second factor, which is performance oriented culture, had also a moderate level of relationship with the effectiveness of PMS. The academic staffs are performance driven people, but extend of performing well is still not at the expected level. It is very important to encourage employees to use PMS for their improvement of potential and skills, as well as to increase performance. However, the level of relationship between management commitment which is factor-3 and effectiveness of PMS are relatively low. The reason is top management involvement is not very clear according to academic staffs. The line managers in this case, head of departments have to lead and make sure that the system is appropriate in evaluating the job performed by employees.

5. CONCLUSION

This study investigates factors influencing implementation of performance management system, effectiveness of it, and the relationship between factors and effectiveness. The findings show that
there is a strong positive relationship between three factors and effectiveness of PMS. A PMS system that is implemented very strongly and positively is influenced by three factors providing significant effectiveness. In addition, this will cause high performance. However, as an important factor, management commitment is still inadequate. In order to increase effectiveness of PMS, this factor should be deemed carefully and strictly.

Overall, this study has achieved the objectives and the purpose intended. From the findings, the authors found that organizational factors are very fundamental parts of PMS. PMS is very important in increasing performance in any workplace, especially in higher educational institutions such as UTM.

In conclusion, this study can be a reference for future researchers in PMS in higher education institution settings which have very unique characteristics compared to business oriented industries. Hence, the authors hope that this study can be beneficial for properly improving the design, quality, implementation, and effectiveness of future PMS. UTM at the last stage of this study has informed of taking further actions and developments to move this system forward for the better of its system users. In addition, making it more a powerful tool for measuring employee performance.

Abstract
This research paper focuses on role of women in environmental protection in Igabi local government, Kaduna State, Nigeria. This study specially focuses on women's role in Environmental Protection. At the end Mann Withney (U) result revealed that the roles women played are completely different to the roles played by men in environmental protection.

Keywords: Role; Women; Environmental Protection; Kaduna State

1. BACKGROUND OF STUDY

There is a growing debate about gender and the environment which highlights women's roles in the use and management of natural resources (Braidoti et. al., 1994). This debate has stimulated much developmental analysis and created greater awareness of the general activities of women. But there are dangers in conceiving of women's roles in relation to the environment in a partial, narrow, or static way. Seeing women as isolated environmental factor, separate from men, with an innate understanding of Nature can be very misleading. Current development policy initiatives are often based on this essentialist assumption that women's relationship with the environment is special and, therefore, women are particularly interested in and capable of protection of the environment. Such a view enables policy makers to argue that projects aimed at sustaining the environment will also benefit women, and vice versa. This synergistic approach can be seen as creating both a trap and an opportunity. In most countries modernization has been accompanied by a decline in women's entitlements to land and common property resources. Women are usually very dependent on common property resources for water, firewood, compost for farmland and wild herbs, mushrooms, fruits and nuts, as it is usually their responsibility to ensure that the family is supplied with these goods (Swope, 1995). When these commonly held resources become scarce and property rights are
exerted because of a perceived market value, their control tends to be assumed by men, although women's role as the supplier to the family of these resources does not change (Agarwal, 1989). The process of land reform has often led to land ownership in male hands, or when land is granted to a household it is registered in the man's name so that women lose their traditional rights to land. Where women do have legal rights to land ownership and inheritance, the plots of land they are able to control are generally the smallest, least accessible, and least fertile (Momsen, 1988). Usufruct rights are often considered to be separate from land ownership, and furthermore the ownership of trees and land may be in different hands. If women plant trees on family land in order to find a new cash-earning product and accessible firewood, as in the case of the shea-butter tree in Uganda, men see this action as a declaration of land ownership and so uproot the trees (Rukaaka, 1994). In other cases, men and women may use individual trees in different ways which are not always compatible. When resources begin to be scarce this incompatibility becomes a problem, as has occurred in the Dominican Republic, where women use palm fronds for making baskets and the fruit for pig food, while the male property owner is the only person allowed to cut the tree for timber (Rocheleau, 1994).

2. SCIENTIFIC RESEARCH AND ADMINISTRATION OF ENVIRONMENT PROTECTION

It is one of the goals of promoting women's participation and carrying out a sustainable development strategy to enhance the ratio of women amongst administrative personnel in the field of the environment and development. Now, there are two vice-chairwomen of the Committee of Environment and Resources of the NPC, one female deputy director-general of the State Environmental Protection Administration and female leaders in charge of the work of environmental protection at provincial, prefectural and county government levels.

China boasts some 400 various types of environmental scientific and technical research organs covering many different subjects. Women make up a third of the 20,000 plus-scientists and researchers working for these organizations. The Ecological Environment Research Centre of the Chinese Academy of Sciences has the majority of female scientists, occupying altogether 42 percent of the total employed there.

Women scientific technicians have made outstanding achievements in curbing pollution and protecting ecological surroundings. Professor Qian Yi from Qinghua University's Department of Environment Science and Engineering and Professor Tang Xiaoyan from Beijing University's Center of Environmental Science are both academicians of the China Academy of Engineering Science. They have scored great successes in teaching and scientific research in controlling water pollution and controlling and preventing air pollution. Besides, they have also played an important role in Sino-foreign scientific co-operation, especially in coordinating and dealing with global and regional environmental problems. Women professors and researchers in well-known universities and research institutions have presided over research and development work in the subjects of water pollution control, atmospheric chemistry, global atmosphere protection, ocean disaster reduction, mineral resource exploration, traffic noise pollution control and biological resource development. Many women have shouldered research and designing work for exploiting and utilizing methane, solar energy and wind energy.
China has laid stress on training aiming to increase awareness of environmental protection for women cadres. From 1997, the ACWF, working with women and the environmental network of the China Environmental Association, carried out the program "Building up the capability of women mayors and enterprise managers in the process of China's sustainable development." By the end of 2000, 12 terms of such training courses have been run and among the 911 trainees, one-third is made up of leading cadres from above county level. Through this training, grass-roots women cadres have raised their awareness of environmental protection, enhanced their basic knowledge of environmental science and environmental management and sharpened their management and decision-making ability.

3. WOMEN’S ROLES IN COMMUNITY FORESTRY
Community forestry encompasses the entire components of a community such as the villages, town, local authority or government, the members of which sharep0kl in cash, kind and/or other benefits, while within the commonwealth and this can also be referred to as communal forestry. In India this is called “Panchayat” (Chijioke, 2003). One of the major parts of developmental improvements of community forestry is production and processing of forest products for domestic, artisan or small scale industry which majorly involves the women can be accelerated through environmental protection. Communal forests have been known to emerge in different ecological zones of Nigeria specially targeted for various purposes. While some have emerged as a result of wood scarcity, others may have been established to check desertification encroachment, where some may become necessary to ameliorate the environment. Others may also be organized to increase earnings from the forest resources or for the purpose of profit making.

The flouristic compositions of communal forest vary from one eco-zones to another and the derivatives benefits are closely tied to the cultural and socio-economic deposition of the parent community. However, the benefits derivable from those communal forests are predicted on an effective local legislation which prevents a constant disturbance of these forests by individual members. The sustenance of such legislation also depends on an arrangement by which all stakeholders share in proceeds of communal forests. Nevertheless, forest protection will not only facilitate women participation in community development but also enhance better understanding by men living in the community who also stand a chance of been affected at the receiving end. As detail manager of living environment, women are experienced in the management of forest products, fisheries, agriculture and food products, soil energy and water resources. They also have developed skills in conservation that are built into their traditional subsistence activities. At the forest community level, co-operative action taken by women demonstrates sharing their knowledge and experience can improve the environment especially in environmental protection and promote sustainable development (Commonwealth Secretariat, 1992). It was argued that what concerns local community is fuel wood or fire wood but the course of this papers shows women are more educated and can obtained information easily hence, help to build a commendable environment sustainably.

In agriculture, women are more than half of the labour force. Often times, they are paid the lowest wages despite the fact that they carry out the menial back breaking and hazardous tasks such as weeding and chemical application. Women’s skills and needs are focal issue in sustainable development and these have often been ignored due to general misconception and marginalization of women’s role in preserving biodiversity. The paper therefore examines the role of women in environmental protection in Igabi Local Government Area of Kaduna State.
4. A REVIEW OF POSSIBLE ROLE OF WOMEN IN ENVIRONMENTAL PROTECTION AND MANAGEMENT

(i) Water Resources Management
Women are always at the center of the management of the communal water resources and household water requirement. A survey conducted by Ebam Etta (1999) at Maroko Low-Income Settlement in Lagos confirmed this. At the communal level, women are always in-charge of the control and management of communal taps or water points. At times they lock the taps to prevent children from damaging the water pipes. At the household level, the burden of fetching water for cooking, washing etc. falls on the women and girls, while men control the water trade. Where women do not have access to the tap water, they make use of streams, rainwater, wells, rivers, etc. At times, women also suffer from water pollution from untreated sewage, which has a lot of health hazards (Uyanga and Buteyo, 1999, Etta, 1999; Mascarenhas, 1999; Akwa, 2005).

(ii) Women in Agriculture and soil Conservation
All over the world, women contribute to agricultural production. They produce more than half of all the food that is grown. In Sub-Saharan Africa and the Caribbean, women produce 80% of the basic foodstuffs. In Asia, they provide fifty to ninety per cent of the labor force for rice cultivation. Women’s roles in agriculture: production and distribution, planting and cultivation, weeding, hoeing, harvesting and storage, marketing, and home preparation and distribution of foods. In addition, 80% of African food is produced by women; 50% is planted by women, and 70% of the weeding and hoeing is done by women. Women contribute to food production in Nasarawa state from growing of crops and keeping of livestock, such as sheep, goats, poultry, and rabbits (Akwa, 2005). As victims of soil degradation, women have participated actively in soil conservation projects. An example is the project Agro-Forester in Yatenga, Burkina Faso. Women’s input has been central (IDS, 1995). Thus, if humanity is to feed itself, environmental degradation must be contained.

(iii) Women and flood Management
Especially during the rainy season, incidence of flood is high (i.e April to October), so flooding is a regular problem in most places. Women play a significant role in the management of flooding either by clearing bushes, digging gutters, or baling water. At times they pay laborers to do sand filling for them. Flood management could be at the household level or community level. During the rainy season many houses get waterlogged and streets are flooded. So women play a vital role in environmental management.

(iv) Drainage Management
Women’s involvement with environmental management and problems make them participate actively in keeping drainages around them clean and free from trash and sand. According to Kwagala (1999), in his study in Kampala, Uganda, drains are mainly cleaned by the women on a regular basis or pay to have them cleaned.

(v) Solid Waste Disposal
This presents many challenges, particularly in the large cities whereby the amounts of solid waste are increasing faster than the growth of population. Solid wastes are dumped at compound dumping or undeveloped land or left at various illegal dumps (Uyanga and Buteyo, 1999). Women, because they are closer to the environment, engage in environmental management by cleaning the environment and keeping it clean, especially in terms of garbage disposal. Given the health hazard of garbage, women see to its regular disposal at the community level, either by doing it themselves or pay people to do it. This is because the dumping ground stinks and can lead to outbreak of
diseases, if it is not burnt in time or collected by the Environmental Agency Unit. In addition, polythene bags and plastics are causing a lot of eyesore in the urban centers because of their non-degradable substances. Discarded packaging plastics create a visible littering problem and contribute to air pollution if the wastes are burnt.

(vi) Human Waste Disposal

Since environmental health is essential to prevent certain diseases, women take an active part in preventive measures against environmentally transmitted diseases and waterborne diseases, such as malaria, diarrhea, cholera, cough, cold, measles, etc. In some places, the slum areas or urban informal sector or rural areas, most houses do not have latrines and so the residents do use drainage or polythene bags and later throw them on the streets, drains, or anywhere they can. Some residents that have latrines or water system toilets don’t use them, especially the children. Studies have shown that eventually, women are generally responsible for human waste disposal of children and cleanliness of latrines and other facilities (Kwagala, 1999). Thus, the burden of human waste disposal falls on women.

(vii) Forest Management and Tree Planting

The need to protect biological diversity (forest) has been realized. This is because forests play a vital role in protecting the soils, watersheds, and climatic stability. They are also a rich source of products – ranging from fruits, pharmaceuticals, and latex to timber. Apart from that, Tolba (1992) rightly noted that loss of the species and the forests is something that cannot come back again; extinction is forever. Whereas, water pollution, air pollution, ozone depletion, and desertification could all be controlled or minimized. Unfortunately, the main sources of energy (cooking fuel) for women are from natural resources: charcoal, firewood, and kerosene - intensive use of which can lead to deforestation, soil degradation, and air pollution. Only very few rich women use gas or electric cookers. The interesting part of the whole dilemma is that we have greater women’s participation in forest management through tree planting, rehabilitation, or protection. For example in India, women participate in Forest Management Scheme (IDS, 1995). Farm forestry is being practiced whereby small holders are encouraged to grow more trees on their land. The women tend the trees after planting to maturity. Similarly, in Kenya, soil degradation and deforestation have created an acute shortage of wood, the women’s major source of energy. Thus, a Green Belt Movement of Kenya was formed; it planted over 7 million trees in 10 years and set up over 1,000 tree nurseries to the extent that it harvests fuel wood from its own trees and the fruit trees are bearing fruits. In addition, women participate in providing seedlings in nursery and flowers to beautify the environment (Maye, 1994). It is now very clear that women globally are playing a key role in the protection of the environment. As rightly pointed out by Maye, (1994), women worldwide are part of a growing movement for the protection of the living world, environment health and security, social justice, and the alleviation of poverty. Women play a major part in the protection of biological diversity through their many roles and responsibilities. In the South, women act as resource managers. Women tend the fields and grow the food that feeds their families (in fact, women grow most of the food in Africa). They gather the firewood and raise the alarm when the forest dwindles.

In India, the threat of deforestation led to the rally of the local women to civil disobedience to protect the ecosystem. This is because their well-being was closely tied to that of the forest in terms of food, fire wood, pure water, etc. Pertaining to the need for restoration of the forests, women worldwide also have known the essence of not only protecting the biodiversity, but to restore and recreate it. As we have stated earlier, Wangari Maathai founded Kenya’s Green Belt Movement, which comprises of over 80,000 women for planting of trees. They established more than 1,000
nurseries and plant a variety of trees to satisfy human and non-human needs (Maye, 1994). Thus, in many countries (developed and developing), women have championed the resistance to non-sustainable resource exploitation. For example, Penan women and children have spent weeks on logging blockade in Sarawak, attempting to protect what is left of the world’s oldest rainforests on the Island of Borneo. Maye (1994) made it clear that the rate of harvesting there is clearly not sustainable, and the rate of extinction is excessively high. Vandana Shira of India has also raised awareness of the potential loss of genetic diversity as a result of the patenting of life forms. In Columbia, Margarita de Botero has increased awareness of the need to protect biodiversity through the Green University. From the foregoing, we can see that women are in the forefront of advocating for the protection of biodiversity. Women NGOs in Nigeria, Women Community Based Organizations (CBOs), and individuals have contributed a lot to the protection of the environment and forests (biodiversity). In advanced countries, Collee McCrory has done a lot as regards environment, and more specifically Late Rachel Carson of the United States raised the alarm about the dangers of biological diversity and human health from the indiscriminate use of chemical pesticides. It seems as if, women are push-full in the move for the protection of our ecosystems for sustainable human development.

5. STUDY AREA
This study was carried out in Igabi local Government of Kaduna, Kaduna state. It is located on latitude 10°37’ and longitude 7°17’E. The local government area shares boundaries with Giwa and Zaria local government areas to Kaduna North and Kaduna South local government areas. It has a good climatic condition with annual rainfall of about 1000mm-1500mm, per annual. It covers an area of about 4456.59sq./km with protected population of 350,000 (FOS, 2006). The local government comprises of three (3) tribes; Hausa, Fulani, and Gbagi people. Their main occupations are farming, civil service, traders and so on. The area is selected for study because of the prior knowledge of activities of women in environment protection.

The respondents in the study area are married (59.2 %) while 26.3 % are single. The involvement of single women in environmental protection was as a result of awareness, tree planting campaign and public enlightenment. 21 – 30 years constitute the largest (39.5 %), followed by 31 – 40 years (26.3 %) while 50 years and above range were the least (6.6 %). This implies that the group of women with majority age limit is highly involved in environmental protection and they are active, hale and hearty. Those above 50 years are not so much active in environmental protection because they are old and not active. Table 4.1.1 also revealed the educational status of the respondents in which majority (52.6 %) had secondary education while (32.9 %) had primary education and 6.6 % had tertiary education. Lastly, 7.9 % had no formal education. This indicates that majority of the respondents are semi-illiterates (dropout from class 3 or JSS3). 52.6 % of the respondents has 6 – 10 house hold size, followed closely by 0 – 5 household size and 16 above had the least with 7.9 % and majority (59.2) of these respondents are Muslims while 27 % are Christians and 13 % are traditionalists. This implies that our study area is been dominated by Muslims thus, influences polygamy and has effect on the number of the household and this also have effect on the type of occupation in which most of them are engaged because majority of them are farmers (52.6 %) thus make use of family labour to work on the farm. Few are civil servants (26.3 %), business women (13.2 %) and lastly 7.9 % of them are extension workers.

</table>

Table 1: revealed that women carried out the majority of work done in the nursery (weeding, cleaning land, broadcasting if seed, shafting and transplanting of seedlings) e.t.c. (78.9 %), field (planting, mulching, irrigation, seedling transfer, planting, afforestation e.t.c. (72.4 %) preparation process, harvesting, cleaning, packaging) e.t.c. (85.5 %). This implies that women participated actively in environmental protection than their male counterpart. Nursery (21.1 %); Field (27.6 %) and preparation process (14.5 %).

Fig. 1: Showing the age difference of the respondents

Source: Field work, 2010
The following statistical tool was used to analyze data collected during the course of this experiment.

6. MANN WHITNEY TEST:

\[ U = n_1n_2 + n_1(n_1+1) - R_1 \]
\[ U^1 = n_2n_1 + n_2(n_2+1) - R_2 \]

Where:-

- \( n_1 \) = sample size for sample 1
- \( n_2 \) = sample size for sample 2
- \( R_1 \) = sample rank for sample 1
- \( R_2 \) = sample rank for sample 2
- \( U \) = Mann Whitney value for sample 1
- \( U^1 \) = Mann Whitney value for sample 2

This was used to test for hypothesis; there is significant relationship between the roles played by women and men in environmental protection.
Table 2: Mann Whitney (U) results: Roles played by women versus roles played by men in environmental protection in Igabi Local Government of Kaduna State.

<table>
<thead>
<tr>
<th>Variables</th>
<th>U calculated</th>
<th>U tabulated</th>
<th>Remarks</th>
</tr>
</thead>
<tbody>
<tr>
<td>Men and women</td>
<td>44</td>
<td>51</td>
<td>not significant</td>
</tr>
</tbody>
</table>

The Mann Whitney (U) result revealed that the roles women played are completely different to the roles played by men in environmental protection. Therefore the null hypothesis ($H_0^2$) is rejected, and alternative hypothesis ($H_1^2$) is accepted which says “there is no significant relationship between the roles played by women and men in environmental protection” at 0.025% probability level. ($U$ calculated < $U$ tabulated).

\[ n_1 = 7 \]
\[ R_1 = 47 \]

\[ U = n_1 n_2 + n_1 (n_2 + 1) - R_1 \]
\[ = 7 \times 9 + 7 \left( \frac{7 + 1}{2} \right) - 47 \]
\[ = 63 + 7 \times 4 - 47 \]
\[ = 44 \]

Women

\[ n_2 = 9 \]
\[ R_2 = 89 \]

\[ U = n_1 n_2 + n_1 (n_2 + 1) - R_1 \]
\[ = 9 \times 7 + 9 \left( \frac{9 + 1}{2} \right) - 89 \]
\[ = 63 + 9 \times 5 - 89 \]
\[ = 19 \]

\[ U(\alpha/2) = U_{0.025,9,7} = 51 \]

\[ U_{cal} < U_{tab} \]
\[ 44 < 51 \]

Thus: Null hypothesis rejected
Religion has very powerful influence in the lives of the people of the Niger Delta as it is in most parts of Africa. Therefore, this paper presents the religious perspective in bridging the gaps created by the problems of kidnappings in the Niger Delta. A total of 1100 questionnaires were administered to respondents. 937 questionnaires were returned by respondents. The results of the data analyzed revealed that the correlation of kidnapping and religious conversion of youths yields a coefficient of 0.748 (r=0.748), while employment and kidnapping gives r=0.652. The correlation coefficient for politically motivated youths and kidnapping is r=0.677. From these results, there exist significant linear relationship between kidnapping and religious conversion of youths, employment and kidnapping; and politically motivated youths and kidnapping at 0.01 level of significance (p<0.01). Therefore the research hypothesis H01, H02 and H03 are all rejected at 0.01 level of significance (p<0.01). This implies that there is a significant relationship between youths’ employment and kidnapping in the Niger Delta Region. The most significant linear relationship exists between religious conversion of youths and kidnapping in the Niger Delta Region. This paper recommends that paradigm shift in theologies of dispensationalism, faith gospel, dualism, teaching of Christian principles and non-violent mass demonstration against poor governance will bridge gaps in the Niger Delta region and usher in a new era of peaceful co-existence.

Keywords: Bridging Social Gaps; Niger Delta; Religious Perspective

Introduction

In Africa, religion plays a very significant role in the lives of the people. Imaekhai (2010. 60) describes this very succinctly:

Religion influences in a comprehensive way, the thoughts and actions of African life, fully determining practically every aspect of life including moral behavior. The African lives in a religious universe: all actions and thoughts have religious meaning and are inspired or influenced by a religious point of view.

A bird eye’s view of the Niger Delta region reveals a society supersaturated mostly with Christian churches of various denominations. These churches have remained as important medium of putting significant issues across to the people. In some part of the Niger Delta, it has been observed that churches are the main ‘industries’ of the people. This anecdotal reference no doubt shows the central place of the churches in communication, education, social organization and control in the area. Religion plays a significant role in the lives of the people of the Niger Delta.

Apart from the apparently rich religious heritage, Niger Delta is naturally endowed with crude oil and gas which are very vital to Nigeria’s economy. The petroleum industry derived from the crude oil in the Niger Delta is the backbone of Nigeria economy accounting for over 90% of the country’s foreign exchange revenue and about 80% of total government revenue (NDRDMP 2006. 9). In
addition to the oil and gas, there are other natural resources also important to the nation’s economy viz: timber and non-timber forest product, agricultural resources, mineral resources, wildlife and bitumen and other mineral resources.

As observed by Okai (2008), the socio-economic situation of the Niger Delta Region does not reflect the huge revenues from oil and gas exploration in the region. The area is undermined by endemic poverty and gaps among people who are ranked the poorest in the world. Uyigue (2010.1) also noted that the poverty in the area is frightening:

Economic activities of the people in the region include fishing, farming and trading. Very few are employed in the civil service and companies. GNP per capita in the region is below the national average of US$280. The rural population commonly fish or practice subsistence agriculture, and supplement their diet and income with a wide variety of forest products. Education levels are below the national average and are particularly low for women. The poverty level in the Niger Delta is exacerbated by the high cost of living. In some parts of the Niger Delta, the cost of living index is the highest in Nigeria.

Again, the Niger Delta has been described as:

A place of frustrated expectations and deep mistrust where widespread restiveness frequently erupts in violence. Long years of neglect and conflict have fostered a siege mentality, especially among youths who feel they are condemned to future without hope, and see conflict, violence, theft and kidnapping as a strategic escape (MPP 9 project sheet)

The nine States officially defined as the Niger Delta are Bayelsa, Delta, Rivers, Edo, Imo, Abia, Cross River, Akwa Ibom, and Ondo States as shown in the diagram below:

![Map of Nigeria numerically showing states typically considered part of the Niger Delta region.](from Wikipedia, the free encyclopedia)
The area has a land mass of about 112.110km² (NDRDMP 2006.8) and a population of about 31 million people, over forty ethnic groups speaking 250 different dialects. The people are generally engaged in farming and fishing, the two main occupations which the tropical climate, rain forest and numerous rivers and creeks encourage (Ekpo 2004.1). Oil exploration went on for several years before the inhabitants of the Niger Delta realized how cheated they were. About the early 1990s, conflict arose in the Niger Delta region of Nigeria primarily over tensions between the foreign oil corporations and a number of the Niger Delta's minority ethnic groups. This is because, as Kekong (2008.90) rightly notes, the Niger Delta Region of Nigeria has been deeply traumatized, robbed, massacred, degraded, discriminated against and brutally exploited successfully over generations and for centuries. The oil-bearing communities of the Niger Delta region of Nigeria gradually but forcefully came to the realization that the multinational oil companies and the Federal Government of Nigeria had taken advantage of them in key areas crucial to their very existence: environmental degradation, human rights violation, political marginalization and lack of access to oil wealth produced in the region, Kekong (2008.85). The local people began to form small groups of militants and channeled their grievances wrongly to the multinational oil companies, kidnapping their workers and demanding huge financial ransom before their release. Gradually, kidnappings became a way of life and gaps created deepened. Ekweremadu (2009:7) rightly observed that:

Since year 2005, kidnapping have become a daily occurrence in Nigeria and now envelopes the country, including the fringes of the Sahara Desert. Unfortunately, Nigeria is on with image re-branding process and yet our ears are filled with news of rampant hostage (oil workers) and so forth to mesmerize the Federal Government ongoing campaign for the nations image re-branding... poverty and unemployment of youths have been identified as one of their potent causes...

There are two major categorizations of kidnapping in the Niger Delta: the kidnapping related to the grievances with the multinational oil companies in the Niger (oil-related-kidnapping) and the second and most rampant conventional kidnapping. Most people seem to think that this last category of kidnappings have political overtone.

The emergence of poverty in the midst of plenty in the Niger Delta, has created deep social disparities, unemployment, insensitivity to the marginalized, inequality, divergence and gaps between the people and the government, and even between the people themselves. There are incessant kidnappings and the demand for huge financial ransom from the victims before their release. These issues are a reflection of administrative neglect and the religious worldview of the people. Religious options can be used in checking these two categories of kidnappings and bridging the gaps in the region.

**Motivation and the purpose for the research**

It is to be noted that the problems of the Niger Delta is multifaceted, as such many approaches are to be utilized in the efforts of finding solutions to the issues. For the past five decades, the Federal Government of Nigeria has been battling with the problems developing of the Niger Delta. There has been the Willink Commission in 1957, Niger Delta Development Board in 1961, Oil Mineral Producing Areas Development Commission (OMPADEC) in 1992 and the Niger Delta Development Commission (NDDC) in 2000. Despite all these efforts, results of development are slow, giving rise to all kinds of anti-social acts and gaps among the people.
Within the past five years, the problem of kidnapping has added another dimension to the Niger Delta issues creating more gaps and social problems. The position of this paper is that given the religious tendencies of the people, the gaps that exist in the Niger Delta can be bridged with religious options. The purpose of this paper therefore, is to present the religious options that may be utilized in bridging gaps and solving the problem of kidnappings in the Niger Delta.

Research Questions:

These research questions were used in the study.

1. In what ways can religious conversion of youths affect or influence kidnapping in the Niger Delta.
3. What is the relationship between kidnapping and youths who are politically motivated in the Niger Delta.

Research Hypotheses:

The following hypotheses were stated for this research.

H₀₁ There is no significant relationship between kidnapping and youths employment in the Niger Delta.

H₀₂ There is no significant relationship between kidnapping and religious conversion of the youths in the Niger Delta.

H₀₃ There is no significant relationship between kidnapping and youths who are politically motivated in the Niger Delta.

The religious situation in the Niger Delta Region of Nigeria

The Niger Delta is one of the areas in the West African sub-region where Christianity was successfully planted in 19th Century (Ekpo, 2004.5). But the people were not in a religious vacuum before the advent of Christianity. They practiced their indigenous religion particularly deep in the belief of a spiritual universe. The spiritual powers are to be tapped regularly to help the humans in the struggle in a mysterious universe. The kidnappers no doubt would rely on these supernatural powers to ensure they go through their operations successfully. Although the whole area is saturated with Christian churches, traditional religious practices are common among the people.

Christianity is largely practiced and is very popular among the people. The major blocs of Christians in the area are:

1. Catholics grouped under Catholic Secretariat of Nigeria (CSN)
2. ‘Protestants’ grouped under Christian Council of Nigeria (CCN)
3. Pentecostals grouped under Pentecostal Fellowship of Nigeria (PFN):
4. African Churches grouped under Organization of African Instituted Churches (OAIC)
5. Evangelicals – grouped under Evangelical Churches of West Africa (ECWA)

Apart from these main bloc, there are numerous cliental-service religious groups in the area. Taking a census of all the churches would be an onerous task as new forms keep arising everywhere and every time. It is very easy to count up to 60-70 churches in a very small town of about 4000 inhabitants. These religious groups have impacted positively in the lives of the people through humanitarian and social services to the poor, orphans, underprivileged and the marginalized, in a way bridging gaps among the people. But certain theological issues militate against their rapid work in addressing some of the gaps and kidnapping in the Niger Delta.
(a) Dispensationalism which emphasizes that the world history is divided into seven dispensations and the present age is at the end of the sixth dispensation just waiting for Jesus’ return at the seventh dispensation which will bring a new age. This will be preceded by snatching up to the heavens true believers, seven years of great suffering, climaxed by the Armageddon immediately before Jesus’ return. This theology encourages fatalism and an attitude of passive resignation to their plight.

(b) Faith Gospel which theologizes that no true Christian can be poor or sick; to be poor or sick is to have sinned or lacked faith. God wants his children to eat the best, wear the best clothes, drive the best cars etc. Prosperity is reduced to a matter of faith and generous giving to the preachers of the gospel-the vicar of Christ. This diverts attention from the immediate causes of the people’s health problems which include inadequate access to safe water, lack of medical care as well as poverty and unemployment etc. Again this theology diverts attention from poor governance, corruption and mismanagement of the people’s natural resources. The further danger of this theology is that it calls for faith and leave everything to God without considering individual societal commitment to the common good.

© Dualism encourages the framing of issues in terms of simplistic alternatives e.g either God or Satan, either this world or the next, either trust in God or reliance on self. Christians are encouraged to have as little as possible to do with this world and should flee it and avoid contamination with it. This, too, diverts attention from the ordinary causes of a political and economic nature and can leave injustice unexposed.

These theologies are partly responsible for the gaps and problems of the Niger Delta. There is need to readdress these theological emphasis in the process of finding lasting solutions to the issues of gaps in the Niger Delta of Nigeria.

Methodology:

A total of 1100 questionnaires were administered in four states of the Niger Delta region of Nigeria. 937 out of this number were returned by respondents, the socio demographic characteristics of the respondents include sex, age, educational level and Religious affiliation. A total of 449 (47.9%) respondents were male while 488 (52.1) were female. The ages of respondents were in four categories, 18-28 years, 29-38 years, 39-46 years and 55 years and above. 42.8% of the respondents were 18-23 years old, 17.3 % of respondents were 29-38 years old, 37.4 % of the respondents were in 39-40 years while 2.5% were 55 years and above. 39.5 % of the respondents had SSCE/OND as their highest qualification. 469 (50.1%) respondents posses HND/B.Sc, while 68 (7.3%) respondents are MA/Ph.D holders. Respondents with other qualifications were 3.1%. In Religious affiliation, 187 (20%)were Catholics (CSN), 373 (39.8) respondents are Pentecostal and Apostolic church members (PFN), Those that attend Methodist, Anglican, Lutheran, Qua Iboe and Presbyterian Churches (CCN) were 326 (34.5%) respondents. Respondents affiliated to Evangelical Council of West Africa (ECWA) were 4 (0.7%) while Cherubim and Seraphim/ Celestial churches (OAIC) had 14 (1.5%) respondents. Respondents in other affiliations were 33 (3.5%).
The response from the 937 respondents were summarized and subjected to statistical data analysis using Microsoft Excel, SPSS and Graph Pad Instat software. A T-test and correlation analysis were performed on the following pair of variables; employment and kidnapping; religious conversion of youths and kidnapping, politically motivated youths and kidnapping.

The result shows that the correlation of Kidnapping and religious conversion of youths yields a coefficient of 0.748 ($r=0.748$), while employment and kidnapping gives $r=0.652$. The correlation coefficient for politically motivated youths and kidnapping is $r=0.677$. From these results, there exist significant linear relationship between kidnapping and religious conversion of youths, employment and kidnapping; and politically motivated youths and kidnapping at 0.01 level of significance ($p<0.01$). Therefore the research hypothesis $H_{01}$, $H_{02}$ and $H_{03}$ are all rejected at 0.01 level of significance ($p<0.01$). This implies that there is a significant relationship between youths’ employment and kidnapping in the Niger Delta Region. Also there is a significant relationship between politically motivated youths and kidnapping in the Niger Delta Region. The most significant linear relationship exists between Religious conversion of youths and kidnapping in the Niger Delta Region. Therefore to curb kidnapping and bridge gaps in the Niger Delta region of Nigerian religious conversion of youths should be encouraged followed by employment and useful engagements for politically motivated youths.

Strategies for bridging gaps in the Niger Delta Region of Nigeria: A religious standpoint

i. Emphasis on Christian values and proper teachings of the adherents.

The data from our field work points at the significant relationship between kidnapping and religious conversion. If the many religious groups in the area have members particularly youths that are truly converted and adhere to the teachings of Christianity, then the problem of kidnapping would end. It is therefore very pertinent for the numerous Christian denominations in the Niger Delta to embark on religious conversion of their members as the members are the political leaders of the Niger Delta. Good Christian political leaders can bridge gaps and end the problem of kidnapping in the region. Christianity as a religion has very good values that can stop the problem of kidnapping in the Niger Delta. At the first instance, the Ten Commandments are models for all Christians. Among other things, these commandments and the Christian ethics forbid stealing, bribery, kidnappings, corruption, mismanagement of funds, greed, avariciousness, materialism, killings, and emphasize values like honesty, obedience, justice, fair play, and good neighbourliness. If the leaders and the people of the Niger Delta imbibe these Christian principles, the problem of kidnapping will end and gaps will be bridged.

ii. Resisting contributions from members whose sources of income are unclear

To bridge gaps and stop the problems of kidnapping, churches should resist financial contributions from members whose sources of income are doubtful.

iii. Justice Development

Religious leaders in the Niger Delta need to intensify their activities in justice development. As long as the people do not experience justice, the problem of the Niger Delta will persist.

iv. Paradigm shift in theological emphasis for social development

For religion in the Niger Delta to be effectively used in bridging gaps and curbing the problem of kidnappings, there is need for a paradigm shift in the theologies of Dispensationalism, Faith Gospel...
and Dualism described above. There is need of a change in the attitude of Christians of the Niger Delta. Rather than the numerous religious groups emphasizing on miraculous interventions in nearly all aspects of life, focusing their attention on the Devil and the ills he has done to humanity (Marshall, 2009:4), the government should be questioned and challenged for unemployment, marginalization, poverty and gaps in the religion.

v. Non-violent mass demonstration against poor governance

Ehusani (1996:104) presents a position that is worth adopting and could be very useful in the Niger Delta situation:

It is important for us Christians to know that we are not helpless in the face of evil…The world has seen many forms of peaceful resistance that are efficacious. We know of peaceful demonstrations and protest marches by which a group of people that have been denied their rights along with their sympathizers make a public outcry against the authorities on the streets, flashing protest placards and singing protest songs. This method was used very much by the oppressed Negros of the United States under the dynamic leadership of Dr. Martin Luther King (Jr) who was a Baptist Minister. It proved to be a very effective method too in Apartheid South Africa under the leadership of Bishop Desmond Tutu, Cardinal Sin of Manila led a successful revolution of the people that brought an end to the oppressive rule of President Ferdinand Marcos, using the instrument of mass demonstrations that are non-violent.

The numerous religious leaders in the Niger Delta should use this option to protest to the government about the degradation, poverty and unemployment of youths and other gaps of social disparity existing in the region.

vi. Using Abraham’s example (Gen 14:11-16)

Refusal to pay ransom to kidnappers may be a yard-stick to ending the problem of kidnapping in the Niger Delta. Christians in the area may wish to opt for the Abraham’s example in dealing with the problem of kidnapping. When Lot the nephew of Abraham and the women and children were kidnapped, Abraham refused to pay ransom. He rather pursued the kidnappers and brought back Lot, the women and the people. Christians in various towns and villages can form vigilante groups to fish out the kidnappers.

vi. Churches and the Government collaboration

The government could support the church to open and run rehabilitation/skill acquisition centres. This will take care of desperate people who are jobless and then see kidnapping as a lucrative job. The people often time believe more in their religious leaders than the government. Therefore, the government should help the Christian church build non-denominational skill acquisition centres to be supervised and run by church leaders for the good of the members.

vii. Prophetic stance against poor governance

The incessant kidnapping problem in the Niger Delta clearly shows that the region is suffering from administrative neglect and poor governance. Religious leaders therefore would be powerful instrument in bridging the gap in the situation when law enforcement and governance is still evolving. The religious leaders need courage to confront the government on issues of poor
Conclusion

The religious leaders and the religious people of the Niger Delta region should learn to question the government on the reasons for gaps, social disparity, poverty, and kidnapping in a region that has been so naturally endowed with crude oil. This is to say that the government should be made to explain the reasons for unemployment, poor health facilities and so on. There is no need to focus their attention on the Devil and the ills he has done to humanity when it is obvious that the nation’s resources are mismanaged. For instance, there is no need to expect God’s intervention in health when healthy living lifestyle is not respected. Social services to the unemployed people, the marginalized should be the responsibility of the government and the religious people should be the voice of the voiceless. The rate for seeking for miracles will be reduced drastically and emphasis can then be placed on personal transformation which will lead to total resolution of the gaps experienced in the region. In other words, de-spiritualization of issues and passing blame of poor governance and mismanagement to Satan and witches are unnecessary. Throughout the history of Christianity, the power of religion is undoubtedly obvious. Religion is a powerful instrument which can be utilized for good course in ending the social problems and bridging gaps of the Niger Delta.

Nigerians in the Niger Delta Region, are mostly Christian and they belong to one denomination or another. It is very unfortunate that it is in this region that we have the greatest number of kidnapping in Nigeria. Religious leaders can embark on religious programmes and reforms aimed at educating their members on true Christian principles to stop kidnappings and bridge gaps in the society.

Abstract
The study examines the concept of outsourcing and the possible impact it has on the competitive advantage it has on a company in Nigerian economy. Outsourcing is the practice in which companies move or contract out some or all of their products or service operations to other companies that specialize in those operations or to companies in other countries. The problems indentified in the Nigeria service industry are high operating cost having negative impact on return on capital employed, sub-optimality in production because of ineffective utilization of resources and inability of organization to identify areas of core competence for competitive advantage. The main objective of this paper is to evaluate the competitive advantage of outsourcing the products and services in the Nigerian service industry. Questionnaire was employed in gathering data from ten sampled organization in the service industry. The following three hypotheses were formulated in null form: High operating costs have no negative impact on profitability and return on capital employed, Ineffective utilization of resources has no impact on sub-optimality in production and outsourcing has no positive relationship with competitive advantage. Chi-Square statistical method was used to analyze the data obtained from the field. Our findings are that outsourcing helps companies to compare their prices with their own costs and that of top performing companies for cost control. This enables them to adopt the appropriate price strategy for the outsourcing contracts. Further, outsourcing of a segment of the products or services enhances contribution per unit of products and services. As for the companies, it was found that outsourcing enhances their core competence and leads to effective utilization of resources. It was therefore recommended that the top management should aim at taking advantage of the services of experts who specialize in their non-core activities and functions among others. This is to help have a vantage competitive advantage.

Keywords: Outsourcing, Core competence, Competitive advantage, Market structure, Benchmarking, Strategic alliance, Sustainable competitive advantage.

Introduction
Firms need to constantly renew and develop new capabilities and resources as they respond to challenges in their environment. These resources can be developed in-house or developed among strategic partners or purchased. Outsourcing entails the delegation of tasks or jobs from internal production to an external entity such as sub-contractor. It is the process of placing the development of system components in another development organization with the aim of achieving cost reduction and a gain in the time of development. Main striking features of the Nigerian economy today is that available infrastructures of all types fall far behind the quantities and quality required. This naturally results in overstretching of most facilities. Despite huge potentials in almost every sector, poor
overall economic performances has made tapping into the opportunities unduly costly and much less profitable than they should be. According to Alaofin (2003), operating costs are high in Nigeria inspite of relatively cheap labour hence, running any business according to international standards is therefore costly. He further stated that facilities management as an area is just evolving in Nigeria through janitorial services which is the best development component, has been around for nearly 5 decades. Security services are in the level of development. He stated that there are various merits of outsourcing which include better focus, economics of scale in purchasing and specialization all obtained in Nigeria. Dalhat(2009) in analyzing the development of a service industry coalition in Nigeria stated that services regulatory bodies exist, active and with existence of a strong professional class. That a well developed services sector enhances competition, leading to stimulation of economic activities and ultimately reducing poverty. He is of the view that there should be coalition of service industry in Nigeria to develop and diversify the sector and to prepare service providers to manage the challenges and opportunities which will be presented in an era of expanding global markets. He outlined other objectives of the coalition as: (i) to promote the further development and competitiveness of Nigeria’s service sector,(ii) to ensure that the highest industry standards are met by all Nigerian service providers,(iii) to educate Nigerian service providers on relevant aspects of the World Trade Organization(WTO) and other trade agreements and on any government policies or issues which can affect trade in services,(iv)to represent the interests of Nigerian service providers by lobbying government for legislative and policy changes which will promote fair multinational rules for trade in services.

The National Outsourcing Policy and Institutional Framework for Nigeria (2007) stated that outsourcing is gaining momentum globally as a potential candidate for enhancing revenue particularly in the developing economies with net advantages in operational costs for wages and key expenses. Outsourcing occurs anytime one enterprise makes a contract with another to perform a process that is normally done internally by the first enterprise. That globalization through economic integration requires that individual economies must identify and develop a competitive strength to harness the benefits of the free flow of trade and financial investment into the future .Globalization creates a product and services markets that far exceeds the borders of any country and facilitate access to move capital flows, technology, cheaper imports and larger export markets. Outsourcing of non-core operations or jobs from internal production to an external entity that specializes in that type of operation is changing the landscape of business globally. It further stated that in every developed economy, companies are taking the advantage of cheap and readily available expertise in other markets to strengthen their competitive advantage in local markets. This same feat should be achieved in Nigerian economy.

Pearce and Robinson (2005: 75), the authors of a major text on strategy, comment, “Strategy is pivotal to a company’s survival”. With this top management game plan, the company can stake out a competitive advantage. Outsourcing is a strategy of a competitive company, which entails contracting out of the non-core activities to other organizations, which specializes in such activities. In decision-taken strategy of an organization, the strategy to continue with the production of a particular service or product or buy the product/service from outside is an issue of cost and benefit analysis.

The issue of outsourcing is an issue of decision making which deals with the future of the organization, and involves picking a choice among alternatives available to management. Decision may be under certainty, risk or uncertainty according to the degree of predictability of the consequences of the decision. The outsourcing decision can be a case of dropping a segment of the production processes, make a product line or buy a product line. Two major economic approaches
must be considered in outsourcing: The first is the economic approach under which we consider the viability of the product or the customer to the general position of the organization. We consider the degree of the economic contribution of each segment, and consider the contribution of the segment to be dropped or deleted. A positive contribution means viability and such cannot be eliminated, while a negative contribution means non-viability and such can be dropped. If the contribution is zero, the decision to drop the segment depends on the management. The second economic approach is the relevant qualitative factors like, the impact of the closure of the segment on the company’s goodwill, the effect of the closure on the total turnover of the organization, the shareholders attitude towards the decision to drop the segment, the creditors position about the closure whether to write a petition for winding up, the effect on the workers welfare and morale, and consideration of another restructuring option like diversification, merger or being acquired by another company. The decision to outsource must be carefully taken it will involve longer-term considerations, capital expenditure and revenues.

**FOCUS**

This paper sets out to examine the effects of outsourcing in order to gain competitive advantage in core areas of performance. Three fundamental problems are indentified in depressed Nigerian economy which need resolution (1) There is the manifestation of high operating costs which have negative impact on profitability and return on capital employed (ii) There is sub-optimality in the ineffective utilization of resources, as poor management of assets, poor monitoring of assets and poor replacement capability of assets have mar capacity utilization. (iii) Companies inability to recognize and institute competitive advantage of services and products in core areas of professional specialization.

The objectives of this paper are to (i) Examine the relationship between high operating cost and profitability/return on capital employed. (ii) Assess the impact of ineffective utilization of resources on sub-optimality in production (iii) Examine the relationship between outsourcing of services/product and competitive advantage.

The key research questions are: (i) Can operating cost negate profitability and return on capital employed in the service industry? (ii) What is the strength of ineffective utilization of resources on sub-optimality in production? (iii) Is there any relationship between outsourcing of services and product and competitive advantage?

This paper will research into a product that is critical to the operations of the service sector which is leasing. Lease or buy decision of Company’s vehicles and equipment for operational activities formed the major focus of this paper. The vehicles and equipment are the staff buses, the operational vehicles and vehicles attached to departments, high powered generators in their profits, cost and investment centers. However, the foregoing concerns, which have generated some worries in the heart of the researchers, have necessitated the study in this area. The layoffs that often result, and even in cases where the service provider hires former employees, they are often hired back at lower wages with fewer benefits, (Egger, et al 2006).

**Leasing option in outsourcing:** According to Uchegbu (2001), leasing is a contract between two parties, the lessor and the lessee of the asset whereby the lessee agrees to pay periodic rents to the lessor in return for the exclusive right of using the asset. The lease can either be a finance lease or an operating leasing. A finance lease is a system where all or substantially all of the benefits, burdens and risks of ownership are transferred to the lessee at the expiration of the lease agreement. Ownership of the asset is transferred to the lessee at the end of the lease period. This type of lease covers the major part of the useful life of the asset, with or without transfer of title to the lessee. An operating lease on the other hand is a lease where all the benefits, burdens and risks of ownership lie
with the lessor. The lessee does not obtain title at any time and could also terminate the lease at short notice without payment of serious penalty. International Accounting Standard 17 regulates the operations of leasing agreement.

Leasing has great advantages for organizations using the option as outsourcing: a. Leasing is a major source of finance for companies. The lease saves the company the problem of paying outright for the purchase, and it is helpful because it is not easy to assemble funds in bulk to purchase an asset outright especially where it involves a large capital outlay. b. Secondly a company may feel that considering its level of equity capital, it should finance the next purchase of fixed assets with fixed interest capital so as to maintain a certain capital structure and consequently enhance a value of the company. Leasing in this circumstance becomes attractive. c. Leasing helps buoyant and viable companies to cut down their tax burden as lease payments are tax deductible. It is a tax allowed expense. d. A company may not have adequate foreign exchange to import an equipment, and may not have the knowledge and capacity to engage in international trade, hence scarcity of foreign exchange could make a company lease the necessary asset locally.

**Hypotheses**

Testing the following hypotheses showed the accuracy of the discoveries of the research and these are stated in null form below:

1. Ho: High operating costs have no negative impact on profitability and return on capital employed in the service industry.
2. Ho: Ineffective utilization of resources has no impact on sub-optimality in production in the service industry.
3. Ho: Outsourcing has no positive relationship with competitive advantage in the service industry.

**Literature Review**

Overcoming the Challenges facing facility management operators in Nigeria to profit from hidden opportunities

Alaofin (2003) stated that Nigeria is a medium sized economy that remains largely driven by government, the oil and gas sector and commercial activities. The only other sector performing is services especially international trade, i.e. imports of goods and services, banking and insurances. The structure of incentives in the economy is presently against manufacturing. He buttressed his argument with Table 1 below about the percentage contribution of sectors to Nigerian economy

Table 1: Relative sizes of major sectors of the Nigerian economy.

He explained the Nigerian economic environment that was hostile to business during much of the first half of nineties. However, over the last 5-7 years there has been a gradual return of some economic stability to the economy. In Nigeria different firms provide single components of the typical services under facility management. These component services and the firm that provide them vary significantly in terms of sophistication, customer acceptance, and market awareness/development. This in turn affects industry maturity, health, structure/complexity, size, depth and number of players. He said the scientific approach to choosing between alternatives of ownership and outsourcing is economic. Such approach will consider not only technical efficiency, but also establish financial gains from whatever choice ia made. That ample evidence abounds in Nigeria, especially in public buildings that significant improvements in the quality services can be achieved via outsourcing because outsourcing companies have more and better trained staff. Also supervision is also significantly better, all of which results in better quality of service. Outsourcing companies seek and adopt newer technologies faster than any player who decides to own such services internally. Optimizing operations and maintenance i.e managing people, place and purpose, significant gains in optimization of resources used can be achieved.

**Outsourcing Software Components: Opportunities for developing countries:**

Daramola and Bamigboye (2009) defined outsourcing in Nigeria as the delegation of tasks or jobs from internal production to an external entity such as subcontractor. Business processes can be outsourced to either domestic subcontractors or offshore subcontractors who are otherwise known as Outsourcing Service providers (OSP). They stated that the rise of globalization is making many more companies in the developed countries to embrace offshore outsourcing. This entails the subcontracting of business processes to other countries in other regions of the world. They based their study on software outsourcing. A software component is a unit of composition with contractually specified interfaces and explicit context dependences only. That a software component can be deployed independently and is subject to composition by a third party. They came out with the following reasons why companies adopt outsourcing strategy in business management (i) A lot of money could be saved on staff emoluments, equipment, training, and maintenance when projects are outsourced. (ii) There is shortage of IT professionals in the developed countries because of the rate of technological development which has reached a critical proportion. There were 340,000 vacant IT position in USA. (iii) Some of the countries to which jobs are being outsourced have a more liberal business environment with lesser taxes, less stringent labour laws compared to developing countries. (iv) Technical competence can be acquired offshore at a cheaper price. They further explained the following benefits from findings: (i) Profitable bargain from signed outsourcing contracts leading to more profit. (ii) Acquisition of more software development experience through collaboration. (iii) More profit for the company, which translate to higher potential for capacity building, staff welfare and better recruitment. (iv) Acquisition of cheap technical competence with high productivity. (v) Faster development is achieved with quality standard. (vi) Reduction in overall development cost which may be up to 50 percent.

**Development of a Service Industry Coalition in Nigeria:**

Dalhat (2009) explained that a well developed services sector enhances competition, leading to stimulation of economic activities and ultimately reducing poverty. Hence the need for coalition service industry in Nigeria. That the objective of setting Coalition Service Industry should be to develop and diversify the sector and to prepare service providers to manage the challenges and opportunities which will be presented in an era of expanding global market. That the coalition will enhance outsourcing of services in Nigeria, promote the further development and competitiveness of
Nigerian service sector, ensure that the highest industry standards are met by all Nigerian service providers, to encourage and assist service providers to export services.

**Company’s competitive advantage concept**

One measure of corporate success is relative dominance in the market place. Larger firms commonly, establish an objective in terms of competitive advantage, often using total sales or market as measure of their competitive position. Competitive advantage is the relative level of dominance (or lack thereof) a firm has in its market compared to its competitors. For example, a firm might have as a target to become the market leader, or to grow from third to second place, in the market for bank customers (Thompson, et al 2005).

However, defining a company’s competitive advantage improves a company’s chances of designing strategies that optimize its environmental opportunities. Development of competitor profiles enables a firm to more accurately forecast both its short and long term growth and its profit potentials (Frendendal, 2001). According to Fleisher and Bensoussan (2003), the exact criteria used in constructing a competitive advantage are largely determined by certain factors. These factors according to them may include; Resource strength, Market share, Strategic alliance, Benchmarking and Profitability.

Once appropriate criteria have been selected, they are weighed to reflect their importance to a firm’s success. Then the competitor being evaluated is rated on the criteria.

**The Impact of Outsourcing on the Competitive Advantage of a Company**

Businesses are beginning to feel the full impacts of outsourcing while trying to create or maintain a sustainable competitive advantage. The impacts of outsourcing on the competitive advantage of a company are experiencing a surge and sophistication. Weele,(2000) suggests that as a result of newly unruly forces coming on them, companies need to rethink their position. Doing so effectively require clear idea of their core versus non-core activities. In order to improve their competitive advantage, companies need to focus their core activities on the needs and requirements of their customers. Non-core activities are increasingly outsourced to specialist suppliers, which explain why suppliers’ management is becoming a core issue in corporate strategies, (Sanyal, 2001).

Given the above, D’Aveni, Richard and Ravenscraft,(2004); identified the positive effects of outsourcing as including,

**Low Risk:** as the business world is growing tremendously as the years pass by, an increasing number of companies are planning to outsource both low-end and high-end jobs to specialist suppliers. Also the number of companies providing outsourcing services is on the rise, thus resulting larger variety. Hence as more companies are outsourcing, the risks are getting smaller as businesses have more experience and clearer objectives.

**A mode of management strategy:** outsourcing in the world today is seen as a strategic management option rather than just a cost cutting operation. It aids companies to achieve their business objectives through operational excellence, a better market position and accelerate their competition effectiveness in the global economy.

**Price reduction:** reduction of products price are created, as outsourcing to specialist suppliers will establish demand for the company’s products. This entails lowering of the overall cost of the service to the business, leading to defining quality levels, re-pricing, re-negotiation and cost restructuring.

**Cost restructuring:** operating leverage is a measure that compares fixed costs to variable costs. Outsourcing changes the balance of this ratio by offering a move from variable to fixed costs and also by making variable costs more predictable.
Enhanced technology: many companies tend to participate in outsourcing leading to advancement in technology as manpower with technological experience from different sources are transferred from one company to another and from one regional location to another even from one continent to another. Thus enhancing high-class technology to different parts within the world.

Time saving: the availability of more skilled people brings new ideas of better work done within which the suppliers bring about raw materials and any needed material for production and prompt service delivery.

Increases productivity: as more expertise manpower skilled is very much available in an organization, the level of decision making within that organization is going to be very high and very effective at the same time. Out of good decisions, better work and less accident, the organization tends to be more productive.

However among others, competitive and economical advantages, commodification and cost reduction are other positive effects of outsourcing;

On the negative side, loss of job-opportunity loss of control of an organization-with a lot of ideas from different people, this makes the level of decision making to be slow and control can be lost within the organization.

Not only that, outsourcing for the purpose of saving cost can often have a negative influence on the real productivity of a company Engardio and Kripalana (2006), stressed the fact that rather than investing in technology to improve productivity, companies gain non-real productivity by hiring less people locally and outsourcing work to less productive facilities that appear to be more productive simply because the workers are paid less.

Methodology

The service industry is taken as the population while ten service institutions were taken as the samples to test the hypotheses and the objectives of the study. Five banking institutions, two insurance companies, two Information Technology service companies and one Oil servicing company were chosen using stratified sampling technique. Questionnaire was administered to collect data for the study to enable the researchers measure the impact of outsourcing on the competitive advantage in the industry. The questionnaire was drawn on a five linker scale of Strongly Agree, Agree, Strongly Disagree, Disagree and undecided. Fifty questionnaires were administered to the companies with five questionnaires sent to each institution. Out of the fifty questionnaires administered forty-two (42) were returned representing 84% of the respondents.

Data analysis was both descriptive and inferential. Simple percentage was used to analyse the data and chi-square was used test the hypotheses whose data take the form of countable and is often referred to as contingency tests.

Data Analysis and Discussion of findings

The analysis of data in this study is presented below. Since the study seeks to determine the impact of outsourcing of leasing on the competitive advantage of an organization for analytical purpose, the findings in this study are classified under different tables as below.

Hypothesis 1: High operating costs have no negative impact on profitability and return on capital in service delivery industry.

Chi-Square: 46.82
Level of Significance: 0.05
Degree of Freedom: 4
Tabulated: 9.49

**Decision:** At the level of significance 0.05 and degree of freedom 4, the critical value is 46.82 against the tabulated 9.49 which signifies the respondents' opinions that high operating costs have negative impact on profitability and return on capital in service industry which call for the outsourcing of the product that is a drain to the profitability of the organization.

**Hypothesis 2:** Ineffective Utilization of Resources has no impact on sub-optimality in production in the Nigerian service industry.

Summary
Chi-Square: 7.72
Level of significance: 0.05
Degree of freedom: 1
Tabulated: 3.84

Decision: At the level of significance 0.05, degree of freedom 1, the critical value is 7.72 which is higher than the tabulated value of 3.84. With the result of the people’s opinions it means that outsourcing of products and services in the Nigerian service industry will impact competitive advantage positively as the organization will enhance the production of their areas of specialization that will increase profitability.

Conclusion
It is obvious from the theoretical review of literature and empirical results that competitive advantage hinges largely on a company’s ability to outsource its non-core functions especially the lease service which is capital intensive. Outsourcing reduces operating cost and ensures control of cost; resources will be effectively utilized to full capacity to attain optimality in production. The leasing option provides a great opportunity for the organization to concentrate on core competence areas that will motivate the morale of the staff. Considering the major advantages of tax benefits for the bank, reduction in operating cost of maintenance of equipment and vehicles, concentration on customers’ satisfaction, maintaining a capital structure that helps to enhance the value of the organization, outsourcing leasing option is a good decision for a profit making organization. Moreover, we can rightly conclude that top management of organizations can take advantage of services of experts who are vast in their non-core activities to have a vantage competitive advantage.
Not only that, research and development should be encouraged both by private and public sectors to enable the companies familiarize themselves with the happenings in their surrounding through their external service providers and what opportunities and threats are

**Recommendations**

Based on the major findings of the researcher, the following recommendations have been put forward to top management for a better competitive advantage of their companies in the market area. These include,

- The top management should aim at taking advantage of the services of experts who specializes in their non-core activities and functions like the leasing options. Leasing will encourage the firm to use its capital for growth and development of their operations. They should concentrate on operating lease which avoid them the burden of ownership structure. The top management should be on the look out for economies of scale through outsourcing. This can help to reduce production costs through the aggregation of orders from many different external providers. The top management should recruit, motivate and manage talents through external service providers. This will further help position the company in the market by virtue of the competence of motivated and well managed talents. The top management should find out from their external service providers about what opportunities and threats are available in the market. The top management should incorporate fast, yet flexible decisions into their outsourcing relationships.
- Top management should ensure that there is a free flow of effective communication (both on-line and off-line) with its external service providers.
References
Sanyal, R.N (2001). International Management: A Strategic Perspective. USA, MCGrawhill publication.
The paper examines two fundamental issues of human existence; one, is the concept of social change and educational policy and the second, is how social factors affect the development of educational policies in Nigeria. The paper also highlighted on the concept of education from Islamic perspective, the global trend on the educational policy, the implication of the social factors such as, political, economical, socio-cultural, environmental, religious, and technological factors to the realization of the objectives of the Nigerian educational policy. Based on the literature reviewed revealed that, the delivery of education in Nigeria has suffered from years of neglect, and compounded by numerous challenges which include: inadequate attention to policy frameworks; unqualified teaching staff; acute shortages of infrastructure and facilities at all levels; access to basic education is inhibited by gender issues and socio-cultural beliefs and practices; emphasis on theoretical knowledge at the expense of technical, vocational, and entrepreneurial education. The authors argue that, for an effective educational policy to prevailed in Nigeria there should be commitment to the policy execution by the government; commitment to professionalism; upward review of schools curricula to make it relevant and practice oriented more especially in the area of information and communication technology, there is also need for adequate funding of educational system in Nigeria to meet the minimum UNESCO’s bench-mark of 26% per capital annual budget.

Keywords: Social change; Social factors; Educational policy

1. INTRODUCTION

Social change is a transitional adaptation of culture, beliefs and values of people in a given society. These changes have a multi-dimensional effect which ranges from social, educational to the burden of economic global trend which is infiltrated by the advent of industrial and technological development or globalization. Societal changed usually result in a change in people’s ways of lives, thinking and values system. (EncyclopediBritannica)

In addition to that, social change also involves change in social structure of the people in the society. There are many factors that might have come into play in the social change; this might include the social institutions, the social behavior, and the people inter-societal relations etc. What
we see, hear, eat, touch almost contribute to the social change. When a pattern of behavior changes in a society, people belonging to that society relate to each other differently either in a positive or negative way. For example, people in a primitive days like to live in hut, sustain with a fresh sea food, however, by the emergence of storey building, brick houses and fast food, people life styles transform gradually to another form as if they were not living in a hut before the discovery of this new adventures. Social change also incorporates three types of changes, such as emergent transformational changes or projectable changes, (Reeler, 2007). According to (Reeler, 2007) society tends to change emergently when a change erupts as a means of a swift growth in which all people undergo changes at a glance. For example, in most cases the changes usually occur in societies which came up with some trend of behavior which at times contradict the wishes and ideals of the already existing phenomenon of either communities or nation in a larger perspectives and this changes could be in terms of the rules and regulation governing the people’s way of lives in societies or in terms of the physical environmental changes. Furthermore, social changes could also be transformational changes which occur in people’s lives in a gradually process; which at times significantly affect people culture or behavior. Social changes could be projectable entity; in the sense that, when a societal organization or group of workers or managers suggested that an organization needs a change in its structure, products, and organizational form this could only happens when the organization injects a project of sending its managers and part of its employees to study how an organization could project itself in terms of product it produces…etc. Having done with the concept of social change, then, what is Educational Policy? Educational policy could be defined as the collection of laws; rules and regulations that governed the operational strategies geared towards the realization of educational aims and objectives of educational systems of a given country (http://en.wikipedia.org/wiki/Education_policy). Educational policies of many countries of the world are being provided by the government under the supervision Ministries of Education. These educational policies include the philosophy of education of a country, the main visions and missions of the educational system, curriculum design for various education programs and other educational infrastructural facilities which could lead to the realization of the main goal of the educational system. In most cases, the government in conjunction with the Ministry of Education controlled the transformation of educational development so as to be in accordance to the needs and aspiration of the society and nation at large. Before we discuss social factors and its effects on the development of educational policies in a given country, it seems necessary to give a little preamble on the concept of Education and its acquisition process. Education can simple be defined as a process of acquiring knowledge be it formal or informal Education. Education to a larger perspective been referred to as an act or experience that has a formative effect on the mind, character or physical ability of an individual. In its technical sense, education is the process by which society deliberately transmits its accumulated knowledge, skills and values from one generation to another. Education is a concept, referring to the process in which students can learn something through the following medium:

- **Instruction** refers to the facilitation of learning toward identified objectives, delivered either by an instructor or other forms.
- **Teaching** refers to the actions of a real live instructor designed to impart learning to the students.
- **Learning** refers to process with a view toward preparing learners with specific knowledge, skills, or abilities that could be applied immediately upon completion.
The concept of right to educational development, transformation and attainment of Nigerian citizen cannot be over-emphasized, this is because, a right to education has been created and recognized by some jurisdictions: since 1952, Article 2 of the first Protocol to the European Convention on Human Rights obliges all signatory parties to guarantee the right to education. At the world level, the United Nations International Covenant on Economic, Social and Cultural Rights of 1966 guarantees this right under its Article 13 and this was initiated because of the significance level of education to the general well-being of mankind. Education is a fundamental human right of all citizenry of any giving country irrespective of gender and any forms of impairment provided a citizen is mentally alert and emotionally stable he/she has the right to be educated. From the perspective of the world’s major religions, particularly Islamic religion emphasizes on the seek of knowledge and as a result Islam looked at seeking of knowledge as a social necessity for over 1400 years. The Qur’an and the Hadiths (sayings of the Prophet Mohammed peace be upon him) explicitly emphasise the importance of education; in Islam seeking education (knowledge) is obligatory for every Muslim, male and female. Indeed the acquisition of knowledge and the use of this knowledge for the betterment of humanity.

In Islam, the right to education is for all, without gender discrimination. Muslims are encouraged to support education for disadvantaged sections of society; this can be observed through some forms of charitable giving to promote education projects for the disadvantaged and the marginalised. Islam has a holistic view of human development, which views education and knowledge as central. Furthermore, the principles of justice and equity are important in Islam; this entitles acquiring knowledge and skills to apply such principles.

Islam emphasized greatly on the need for Education and knowledge seeking in the various verses of the Holy Qur’an such as the first verse of the Qur’an revealed to the Prophet Muhammad (pbuh) indicates the importance of education in Islam; the verse started with the word “Iqr’a”, it is a command that means ‘read’ in Arabic, and that implies the concepts of ‘learning’, ‘exploring’ and ‘seeking enlightenment'. This demonstrates that reading (knowledge) is the way to approach the Creator of all that exists. Quran 96/1-5 states:

"Read! In the Name of your Lord who has created (all that exists). He has created man from a clot (a piece of thick coagulated blood). Read! And your Lord is the Most Generous.

Who has taught (the writing) by the pen. He has taught man that which he knew not."

The importance of education has been emphasized repeatedly in the Qur’an, which is the ultimate source of guidance for Muslims. Quran 20/114 says, "My Lord! Increase me in knowledge." This verse indicates that whatever we know is limited as we need to keep asking the lord of the world to increase our knowledge. More-over, from the holy Qur’an Allah said, “

“Allah grants wisdom to whom He pleases and to whom wisdom is granted indeed hereceives an overflowing benefit.” Surah 2/269

“Those truly fear God, among His Servants, who have knowledge: for God is Exalted in Might, Oft-Forgiving.” Surah 35/28
All of the above signifies the values and importance of seeking knowledge to humanity.

Global trend of social factors and Educational policy

The relationship between educational policies and its impact sociologically has been established, in the sense that education is now internationally accepted as a key development index. It is in recognition of this importance that the international community and governments all over the world have made commitments for its citizens to have access to education. Then what is development? Development is more than economic growth; it encompasses economic, social, cultural and political dimensions. The UN's Declaration on the Right to Development Article 1 emphasises that “every human person and all peoples are entitled to participate in, contribute to, and enjoy economic, social, cultural and political development” (UNHCR 1986). Development focuses on improving the well-being of individuals on the basis of their participation and the fair distribution of benefits resulting from their active participation. Hence, along with being a basic human right, education is recognised as being at the core of development.

Education has a multidimensional impact on communities, and it is widely recognized as one of the building blocks for sustainable development. As World Bank research notes, “Investment in education benefits the individual, society, and the world as a whole” and “broad-based education of good quality is among the most powerful instruments known to reduce poverty and inequality” (World Bank, 2009). Therefore, in addition to other interrelated tools of development, promoting education is integral to socio-economic development and poverty reduction.

Investment in education serves to promote economic growth through enhancing the skills and productivity of the poor (Oxal 1997: 1). This will eventually contribute to developing the human capital of the society. Therefore, this study will look at the implication of some the social factors in the development of education in Nigeria and these social factors include: Political implication; Economic implication; Socio-cultural implication; Environmental Implication; Religious implication; Technological implication.

Political factors refer to what extent or degree of a government involvement in the provision of education to respective citizen of a nation and the level of governments’ ‘political will’ interest, commitment, initiatives, strategies, focus etc, toward realization and achievement objectives of the national educational plan which should be in line to the educational policies of a country. Political factors may also include goods and services in the area of education which the government is responsible for providing and these include the following: teachers’ training, conducive environment for teaching and learning, tackling the ideological phenomenon of brain drain, free education for all and political stability.

Furthermore, governments have great influence in the provision of laudable educational policies and educational infrastructures and social amenities for the betterment of a nation’s educational system to work efficiently and effectively. Thus, it is duty bound for governments in collaboration with international organization, non-governmental organization and civil society organisations to
come on board and advocate for the availability of quality educational opportunities that could be accessible to all. The right to education is paramount and part of the inherent dignity of all humans; it is a tool to facilitate communication and bring cooperation among societies and by extension a means of bringing peace, stability and more mutual understanding between communities and nations (UNHCR1966).

According to international declaration and convention of human right, the right to education has been spelled out clearly, example Article 26, outlines the right of everyone to free, compulsory, elementary education with tertiary levels education to be made available to all without discrimination, although higher education may be merit-based. While recognizing an individual’s right to choose their form of education, the Declaration emphasizes that, “Education shall be directed to the full development of the human personality and that concurred with the mission of the Millennium Development Goals (MDGs) of achieving eight educational goals by the year 2015 and that respond to the world's main development challenges.

The MDGs were adopted by 189 nations during the UN Millennium Summit in September 2000. The goals which includes:

- First eradicate extreme poverty and hunger;
- Second, achieve universal primary education;
- Third, promote gender equality and empower women;
- Fourth, reduce child mortality;
- Fifth, improve maternal health;
- Sixth, combat HIV/AIDS, malaria and other diseases;
- Seventh, ensure environmental sustainability;
- Eighth, develop a global partnership for development.

Source: UN Millennium Summit on MDGs reports, September 2000.

Economic factors refer to the government expenditure on educational development and transformation strategies of a nation’s educational system which include: the financial recurrent expenditure budgeted for the realization of educational objectives of a country which basically differ from one country to another. But according UNESCO declaration (2006) stipulated that 26% of every country’s annual budget should go to education, in which now some of the developing countries are yet to meet of up to this declaration and expectation, and this may be as result of lack of sound economic stability or lack of commitment towards the development of education. These factors have major impacts on how educational system operates both in terms of the provision of educational infrastructures, training of teachers, technical and professional expertise enhancement. As such there will be no any educational system that could work effectively without adequate and proper funding, but yet the situation in some of the developing countries particularly Nigeria is worrisome, this is because, the education sector is yet to meet up to some basic fundamental educational policy issues such as the controversy that exist between federal and local government on the management of basic primary education, decay in the public schools’ infrastructure, lack of qualified teaching staff, poor remuneration etc. which all of these is central to proper and adequate funding, commitment and selfless service to humanity.
Socio-cultural factors refer to the cultural aspects of people which include: belief, aspiration, norms, values of the societies or communities to which education is to be provided. There are some other aspects which include: health consciousness, population growth rate, age distribution, career attitudes and emphasis on safety. Culture is also defined as the system of shared beliefs, values, customs, behaviors and artifacts that the members of society use to cope with their world and with one another, and that are transmitted from one generation to another through teaching and learning processes. As such educational policy makers should give considerable regard to socio-cultural background of the people in educational policy formulation and execution and this priority should be given to areas of curriculum design, development and recruitment of teachers, in such a way that, the policy and philosophy of education designed should cater for the need and aspiration of the society in particular and the nation at large.

Emphasis should be given to teacher training; this is because at different time and in different part of the world teachers had been championing the role of disseminators of literacy, guardians of culture, vicars of morality, architects of the ‘good citizen’ or good personality. In more recent times, schools have been allocated the task of achieving social equality, overcoming material disadvantage and eradicating prejudice. Teachers and instructional designer need to be capable of diagnosing the needs of the individual learner and know how to meet these when discovered (Wood, 1995).

Environmental factors are worthy of note in the event of school construction and this consideration should include: environmental factors as such ecology, weather, climate, and climate change which may have especial effect on the educational development. Furthermore, lack of growing awareness of the potential impacts of climate change is affecting some educational structures and operational timing, as such policy makers should have put into consideration while making educational planning in order to avoid some negative unforeseen circumstances of massive distraction of buildings and teaching/learning materials that may result from wind or water.

Religious factors refer to the system of beliefs based on humanity's attempt to explain the universe and natural phenomena, often involving one or more deities or other supernatural forces and also requiring or binding adherents to follow prescribed religious obligations. Two identifying features of religions are to some extent require faith and seek to organize and influence the thoughts and actions of their adherents. The Influence of Religion on Social development and importance of religion as a factor in social evolution, particularly in tribal organization and race differentiation, has been acknowledged by nearly all scholars of sociology. Some have placed so much emphasis upon its importance as to lead to the conclusion that it is the primal influence in securing primitive social unity. Others have either ignored it or insisted that it has retarded social progress. Neither of these views is correct. While it has had a strong influence in cementing the social group, in bringing about its unity, and in developing social forms and social order, nevertheless it is not the fundamental factor of social organization in primitive society.

On the other hand, it has been asserted that it retards the progress of social life and that it is possible for philosophers to devise some better agency than religious organization for the advancement of civilization. Whatever may be the degree of truth in these assertions, it must not be forgotten that the careful student of the historical growth of society will find religion an ever present factor, indeed a force that must be reckoned with everywhere. In this respect it works
peculiarly, for, while, on the one hand, it has favored differentiation between the races and between the independent growth of certain groups, on the other hand, it has been a potent force in increasing the unity of the group; that is, it has brought the interior life of the group or tribe into harmonious unity. When we consider how strong religion has been in the primitive culture of early society, it is easy to infer its great power as a society builder.

As a consequence of that, educational policies makers should give reasonable regard and tribute to the religious issues/matters when formulating educational policies of a giving society or community. For instance, Islamic religion considers that humans have the responsibility (stewardship) to serve the earth and humankind and are accountable for this role. This includes serving humanity and applying the principles of justice for all. Justice is crucial for peace and social harmony. In Islam, justice is a sacred principle in all matters from personal relations to matters of governance. Justice is instrumental in fighting poverty and inequality and is vital in the achievement of sustainable development. In Islam, justice entails protecting individuals’ rights, as well as the fair distribution of wealth and resources. Justice is a human value in Islam; ignorance and illiteracy of Islamic religion would prevent the performance of justice as it is taught in the Qur’an and the hadiths of the Prophet (pbuh). Therefore, knowledge and wisdom are paramount for the achievement of justice and social harmony in Islam; The Qur’an states that individuals bear a responsibility towards the community; Verse 5/2 states:

“and help one another in goodness and piety, and do not help one another in sin and aggression; and be careful of (your duty to) Allah”

Therefore, there is no doubt that incorporation of religious studies in formal schooling and knowing its contextual meaning will lead to the better understanding of the social and economic implications which would contribute to the achievement of justice and social equity in the society. This is also apparent from the Qur’an, Surah 2/269 mentioned above, which promotes the importance of religious wisdom and knowledge.

Technological factors include technological aspects such as Information and Communication Technologies (ICTs), and automation. Information and communication technologies incentives should be incorporated in the core educational schools’ curriculum for harmonious national and international educational development and relationship between nations. When considering literature concerning educational technology and instructional design the development in information technology and communication technology is of a great importance in solidifying and harmonizing the emergence of new findings and development in the field of human capital development. (Reigeluth,1996) said that, the most important new directions for research in educational technology and advancement of the instructional prescriptions should include among other issues:

- Facilitating understanding, generic skills application, and affective learning,
- Utilizing the unique capabilities of new technologies,
- Structuring and sequencing a course or curriculum,
- Selecting mediation systems,
Designing instructional-management systems, and motivating learners to learn,

Developing expert systems as job aids for, or even replacements for, instructional designers,

Providing more help to the public schools, especially by applying systems thinking to design the structural features that are more appropriate for the educational needs of an Information society.

The arguments for why we need to introduce technology into education are often that “we need to prepare workers for the competitive global economy” (Kerr, 1996, p.7). Educational technology is almost everywhere discussed in terms of method, which is seen as having direct effects that are meaningful to national purposes or the formation of citizens that could be able to contribute in specific ways to the society and the economy (Kerr, 1996).

RECOMMENDATION
There is dire need for understanding of the process of policy formulation and implementation. This understanding will be apt to positively influence the processes of educational policy implementation from its beginning to the last drop point with vigor and directed focus toward achieving the main aims and objectives of Nigerian philosophy of education without any ambiguity or lost of generality. Nigeria as a country has its own national development plan on education and recognizes the need of education as an essential tool for comprehensive, sustainable development and as an instrument for economic and social development. Furthermore, education is instrumental in promoting equal opportunities and higher income levels amongst the entire population. Economic growth, per se, does not necessarily imply the reduction in economic inequality. Combating poverty necessitates having equal opportunities in economic activities and more equitable income distribution. While the past 20 years have witnessed a marked decrease in global poverty rates, inequality in many regions has increased. Among developing regions, inequality is highest in Latin America and sub-Saharan Africa, and it is increasing in Asia as well (UNESCO 2008: 14). While education on its own cannot solve the problem of economic inequality, it is one important tool in promoting equal opportunities for all, including children from marginalized social or economic backgrounds and women.

“Unless compensating policies are introduced, especially targeting children from the least advantaged backgrounds,” contends UNESCO, “existing socio-economic inequalities could even be reinforced because of poor education quality, low achievement, high dropout rates, differentiated school systems and limited access to higher education levels” (UNESCO 2008:19). Where education is considered as part of a broader tool to promote equal opportunities, the effects are likely to be more profound. Corresponding policies, such as promoting equitable employment opportunities are necessary if the “potential equalizing benefits of education expansion are to materialize” (UNESCO 2008: 23). Thus, education is one tool that can help the poor and marginalized to contribute to and benefit from economic growth. Therefore, all the aforementioned benefits that could be derived by mean of having proper and executable educational policies could only be actualized if and only if the following hold good: policy makers, curriculum developers, federal and state ministries of education, non-governmental educational organizations in Nigeria, Nigeria tertiary institutions of higher learning, faculties and departments of education, educators and professors in education, Parents, schools heads educational researchers, educational consultants, teachers and concern individual etc. have to come on board in salvaging the flight of Nigerian educational system from total deterioration by way of carrying out and execution of their civic national educational responsibilities with utmost level of sincerity and honesty, distancing
oneself from sharp practices and corruptions. Otherwise the situation will remain pathetic and the end result will be under development in all aspect of human capital development.

CONCLUSION

The severe decline of the oil market in the early eighties, combined with the Structural Adjustment Program (SAP), led to drastic reductions in spending on education. Even though in the late nineties and midst 2000 Nigeria has witnessed and realized huge amount of revenue more especial in the oil sector, but yet, the resultant effect in the educational transformation and development of the country has nothing to write home about. There were laudable policies and programs being formulated such as universal basic education (UBE) vision 2015 of the Millennium Development goals (MDGs) but the results were delay in the payment of teachers’ remuneration and some unpaid teacher salaries, degradation of education facilities at all levels and strikes in universities/public schools, culminating in declining literacy rates.

The poor state of education in Nigeria is aptly captured in the National Empowerment Development Strategy (2006) as follows:

‘...the delivery of education in Nigeria has suffered from years of neglect, compounded by inadequate attention to policy frameworks within the sector. Findings from an ongoing educational sector analysis confirm the poor state of education in Nigeria. The national literacy rate is currently 57 percent. Some 49 percent of the teaching forces were unqualified. There are acute shortages of infrastructure and facilities at all levels. Access to basic education is inhibited by gender issues and socio-cultural beliefs and practices, among other factors. Wide disparities persist in educational standards and learning achievements. The system emphasizes theoretical knowledge at the expense of technical, vocational, and entrepreneurial education. School curricula need urgent review to make them relevant and practice oriented’

Over the years, Nigeria has expressed a commitment to education, with the belief that overcoming illiteracy and ignorance will form a basis for accelerated national development. However, regardless of the incontrovertible evidence that education is crucial to the development of the community and the nation, there remain inequalities in access to education. Despite its potential for leveling opportunities, education is pathetically used to perpetrate inequalities. Millions of poor people are still being excluded from the processes and outcomes of education.

Abstract
Organizational citizenship behavior is one of the subjects that organizations are required to it. Existence of such behaviors in organization without imposing any cost, improves performance and organizational effectiveness indirectly. The purpose of current study is investigating the effect of organizational identity and organizational commitment on organizational citizenship behavior. The study is an applied research and regarding its nature is a descriptive-survey research. Data collection tool was a third-part questionnaire that its validity and reliability has been approved. Data analysis using descriptive statistics, t-test and path analysis by LISREL 8.53 was performed. Conducting pre-test, reliability of organizational citizenship behavior questionnaire was estimated equal to 0.856 and organizational commitment questionnaire reliability was equal to 0.875 also reliability of organizational identity questionnaire was equivalent to 0.846. Findings indicate the appropriate status of variables in population. The effect of organizational identity and organizational commitment on organizational citizenship behavior was confirmed. Therefore identity and commitment are considered two predictors of organizational citizenship behavior. About 56 percent of the variation of organizational citizenship behavior was explained by identity and commitment.

Keywords: Organizational Citizenship Behavior (OCB); Organizational identity (OI); Organizational commitment (OC).

1. Introduction
In currency world that inflexible and bureaucratic structures do not respond to organizations, for surviving and achieving sustainable competitive advantage the need to flexible and organic structures for responding to the environmental changes on time has been felt. In this structure, organizations require staffs who are not only perform their formal role requirements, but also to promote performance and effectiveness of their organization in order to achieve sustainable competitive advantage, they should go beyond the role expectations and job duties. Organizational citizenship behavior for any organization is desirable because it deals with major variables such as: organizational effectiveness and productivity. By enhancing the sense of justice and fairness and
paying attention to the values and goals of organizational goal setting improve variables such as commitment and identity and ultimately they will observe extra-role behavior of their staff in their organizations. The purpose of current study is investigating the effect of organizational identity and organizational commitment on organizational citizenship behavior.

2. Organizational citizenship behavior (OCB):
In recent years, researchers have begun to study behaviors that are not component of essential requirements and formal role in organization. This behaviors are recognized as citizenship behavior. Behaviors in organizations were divided into in-role behavior in accordance with formal role descriptions, and extra-role behavior which is beyond formal role requirements. extra-role behavior arises from feelings of “citizenship” with respect to the organization (Burns & Collins, 1995). These feelings have been perceived as the backbone of behaviors that were not required by an organization, but which have positive impact on organizational function (Organ, 1988). Diverse terms to describe extra-role behavior have been suggested such as organizational citizenship behavior (Organ, 1988; Smith, Organ, & Near, 1983), prosocial organizational behavior (Brief & Motowidlo, 1986), civic organizational behavior (Graham, 1991), organizational spontaneity (George & Brief, 1992), and contextual performance (Borman & Motowidlo, 1997). Organ in his book on title of “organizational citizenship behavior:syndrome of good soldier” defined OCB as “individual behavior that is discretionary, not directly or explicitly recognized by the formal reward system, but totally it promotes the effective functioning of the organization” (Kernodle, 2007).

2.1 Types of citizenship behavior in organization
Graham believes that OCB is divided in three groups consisting of organizational obedience, organizational loyalty and organizational participation.

1- Organizational obedience: this term describes behaviors that their necessity is recognized and in a reasonable structure of discipline and regulations has been accepted. Indicators of organizational obedience are behavior such as respect to organizational regulations, performing duties and responsibilities completely in regards to human resources.

2- Organizational loyalty: loyalty to organization is different from loyalty to other individuals or loyalty to organizational units. It describes staff loyalty level towards organizational interests and support and defense of the organization.

3- Organizational participation: this term with staff active participation in organizational affairs will be meant. These affairs include participating in meetings, sharing their ideas with others and awareness of current issues in organization.
2.2 Dimensions of Organizational citizenship behavior

Perhaps it can be said that the most reliable and widely used classification on components of organizational citizenship behavior was presented by Organ. These dimensions include: 1. Altruism 2. Civic virtue 3. Conscientiousness 4. Courtesy 5. Sportsmanship which are showed in figure 1.

1) Altruism
Altruism is the category consisting of discretionary behaviors that aim at helping certain people in an organization with a relevant task or problem.

2) Civic virtue
Civic virtue is the involvement that the employee shows in the political life of the organization.

3) Conscientiousness
Conscientiousness is originally termed general compliance, which involves employees going beyond the minimum requirements of the organization.

4) Courtesy
Courtesy includes proactive gestures that consider consulting with other workers in the organization before acting, giving advance notice, and passing along information.

5) Sportsmanship
Sportsmanship refers to the forbearance of doing some action such as filing petty grievances.

Organ remained that all five dimensions of OCB may not be simultaneously appeared for example a person may be conscientious and not be sportsman or that some of these dimensions, such as altruism and conscience are tactical tools for putting pressure on organization managers (Castro, 2004, 141).
2.3 Key properties of Organizational citizenship behavior

1) It is a kind of behavior that goes beyond formal role requirements prescribed.
2) Behavior that is discretionary and it is base on individual interests.
3) Behavior that is not directly seeking compensatory and through the formal system will not be appreciated.
4) Behavior that for organization performance and operation success is important.

3. Organizational commitment

Organizational commitment is an attitude about loyalty to organization and a continuous process through participation of individuals in organizational decisions, it indicates welfare and success in organization. In the dictionary commitment defined as a essence which limits freedom of action. As noted by Porter and colleagues (1982), commitment is the “relative strength of an individual’s identification with and involvement in the organization” in terms of values and goals. This definition of organizational commitment has three factors:

1) Belief in and acceptance of the organization’s goals and values.
2) A willingness to focus effort on helping the organization achieve its goal’s, and
3) A desire to maintain organizational membership

In relation to organizational commitment, several studies carried out. The most important studies belong to Allen & Meyer. They explained the kinds of commitment that express the following:

Affective commitment is defined as the emotional attachment, identification, and involvement that an employee has with its organization and goals. Continuance commitment is the willingness to remain in an organization because of the investment that the employee has with “nontransferable” investments. Normative commitment (Bolon, 1993) is the commitment that a person believes that they have to the organization or their feeling of obligation to their workplace.

4. Organizational Citizenship Behavior and Organizational Commitment

Organizational commitment that is considered as honesty and loyalty towards the organization have a relationship with the acceptance of objectives and values of the organization and means a type of tendency to try in organization and interesting to work in it (Porter and others, 1974). Results of a meta-analysis by Brian and organ in 1995 were showed that organizational emotional commitment is related to dimensions of sacrifice and obedience of organizational citizenship behavior. Mayer and others (2000) expressed that government employees with strong emotional commitment possibly try more for the government and help others in achievement organizational objectives. Employees search the best ways and methods to increase the quality of job performance voluntarily and without any reward. Positive emotional reactions depend on organizational attachment with organizational commitment; organizational citizenship behavior is in direction of positive emotions, therefore organizational citizenship behavior will increase organizational commitment. Bormann (2004) states that OCB
increases the organization ability to attract and retain of people by creating an attractive environment in work. Organizational citizenship behavior help to create the belonging sense, group cohesion, work ethic and maintenance of employees in the organization which all of these leads to increase organizational performance. Sportsmanship is one of the components of organizational citizenship behavior that has a strong relationship with organizational commitment. Sportsmanship means suffering without profess and complain about the problems and issues of organization. Ryan and Ang in a study which conducted in Singapore in 1995 had showed the effect of organizational citizenship behavior on organizational commitment among specialized personnel of banks and hospital. They stated that staffs with higher citizenship behavior have more commitment.

5. Organizational identity
In the past several decades, organizational scholars have implemented the social identity theory and have used it widely in the organizational environment. Organizational identity is one of the parts of this theory. In definition of organizational identity, most experts agree on differentiation and oneness. Organizational identity is the sense of psychological attachment or the sense of dependency to the organization or company. This concept is representing distinction and membership in a particular organization (Ashforth et al, 2008). Rousseau (1998) defined organizational identity as a degree to which people consider themselves as members of an organization, it means that people are proud of their membership in an organization and if people consider their individual identity based on organizational identity, then they have high organizational identity. Organizational identity will creates motivation needed for arousing voluntary behaviors in the organizations. Organizational citizenship behavior can be considered as part of voluntary behaviors, because these behaviors are not recognized by formal reward systems of organization. In the next section, the relationship between organizational identity and citizenship behavior has been studied.

6. Organizational citizenship behavior and organizational identity
Most of researches which conducted about the relationship between organizational citizenship behavior and organizational identity have included the identity as predictor variable for organizational citizenship behaviors. In most studies, organizational identity has been predicted change in citizenship behavior. Liponen and others (2004) in a study found that organizational identity has the effect on organizational citizenship behavior and enhances this behavior in the organization. Blow and others (2006) in a correlation study was conducted among nurses and doctors found positive and significant Relationship between identity and citizenship behavior. So we can say that there is a positive and significant relationship between organizational identity and citizenship behavior and both of these variables have effect on each other. Former researches introduced identity as predictor of citizenship behavior. There are limited studies about the effect of organizational identity on organizational citizenship behavior.
7. Research model
The research model is shown in figure 2.

![Organizational Identity](image1.png) ![Organizational Commitment](image2.png) ![Organizational Citizenship Behavior](image3.png)

**Figure 2: Research Model**

8. Method of research
Since the aim of this research was to determine causal relationships among organizational identity, organizational commitment and organizational citizenship behavior variables, so according to the goal, this study is applied research and according to the manner of collecting information, this study is descriptive-correlation research type. In this regard, regression analysis and path analysis were used.

9. Tools of Data collection
The main tool to gather data was a questionnaire and to measure organizational identity and organizational commitment, Ashforth and Mayer questionnaires respectively were used and also Organ questionnaire was used to measure of organization citizenship behavior. For measuring reliability and validity 30 questionnaires as pre-test was used. For validity measurement the factorial validity was used. Load factor of all questions was more than 0.7. This represents that the questionnaire is valid.

Confidence coefficient (reliability) was calculated using Cronbach's alpha coefficient, which these values respectively for the questionnaire of organizational identity 0.875, organizational commitment 0.894 and organizational citizenship behavior 0.856 was calculated.

10. Statistical population and sample
Population of this study was all of employees of Educational Department of Isfahan province, with population 300 people who were randomly sampled. The statistical sample size using formula of limited population, was equal to 100.

11. Data analysis
First the Kolmogorof-Smirnoff test was used to evaluate normality of variables, output of SPSS software in Table 1 are shown.
According to significance, all of the three variables had normal distribution. To analysis of data, parametric test has been used. The overall features of sample including mean, standard deviation and independent t-test are shown in Table 2. Relationship between organizational commitment and organizational citizenship behavior ($r = 0.674$, $p = 0.01$) and organizational identity and organizational citizenship behavior ($r = 0.671$, $p = 0.01$) which is positive strong and significant. Therefore, increasing (reducing) the level of organizational identity and organizational commitment, organizational citizenship behavior level will be increased (decreased). According to Mackenzie and Podsakf research which have considered the dimensions like job satisfaction, organizational commitment, identity and justice as predictors of organizational citizenship behaviors, and also the dependence of research variables according to Table 1, organizational identity and organizational commitment were selected as predictors of behavior organizational citizenship. Since correlation coefficient of organizational identity and organizational commitment is relatively strong (0.604). To refuse the existence of self-correlation between independent variables, the Durbin-Watson test was used that are shown in Table 4.

11.1. Test of research Hypotheses

Two indices of critical value and P to test the significance of hypotheses have been used. Critical value (t) is the "regression weight estimate" over "standard error". In the significance level 0/05, critical value must be greater than 2. If critical value of a parameter is less than this amount, then it is not to be considered as important parameter in the model and also smaller amounts of 0/05 for P value indicate significant difference in the value calculated for the regression weights with zero value at confidence level 0/95. Hypotheses along with the regression coefficients and the values of partial indicators related to each hypothesis are given in Table 5.

<table>
<thead>
<tr>
<th>NO.</th>
<th>Hypothesis</th>

<td>Accepted</td>
</tr>
<tr>
<td>2</td>
<td>OC → OCB</td>
<td>0.42</td>
<td>3.353</td>
<td>0.00</td>
<td>Accepted</td>
</tr>
</tbody>
</table>

11.2. Test the hypothesis 1

Impact factor for this hypothesis is equal to value 0.42, as it is observed in the table, the critical value (3/258) for the hypotheses is larger than 1.96 and also P-value for the hypothesis 0/001, thus we can say that regression coefficient of this hypothesis has significant different with zero, so with confidence level of 0.95, this hypothesis can be confirmed and can be stated that organizational identity is effective on organizational citizenship behavior.

11.3. Test the hypotheses 2

Standardized regression coefficient for this hypothesis is 0.42 that given the amount 3.353 for C.R and P value related to this regression coefficient that is smaller than 0.05, we can say that this hypothesis is confirmed, in other words the organizational commitment has a significant effect on organizational citizenship behavior. Therefore
both of the research hypotheses were confirmed. We can use of Standardized regression coefficient to compare the effect of each variable on the dependent variable. The values of impact coefficient of two variables of organizational commitment and organizational identity are equal, and both of them are equal to 0.42. One unit change in organizational identity or organizational commitment will change organizational citizenship behavior to the 0.42. The high rate of these coefficients reveals importance of research factors. Analyzing model was done by lisrel 8.53 software that output this software is shown below.

In figure 3, Significance of regression coefficients is shown; According to the figure t all coefficients are greater than 2 that is representing the significance of all coefficients including regression and correlation. T- Value (3.32) indicates relationship between organizational identity and organizational commitment. Covariance value of these two factors is positive that indicates direct relationship between the variables of organizational identity and organizational commitment. In figure 3, regression coefficients are shown in standard status. Because the study model has been the regression type, so the type of model is saturated and the amount of chi – square and freedom degree of model is zero. In this kind of model, the determination coefficient is used for the measurement and interpretation of data fit (fitness) with model. Considering the rate of error in Figure 4 that is 0/44, the determination coefficient of the Model is 0/56 (table 6).

![Figure 3](image_url)

Chi-Square=0.00, df=0, P-value=1.00000, RMSEA=0.000

Because in this model the determination coefficient is used for data fit, the significant test of determination coefficient was used to ensure the accuracy of this coefficient. The results are shown in table 7. According to the table 7 because sig F is 0/000, then the coefficient of determination has significant difference from zero. In total the coefficient of determination is significant. Thus the data have well fit (fitness) with model and model of research is confirmed. In total organizational identity and organizational commitment explain 56 percent of organizational citizenship behavior changes. So we can say that
organizational identity and commitment are predictors of organizational citizenship behavior.

12. Discussion & Conclusion

Using the Kolmogorof – Smirnoff test, it was found that research variables follow of normal function. By one sample independent T-test, it was determined that all research variables including organizational commitment, organizational identity and organizational citizenship behavior have had suitable condition among employees. The mean of organizational citizenship behavior and organizational commitment was almost equal and the mean of organizational identity has been slightly difference and is less than the means of two factors of organization commitment and organizational citizenship behavior. The correlation coefficients of organizational commitment and identity with organizational citizenship behavior are representing a relatively strong relationship between these factors. The research model was tested through structural equation. According to saturation model (fitted model), the determination coefficient has been fit
index (fitted the index), the determination coefficient was also significant that shows the data fitness with model. Both of the research hypotheses were confirmed that it continues to be paid. Lowell in his research has studied the relations among organizational justice, commitment and citizenship behavior and introduced the organizational commitment as one of variables affecting organizational citizenship behavior. Also Tabersa and others investigated the factors affecting organizational citizenship behavior and discussed about the organizational commitment as effective and significant factor on organizational citizenship behaviors. Sohrabi and Khanlari in an article have examined the relationships among ethics, information technology and organizational citizenship behavior, their findings were representing the effect of organizational commitment on organizational citizenship behavior (individual and organizational). In this study the effect of organizational commitment on citizenship behavior was confirmed. Organizational commitment variable has been introduced as one of the predictors of organizational citizenship behavior. So through strengthen of organizational commitment in the research community can increase emergence likelihood of voluntary behaviors in the organization and will help to improve the performance and effectiveness of the organization. In a simple regression equation, the organizational commitment and citizenship behavior that were controlled as demographic variables; the organizational commitment is explained 50 percent of changes in organizational citizenship behavior. If regulations be implemented in the organization fairly, promotion and progression done and based on competencies and also if the employees objectives have been attended in determining the organizational values and objectives, we can increase the level of organizational commitment and thereby help to increase the organizational citizenship behavior. One of the most important variables affecting on organizational commitment is organizational justice that in many of research its effect is confirmed. Also job satisfaction is considered as influential factors. So managers should pay more attention to this issue. In the correlation research projects that are performed, organizational identity and citizenship behavior have had a direct and significant relationship. Blue and others have been confirmed the significant relationship of these two factors. Liponen in a study introduced the organizational justice as an effective factor on organizational identity, he said that organizational citizenship is affected by organizational identity. In this study, the effect of organizational citizenship behavior on organizational identity was confirmed. In a simple regression equation that demographic variables were controlled, the organizational identity explained 50 percent of the variance of organizational citizenship behavior.

Abstract
Nowadays, sponsorship especially sport sponsorship is one of the most important parts of marketing activities in the world. Sport sponsorship traverses an ascending trend in Iran too. Therefore, managers need accurate and complete information about effectiveness of sport sponsorship to make right decisions about issues such as resource allocation to sport sponsorship. The purpose of this study was to examine theoretical relationships between key variables of sport sponsorship effectiveness (i.e. sports involvement, sponsor awareness, corporate image and future purchase intention) among Persepolis and Esteghlal fans in Iran. The statistical population of this study was all of Persepolis and Esteghlal fans in Iran. In this research, questionnaires were sent electronically to 384 of Persepolis and Esteghlal fans and these fans answered to 16 main questions of questionnaire. By using statistical method (Regression analysis), the relationships between these key variables of sport sponsorship effectiveness were evaluated. According to the findings, Consumer involvement had a direct positive effect on brand awareness, perceptions of corporate image and intention to purchase a sponsor's product. Sponsorship awareness had a direct positive effect on corporate image and finally sponsorship awareness and corporate image had a direct positive effect on intention to purchase a sponsor's products. This test also was performed on Persepolis and Esteghlal fans separately and the result of Persepolis and Esteghlal fans was the same as whole sample.

Key words: Sport sponsorship, Sport involvement, Brand awareness, Corporate image, Purchase intention.
1. Introduction

In today’s marketplaces companies look for new methods for their marketing activities and they try to be different from competitors and increase their market share and sales and for these purposes they spend a lot of money. One of these methods is sport sponsorship that companies look for different goals sponsoring the events or sports club. Corporate sponsorship, defined as "an investment, in cash or in kind, in an activity, in return for access to the exploitable commercial potential associated with that activity" (Meenaghan, 2001). Companies have paid more attentions to sport sponsorship in the past few years and they consider it as a suitable communicative method to communicate with consumers which has a high efficiency. Worldwide corporate investment in the sponsorship market grew from approximately US$2 billion in 1984 to US$23 billion in 1999 to an estimated US$28 billion in 2004 (Yong Jae et al, 2008). In 2002 more than 70% of sponsorship dollars were invested in sport and sports events (Howard & Crompton, 2004). In this environment, sports sponsorship has become an important marketing tool due to its flexibility, its broad reach and the high level of brand or corporate exposure that can be gained through the process (Yong Jae et al, 2008). One reason for the increase in sports sponsorship expenditure is that sponsorship can contribute to reaching large and diverse audiences—for example, the 37 billion television viewers of the 1998 FIFA World Cup (Lardinoit & Derbaix, 2001). According to a recent survey, a second reason driving investment in sports sponsorship is that nearly three-quarters of corporate sponsors of sport have been generally satisfied with their relationships with sports leagues, teams and organizations (Yong Jae et al, 2008). Now that most of the sports leagues specially soccer have become professional and attract a lot of people, a competition has been formed among companies for sponsoring the events and famous sports club. Nowadays sponsorship is a essential part of incomings in sports club. Fans pay attentions to the product which the name of it's company as a sponsor is been curved on the shirt of their favorite team. Fans consider the products of their team’s sponsor more attractive than the same one. On the other hand, sponsoring the events by big companies can help both sports club and sponsors succeed and benefit from this deal (Eshghi,2009). In light of the phenomenal growth of sports sponsorship, understanding sponsorship effectiveness has become increasingly important for both sports marketers and sponsors. Sport sponsorship is often attractive to corporations because sporting events, especially those produced within the same league or association (i.e., NFL, NBA, NCAA), provide a highly involved, passionate, and loyal audience that is comprised of individuals with similar demographics. Therefore, creating unique marketing messages to target these specific audiences is time efficient and cost effective (Dees et al,2008). Sponsorship is also appealing to the firm because it can be used to link consumers to sponsoring brands, using the sporting event as the tie, or association, and influence consumers to form positive brand images or make purchases from these corporations. Ideally, sponsoring firms would like the fans of a particular event to equate or connect positive feelings for the property to their brands or specific products and services (Meenaghan, 2001), a process often operationalized as image transfer. Thus, many corporate sponsors seek to develop, improve, or change their brand image by associating their company or brand with a specific sporting event. Other marketing objectives that can be accomplished through sponsorship endeavors include generating goodwill within the target audience (Meenaghan, 2001), fostering positive attitudes toward the brand and increasing consumer purchase intentions (Dees et al,2008).
2. Statement of Problem

Due to the fact that commercial sponsorship has become a major form of marketing communication, it is necessary to continually study this phenomenon in an effort to determine its impact on consumers and their perceptions of commercial sponsors and their products and services. There is a plethora of original research, position papers, and theoretical manuscripts exploring the topic of advertising effectiveness. While there is a wealth of scholarship on sponsorship, a relative paucity of original research exists on the effectiveness of CS. An even greater disparity exists regarding the relationships between key variables of sponsorship effectiveness (i.e. Sport involvement, Brand awareness, Corporate image and Purchase intentions). Nowadays most of the companies want to evaluate the effectiveness of their marketing activities to make a better decision. Unfortunately a few studies have been conducted that attempt to evaluate sponsorship effectiveness in Iran. Consumer sports involvement, brand awareness, corporate image and purchase intentions need to be measured in the context of sponsorship effectiveness. However, only a few sponsorship effectiveness studies have done so. Although companies spend a lot of moneys to return their investments, but they have problem in measuring their marketing activities effectiveness. In this study the effectiveness of sport sponsorship among football fans (Persepolis and Esteghlal fans) in Iran is measured by analyzing the constructs of sponsorship effectiveness.

With due attention to the firms attitude towards sports sponsorship and their success in reaching their goals, Iranian companies want to support sports clubs or events, but a few studies have been conducted to examine how these activities influence target market and how to measure the effectiveness of these activities. Sports involvement, brand awareness, corporate image and purchase intentions are the main factors of measuring sports sponsorship effectiveness (Yong Jae et al, 2008). we want to study these factors and the theoretical relationships between them. The level of sports involvement, brand awareness, corporate image and purchase intentions among football fans in Iran and the theoretical relationships between these factors have not been examined in any researches. Lack of information in this context is clear in Iran and we want to resolve these requirements. Therefore the main question of this research is: Is there any significant relationships between key variables of sponsorship effectiveness (i.e. Sport involvement, Brand awareness, Corporate image and Purchase intentions)?

While previous research has advanced our understanding of single variables, a more complete understanding of sponsorship effectiveness requires assessment of more complex relationships among the key variables. Additionally, many scholars have attempted to evaluate sponsorship effectiveness. However, most have concentrated largely on the use of a single variable such as consumer awareness or effect of sponsor image as a predictor of sponsorship effectiveness. The objectives of this study are:

1. To evaluate the communication process of sponsorship and the consumer responses to that.
2. To recognize and investigate the factors of measuring the effectiveness of sports sponsorship.
3. To assess the theoretical relationships between key variables of sport sponsorship effectiveness.
4. To investigate how sponsorship works in the minds of consumers.
5. To offer a framework to managers so that they can evaluate the activities of sports sponsorship via that.
3. Literature review
A few studies have been conducted in the context of sponsorship specially sports sponsorship in Iran compared to outside of Iran. Some of the sport sponsorship studies in Iran are as follows:

- **Evaluating effectiveness of sport sponsorship among football fans in Iran** is one of the numerable studies about effectiveness of sport sponsorship in football leagues of Iran that was conducted by Kamran Eshghi in 2009. This study evaluated the effect of sport sponsorship on five important variables of consumer maturation process. The results indicated that sport sponsorship enhanced the corporate image, increased the probability of purchase intention and loyalty of fans to the company and its’ product but it did not increase brand awareness and liking of company and its’ products.

- **Describing the marketing mix elements in football industries of Iran compared to some Asian countries (South Korea & Japan) and offering a theoretical model** is the title of a PhD thesis that was conducted by Reza Mohammadkazemi in 2007. In this research four elements of marketing mix in football industries were measured and compared to South Korea & Japan and ultimately a model was suggested to use these four elements in football industries.

- **Strategic assessment of sport sponsorship as a marketing communication tool in electronic industries of Iran** (Faed, 2007): The purpose of this research is to achieve a better understanding of how and why companies in the electronic industry get involve in sports sponsorship, also the thesis describes the varieties of objectives when involving in sports sponsorship also the process of sports selection as well as the evaluation approaches that are related to the electronic brands.

- **Describing the factors that effect on corporate sponsors of Iran’s professional football in sponsorship attraction** (Eezadi, 2004): This study was conducted in the context of sponsorship in Iran’s football league by Eezadi at Tarbiat Moallem University. He believed that one of the ways of providing sufficient budget for doing sports activities specially championship activities was attracting companies and organizations as sponsors or financial supporters. He noted that commercial advertising was different from sports sponsorship, because sponsorship is an indirect part of sport marketing. The purpose of this research is to describe sponsorship goals of corporate sponsors of Iran’s professional football. The results of this study indicated that football sponsorship in Iran could partly help the firms access to the target markets and competitive advantages against the competitors.

A lot of studies have been conducted in the context of sponsorship specially sports sponsorship in outside of Iran specially in Australia, Ireland, America. One of the most famous researchers in this context is Tony Meenaghan who has provided a lot of articles in the context of sponsorships. Some of these are as follows:

- Commercial sponsorship (1983)
- Sponsorships-Legitimaizing the medium (1991)
- The role of sponsorship in marketing communications mix (1991)
- The effect of medium on Commercial sponsorship (1999)
- Understanding sponsorship effects (2001)

In above researches Tony Meenaghan points out the sponsorship totalities and sponsorship effects on target market and offers some models to evaluate sponsorships effectiveness and
communicate with other marketing factors. Other researchers have also conducted important and effective studies in this context. Some of these studies are as follows:

- **Measuring the Effectiveness of Sponsorship of an Elite Intercollegiate Football Program (Dees, Bennett & Villegas, 2008):** In this study the sponsorship of an elite intercollegiate football program was evaluated by analyzing the effects of the constructs of attitude toward the sponsor, goodwill, and fan involvement on consumer purchase intentions. The results of this study indicate that although attitude toward the sponsor and fan involvement are important facets of sponsorship effectiveness, goodwill may be one of the keys to transforming avid fans into loyal consumers and has the most impact on consumers' intentions to support the corporate sponsors via purchasing behaviors.

- **The Evaluation of Sponsorship Effectiveness: A model and some methodological considerations (Pham, 2000):** In this study the Evaluation of Sponsorship Effectiveness has been discussed. The most emphasis of this research is on corporate image and brand awareness. A theoretical model for the objectives of these two dimensions (i.e., Image & Awareness) was suggested that indicated the communication process of sponsorship and the consumers' responses to that. Generally the purpose of this study is to offer a framework to managers so that they can evaluate the activities of sports sponsorship via that.

- **The Effects of Consumer Knowledge on Responses to Event Sponsorships (Roy & Cornwell, 2004):** Roy and Cornwell stated that the effect of consumer knowledge on responses to sponsorships has received considerably less research attention. This research refers to the difference of events information between experienced consumers and inexperienced consumers and discusses if there is any differences between these two groups and also if there is any congruencies between sponsor and event. 6 sponsors and events were selected for this purpose and the congruency was evaluated among them.

- **Corporate sponsorship: The measurement of effectiveness** is the title of a thesis that was conducted by Glaser & Rum in Canada. The purpose of this study is to investigate the sponsorships and difficulties of measuring effectiveness. Glaser and Rum investigated the history of sponsorships and methods of measuring sponsorship effectiveness and expressed the sponsorship goals of firms. Finally they concluded that assessing the sales and purchase intentions are two appropriate scales for measuring the effectiveness of sponsorships.

- **Sport Sponsorship Management: Major Australian Sponsor Practices in Objective Setting and Measurement** is the title of a study that was conducted by Kara in Australia. The purpose of this research is to examine the sponsorship management practices of Major Australian Sponsors. This study emphasizes on the objectives of these firms and the tool that they use to evaluate their practices effectiveness.

**4. Research model**

While various researchers have attempted to measure sponsorship effectiveness, there has been no consistency with respect to the predictor variables and outcomes being measured (Cornwell, 1995). In addition, assessing sponsorship effectiveness based on single variables may not be sufficient due to the complex nature of the process of developing perceptions about a sponsorship.
It has been suggested different models to study sponsorships specially sport sponsorship effectiveness. The researchers have not reached any consensus about sport sponsorship effectiveness, because this field is on its’ primary ages. One of these models that have been agreed by experts is a model provided by Yong Jae et al. This research model was used to delineate the relationships among the four constructs (i.e. sports involvement, sponsor awareness, corporate image and future purchase intention) of sponsorship effectiveness (see Figure 1). Figure 1 illustrates the hypotheses that fan sports involvement directly affects awareness, image and purchase intention. Heightened levels of awareness and image predict a higher level of purchase intention. Corporate image is directly influenced by sponsor awareness. Each construct is discussed next followed by pertinent research hypotheses.

**Figure 1: The relationships among the constructs of sponsorship effectiveness (Yong Jae et al, 2008)**

1.1 Fan sport involvement

A consumer's sports involvement is defined as "the perceived interest in and personal importance of sports to an individual" (Shank & Beasley, 1998, p.436). Highly involved consumers are those individuals who are often most knowledgeable about their favored event, team, or player (Meenaghan, 2001). These individuals are generally aware of the sponsor and whether or not that sponsor is helping or hindering the progress of the sport (Dees et al, 2008). The level of a consumer's involvement provides a powerful explanation of social behavior, as witnessed in the adulatory responses to rock music stars and the fanatical loyalty of sports fans (Meenaghan, 2001). Depending on how involved consumers are with their favorite sports or other events (such as the arts), they can establish a range of relationships with the commercial sponsors (Dees et al, 2008). Because the target market of corporate sponsors is the sports consumer who watches and participates in sponsored sporting events, consumer sports involvement needs to be measured in the context of sponsorship effectiveness (Yong Jae et al, 2008). Fan involvement is an integral construct when assessing the effectiveness of commercial sponsorship, because the various emotional levels of commitment fans have with the sponsored event will affect how attentive they are to that event's sponsors (Dees et al, 2008).

Shank and Beasley (1998) developed a Sports Involvement Scale (SIS) that consists of cognitive and affective dimensions of sports involvement. These two dimensions were evaluated relative to...
viewing sport on television, reading about sport in magazines and newspapers, attending sporting
events and participating in sport.
Current sponsorship literature supports the idea that consumer sports involvement plays an
important role in determining the overall effectiveness of sports sponsorship (Lardinoit &
Derbaix, 2001; Lascu et al, 1995; Levin et al, 2001; Meenaghan, 2001; Pham, 2000 ;Yong Jae et
al, 2008). Research indicates that highly involved consumers are most likely to develop an
awareness of sponsors and a positive image of them (Lascu et al, 1995; Levin et al, 2001
;Meenaghan, 2001; Pham, 2000; Yong Jae et al, 2008). For example, Meenaghan (2001), in his
focus group interviews, found that increased event or fan involvement in a particular sponsored
activity evoked a positive emotional orientation towards the sponsor. These results were further
supported by Lascu et al (1995) in their golf sponsorship research. The authors found that there
is a positive relationship between golf spectators' involvement and their ability to identify
sponsors of a golf tournament. Spectators at a Professional Golfers' Association of America
(PGA) tournament who had a high level of involvement with golf could correctly name the
major official sponsors. Similarly, Levin et al (2001) found that individuals who had higher
levels of involvement with the National Association for Stock Car Auto Racing (NASCAR) were
more influenced by marketers' sponsorship activities. Therefore, it is expected that:

**H1: Consumer involvement has a direct positive effect on sponsorship awareness.**

Several studies have found that consumers with high involvement were more likely to buy the
sponsor's products and expressed a strong preference for the particular sponsor's product (e.g.
Dees et al,2008; Yong Jae et al, 2008). The results suggest that future purchase intention can be a
strong indicator of sponsorship effectiveness, particularly when a corporate sponsor participates
in sports events targeted at sports fans who share a unique identity (Yong Jae et al, 2008). In
sum, involvement has a direct positive influence on consumer awareness and perception of a
sponsor's corporate image which is likely to contribute to future purchase intentions (Dees et
al,2008; Turco, 1995; Yong Jae et al, 2008). Accordingly, the next two research hypotheses are:

**H2: Consumer involvement has a direct positive effect on perceptions of corporate image.**

**H3: Consumer involvement has a direct positive effect on intention to purchase a sponsor's
product.**

1.2 **Brand awareness**

Brand awareness is defined as "brand recall and recognition performance by consumers" (Yong
Jae et al, 2008). Generally three levels of brand awareness are recognition, brand recall and top
of the mind (Aaker,1991). In measuring brand awareness, unaided recall and aided recall
(recognition) of sponsors are used (Lardinoit & Derbaix, 2001). Sports sponsorship researchers
often use recall methods to assess awareness of a sponsor's brand. Unaided recall tasks are
considered to be a more appropriate measure than recognition tasks because they require the
respondent to retrieve the sponsor's name from memory rather than by recognising their brand
name from a list (Yong Jae et al, 2008). Recall increases as a function of duration of exposure to
sponsors, previous brand awareness of sponsors, message length and design, sociodemographic
variables of the spectators and interest in the event sponsored (Walliser, 2003).
A review of the sponsorship literature indicates that the primary objectives of corporate sponsorship are (a) increasing brand awareness, (b) enhancing corporate image (Meenaghan, 1991) and (c) increasing sales and market share (Yong Jae et al, 2008). Both brand awareness and corporate image have been used as indicators of whether a sponsorship deal achieved the communication objectives sought through sponsorship involvement (Meenaghan, 1991; Yong Jae et al, 2008).

Sponsorship awareness has a positive effect on corporate image (Turco, 1995; Yong Jae et al, 2008). The researchers found that individuals who could recall sponsors had stronger beliefs (i.e. a more positive image) about sponsors than those who could not recall sponsors. Corporate sponsorship can enhance corporate image, particularly when the company has a positive image before participating in the sponsorship. Corporate sponsorships might exacerbate a negative image if consumers hold prior negative perceptions (Yong Jae et al, 2008).

H4: Sponsorship awareness has a direct positive effect on corporate image.

H5: Sponsorship awareness has a direct positive effect on intention to purchase a sponsor's products.

1.3 Corporate image

Corporate image is defined as "the positive or negative image of a particular company or brand that is formed in mind of consumers" (Eshghi, 2009).

Corporate image is the impressions of a particular company held by some segment of the public. Sport encompasses a rich range of values and symbols that can be expressed in image. The image of sport and/or a sports organization has the potential to influence the behavior of all those involved with a sports organization, including its members, spectators and sponsors (Yong Jae et al, 2008).

Although enhancement of corporate image is one of the most important communication objectives for corporate sponsors, image-related evaluation has received considerably less research attention (Turco, 1995) than brand awareness. Additionally, previous research has not been consistent in terms of the method used to measure the effect of corporate image. For example, in some studies, consumers' attitude towards sponsors was measured to evaluate corporate image (Dees et al, 2008; Turco, 1995). However, other scholars have suggested that to measure corporate image correctly it is necessary to measure specific 'qualitative' characteristics of a company's personality rather than measuring a consumer's overall attitude towards corporate sponsors (Yong Jae et al, 2008). Furthermore, while some researchers measure corporate image (Turco, 1995), others measure brand image as an indicator of sponsorship effectiveness. Although brand (i.e. product) image is an important indicator of sponsorship effectiveness, one of the ultimate goals of sponsorship involvement is to enhance overall positive image of corporate sponsors. Accordingly, in this study, we focus on overall corporate image of sponsors and thus measurement of a relatively long-term and broader effect of sponsorship rather than short-term enhancement of a single brand image.

In an empirical study, Turco (1995) found that customers with a more favorable image of a sponsor were more likely to purchase that sponsor's products than those with a less favorable image. Similarly, Dees et al (2008) examined the impact on consumer purchase intentions of attitude toward sponsors, goodwill and fan involvement. Therefore, it is hypothesized that:
H6: Corporate image has a direct positive effect on intention to purchase.

1.4 Purchase intention

The final construct in this model is a consumer's future intention to purchase a sponsor's products. Most studies concerned with the prediction of human behavior from attitude have relied on the theory of planned behavior and the theory of reasoned action. People act in accordance with their intentions and perceptions of control over their behavior: intentions are influenced by attitudes towards the behavior, perceptions of behavioral control and subjective norms (Yong Jae et al, 2008).

A significant number of studies have shown that attitudinal variables are important predictors of behavioral intentions (e.g. Aaker, 1991). Attitude towards advertising is one of five antecedent variables (i.e. ad credibility, perceptions of ads, attitude towards the advertiser, attitude towards advertising and mood) that may influence attitude towards a specific advertisement. Attitude towards the advertisement then has a significant and positive influence on attitude towards the brand. Attitude towards the advertisement indirectly affects purchase intention through attitude towards the brand or acts as an important mediator variable on brand choice (Yong Jae et al, 2008).

The relationship between intention and actual behavior has been supported by previous studies focusing on condom use, dieting and voting. Clearly, intentions play an important role in guiding behavior. However, to date, only a few sponsorship studies have examined sports consumers' future purchase intentions, that is, the sales objective of corporate sponsorship (Yong Jae et al, 2008). Howard and Crompton (1995, 2004) noted that stages in the communication process could be measured to evaluate sponsorship effectiveness. This approach, as observed in the advertising research, suggests that individuals go through a series of stages from first becoming aware of a company to finally making a purchase decision. More specifically, potential customers move from awareness to interest to intent to purchase before investing in a sales action. "Hence, intent to purchase studies are the most useful indicators of the impact of sponsorship on future sales" (Howard & Crompton, 1995, p. 363).

5. Methodology

According to Fade (2007), research can be divided in to three different categories of studies. Choosing the analytic strategy for a research will help the researcher treat evidence fairly, produce compelling analytic conclusions, and rule out alternative interpretations. The different types of studies are: exploratory, descriptive and explanatory studies (Faed, 2007).

In view of the fact that we want to gain a better understanding of sport sponsorship effectiveness, our study is to some extent exploratory. The study is also descriptive because we portray the key variables of sport sponsorship effectiveness and theoretical relationships between them. The study is also partly explanatory because it focuses on football fans to try to explain relationships between key variables of sport sponsorship effectiveness.

Given the fact that the purpose of this research is to find out football fans’ attitudes, a builds research questionnaire has been used for gathering the data.

The validity and reliability of expected responses to the questionnaire were evaluated using a panel of experts and an internal consistency measure (Cronbach, 1951). The content validity of the initial survey was evaluated first by a panel of experts who were asked to judge the items' content validity. The panel consisted of two management professors and one sport management
professor. The experts were asked to comment on the relevance, representativeness, and clarity of items and provide suggestions for improving the questionnaire. Reliability measures were calculated for each of the four variables of the instrument. For the four items constituting consumer sport involvement, $\alpha = .908$. For the three items constituting brand awareness, $\alpha = .863$. For the six items constituting corporate image, $\alpha = .822$. For the three items constituting purchase intentions, $\alpha = .902$. Therefore, coefficient alpha reliability tests run for each factor satisfied Nunally's (1978) criterion of .60 or higher as a standard for an exploratory research study. The total Reliability of the questionnaire was $\alpha = .922$

The questionnaire that was made by the researcher included 16 questions and measured consumer sport involvement, brand awareness, corporate image and purchase intentions. The first section of the questionnaire was related to the demographics of the respondents. There were three items on brand awareness and purchase intentions, four items on consumer sport involvement and six items on corporate image. This amounted to 16 total items measuring the variables of sport sponsorship effectiveness. All of the variables in the analysis were measured using a five-point Likert scale ranging from 5 (Strongly agree) to 1 (Strongly disagree). Table 1 displays the list of questionnaire items for each variable in the study.

After collecting the questionnaires, some questionnaires were excluded because of being incomplete and lack of cooperation of fans which in final 384 complete questionnaires [192 Persepolis fans and 192 Esteghlal fans] were used as the sample of this study.

The data analysis in the study included descriptive statistics (i.e. means and standard deviations), reliability measures and regression analysis. Also the analysis of data were in significant level $p<0.05$ by using software SPSS 16. The overall means of sponsorship effectiveness factors were 5.48 (involvement), 3.23 (image), 3.54 (awareness) and 3.02 (purchase intention), and standard deviations ranged from .73 to 2.90.

6. Results
The demographic variables analyzed in this study were gender, age and education level. Of the 384 respondents, 66% (n=254) were male and 34% were female. The majority of the respondents were between 15 and 29 (57.7%) and 30 and 55 years old (27.2%). The majority of the respondents were highly educated (high school, 3%; high school graduate, 3%; college graduate, 25%; university or higher, 69%).

A regression analysis was conducted to answer the 6 research questions that probe the theoretical relationships between the key variables of sport sponsorship effectiveness (i.e. Sport involvement, Brand awareness, Corporate image and Purchase intentions). The results are displayed in table 2.

Hypothesis 1 regression analysis ($R=0.534$, $\beta=0.367$, Sig=0.3) indicates that sport involvement has a direct positive effect on brand awareness and the effect of sport involvement on brand awareness is significant at $p < 0.05$ level. According to the results of Hypothesis 2 regression analysis ($R=0.641$, $\beta=0.389$, Sig=0.0), sport involvement has a direct positive effect on corporate image and the effect of sport involvement on corporate image is significant at $p < 0.05$ level. According to the results of Hypothesis 3 regression analysis ($R=0.549$, $\beta=0.433$, Sig=0.0), sport involvement has a direct positive effect on purchase intentions and the effect of sport involvement on purchase intentions is significant at $p < 0.05$ level. According to the results of Hypothesis 4 regression analysis ($R=0.610$, $\beta=0.524$, Sig=0.0), brand awareness has a direct positive effect on corporate image and the effect of brand awareness on corporate image is significant at $p < 0.05$ level. According to the results of Hypothesis 5 regression analysis ($R=0.641$, $\beta=0.700$, Sig=0.0), brand awareness has a direct positive effect on purchase intentions and the effect of brand awareness on purchase intentions is significant at $p < 0.05$ level. According to the results of Hypothesis 6 regression analysis ($R=0.635$, $\beta=0.825$, Sig=0.0), corporate image has a direct positive effect on purchase intentions and the effect of corporate image on purchase intentions is significant at $p < 0.05$ level.

7. Discussion

The present study was conducted to examine theoretical relationships among the four constructs (i.e. sports involvement, sponsor awareness, corporate image and future purchase intention) of sponsorship effectiveness. Results of the regression analysis generally support the hypothesized relationships. Hypotheses 1, 2 and 3 predicted that sports fan involvement would have a direct and positive influence on sponsor awareness, corporate image and consumers' future purchase intentions. Regression analysis between involvement & awareness (R=0.534, β=0.367, Sig=.03), involvement & image (R=0.641, β=0.389, Sig=.0) and involvement & intention (R=0.549, β=0.433, Sig=.0) provided empirical support for these hypotheses. The results support previous findings that highly involved consumers are more likely to be aware of sponsors (Lardinoit & Derbaix, 2001; Lascu et al, 1995; Yong Jae et al, 2008). The results also indicate that increased event or fan involvement in a particular sponsored activity will evoke a positive emotional orientation towards the sponsor and highly involved consumers are more likely to develop a positive image of the sponsors (Turco, 1995; Yong Jae et al, 2008). In addition, these highly involved consumers are likely to report an intention to purchase sponsors' products (Dees et al, 2008; Yong Jae et al, 2008). According to the results of this study, individuals who described
themselves as loyal and dedicated fans of the team or event were much more likely to purchase or consider purchasing from sponsors than those who were not avid fans. This substantiates previous studies indicating that highly involved or loyal fans purchase more sponsors’ products and services than casual fans (e.g. Dees et al, 2008; Yong Jae et al, 2008).

On the other hand, Pham (2000) suggested that sports involvement may have a directional property. He found that spectator involvement during a soccer game had a curvilinear (i.e. inverted-U) effect on the recognition of embedded billboards. In this case, as involvement to process the event reaches high levels, attention becomes more focused on the relevant sources of information (e.g. the game itself) and away from irrelevant information such as sponsorship stimuli. Accordingly, people highly involved in sport are no longer willing to process irrelevant billboards while watching a soccer game. Thus, timing of sponsorship activities may be another important aspect of involvement that should be considered in future research. Additional variables for future research might include knowledge and social alliances of consumers, as suggested by Cornwell et al (2005). Additionally, the link between purchase intention and actual purchase behavior needs to be more fully explored in the sports sponsorship context. Further empirical investigation of involvement in the context of sponsorship effectiveness might contribute to a greater understanding of this relationship.

Hypothesis 4 predicted that fans who are aware of sponsors are likely to develop a positive image of the sponsoring companies. The results of regression analysis (R=0.595, β=0.524, Sig=0) confirmed that there is a positive relationship between these two salient sponsorship variables. The results support the findings of Yong Jae et al (2008) that individuals who recall sponsors have stronger beliefs (i.e. positive images) about sponsors than those who cannot recall sponsors.

Hypotheses 5 and 6 predicted that favorable purchase intentions are likely to occur for consumers who are aware of sponsors and hold a positive image of them. The highest correlation coefficient between image and intentions (.63) suggests that image is the most significant predictor of sports fans’ intention to purchase sponsors’ products. These results support previous research findings that customers with a more favorable image were more likely to purchase a sponsor's products compared to those with a less favorable image. Interestingly, however, the result supported that consumers' awareness of sponsors directly influenced their future purchase intention. The significant impact of image on future purchase intention may suggest that corporate image is a better predictor of sponsorship effectiveness than sponsor awareness when we consider future purchase intention as an ultimate dependent variable of sponsorship.

The findings here should be interpreted with caution, for two reasons. First, fans may be aware of corporate sponsors of a sports event, this awareness might not increase purchase intention if fans do not have a positive image of those sponsors. This supports a recent argument that sponsor identification responses may be a judgment task as opposed to a strict memory task, that is, sponsor identification involves a substantial degree of constructive processes that capitalize on general characteristics of the brand such as their perceived relatedness, prominence and general involvement in sponsorship. (Yong Jae et al, 2008)

Second, intention to purchase sponsors’ products was determined in a general fashion; the specific questions were not repeated for each sponsor recalled. Overall, this study contributes to the field of sponsorship research by extending our understanding of key variables of sponsorship effectiveness and their relationships. Future research should include analysis of sponsor impact on sponsor image as well as the role of sponsor image in evaluating sponsorship effectiveness.
The results of this study also have practical implications for corporate sponsors and sports organizations. One of the most important goals of sponsorship is to develop an association between sponsors and sponsored properties. Although exposure to a brand through such vehicles as on-site signage may increase awareness, awareness alone may not achieve the full potential of sponsorship effectiveness (Cornwell et al., 2005). The results of this study suggest that to maximize sponsorship effectiveness, corporate sponsors should go beyond brand awareness efforts and develop more effective marketing strategies geared to enhance consumers' positive perception of sponsors' image.

According to the results of this study that indicates consumer involvement has a direct positive effect on sponsorship awareness, perceptions of corporate image & intention to purchase a sponsor's product, it is suggested that sponsors should consider passionate and devoted fans when creating marketing messages and they should be the target of most sport marketing activities.

It is also suggested that sponsors should develop brand association with sports events that are particularly targeted at sports consumers with a unique identity. Participants in the current study were highly involved loyal fans of soccer events and most particularly their national team. This type of mega-event held in a unique culture provides corporate sponsors with an opportunity to maximize their sponsorship effectiveness due to the high level of interest and identification among the target public.

8. Limitations and Future Research

There were several limitations that took place in the course of the study. First, this was a web-based survey and participants had to complete the questionnaire on-line. Additionally, the fact that a computer and internet access were necessary to participate may have contributed to the age distribution of the sample. The young adults who participated may have been more comfortable completing the questionnaire using the requisite technology. Second, in order to measure sponsorship effectiveness of a global event such as a World Cup soccer event, a broader sample should be selected from various countries. Convenience sampling using a sample within one geographic location limits our ability to generalize our findings. Finally, to further validate the model it will be necessary to conduct follow-up studies in other sports sponsorship contexts such as the Olympics and various other national and regional sporting events. Further research should examine the constructs of attitude toward sponsor and goodwill and their relationships to purchase intentions and additional constructs. The study of sponsorship effectiveness in other settings is also a suggestion for future research. Since sports at the various levels receive different finding, attract different demographics, and provide different forms of entertainment, it would be very interesting to study how corporate sponsorship is sold, who buys it, who is exposed to it, and how effective it is in each of these diverse settings. It would also be advantageous to further analyze the various constructs with different measurement designs, especially structural equation modeling or path modeling to determine more scientifically the relationships of these constructs. Additionally, a larger sample, increased minority participation, and further analysis of the constructs' reliability and validity would ideally need to be addressed. Future research should also include an in-depth investigation of highly involved fans, such soccer, and action sports enthusiasts. These types of consumers tend to be so vested that they represent the pinnacle of fan involvement. Therefore, their responses to corporate sponsorship may differ greatly from the average sport or leisure consumer.

Abstract
Higher education is considered one of the most important elements in the society in every country; the kind of the dominant leadership in the university is very significant. Servant leadership style is one of the styles of leadership that has been focused on during recent years. The basis of this theory is to value equality of human beings, concentrate on followers and satisfy their needs. The objective of the present survey is to determine and match servant leadership's components in view of management texts and Imam Ali’s tradition in Najafabad Islamic Azad University. Two separate questionnaires were designed and distributed in order to perform this survey. By comparing the average score of servant leadership characteristics, the results implied that all characteristics except commitment to growth of people were higher than the average level in view of management texts. In viewpoint of Imam Ali’s tradition all characteristics except encouragement were higher than the average level. Average comparison of servant leadership characteristics in terms of demographic characteristics revealed that the observed F about conceptualization and commitment to growth of people based on educational degree, and awareness based on working experience has been significant in view of management texts. Observed F about foresight, stewardship, commitment to growth of people, conceptualization and building of integrated communities based on educational degree has been significant in view of Imam Ali’s tradition.

Key words: Leadership; Servant Leadership; Imam Ali’s tradition

1. Introduction
Leadership has always been intertwined with human beings from the beginning of creation. The subject of leadership has gained more importance due to passing of time and human changes, and most of the clear-sighted expertson of management and organization regard the twenty-first century as the leadership century for organizations. Leadership has a special position in every organization but it is more significant in an institution like university which is the source of great scientific, social and cultural changes in every society. because managers who will be the future leaders in different organizations and various posts are trained there. Today various leadership styles are applied in different organizations of the world but it could certainly be said that servant leadership style has a wide application in all kinds of organizational environments, and many organizations have utilized this style in recent years in order to manage their organizations. This confirms Greenleaf’s claim (servant leadership is a leadership style for all social institutions). According to Nair, although leadership idea has ruled over our minds from the past, we haven't yet achieved a high standard of leadership. We should place serving in the center and core of leadership. Power has always been related to leadership but it should be kept in mind that power
has just a legal and accurate usage, serving (Rusell and Stone, 2002:145). Many scholars have expressed their views about servant leadership, and all have emphasized that the basis of servant leadership style lies in giving value to equality of human beings, concentration on followers and satisfaction of their needs; and through this, individual development of members of the organization is materialized. All humans are equal in Islam's viewpoint and serving people is among the highest actions and worships, as in some narrations serving has been stated as one of the main characteristics of a Muslim. Imam Ali (peace be upon him) says: "avoiding benefaction to people is the calamity of power" (Gherar al-Hikam and Dorar al-Kilam). Imam Khomeini, The founder of the Islamic Republic of Iran has repeatedly stressed upon the necessity of serving and rendering services to people. In this regard he says: "all of us should be servants of people and it is our honor of us is to serve the God's people… I feel better if I am called a servant rather than the leader" (Imam Khomeini, Sahifeh Noor, volume 9: 76 and 456).

Due to the closeness and conformity of principles of servant leadership style with the teachings of Islam, it appears that performing a comparative evaluation in this regard could be effective in explaining, developing and compiling of leadership model and style according to Islamic culture and ideology.

2. Objectives of research

1- Studying and matching components and characteristics of servant leadership in viewpoint of management texts and Imam Ali’s tradition.
2- Determining the extent of servant leadership in view of management texts and Imam Ali’s tradition in Najafabad Islamic Azad University.

3. Research questions

1- To what extent do the indices of servant leadership exist in Islamic Azad University in view of management texts and Imam Ali’s tradition?
2- Is there a difference between indices of servant leadership in view of management texts and Imam Ali’s tradition based on demographic factors?

4. Research methodology

This research is descriptive-metrical and the studied population includes managers and employees of Najafabad Islamic Azad University. Estimating the sample number was carried out based on the formula and through classification proportional to the volume that one-hundred and fifty (150) individuals were considered. Historical study was used to collect one part of data and researcher self-made questionnaire was applied for field studies. The above questionnaire was prepared in two sections with fifty-five (55) questions according to likert five-option spectrum. The first section included twenty-three (23) questions to measure the characteristics of servant leadership in view of management texts and the second section consisted of thirty-two (32) questions to measure the characteristics of servant leadership in view of Imam Ali’s tradition. Reliability of the questionnaire was examined based on the primary study and pre-test, so questionnaires were first distributed randomly among thirty-five (35) employees of Najafabad Islamic Azad University and twenty eight (28) questionnaires were returned. After data analysis and by means of Cronbach alpha coefficient the validity of the questionnaire was estimated (the questionnaire for studying the characteristics of servant leadership in view of management texts) 0.987 and (that for studying of characteristics of servant leadership in view of Imam Ali’s tradition) 0.968 . In addition to measurement of total reliability of the questionnaire, the reliability of each characteristic of servant leadership was measured, too. The amount of Cronbach alpha higher than 75% showed high reliability of questionnaires. One variable t-test and F-test were used to study and analyze the collected data, and SPSS software was applied for data analysis.
5. Research background

Results obtained from studies conducted by some researchers in the country demonstrate that patriarchal leadership dominates servant leadership in governmental organizations in Iran and ignorance of followers' role in the organization has led to weakness of organizational effectiveness (Norouzi, 2008).

Another research titled "adaptation of managers' behavior with indices of servant leadership and its effect on employees' confidence level" that has been done at Ferdowsy University in Mashhad reveals that the more the adaptation of managers' behavior to indices of servant leadership, the higher the organizational confidence of employees (Khojaste Boujar, 2010).

Studies that have been performed by some foreign researchers in institutes and schools of higher education imply that institutions in which servant leadership style is executed act more successfully than others (Murray (2008), McClellan (2008), Vidic (2007), Lcon (2005) and Carraway (2003)).

6. Leadership in viewpoint of Islam

Existence of a leader and guide for every nation is essential in viewpoint of Islam and the Holy Koran. According to verse 7 of Al-Raad, the sura existence of a leader and guide is necessary for every nation.

Necessity of existence of leadership has repeatedly been referred to in the Prophet and Imams' tradition and especially in eloquent sayings of Imam Ali (peace be upon him). The holy prophet says: when there are three passengers on a trip, one of them must undertake the group leadership (Kanz Al-Ummal, volume 6:717). Regarding the necessity of existence of a leader for the society, Imam Ali (peace be upon him) says: "O people! Know that your interests are provided only by having a government and a leader, whether he is beneficent or maleficent (description of Nahj al-Balagha, Ibn Abi Al-Hadid, volume 2, page 307).

7. Serving in Islam's viewpoint

Serving has an extensive and wide concept. It is much recommended in Islamic culture and education directly or indirectly so that in Islam's viewpoint the most valuable individual is the one who is the most useful for others (Nahj al-Fasaha:315). In other words, there is a direct relationship between serving people and the individual's spiritual value and grade in Islam.

The holy prophet considers usefulness and serving people beside having faith in God as the standard of human's value and says: "faith in God and to serving people are two good traits and there is nothing better than them" (Bihar al-Anvar, volume 137:74).

8. Boundary of serving

Islam doesn't specify a limit or boundary for serving and doesn't differentiate between Muslims and non-Muslims. In other words, serving human beings and creatures of God is a desirable and competent action in view of Islam. The holy Prophet says: "after faith in God, philanthropy and doing good to people are the best of all reasonable actions, whether people are good and beneficent or wicked and libertine" (al-Mustadrak, old edition, volume 8:67). Imam Ali (peace be upon him) says: "goodness and doing good to people are the highest steps of faith" (Gherar al-Hikam and Dorar al-Kilam, volume 2:1154).

9. Background of servant leadership

Greenleaf stated the term servant leadership for the first time in his impressive article titled "servant in the role of leader" in 1970. After that time the concept of servant leadership has had a deep and stable impact on many modern theories and methods of management and leadership.
The result of his experiences and findings during half a century has been reflected in an article titled "servant in the role of leader". According to him, accurate leadership starts from deep tendency to help others, and leaders act as servers in order to satisfy necessary needs of employees and customers, and the society acts as a servant. Servant leadership in the first phase starts from the individual's natural feeling for service and then deliberate choice leads him towards servant leadership (Spears, 2004:9).

10. Definitions of servant leadership
Servant leaders emphasize serving others, and sacrifice their personal interests for others' interests so that people would enjoy more knowledge, authority and health and are changed to servant leaders (Greenleaf, 1971). Servant leadership is the leader's perception and action in a way so that he prefers others' interests to his personal tendency and interest (Luob, 2004). Servant leadership values humans' equality and looks for individual development of the members of the organization (Russel, 2002).

11. Fostering servant leadership
Many individuals and organizations have accepted servant leadership as a strategic philosophy that suggests an elevation method and tool for individuals like spiritual, professional, sensational and mental growth. Strong power of servant leadership leads to encouraging all individuals to search actively for opportunities of serving and guiding others and so begins enhancement of life's quality across the society. An increasing number of companies such as Toro Company, Synovus Financial Corporation, Servis Master Company, South-West airlines and TD Industries have adopted servant leadership as a part of the company's philosophy or as the basis of their apostolate statement. TD Industries, a contracting company of temperature and plumbing is one of the first users of servant leadership. It is always in the ranking of ten selected superior companies in Fortune Magazine and is one of the best companies in America (Spears, 2004:9).

12. Characteristics of servant leadership
Spears, manager of Greenleaf's servant leadership foundation has stated the following ten characteristics for servant leadership based on writings of Greenleaf: listening, sympathy, healing, awareness, persuasion, conceptualization, foresight, stewardship, commitment to growth and improvement of others, and establishing coherent communities (Spears, 2004:8-12). These characteristics have been compared with Imam Ali’s tradition and statement (peace be upon him) and matched to them in a comparative study by referring to existent resources.

12.1 Listening
Servant leaders are good listeners. They are interested in others’ viewpoints and opinions and accept them (Barbuto, 2007: 2). Leaders have always been evaluated on the basis of their relational skills and decision-making.
Servant leaders must be reinforced with more participation and commitment through listening eagerly to others’ opinions and hearing employees' speeches (Spears, 2004:8). Imam Ali (peace be upon him) recommends much about the necessity of effective listening in Nahj al-Balagha: "a seeing person is one who listens and thinks, sees, observes and learns" (Nahj al-Balagha, letter 53).
He commands to his governor: "Devote a part of your time to those who need you to (listen to their remarks) personally and deal with their affairs and sit with them in a public party" (letter 53).

12.2 Sympathy
Servant leaders are able to place themselves in others’ situation. They understand others' problems and sympathize with them. Leaders who have a sense of sympathy attract others' confidence by perceiving of the situation they have encountered (Barbuto, 2007: 5). Sympathy is the ability to perceive another person (to a large extent) as he perceives himself (Bolton, 2006: 373-378).

We can observe abundant emphasis on sympathy in Imam Ali’s statement (peace be upon him), for example he says to one of his governors in a letter: "shall I consent to this to call me Commander of the faithful and not share with people in bitters of the time? And be not their example in life's problems?" (Nahj al-Balagha: letter 45).

12.3 Healing
Servant leaders are those that others want to refer to when a shocking event happens. Leaders pay increasing attention to psychical and mental health of individuals. They facilitate the healing process and make mental relation with them whenever individuals feel the need, and console them (Spears, 2004:9).

Generally, healing is fulfilled with due attention to psychical and mental health of individuals and satisfying of their mental and psychical needs. In this regard, Imam Ali (peace be upon him) writes to his managers "so, in their affairs (your subordinates) think in away that a kind father thinks about his child, and satisfy the needs of your subordinates" (Nahj al-Balagha, letter 53).

12.4 Awareness and vigilance
Servant leaders have a shrewd sense about what is happening around them. They are always looking for signs from the environment in order to prepare opinions and decisions. They know what will happen and are rarely deceived by the appearance (Spears, 2004:9). Awareness has a high position in viewpoint of Islam and Imam Ali (peace be upon him) this esteem and position is perceptible in the tradition of imams and especially Imam Ali (peace be upon him). In letter 31 to Imam Hassan, which is one of the complicated letters of Nahj al-Balagha, he says: "If you have a problem about the world and changes of the time, relate it to unawareness" (Nahj al-Balagha, letter 31). About the importance of awareness, Imam Ali (peace be upon him) says elsewhere: "No worship is like thinking" (Gherar al-Hikam and Dorar al-Kilam, volume 2:1162).

12.5 Persuasion and encouragement
Servant leaders try to persuade individuals to perform action rather than work with the order of formal authorities. They are naturally very persuasive and state clear and convincing reasons for their demands. They never force individuals to perform an action (Spears, 2004:10). About the necessity of encouraging employees, Imam Ali (peace be upon him) orders to Malik-ashtar: "Malik! know that no tool is better than beneficence with people, tax reduction and non-compulsion of them to a job they don't like in order to attract the governor's confidence in people... always extol them and recall the important tasks that they have done, because recalling their valuable actions stimulates brave men (they are persuaded to do tasks) and stimulates cowards to try" (letter 53).

12.6 Foresight
Servant leaders have a strange ability to predict the future events. This does not mean that they are predictors or that they always say what is correct. But they are skillful in benchmarking from
the environment and seeing what will happen in the future. They usually predict the result of
decisions with a high precision (Spears, 2004:10).
Foresight in view of Imam Ali (peace be upon him) is one of the prominent characteristics of a
manager and is among the points that he suggests to his managers. "O Malik! Be provident"
(Nahj al-Balagha, letter 53).
In Imam Ali’ view (peace be upon him) "the most provident individual is one whose motto and
action are patience and thought in affairs" (Gherar al-Hikam and Dorar al-Kilam, volume
1:256).
He knows victory as the result of foresight and says: "victory is achieved by foresight and
 providence" (Nahj al-Balagha, letter 53).

12.7 Stewardship
Generally, servant leaders consider themselves as supervisors of individuals and resources that
are under their control and stewardship. One of the tasks of leaders and managers is stewardship
over affairs and actions of the organization (Spears, 2004:10).
Regarding stewardship Imam Ali (peace be upon him) says: "Examine your agents' behavior"
(Nahj al-Balagha, letter 53). ((After selecting a judge, think more about his judgments and
control his work)) (Nahj al-Balagha, letter 53).

12.8 Commitment to growth of people
Commitment to growth of people could be considered the concept of helping humans to enjoy
existential talents, abilities and capabilities in various dimensions of human personality (Barbuto,
2007: 4). Human force has a special position in the viewpoint of Imam Ali (peace be upon
him), and existential value of human differentiates him from other organizational resources and
factors settling his guidance and training among the major functions and tasks of management
and the leader. He orders his mangers to try to help others in any possible way while paying
attention to growth of subordinates: "Allocate a part of your time to those who need you and deal
personally with their affairs" (Nahj al-Balagha, letter 53).
"Thus satisfy your employees' wishes (try to satisfy their needs) and always extol them and pay
attention to important duties that they have done" (Nahj al-Balagha, letter 53).

12.9 Conceptualization
Servant leaders spend much time and attempt to create more extensive thoughts conceptually.
They nurture the ability and capability to perceive the world and its surrounding events and
provide an environment that encourages great thinking, and values creativity (Spears, 2004:11).
Imam Ali (peace be upon him) suggests to his son: "Reason with what you have seen or heard in
the past for what hasn't still come because life's changes and affairs are similar" (Nahj al-
Balagha, letter 31). "Every day do the activities of that day, as each day has special work for
itself" (Nahj al-Balagha, letter 53).

12.10 Building coherent groups (building community)
Servant leaders have a stable feeling of social spirit and try to train such feelings in the
organization. They believe it is necessary for an organization to act like a community (Barbuto,
2007: 6). Idea of building coherent groups tells us that humans can work beside each other, with
each other and along a total harmony and consistency without the need to establish a formal
organization (Hamell, 2009).
Elsewhere Imam Ali (peace be upon him) states that the task of the leader in lieu of creating a
coherent community with the sense of altruism, sincerity and cooperation is heavier than that of
other individuals, and the leader of the community must pay more attention to this issue.
"Know that there is no one like me in Islam's nation who is more compassionate with regard to
unity of Mohammad 's nation and their (people) association with each other" (Nahj al-Balagha,
letter 77).
13. Data analysis

Descriptive and inferential statistics methods are used to study and analyze the collected data consistent with objectives and questions of research. Diagrams and tables are used in descriptive statistics section and t-test and F-test are applied in inferential statistics section.

1-To what extent do the indices of servant leadership exist in Islamic Azad University in view of management texts and Imam Ali’s tradition?

Table 1- comparison of average score of servant leadership characteristics in viewpoint of management texts with supposed mean of 3

<td>0.842</td>
<td>0.074</td>
<td>6.21</td>
</tr>
</tbody>
</table>

According to the findings in table 1, observed t with regard to characteristics of servant leadership in aspects of listening, sympathy, healing, awareness, encouragement, conceptualization, foresight, stewardship, building coherent groups is higher than the critical amount of table (1.64) on error level of 5%. Thus, the above characteristics are more than the average level. The observed t about the characteristic of commitment to growth of people is lower than the critical amount of table on error level 5% ; hence, this characteristic is lower than the average level.

According to the findings in table 2, observed t with regard to characteristics of servant leadership in aspects of listening, sympathy, healing, awareness, encouragement, conceptualization, foresight, stewardship, building coherent groups is higher than the critical amount of table (1.64) on error level 5%. Thus, the above characteristics are more than the average level. The observed t about the characteristic of encouragement is lower than the critical amount of table (1.64) on error level 5%; hence, this characteristic is lower than the average level.

Results of table 4 show that the observed F about foresight, stewardship, commitment to growth of people, conceptualization and building coherent groups has been significant based on educational degree.

14. Discussion and conclusion

Serving human beings whether Muslims or non-Muslims has been much recommended in Islam and serving creatures is among the superior worships. In management texts, theoretical aspects of serving are just referred to, while Imam Ali (peace be upon him) has explained diverse dimensions of serving as he talks about serving skills through stating applied skills. Results obtained from data analysis in the present survey about determining the existence level of servant leadership indices in viewpoint of management texts and Imam Ali’s tradition in Najafabad Islamic Azad University are as follows: results of one variable t-test (comparison of average score of servant leadership characteristics in viewpoint of management texts and Imam Ali’s tradition with supposed average of 3) show that the observed t with regard to the characteristic of commitment to growth of people is lower than the critical amount of table on error level 5%. Therefore, this characteristic is lower than the average level. The observed t about servant leadership characteristics in viewpoint of Imam Ali’s tradition about the encouragement characteristic is lower than the critical amount of table (1.64) on error level 5%. Thus, this characteristic is lower than the average level.

Comparison of average score of servant leadership characteristics in viewpoint of management texts and Imam Ali’s tradition in terms of demographic characteristics reveal that the observed F about conceptualization and commitment to growth of people based on educational degree, and awareness based on working experience has been significant in management texts' view. The observed F about foresight, stewardship, commitment to growth of people, conceptualization and
building coherent groups based on educational degrees has been significant in view of Imam Ali’s tradition.

With the regard to the results obtained from the study the following suggestions are presented in two parts:

A) The following cases are recommended in order to develop and extend servant leadership characteristics in Najafabad Islamic Azad University:

1- Due to the results of t-test, it is recommended to managers the organizations to harmonize employees with long-term objectives and programs of the organizations through holding useful educational courses for employees and their families so that individual and organizational growth and development will be fulfilled.

2- Due to the results of t-test, it is recommended to review and design the reward system in a way that the majority of employees who play a main role in the growth and development of the organization enjoy rewards and encouragement to the essential amount.

3- Through long-term programming for training employees it is possible to reinforce the sense of sympathy among them, to improve perceptional and human skills and to help them build coherent groups by growing of employees.

B) The following cases are recommended to researchers in order to perform future researches:

1- Due to the emphases of the supreme leader about preparing an Iranian-Islamic model of improvement and necessity for the domestication of sciences’, various researches should be performed by concentrating upon Islamic and Iranian resources about topics like servant leadership which are useful in preparing this model.

2- Due to the closeness of concepts of servant leadership our religious and national culture, it is recommended to researchers to design models for the implementation and execution of this theory in all organizations.

3- It is recommended to study and measure the adaptation level of servant leadership style with the existing leadership styles in governmental and private organizations in Iran.

Abstract
This paper investigates the profitability of a simple and very common technical trading rule applied to the General Index of the Madrid Stock Market. The optimal trading rule parameter values are found using a genetic algorithm. The results suggest that, for reasonable trading costs, the technical trading rule is always superior to a risk-adjusted buy-and-hold strategy.

Keywords: Technical trading rules, Genetic algorithms, Security markets

1. Introduction
Technical analysis is aimed at devising trading rules capable of exploiting fluctuation on the financial markets. Recent results indicate that the market timing strategy may be a viable alternative to the buy-and-hold strategy, where the assets are kept over a relatively long time period. The market timing approach is more dynamic and focuses on market fluctuations. The trading rules, through technical analysis, are devised to generate appropriate buying and selling signals.

The first results, using technical analysis in various financial domains, in the 1960s and 1970s supported the “efficient market hypothesis”, which implies that there should not be any exploitable pattern in the data (Fama, 1970; Jensen & Bennington, 1970). Some recent results seem to indicate otherwise (Brock et al., 1992), followed by Bessembinder and Chan (Bessembinder & Chan, 1995), also demonstrated the simple trading rules could be profitable (but, without transaction costs).
Nevertheless, these developments are based on a priori rules determined through technical analysis. The emergence of new technology, in particular evolutionary algorithms, allows a system to automatically generate and adapt trading rules to particular applications. Genetic algorithms (Holland, 1975) have already been applied to a number of financial applications (Bauer, 1994). For learning trading rules, the genetic programming (GP) approach of Koza (1992) looks more promising, as it provides a flexible framework for adjusting the trading rules. Although, the first attempts by Chen and Yeh (1996) and Allen and Karjalainen (1999) on the stock exchange markets did not show any excess returns with regard to the buy and hold approach, other recent applications of GP are more encouraging (Neely et al., 1997; Neely&Weller, 1999; Marney et al., 2001).

A considerable amount of work has provided support for the view that simple technical trading rules (TTRs) are capable of producing valuable economic signals (Brock et al., 1992; Bessembinder&Chan, 1995; Mills, 1997; Fernández Rodríguez et al., 1999). However, the majority of these studies have ignored the issue of parameter optimization, leaving them open to the criticism of data snooping and the possibility of a survivorship bias (Lo&MacKinley, 1990; Brown et al., 1995) respectively. To avoid this criticism, a more objective and valid approach consists in choosing TTRs based on an optimization procedure utilizing in-sample data and testing the performance of these rules out-of-sample. In this sense, a genetic algorithm is appropriate method to discover TTRs (Allen&Karjalain, 1999).

The aim of this paper is to investigate the profitability of some popular TTRs using genetic algorithm optimization procedures. Section 2 describes the TTRs examined in this paper, while Section 3 presents the genetic algorithms and. The empirical results are shown in Section 4.

2. Technical trading rules

In this section, we review the different ingredients that constitute the basis of a trading model and reformulate them in terms of simple quantities that can be used in conjunction with a genetic algorithm. We first need to specify an appropriate universe of trading rules from which the current GA may have been applied to. Real trading models can be quite complicated and may require many different rules that also depend on the models own trading history. Here we limit ourselves to simple models that depend essentially on a set of indicators that are pure functions of the price history or of the current return.

E.g. Moving Average rules (MA). (Ryan et al., 1999)
Define the following parameters for a simple Moving average rule:
Short run (term/day): sr
Long run (term/day): lr
Short run average: s, is the average price of the sr days trading price;
Long run average: l, is the average price of the lr days trading price;
Fix band: x.
Generating a buy alert signal, when sr-lr>x;
Generating a sell alert signal, when lr-sr>x; (see Figure 1)
About the data set, we divide them into two parts: in sample set (training set) and out-of-sample set (testing set). In training set, we find the robust parameters and we use the same parameters in the testing set to evaluate the result. In this paper, we use a one-year-long data as training set and continued one-year-long data as testing set. We have tested four trading rules: Filter Rules, Moving Average (MA), Support and Resistance and Channel Break-outs (Ryan et al., 1999).

The evaluation used in this paper is Sharpe Ratio, which is defined by \( \frac{R_p - R_f}{\sigma_p} \), where \( R_p \) is Expected portfolio return, \( R_f \) is Risk free rate and \( \sigma_p \) is portfolio standard deviation. The reason we use Sharpe Ratio is because it considers both return and risk at the same time, and more and more researchers and traders are considering it.

Then, The simplest and most common trading rules are moving averages (MA). In particular, we consider a generalized MA (GMA) rule that can be represented by the following binary indicator function:

\[
S(\Theta)_t = MA(\theta_1)_t - (1 + (1 - 2S_{t-1})\theta_3)MA(\theta_2)_t
\]

(1)

Where \( \Theta = [\theta_1, \theta_2, \theta_3] \) denotes the parameters associated to the GMA rule, and \( MA(\theta) \) is a MA indicator defined as follows:

\[
MA_\theta(t) = \frac{1}{\theta} \sum_{i=0}^{\theta - 1} P_{t-i}, \quad t = \theta, \theta + 1, \ldots, N
\]

The lengths of the short and long MA are given by \( \theta_1 \) and \( \theta_2 \) while \( \theta_3 \) represents a filter parameter included to reduce the number of false buy and sell signals generated by a MA rule when price movement is nondirectional.

The GMA rule is used to indicate the trading position that should be taken at time \( t \). In particular,
equation (1) returns either a one or zero, corresponding to a buy or sell signal, respectively.

3. Genetic algorithms

A genetic algorithm is a population-based search and optimization method that mimics the process of natural evolution. The two main concepts of natural evolution, which are natural selection and genetic dynamics, inspired the development of this method. The basic principles of this technique were first laid down by Holland and are well described, for example, in (De Jong, 1975; Goldberg, 1989).

The performance of a genetic algorithm, like any global optimization algorithm, depends on the mechanism for balancing the two conflicting objectives, which are exploiting the best solutions found so far and at the same time exploring the search space for promising solutions. The power of genetic algorithms comes from their ability to combine both exploration and exploitation in an optimal way (Holland, 1975). However, although this optimal utilization may be theoretically true for a genetic algorithm, there are problems in practice. These arise because Holland assumed that the population size is infinite, that the fitness function accurately reflects the suitability of a solution, and that the interactions between genes are very small (Beasley, 1993).

In practice, the population size is finite, which influences the sampling ability of a genetic algorithm and as a result affects its performance. Incorporating a local search method within a genetic algorithm can help to overcome most of the obstacles that arise as a result of finite population sizes.

Incorporating a local search method can introduce new genes which can help to combat the genetic drift problem (Asoh & Mühlenbein, 1994; drift, 1998) caused by the accumulation of stochastic errors due to finite populations. It can also accelerate the search towards the global optimum (Hart, 1994) which in turn can guarantee that the convergence rate is large enough to obstruct any genetic drift.

The Parallel Recombinative Simulated Annealing (PRSA) algorithm (Mahfoud & Goldberg, 1995) fights the genetic drift problem in another way by combining the concept of the cooling schedule of simulated annealing (Kirkpatrick et al., 1983) Boltzmann tournament selection (Mahfoud, 1997), and standard genetic operators.

Due to its limited population size, a genetic algorithm may also sample bad representatives of good search regions and good representatives of bad regions. A local search method can ensure fair representation of the different search areas by sampling their local optima (Gruau & Whitley, 1993) which in turn can reduce the possibility of premature convergence.

---

2. Three different MA rules are nested within the GMA rule and can be derived individually by imposing certain restrictions on equation (1):

1) Simple MA: \( R_1 = 1, R_2 > 1, R_3 = 0 \)
   \[ S(T)_2 = R_2 - MA(T_2)T_e \]

2) Filtered MA: \( R_1 = 1, R_2 > 1, R_3 > 0 \)
   \[ S(T)_2 = R_2 - (1 + (1 - 2S_{t-1})R_3)MA(T_2)T_e \]

3) Double MA: \( R_1 > 1, R_2 > R_3, R_3 = 0 \)
   \[ S(T)_2 = MA(T_2)T_e - MA(T_2)T_e \]
In addition, a finite population can cause a genetic algorithm to produce solutions of low quality compared with the quality of solution that can be produced using local search methods. The difficulty of finding the best solution in the best found region accounts for the genetic algorithm operator’s inability to make small moves in the neighborhood of current solutions (Reeves, 1994). Utilizing a local search method within a genetic algorithm can improve the exploiting ability of the search algorithm without limiting its exploring ability (Hart, 1994). If the right balance between global exploration and local exploitation capabilities can be achieved, the algorithm can easily produce solutions with high accuracy (Lobo & Goldberg, 1997).

Although genetic algorithms can rapidly locate the region in which the global optimum exists, they take a relatively long time to locate the exact local optimum in the region of convergence (Jong, 2005; Preux & Talbi, 1999). A combination of a genetic algorithm and a local search method can speed up the search to locate the exact global optimum. In such a hybrid, applying a local search to the solutions that are guided by a genetic algorithm to the most promising region can accelerate convergence to the global optimum. The time needed to reach the global optimum can be further reduced if local search methods and local knowledge are used to accelerate locating the most promising search region in addition to locating the global optimum starting within its basin of attraction.

The improper choice of control parameters is another source of the limitation of genetic algorithms in solving real-world problems (Deb, 1997) due to its detrimental influence on the trade-off between exploitation and exploration. Depending on these parameters the algorithm can either succeed in finding a near-optimum solution in an efficient way or fail. Choosing the correct parameter values is a time-consuming task. In addition, the use of rigid, constant control parameters is in contradiction to the evolutionary spirit of genetic algorithms (Eiben et al., 1999). For this reason, other search techniques can be utilized to set the values of these parameters whilst the search is progressing.

This process, which can be described as an automated, intelligent approach to trial and error, based on principles of natural selection, is depicted in Figure 2.
As indicated, the first step in the process is initialization, which involves choosing a population size (M), population regeneration factors, and a termination criterion. The next step is to randomly generate an initial population of solutions, P(g=0), where g is the generation. If this population satisfies the termination criterion, the process stops. Otherwise, the fitness of each individual in the population is evaluated and the best solutions are "bred" with each other to form a new population, P(g+1); the poorer solutions are discarded. If the new population does not satisfy the termination criterion, the process continues.

**Fig 2: The GA Process**

**Types of GAs**

The simplest genetic algorithm represents each chromosome as a bit string (containing binary digits: 0s and 1s) of fixed-length. Numerical parameters can be represented by integers, though it is possible to use floating-point representations for reals. The simple GA performs crossover and mutation at the bit level for all of these. (Goldberg, 2002; Wikipedia, 2004). Other variants treat the chromosome as a parameter list, containing indices into an instruction table or an arbitrary data structure with pre-defined semantics, *e.g.*, nodes in a linked list, hashes, or objects. Crossover and mutation are required to preserve semantics by respecting object boundaries, and formal invariants for each generation can specified according to these semantics. For most data types, operators can be specialized, with differing levels of effectiveness that are generally domain-dependent. (Wikipedia, 2004).

**Applications**

Genetic algorithms have been applied to many classification and performance tuning applications in the domain of knowledge discovery in databases (KDD). De Jong *et al.* produced **GABIL (Genetic Algorithm-Based Inductive Learning)**, one of the first general-purpose GAs for
learning disjunctive normal form concepts. (De Jong et al., 1993). GABIL was shown to produce rules achieving validation set accuracy comparable to that of decision trees induced using ID3 and C4.5. Since GABIL, there has been work on inducing rules (Zhou et al., 2003) and decision trees (Cantú-Paz & Kamath, 2003) using evolutionary algorithms. Other representations that can be evolved using a genetic algorithm include predictors (Au et al., 2003) and anomaly detectors (González & Dasgupta, 2003). Unsupervised learning methodologies such as data clustering (Hall et al., 1999; Lorena & Furtado, 2001) also admit GA-based representation, with application to such current data mining problems as gene expression profiling in the domain of computational biology (Iba, 2004). KDD from text corpora is another area where evolutionary algorithms have been applied (Atkinson-Abutridy et al., 2003). GAs can be used to perform meta-learning, or higher-order learning, by extracting features (Raymer et al., 2000), selecting features (Hsu, 2003), or selecting training instances (Cano et al., 2003). They have also been applied to combine, or fuse, classification functions (Kuncheva & Jain, 2000).

Future Trends

Some limitations of GAs are that in certain situations, they are overkill compared to more straightforward optimization methods such as hill-climbing, feed forward artificial neural networks using back propagation, and even simulated annealing and deterministic global search. In global optimization scenarios, GAs often manifest their strengths: efficient, parallelizable search; the ability to evolve solutions with multiple objective criteria (Llorà & Goldberg, 2003); and a characterizable and controllable process of innovation. Several current controversies arise from open research problems in GEC:

- Selection is acknowledged to be a fundamentally important genetic operator. Opinion is, however, divided over the importance of crossover versus mutation. Some argue that crossover is the most important, while mutation is only necessary to ensure that potential solutions are not lost. Others argue that crossover in a largely uniform population only serves to propagate innovations originally found by mutation, and in a non-uniform population crossover is nearly always equivalent to a very large mutation (which is likely to be catastrophic).
- In the field of GEC, basic building blocks for solutions to engineering problems have primarily been characterized using schema theory, which has been critiqued as being insufficiently exact to characterize the expected convergence behavior of a GA. Proponents of schema theory have shown that it provides useful normative guidelines for design of GAs and automated control of high-level GA properties (e.g., population size, crossover parameters, and selection pressure). Recent and current research in GEC relates certain evolutionary algorithms to ant colony optimization (Parpinelli et al., 2002).

In order to determine which solution candidates are allowed to participate in the crossover and undergo possible mutation, we apply the genitor selection method proposed by Whitley (1989). This approach involves ranking all individuals according to performance and then replacing the poorly performing individuals by copies of better performing ones. In addition, we apply the commonly used single point crossover, consisting in randomly pairing candidates surviving the selection process and randomly selecting a break point at a particular position in the binary representation of each candidate. This break point is used to separate each vector into two sub vectors. The two sub vectors to the right of the break point are exchanged between the two vectors, yielding two new candidates. Finally, mutation occurs by randomly selecting a particular
element in a particular vector. If the element is a one it is mutated to zero, and vice versa. This occurs with a very low probability in order not to destroy promising areas of search space.

4. Empirical results

The data consists of daily closing prices of the General Index of the Iran Stock Exchange and the daily 3-month rate in the interbank deposits markets, covering the 2 January 1985-15 November 2010 period (4376 observations). The total period is split into an in-sample optimization period from 2 January 1985 to 16 December 2001 and an out-of-sample test period from to 16 December 2001 to 15 November 2010 (2188 observations in each sub period).

The initial population was set at 150 candidates, while the maximum number of both generation allowed and iterations without improvement was fixed at 300. The maximum the probabilities associated with the occurrence of crossover and mutation were set at 6% and 0.5%, respectively. These choices were guided by previous studies (Bauer, 1994) and experimentation with different values. The signals from the trading rules are used to divide the total number of trading days ($N$) into either “in” the market (earning the market return $rm_t$) or “out” of the market (earning the risk-free rate of return $r_f$). Therefore, the objective function used to evaluate the trading rules is given by the following expression:

$$r_{fr} = \sum_{t=1}^{N} S_{t-1} rm_t + \sum_{t=1}^{N} (1 - S_{t-1}) r_f - T^* c$$

Where $T$ is the number of transactions and $c$ is the cost per transaction. As an appropriate benchmark, we consider the return from a risk adjusted buy and hold strategy defined as

$$r_{bh} = \alpha \sum_{t=1}^{N} r_f + (1 - \alpha) \sum_{t=1}^{N} rm_t - 2 c$$

where $\alpha$ is the proportion of trading days that the rule is out of the market. Table 1 summarizes the results. As can be seen, the best GMA rules are double MA rules, without a filter parameter (except for the case of 0 transaction costs). The Sharpe ratio and the annualized returns corresponding to the best GMA rule are higher than those from the risk adjusted buy and hold strategy, both for the in-sample and out-of-sample periods. It is interesting to note that this result holds for all transaction costs examined.

3. The Sharpe ratio is a measure of risk-adjusted returns: $SR = \frac{\overline{F}}{\sigma \sqrt{T}}$, where $\overline{F}$ is the average annualized return of the trading strategy, $\sigma$ is the standard deviation of daily trading rule returns, and $Y$ is equal to the number of trading days per year.

Abstract  
This paper first researcher to introduce short of push and pull systems is then paid to the effect of various factors related to information systems are and can evaluate performance of many organizations to help study the research has In the present part of E Company was undertaken by using appropriate statistical methods and indicators that were identified.

Keywords: Performance, DSS, indicators, assessment, push production

1. Introduction  
managers contemplating the installation of a pull system cannot measure progress toward meeting pull system goals without knowing the significant metrics of his system. This manager also requires a method for predicting when the system should change from one transition state to the next and a means to control the analysis of these changing metrics. The methods presented fulfill these needs. First, a simulation model of a real electronics assembly system is developed. The simulation model provides a case study, a mechanism for obtaining data and a vehicle for method validation. Step-wise multiple regression is used to determine which factors and factor interactions significantly influence the simulation model output. The transition functions of pull system implementation are then estimated using dynamic programming. Validation of the transition functions is accomplished by comparing simulated results and results predicted by using the transition functions. A decision support system framework provides guidelines for the development of software employing these methods.

2. Literature review  
In the 1990s, companies came up with new manufacturing philosophies that enabled them to reduce costs and compete in volatile markets. Manufacturing operations need to cultivate capability to deal with unanticipated events. In other words, manufacturing operations need to be agile. One can analyze flexibility in manufacturing operations in three levels: firm, function and operations. “Flexibility is always studied in context of resources or labor but never as manufacturing planning and control” (Slack&Correa,1992).
2.1. Push Systems

A push system supports batch manufacturing operations. In batch manufacturing, the material-planning department of an organization typically releases a schedule that is developed by taking into consideration the lead times of various components and subassemblies (Vollmann et al., 1997). These lead times consist mainly of the waiting time and the queue time for a particular component as the actual processing time only constitutes a small part of the total lead time. The main objective of the push system is to effectively utilize the capacity of each work center. This type of manufacturing system schedules shop orders by taking into consideration the routing of every component. The criterion used to allocate the schedule is the due date of the finished product. As MRP systems have evolved, it has become possible to track the progress of the components produced throughout the shop floor. In the mid 1970’s, Orlicky introduced the concept of ‘Material Requirements Planning’ and is recognized by many as the father of the modern MRP system (Vollmann et al., 1997). Various studies have been conducted to understand the performance of MRP or push systems. Suri, Krishnamurthy and Vernon (2004) identify the following key issues in modeling a push system:

- Estimating release lead-times
- Modeling future requirements for different products
- Determining the safety lead-times and stock

Buzacott and Shanthikumar (1994) conducted research that studied safety stock vs. safety lead-time in a MRP-controlled production system. Their research proposes that safety lead time is preferable than safety stock whenever it is possible to have a good forecast of the future requirements. But in cases where it is only possible to predict the mean demand then either of the two can be used. Even Suri et al (2004) conclude that in case of single product systems where future demand is accurately known it would be more appropriate to implement push strategy with safety lead times.

2.2. Pull Systems

Pull (kanban) strategies have been the subject of numerous studies by researchers (Uzsoy et al., 1990; Berkley, 1992; Liberopoulos & Dallery, 2000; the references therein). A kanban system is a common example of a pull production system that is extensively used in industry. The Toyota Production System has made the word kanban so synonymous with the pull system they practice that pull systems are often referred to as kanban systems (Ohno, 1988). In Japanese, kanban means display or a card. A kanban in a pull system is an authorization to produce. It is a signal from a downstream manufacturing process that prompts the upstream process to begin production of a component that has been consumed from inventory. The two things that have become integral to the pull type manufacturing system are:

- kanban cards
- Standardized containers

The containers are used to standardize the production batch sizes, protect the material from damage and also assist in maintaining visual control of the WIP inventory (Hyer & Wemmerlov, 2002). Though kanban type pull systems are most commonly used, there exist other pull systems, like POLCA (Paired-cell overlapping loops of cards with authorization), CONWIP (Constant WIP), and DBR (Drum-buffer-rope) (Hyer and Wemmerlov, 2002). POLCA is a generic card system in which the cards are circulated immediately after a product exits the

Copyright © 2011 Institute of Interdisciplinary Business Research

155
last of the two cells in a loop. With CONWIP, an authorization to produce the next batch is produced when another batch is removed from inventory, regardless of the product type. DBR is a system in which the master schedule sets the production rate according to the output rate of the bottleneck resource. Researchers have extensively studied pull strategies; Tayur (1993) developed theoretical results to characterize the dynamics of kanban systems and reduce the simulation effort needed to study them. Gstettner and Kuhn (1996) show that the performance of a kanban system is significantly affected by the distribution of kanban cards.

In the Push scheme each time a demand arrives it immediately authorizes the release of a new job. The demand is either immediately satisfied from the stock or it is backlogged. The Pull scheme examined is similar to CONWIP (Spearman, 1992; Spearman et al., 1990; Spearman & Zazanis, 1992). The main difference is that instead of the requirement that the WIP in the system remain constant we require that the total work-in-process including the Finished Goods Inventory (FGI) remain constant and equal to $S$. External demands, if not immediately satisfied, are again backlogged. In this scheme the arrival of a demand authorizes the release of a new job only when the work in process is less than $S$ or equivalently the finished goods inventory is greater than zero. Proper operation of this scheme, which of course depends crucially upon the right choice for $S$, results in the same benefits in terms of increased system efficiency and reduced inventory levels as other pull systems (Buzacott & Shanthikumar, 1993; Hall, 1983; Karmarkar, 1986; Mitra & Mitrani, 1990; Mitra & Mitrani, 1991; Spearman et al., 1990; Spearman & Zazanis, 1992).

2.3 Push/Pull Interface

It is not necessary that a production line be pure push or pure pull. One can design a line so that a segment of the line operates as push and the another segment operates as pull. We present a specific example to illustrate this.

2.4 Electronics assembly case in Iran industry

An actual push design electronics assembly system was modeling using the SIMAN simulation language. The simulation model was a representation of a real electronics assembly facility prototype line, producing one product style in high volume. Although the prototype production line is very simple, the case provides an adequate demonstration of these research methods.
The unit load of the simulation model was a single circuit board. The production process begins with board washing and serialization. The next process is surface mount technology (SMT) with solder paste screening, parts placement and either phase or infrared (IR) solder reflow. The SMT process is completed with degreaser cleaning. The automatic insertion (A/I) process forms the second part of this electronics assembly system and includes: automatic part insertion, manual part insertion, wave soldering, aqueous cleaning and special parts assembly. Inspection and rework stations are located after: solder screening, SMT parts placement, SMT solder reflow, aqueous cleaning and special assembly. The last step in the simulation model was final inspection. Circuit boards passing final inspection left the system.

In the literature, there has been considerable interest in comparing push and pull strategies, and in studying the driving factors for choosing between push and pull. Table 1 summarizes the literature comparing push and pull in a production system context to capture the following issues: 1) manufacturers’ key performance metrics; 2) key factors that influence the performances; and 3) research methods. While push is still the most widely employed strategy by semiconductor manufacturers today (Fowler et al., 2002), leading manufacturers such as Xilinx (Brown et al., 2000) and solution providers such as Technology have initialized the transition from push to push-pull for the next-generation production of high-margin, high-volume products. The push-pull system that takes the advantage of both push and pull characteristics may outperform pure push and pure pull systems (Spearman & Zazanis, 1992). In general, however, no identical conclusions can be drawn from Table 1 for choosing a better strategy since there are numerous factors that influence system performance.

2.5. Simulation model

Digital simulation was utilized to model the actual production system. Although a brute force method and worker intensive, simulation supplies a feasible mechanism to analyze complex simultaneous activity. The simulation model employed standard probability distributions for input data. A run time period of 40 h, after steady-state, was observed. If the output change was statistically equivalent to zero, steady-state was said to have been reached. Input data were verified by comparison to actual system process standards using derived probability distributions and the chi-squared goodness of fit test. Simulation model validation included internal mathematical consistency checks and comparing simulation model output to the physical system metrics.

3. Identification of metrics

Step-wise multiple regression was used to determine which factors and factor interactions significantly influence the simulation model output parameters. Total cost, as a function of simulation run time, was the dependent variable in a factorial design, and was tested step-wise for response to various combinations of six potentially significant factors. These factors were based on metrics deemed most important by managers familiar with this system and by literature
search (Galbraith et al., 1991). The six factors were: mean flow time (MFT), quality, flexibility, material flow, process utilization and mean queue time. Three levels of each factor tested were represented by three critical processes of the real system under study. The three levels (processes) for each factor were: component placement, wave solder and solder reflow. This method could be applied to other discrete parts manufacturing systems by selecting three critical processes for the system of interest. MFT was measured as the time spent in the system by a unit of product (Baker, 1974). A direct output value from the simulation model, MFT was measured in hours, with lower values being desirable. Quality was calculated as the percentage of defects: the ratio of inspection failures to the total number of product units flowing through a process block. Quality control included 100% inspection of product. A lower non-conformance ratio indicated better quality. Flexibility was calculated as the mean number of available workstations able to process an operation (Chang, 1986), where: flexibility = 1 - process utilization. Material flow smoothness was measured by the level of congestion. Congestion was defined as the ratio of time spent in queue to time spent in process (Allen & Chavous, 1989; Spearman, 1988). Process utilization and mean queue time were obtained directly from simulation results. It may appear that MFT and mean queue time would be co-dependent. Good material flow with low congestion would be expected to result in a low mean queue time, high or low flexibility depending on process utilization, and low MFT. On the other hand, poor material flow with high congestion centred around one or two large queues associated with bottleneck processes near the beginning of the line can result in downstream processes being starved. These downstream processes will have low mean queue time and high flexibility. Overall, the system may have a high MFT. These two examples show that MFT and mean queue time should not be assumed to be co-dependent based on definition. From a multicollinearity study, it was concluded that multicollinearity was present for process utilization and flexibility, and MFT, material flow and mean queue time. Figure 2 graphically portrays the factor dependencies. System product flow was evaluated using the metrics of MFT, material flow congestion and mean queue time. The material flow measure of congestion is a direct indication of mean queue time and a significant influence on MFT. Flexibility was thought to give a more direct indication than process utilization of overall system efficiency and capacity for meeting changes in demand. Quality, an independent factor, was also used in the regression. The multicollinearity analysis was continued using the metrics of quality, flexibility and material flow. The results for placement and IR reflow processes are printed above wave solder for each matrix cell of Table 2. Table 3 shows the eigenvalues of the correlation matrix for quality, flexibility and material flow, and further substantiates the relative independence of these three metrics. The correlation matrix eigenvalues were not very close or equal to zero. Step-wise regression was then performed using these three metrics and their two-way interactions. Three way interactions were assumed to be negligible. If three-way interactions were in fact significant, it would be very difficult to interpret for an actual system (Hicks, 1982; Law & Kelton, 1986; Taguchi, 1986). The response variable was total production cost as a function of simulation system run time. A constant cost of $1000 per run hour was assumed to relate system run time to production cost. Other cost per run hour values could be chosen to reflect a particular system under study. Table 4 presents the best model of the step-wise multiple regression results. Those factors and factor interactions that were not shown to be significant influences (α = 0.05) on run time were not included in the model. The best model was defined in terms of coefficient of determination.
closest to 1.0, lowest standard error and lowest residual variance. The coefficient of determination indicated that 90.34% of the variation in the response data was explained by the model, and hence was considered a favorable indicator of model fit for these data. The input data did not contain gaps and the input data magnitudes were in the hundred thousands. The standard error of prediction indicated that the estimator of mean response had moderately low variance. The balanced spread of the residuals about zero was indicated by the low coefficient of skewness.

Two-way interactions were not shown to be significant for this system model. The three critical processes were separated by several other processes in each case, so that the model indicating no significant interaction between critical processes' metrics seemed to be a reasonable result. The regression model results suggested that this system was heavily influenced by quality and material flow. Two disadvantages associated with the traditional push system design are complex material flow and poor quality.

4. Estimation of transition functions

The case study metrics found to be significant in the regression analysis were used as the metrics for estimating transition functions. Dynamic programming methods were used to estimate the transition functions. Once these transition functions are identified, a manager has milestones for when to initiate changes to the system Decisions cause a system to change from one stage to the next by activating transition functions. The decision variable chosen in this research was buffer size of critical process workstations. Buffer size may be considered a limit to the effectiveness of pull systems. Inflated buffers placed before critical processes can increase work-in-progress (WIP) while inadequate buffers may result in unbalanced production flow and blockage. An ideal pull system would not require buffers, but a realistic goal for pull system buffer size may be one part. The transition from one state to another (based on buffer size
decisions) occurred when reducing the buffer size further caused a deterioration in significant metrics or when the buffer size equaled one. Overall pull system implementation stages have been said to be:

- process improvements;
- group technology layout
- pull system scheduling;
- cell operations stopping with any cell equipment failure (cell down rule).

An example first state of the process improvements stage would be applying process improvements to the first process, perhaps improving the screen printing process. The second state for the process improvement stage would then be improving the second process. Example states within the stage of group technology (GT) layout may be the number of cells developed. For example, the first state in the GT layout stage may have only one cell, while the second state of the GT stage may have two or three cells.

5. Pull system implementation

The simulation model was revised for each of the four major pull system implementation stages. Process improvements, the first implementation stage, included reducing process times, inspection times and the number of defects to a level thought realistic by engineers familiar with the system. In an actual manufacturing facility, process changes could be made continually. Implementing a group technology layout was the next stage. Machines to be grouped into cells were selected by their criticality to the process, original location and number of duplicate equipment. First, four cells were formed in the A/I area. Next, two cells were created in the SMT area. The third implementation stage was pull system scheduling. A simple Kanban system was integrated process-by-process working backward from final inspection. The fourth and last pull system implementation stage was the rule of stopping all cell operations when any of that cell's equipment broke down (cell down rule). The enforcement of the cell down rule is similar to having a buffer of zero within the cells. This strict rule must be implemented last because of its dependence on high quality, high machine reliability and balanced smooth production flow.

Global variable toggles were placed in the simulation model to stop a given cell's operations when any of that cell's machines broke down. A part loaded on a machine at the time of machine failure was assumed to be destroyed. Implementation stages were layered, i.e. pull scheduling was integrated into a group technology model. One simulation model was run for each of the manager-recommended buffer sizes from one to five, for the critical processes, for each implementation stage. When the last major pull system implementation stage was reached and further buffer size changes in that stage did not result in significant metrics improvement, the transition endpoint was said to be reached. Without substantial process enhancement, additional significant performance measure improvement was assumed not to be possible after reaching complete pull system implementation. When a saddle point or inflection point was reached the buffer size associated with the minimum system run time was chosen. Buffer size changes from five to one did not significantly impact the quality performance measure for the first three pull system implementation stages. When the cell down rule was added to the installed protocol of pull scheduling, quality became sensitive to buffer size. IR reflow and wave solder, involving fewer non cellular machines, did not show this sensitivity to buffer size. In this case, cellular grouping seemed to decrease the sensitivity of
critical processes to buffer size changes. Within each implementation stage and overall, wave solder flexibility decreased as the buffer size increased. The wave solder process was conveyorized, allowing little flexibility in material movement within the process, but was sensitive to receiving a steady delivery of material. Another conveyorized process, IR reflow, was quite sensitive to buffer size changes. IR reflow material flow congestion seemed to be sensitive to cell formation before or after its workstation. Pull scheduling did not seem to smooth out production flow for the IR process when the buffer size increased. Since pull scheduling is based on an assumption of minimum WIP, this result seems reasonable. These results indicated that the IR process congestion can be reduced with smaller buffer sizes if the cell down rule is applied on top of pull scheduling. A significant increase in system run time was noted with the implementation of the cell down rule. For this particular system, it seemed that the improvements made in equipment maintenance and process enhancement were not sufficient to allow the enforcement of the cell down rule without jeopardizing significant metrics. Real manufacturing lines must have excellent process and quality control before implementing the cell down rule. This result demonstrates one of the major weaknesses associated with the application of pull system philosophy in actual production systems.

6. Dynamic programming results

When the last major pull system implementation stage was completed and further buffer size changes in that stage did not result in significant performance measure improvement, the transition endpoint was said to be reached. Once an assumed endpoint was reached, the transition functions were defined using dynamic programming. The recursive equation for the transition functions may be described as:

$$f_n(s_n, x_n) = \sum_{i=1}^{n} \left[ C_i + f^*_{n+1}(i) \right]$$

where $s_n$ is stage $n$, $x_n$ is the decision to move from stage $n$ to stage $n+1$, and $C_i$ is the contribution to cost from being in state $i$ of stage $n$, $f^*_{n+1}(i)$ is the minimum future cost of the decisions taken for stages $n + 1$ onward, while $f_n(s_n, x_n)$ is the cost contribution of stage $n$ plus the minimum future cost, $n.f^*_{n+1}(i)$. By assuming constant cost values per system run hour, $C_i$, and using the definitions above, the transition functions were defined. The dynamic programming stages were the pull system implementation stages, one through five. The number of states varied for each stage. The decision variable $x_n$ was the buffer size. Table 5 shows the predicted and simulated results. Predicted results were derived from the use of the dynamic programming recursive equations. In Table 4, group technology is abbreviated as GT.

Working backwards from the endpoint, the decision leading to a state was defined. Stage by stage, from the endpoint to the initial state, each state and decision was derived by observing the decisions made during the state transitions of the dynamic programming model. The state having the minimum simulated system run time was chosen as the level of implementation for that stage. The decision of buffer size was based on system run time and
significant metrics selected. The case study implementation recommendations based on dynamic programming results are shown in Table 6.

7. Validation of transition functions

An Analysis Of Variance (ANOVA) was performed to evaluate the validation of the transition functions estimated above. Total production cost as a function of simulation run time was used as the response variable. The hypothesis tested was that there was no significant difference between the predicted and simulated total production costs.

The total production cost was predicted for the various transition states and stages using the estimated transition functions and the regression model previously defined. The predicted results were then compared to the original simulation results using ANOVA. Bartlett's test was run to test the assumption of homogeneity of variance: Bartlett's test: 1.0317 with probability 0.2256. Probability values well above 0.05 are considered to suggest homogeneous variances (Hicks,1982).

The ANOVA results indicated an F ratio of 3.568 with 0.0649 significance, so that the hypothesis was not rejected for the chosen $\alpha$ level of significance of 0.05. A rank test was also performed to non-parametrically compare the two methods for estimating total production cost. The Wilcoxon test, based on signed ranks, gave a very low probability of equaling or exceeding the Z test statistic. This test supported the conclusion of no significant difference between the predicted and simulated total production cost estimates. The transition functions, which the predicted values were based on, were therefore said to be validated.

8. Decision support system framework

The proposed decision support system (DSS) framework outlines the structure of a DSS focused on the problems associated with evaluating and controlling the transition from a push production system to a pull system design. Decision support systems have been defined as interactive systems that assist decision makers to utilize data and models to solve unstructured or underspecified problems. DSSs are structured to facilitate the type of complex decision making involved in the transition toward pull system design. Figure 3 shows the outline of the DSS framework for the transition to a pull system. Structures connected by lines with bidirectional arrows show that information flows back and forth between these structures. Input data such as market data, pull system production control data and company-wide data is collected and sorted by an existing production control system. This organized data is then input to the DSS data base. Significant metrics and the transition functions have been identified by the methods described above and are also part of the DSS data base. The DSS data base simplifies the collection and maintenance of the data used by the DSS and limits the set of functions and users that the DSS needs to support. The problem processing subsystem interacts, through the command language and the model operating system, with the DSS data base.

The digital simulation manager controls and runs the simulation model and facilitates the interface of the simulation model and statistical analysis manager. The major functions of the digital simulation manager are to:

- Incorporate simulation model structural changes associated with the actual system configuration evolving toward pull system structure. Each request for a change in pull system implementation state or stage prompts the incorporation of input changes into the simulation model and results in a new model;
- Recode and run simulation model when prompted;
- Revalidate the simulation model after the model undergoes structural changes;
- Export simulation model output statistics to the statistical model manager.
• Interpret output from the simulation model to provide answers for what-if scenarios;
• Respond to interactive queries and generate reports;

Figure 3. The DSS framework for the transition to a pull system

The statistical analysis manager includes a database management system (DBMS) and provides the communication between the digital simulation manager and the model manager. The main functions of the statistical analysis manager are to:
• Use an internal DBMS to organize simulation output statistics;
• Receive data from the DBMS and run multiple regression to identify the significant performance measures;
• Export results to the model manager;
• Respond to interactive queries and generate reports.
The model manager uses the results generated by the digital simulation manager and statistical analysis manager to run the dynamic programming model. The primary functions of the model manager are to:

- Prompt the statistical analysis manager to provide significant performance measure results;
- Prompt the digital simulation manager to restructure the simulation model to fit the implemented pull system stages;
- Choose the buffer size for evolving pull system stages by evaluation of the significant metrics results of the simulation and regression;
- Prompt the digital simulation manager to run the simulation model using chosen buffer sizes and report results to the statistical analysis manager;
- Run the dynamic programming model to determine production costs of alternatives;
- Respond to interactive queries and generate reports.

The decision logic subsystem may be designed to be a combination of simulation model and expert system. With the decision logic subsystem, the problem processing subsystem analyzes the data from the DSS data base and from interaction with the decision maker to generate candidate solutions, optimize solutions and validate solutions. The solution validation model component interacts with the decision maker to present reports, what-if alternatives and answer simple queries interactively.

Using this framework as a guideline for the structure, a computer scientist can work with the production manager to develop a fully functional DSS. After the DSS is created, thorough validation and testing of the DSS should take place before implementation. Validation and testing of the DSS framework can be accomplished in a similar manner to that of simulation model validation.

9. Conclusions

This research provides three types of decision support for the transition from a traditional push production system to a pull system design: (1) a method to determine the significant metrics of an evolving assembly system, (2) a method to estimate the transition functions of a system design evolving from a traditional push system to a pull system, and (3) a decision support system framework which gives guidelines for development of software employing these methods. The push simulation results were typical of those expected from a traditional push system. The push system showed relatively poor quality and high flexibility. Moderate to high congestion with variability was also noted. Process utilization was low, matching the high system flexibility. Queue times were low for the three critical processes. The regression analysis indicated that the significant performance metrics for this system were: wave solder quality, placement material flow, 1R material flow, placement quality, IR flexibility, IR quality and wave solder flexibility. Buffer size did not seem to significantly influence quality as long as the product was allowed to flow freely from station to station. When the cell down rule was added to the installed protocol of pull scheduling, quality became sensitive to buffer size. A significant increase in simulation run time was noted with the implementation of the cell down rule. For this particular system, it seemed that the improvements made in manufacturing system and process redesign were not sufficient to allow the enforcement of the cell down rule without jeopardizing significant metrics.

When the last major pull system implementation stage was completed and further buffer size changes in that stage did not result in performance measure improvement, the transition endpoint...
was said to be reached. Transition from one pull system state to another was predicted using dynamic programming recursive equations. The dynamic programming stages were the major pull system implementation stages. Buffer size was the decision variable.

It was concluded that the predicted and simulated estimates of total production cost were not significantly different. The transition functions, which the predicted values were based on, were therefore said to be valid. The proposed decision support system framework gives guidelines for the development of software employing the above methods. The framework focuses on the problems encountered with the transition from a traditional manufacturing system to a pull system design. Using the described methods and DSS guidelines, a fully functional decision support system for this problem could be developed.

Abstract
This survey studies the impact of human capital on economic growth of provinces in Iran. According to Mankiw-Romer-Weil model (1992) through Cobb-Douglas production function and by means of panel data in this survey we have studied effectiveness level of two indexes of human capital, i.e. educational expenditures and health care expenditures on gross domestic product growth of the provinces in Iran during the time period 2001-2007. Results reveal that impact of health care expenditures on economic growth is higher than educational expenditures. After inserting of mutual impact variable (product of two previous indexes) its coefficient becomes positive and significant. Mutual impact shows that one percent of growth in educational and health care expenditures simultaneously is leaded to 0.09 percent growth of gross domestic product. Granger causality test illustrates a single way relation from health care expenditures to educational expenditures. This issue specifies that health of human forces has a direct impact on human capital accumulation (gaining of education and skills) in addition to production and income, since necessity of learning education and skills is to have physical health.

Key words: economic growth, human capital, panel data, endogenous growth

1. Introduction
During the first years of the 1950's it was imagined that the main reason of underdevelopment and inadequacy of the developing countries was resulted from lack of physical and material capital. Experimental studies of researchers reached to a deadlock in the 1960's so that they were not able to explain the remaining of economic growth explanation by the labor force and physical capital and on the other hand they couldn't analyze incomes distribution accurately. The observed growth in time series statistics with conventional measurements of the work factor and the applied physical capital in production of the United States of America and other developed countries in that time were by far lower than the real growth of national economy. On the other side, published data about personal income distribution demonstrated high difference of the labor force that was mainly related to inequality in personal incomes. It was in this period that human capital theory could explain the cause of the above two problems. The
major reason for failure of experimental researches until this period of time was that labor force was considered homogenous and all attempts were towards accumulation of physical capital. Economists unanimously believe that the excessive and remaining factor that explains a main part of economic growth of the developed countries has direct or indirect relation with human capital, because there are scientific and serious problems for initiation and execution of extensive economic programs in the developing countries. Executing of such programs is impossible without existence of individuals with the intended specialty and educations. On the other hand, more healthy individuals have higher physical and mental capability and lower absenteeism and finally they achieve more production level. Objective of the present survey is to study the impact level of educational and health care expenditures on economic growth of provinces in Iran by means of Mankiw-Romer-Weil model (1992) during years 2000-2006. In the following sections we will talk about human capital theory and its place in theories of economic growth. Then theoretical models of human capital, MRW model, research background, theoretical principles, model specification and estimation and at last conclusion are mentioned briefly.

2. Human capital theory
It was in the 1960's that Schultz could explain the reason for failure of previous experimental researches by introduction of human capital theory. In fact he proved this theory in the form of scientific research that many economists like Adam Smith, Robert Locus, John Stuart Mill, Malthus, Marshal and Fen Thunen in the past had implicit referring to it and stated that in the form of a theory. In 1776 Adam Smith in the book "capital of nations" wrote: "it is possible to compare a person who has educated by spending of too much time and working with one of the expensive machineries" (Rogers and Rachline, 1992).

Generally, the concept of human capital is defined broadly in the economics literature to include education, health, training, migration, and other investments that enhance an individual's productivity. The health, education, and growth relationship is dynamic and complementary; health capital increases the efficiency with which individuals produce education, and presumably, other forms of human capital(Gyimah-Brempong, 2004).

Human capital is totally an economic concept. Indeed, qualitative characteristics of the individual are a kind of capital, since these characteristics develop human's capabilities under education and could be converted to a higher income resource or more abundant satisfaction in the future. Such capital is humane, because it constitutes one part of the human's elements, grows with him and is destroyed by his death. Human capital complements physical capitals and increases production productivity like physical capitals (Emadzade, 2004). Schultz (1963) has listed some of the advantages of education as the following: 1) Advantages that the economy gains from educational researches. 2) Discovering and fostering of hidden talents. 3) Increasing of individuals' capability in order to adapt themselves with changes created in job opportunities. 4) Recruiting of students and educating of them for teaching (teacher training). 5) Conforming of individuals' needs with knowledge and skills.

Schultz believes that if investment opportunities in human capital are equally for all levels of the society, poor people could enhance their productivity through that and achieve higher income. Investment in individuals' education is leaded to increasing of their abilities and skills and such capabilities are reflected in their production
power. It means that educated and specialized people participate in national production in a higher proportion at equal conditions (Emadzade, 2004).

Impact of educational and health investments in Schultz view is so important that could transforms usual standards of savings measurement and the existent investments fundamentally and changes structure of wages and salaries and amount of obtained incomes from work to the proportion of incomes obtained from properties and assets (Karnoy, Aminfar, 2002).

Health besides education is considered as one of the most important aspects of the human capital. Hanushek and Dongwook (1995) and Schultz (1999) suggest that health improves an individual’s mental and intellectual capabilities, leading to better educational outcomes. Given that long-term growth is fueled by technical progress—itself the product of increased health, education, and training—increased health can raise the growth rate of income through technical innovation. Schultz (1999) has argued, health is the ultimate indicator of the well being of a nation, hence the attainment of high stocks of health is an important aspect of development in its own right (Gyimah-Brempong, 2004).

Health can affect production level of a country through various channels. The first channel that its impact has been pointed out in most studies is better efficiency of healthy workers in comparison with others. Healthy workers work better and more than others and have a creative and more prepared mind. Along this direct impact it has indirect impacts on production too. For instance, improvement of health in human force will have the motivation to continue education and gaining of better skills, since improving of health conditions will increase attractiveness of investment in education and educational opportunities from one side and it will prepare individuals more to continue education and gain more skills by increasing of learning capability on the other side. Also enhancement of health is leaded to decreasing of mortality and increasing of life expectancy and this will encourage individuals to save more. Following increasing of saving in the society physical capital will be enhanced and this issue will affect labor force productivity and economic growth indirectly (Weil, 2006).

3. Research Background

We can find out importance of human capital by referring to performed historical studies about impacts of human capital on economic growth. Numerous studies in the economic growth literature argue that human capital has a positive effect on economic growth (Barro, 1991, 1996; Mankiw et al., 1992; Levine & Renelt, 1992; Benhabib & Speigel, 1994; Caselli, Esquivel, & Lefort, 1996; Barro & Lee, 1996; Sachs & Warner, 1997).

Barro and Sala-I-Martin (1995) fitted economic growth rate on indexes such as having access to gross domestic product in a sectional-time study and based on data of a group of countries in years 1965-1985. According to obtained results, education attainment that is measured with average amounts of education years has a positive and significant relation with growth. On the other hand, educational expenditures of the government have a positive and significant impact on growth. Knowels and Owen (1997) have studied the impact of health and education on economic growth too by means of health care expenditures index. They conclude that there is a strong relation between income and health and also between income and education. Rivera and Currais (1999) found out positive conclusions with regard to impact of human capital on economic growth in two researches that had done about the
impact of health on economic growth and income differences. They used health care expenditures per capita as an index for the society's health. They investigated about the relation between health and growth with economic growth of OECD countries in the time period 1960-1990 through this index (health care expenditures) and reached to a positive and significant relation. They illustrated that education is not the only effective factor on labor force performance and productivity.

Luan Huang et al (2008) studied health, human capital and economic growth in Taiwan by means of panel data for twenty three (23) OECD countries and perceived a significant relation. Raymo applied information related to the time period 1970-1991 in order to study the role of human capital in economic growth of Japan to measure its share in gross domestic product with economic growth. The applied human capital indexes were: average amount of academic years in higher levels multiplied by number of those having a business and educational expenditures. He used educational expenditures as quality criterion of education. Results of his research revealed that the spent expenditures in education and average amount of academic years of the labor force as two indexes of human capital had a positive and significant impact on economic growth of Japan.

Blankenau and Sympson (2003) studied the relation between general educational expenditures on the economic growth by means of endogenous growth model in which both public investment and private investment towards capital accumulation were entered in the model. When other effective factors on growth act negatively, positive and direct impact of general educational expenditures could be reduced or even become negative. They showed that reaction of economic growth towards general educational expenditures may be not monotonous in the related period. Also this relation depends on the government's expenditures level, tax structure and technological parameters.

Ghanbari et al (2008) examined the impact of human capital on Iran's economic growth. Health care expenditures were used in this study as an index for measuring of health (human capital). Estimated results that were estimated through time series data related to years 1960-2005 demonstrated the positive and significant impact of health care expenditures of the government on economic growth. Pourfaraj (2004) studied the impact of spent expenditures in education on Iran's economic growth in a study. Results illustrated that current expenditures of the government (other than educational and research expenditures) had negative impact on growth and impact of reconstruction expenditures on growth was positive. Educational and research and technico-vocational expenditures of the government had positive impact on growth. Alireza Amini and Zohreh Hejazi Azad (2007) studied the role of health in enhancing of the labor force productivity. They used life expectancy as health index (human capital). After estimation of the model by autoregressive distributed lag models (ARDL) for the period 1968-2005 they concluded that productivity of the labor force was increased 1.8 percent and about 38.2 percent of this growth was obtained because of improvement of the labor force health.

4. **Theoretical models of human capital and economic growth**

Modeling and theories of economic growth have traversed a long route. Solo-Swan's neoclassic model of growth is a suitable starting point for modeling of the human capital and also a basis for comparing of growth models. Solo-Swan's neoclassic model of growth has been evolved by considering exogenous technology change and then developing of it for inserting of human capital in analyses – that is known as generalized human capital Solow
model which has been introduced by Mankiw-Romer-Weil. Mankiw-Romer-Weil (1992) generalized Solo's growth model and inserted human capital and technology directly into the production function. Physical capabilities of the labor force are just considered in Solo model but in this model (MRW) education, skills, and etc, are considered in addition to physical capabilities. On the other side, technology gives rise to increase productivity and production power of the labor force, while by lower labor force we can have access to the same level of production or higher than that which is called Labor-Augmenting Technical Progress. In other words, we can say that Mankiw-Romer-Weil made technology endogenous and this led to neutralizing of descending productivity of the work factor. As it is obvious the major barrier of economic growth in neoclassic growth models has been descending productivity. One way to be released of descending productivity is supposing of a production function that is not exposed to descending productivity for example a function like AK and other models that have made progress of technology as endogenous. Generally, we can consider weak points of Solo's neoclassic model in un-inclusion of these two facts: 1- Technology progress is the achievement of individuals' work and it is not possible to perceive discoveries totally as pure general product. 2- Growth convergence hasn't been confirmed experimentally. Robert Locus (1988) and Paul Rumour (1990) recalled that reason of this failure was that economists were not able to put two major classic assumptions beside each other: one is that changes of technology are exogenous and the other is that technological opportunities are available equally for all countries in the world (Rumour, 1990). Endogenous growth models are generally based on AK model and Ro/Lu/Re/Ba (AK model includes models of Rumour (1978), Lucas (1988), Reblu (1991) and Barrou (1991) that are stated as Ro/Lu/Re/Ba) and R&D model and Ro/G.H/A.H (because this model is based on models of Rumour (1990), Grassman & Heliman (1991) and Aghiun & Hawitt (1992), it is stated as Ro/G.H/A.H for easiness). However, because many factors like education, technology, business organization, research and development activities, culture, international business growth, governmental and local policy are effective on major elements of economic growth (investment, labor force and technology) in endogenous growth models we can say that they have no certain and precise primary hypothesis. While the used method by Mankiw-Romer-Weil is applied in this article in order to remove the problem of the neoclassic model, endogenous growth model is not considered and MRW will be emphasized. Generalized Solo model will be studied in the next section.

5. Mankiw-Romer-Weil Model

Mankiw, Romer, and Weil (1992) extended the Solow–Swan model to consider the role of human capital. The extended model assumes that the aggregate output function includes three inputs: physical capital, human capital, and labor measured in efficiency units. In this model framework, human capital contributes directly to production. The production function exhibits constant returns to scale in the three inputs but diminishing returns in the reproducible inputs (physical and human capital):

\[ Y(t) = F(K(t), H(t), L(t)) \]  
(1)

\[ Y(t) = K(t)^{\alpha} H(t)^{\beta} [A(t), L(t)]^{1-\alpha-\beta} \]  
(2)

-Savvides and Stengos, 2009
where $H(t)$ represents the stock of human capital in period $t$ and $\beta$ is the output share of human capital. We define variables in efficiency terms so that the equivalent:

$$y(t) = k(t)^{\alpha} k(t)^{\beta}$$

(3)

Where:

$$y(t) = \frac{Y(t)}{A(t) L(t)} , \quad k(t) = \frac{K(t)}{A(t) L(t)} , \quad H(t) = \frac{H(t)}{A(t) L(t)}$$

the equation for physical capital accumulation and human capital accumulates according to:

$$\dot{h} = s_h y - (\delta + g + \beta) h$$

(4)

$$\dot{k} = s_k y - (\delta + g + \beta) k$$

(5)

$s_h$ and $s_H$ denote the share of output devoted to physical capital formation and human capital formation. $n$ is rate of labour force growth (The labor force is exogenous and grows at a constant rate that is given by $s_L = (L')/L$ ), $g$ denote technological progress (technological progress is exogenous so that the technology index grows at a constant rate given by $s_A = (A')/A$ ) and $\delta$ denote, constant depreciation rate of physical capital (By assumption, the rate of depreciation for the two reproducible inputs is the same).

The steady-state level of efficiency physical capital and the steady-state level of efficiency human capital is:

$$h^* = \frac{s_h y}{n + g + \delta}$$

(6)

$$k^* = \frac{s_k y}{n + g + \delta}$$

(7)

According to 3, 6 and 7, we arrive at the steady-state levels of human and physical capital:

$$H^* = \left[ \frac{s_h}{n + g + \delta} \right]^{1-\alpha-\beta}$$

$$K^* = \left[ \frac{s_k}{n + g + \delta} \right]^{1-\alpha-\beta}$$

(8)

and the steady-state level of efficiency income as:

$$y^* = \left[ \frac{s_h}{n + g + \delta} \right]^{1-\alpha-\beta}$$

(9)

With taking the logarithm of 9 the steady-state level of income per worker can be expressed as:

$$\ln y^* = \ln A^* + \left( \frac{\alpha}{1-\alpha-\beta} \right) \ln s_h + \left( \frac{\beta}{1-\alpha-\beta} \right) \ln s_k - \left( \frac{\alpha + \beta}{1-\alpha-\beta} \right) \ln (n + g + \delta)$$

(10)

The equation 10 can also be expressed in terms of the (steady-state) level of human capital by substituting for $s_H$ and rearranging to obtain:

$$\ln y^* = \ln A^* + \left( \frac{\alpha}{1-\alpha-\beta} \right) \ln s_h + \left( \frac{\beta}{1-\alpha-\beta} \right) \ln H^* - \left( \frac{\alpha}{1-\alpha} \right) \ln (n + g + \delta)$$

(11)
First, Mankiw-Romer-Weil estimated Solo's simple model (without human capital) (relation (11) when $\beta=0$), results of estimation were in the way that coefficient $\frac{\alpha}{1-\alpha}$ was equal to 1.4, i.e. $\alpha$ was about $\frac{2}{3}$ but it should be about $\frac{1}{3}$ (in other words capital share in production was overestimated) and on the other hand coefficient of determination had been equal to 0.59. In the next step, they estimated the model with the existence of human capital and used a share of population of the educated work force as representative of human capital. In this state coefficient of determination obtained 0.78 and physical capital coefficient was equal to about $\frac{1}{3}$. Mankiw-Romer-Weil concluded that investment in human capital and physical capital explained 0.78 of income per capita difference among the countries by a common investment and meanwhile amounts of parameters were rational and significant (Acemoglu, 2009).

6. Specification of the model and data

Generally economists have applied three main approaches for evaluation of economic benefits and consequences of investment in human capital experimentally (Dehghani et al, 2010): 1- correlation method 2- analysis method of cost-investment profit in education 3- method of considering of educational index as the productive data in the production function.

In this survey the third method is used that is the most-used method and Cobb-Doglas production function has been applied. This function has been specified as the best function in terms of adaptation and conformation with economic conditions because of its appropriate functional form and saliency of internal relations of its variables.

$$Q = A L^\alpha K^\beta H^\gamma$$ (12)

In this relation, $Q$ is gross domestic product, $L$ is labor force, $K$ is physical capital inventory, $H$ is human capital and $A$ is the technology coefficient.

(13)

By logging of natural logarithm from two sides of the relation (12) the obtained model is as below:

$$\ln(Q) = \ln(A) + \alpha \ln(L) + \beta \ln(K) + \gamma \ln(H)$$ (13)

Coefficients of $\alpha$, $\beta$, $\gamma$ in the above equation are elasticity of production with regard to the labor force, physical capital inventory and human capital respectively. In order to examine the impacts of production factors such as education on economic growth, both sides of the equation (13) are differentiated to obtain the final form. The mathematical final form of the model is:

$$d\ln(Q) = \alpha d\ln(L) + \beta d\ln(K) + \gamma d\ln(H)$$ (14)
The final form of its econometrics model is:

$$d\ln(Q_{it}) - \alpha d\ln(L_{it}) + \beta d\ln(K_{it}) + \gamma d\ln(H_{it}) + \epsilon_{it}$$

Variables of this model are:

- $d\ln(Q_{it})$: Differential of logarithm of gross domestic product of the province $i$ in year $t$ that shows economic growth of provinces during the time.
- $d\ln(L_{it})$: Differential of logarithm of active population of the province $i$ in year $t$ that shows growth of the active population during the time.
- $d\ln(K_{it})$: Differential of logarithm of physical capital inventory of the province $i$ in year $t$ that shows growth of physical capital inventory during the time.
- $d\ln(H_{it})$: Differential of logarithm of human capital inventory of the province $i$ in year $t$ that shows growth of human capital inventory during the time. $\epsilon_{it}$ is the disturbing element.

Before dealing with the method of model's estimation it is necessary to give explanations about the manner of extraction of the model variables. The main reason for selecting of the studying period in this survey (2001-2007) is availability of information related to gross domestic product of provinces in this period. Twenty eight (28) provinces are studied in this survey and data related to three provinces of Khorasan Razavi, Khorasan Jonoubi and Khorasan Shomali from the year 2005 onwards has been added to each other and they are considered as one province (Khorasan) in the analysis. No statistics and information about physical capital inventory of provinces has already been published by any organization, because of this we have used a representative variable in the present survey. Provincial investment has been obtained from the sum of banks’ paid accommodations to the private sector and performance of reconstruction credits of the province (in Iran a low percentage of paid accommodations to the private sector is allocated to performing of investment activities but because of being close to the variable of physical capital inventory, it is supposed that the paid accommodations are spent for investment). Then proportion of gross domestic product of the province to the gross domestic product of the whole country in 2001 is multiplied by pure physical capital inventory and the obtained amount is considered as the primary inventory of physical capital. Afterwards, investment price of the province is added to the primary inventory of physical capital to obtain physical capital inventory for next years. At last, educational and health care expenditures that are indexes for human capital are extracted from the output value of the education and health sector which reveal spent expenditures on education and health by government and the private sector. These statistics for the years 2001-2007 have been published by Statistics Center.

6.1. Estimation of the model in the state of existence of educational expenditures

First, we estimate the model in the form of stable impacts that F-Limer statistic has been equal to 278.5 (with the possibility of 0.76). As a result, the null hypothesis (pooling) could not be rejected. After estimating of the model

---

5. paid accommodations of banks to the private sector are considered as representative of the private sector’s investment. Source: Central Bank
6. Source: Iran’s Central Bank
through ordinary least squares method we estimate the model through generalized least squares method due to existence of variance dissimilarity (chi-square statistic of Breusch-Pagan/Cook-Weisberg test 447.05 (with the possibility of 0.000) rejects the similarity assumption of variance). Obtained results of estimation are illustrated in column (1) of table 1.

Coefficients of physical capital inventory, labor force and educational expenditures are equal to 0.34, 0.40 and 0.14 respectively. These coefficients mean that if physical capital inventory, labor force and educational expenditures grow to one percent, gross domestic product of the provinces will be increased averagely as 0.34, 0.40 and 0.14 respectively.

Note: *and ** indicates the significance level at 5 and 1% respectively based on the two-tailed test. Standard error estimates are in parentheses.

**EE**: Annualized change in log Education Expenditure.

**HE**: Annualized change in log Health Expenditure.
6.2. Estimation of the model in the state of existence of health care expenditures

First, we estimate the model in the form of stable impacts that F-Limer statistic has been equal to 278.5 (with the possibility of 0.76). As a result, the null hypothesis (pooling) could not be rejected. After estimating of the model through ordinary least squares method we estimate the model through generalized least squares method due to existence of variance dissimilarity (chi-square statistic of Breusch-Pagan/Cook-Weisberg test 273.68 (with the possibility of 0.000) rejects the similarity assumption of variance). Obtained results of estimation are illustrated in column (2) of table 1.

Obtained coefficients mean that if physical capital inventory, labor force and educational expenditures grow to one percent, gross domestic product of the provinces will be increased averagely as 0.33, 0.35 and 0.19 respectively.

6.3. Estimation of the model in the state of existence of mutual impact variable of educational expenditures and health care expenditures

Now we enter the mutual impact variable to measure the mutual impact of educational and health care expenditures. Results obtained from estimation are illustrated in column (3) of table 1. Obtained coefficients mean that if physical capital inventory, labor force and mutual impact of educational and health care expenditures grow to one percent, gross domestic product of the provinces will be increased averagely as 0.33, 0.37 and 0.09 respectively.

7. Conclusion and discussion

Studying of the importance of human capital at the production level of a country enjoys a high significance. Economists have tried to measure profits of investment in human capital and also human capital share in productions of a country through various methods. In the present survey, the relation between human capital and economic growth of the provinces in Iran has been studied by means of Mankiw-Romer-Weil model (1992) - in two forms of education and health. According to human capital theory, education and health as two main variables that create human capital will be leaded to increasing of production and income per capita. Difference of the performed studies in relation to this issue is in the type of the applied index. Two indexes of spent expenditures in education and spent expenditures in health care are used in this paper. Results obtained from estimation demonstrate that both variables of human capital have a positive and significant impact on economic growth, but amount of effectiveness of health care expenditures is more than educational expenditures. According to performed studies, average rate of investment in health care to educational investment is equal to 0.7. We can argue that because of lower volume of investment in health increasing of one Rial of investment in it would be leaded to higher economic growth. On the other side, mutual impact variable of two forms of human capital has a positive and significant impact on economic growth based on the results obtained from estimation. It means that by spending of one Rial (dollar) in educational and health care expenditures at the same time, economic growth of 0.09 percent will be fulfilled. Finally, direction of causality has been determined through Granger causality test. Direction of causality is from health care expenditures to educational expenditures as expected that is health of the labor force has direct impacts on education accumulation of human force in addition to income and production. If we want educational expenditures to be
effective, first we should provide the ground for the individual's health in order to receive education, as healthier individuals have higher learning ability than others. Thus, economic policy makers must focus on human capital in order to reach to a stable growth and economic development. So it is recommended to pay more attention to human capital as the complementary factor of physical capital and the main factor that creates technology beside investment in physical capital. Also, grounds of total health should be first provided to enhance effectiveness level of educational expenditures and this issue depends on more investment towards developing of public health system that provides cheap services for the poor.

Abstract
This study is an attempt to investigate the relationship among Total Quality Management variables and TM in schools of Naghadeh city, Iran. The research hypothesis has compiled six variables of TQM including Leadership, Strategic Planning, Customer Focus, Information Analysis, Process Management and Human Resource Management and Morale Dimensions including Identification, Belongingness, and Rationality. The Research method in data analysis was descriptive and correlation. The population of this study is included all male and female teachers in Naghadeh schools. Through stratified random sampling, 150 teachers were chosen. To gather the data, are used two questionnaires with Likert five grades (TQM questionnaire with 57 questions, morale questionnaire with 15 questions). Cronbach coefficient is used to determine reliability of questionnaires. The reliabilities of questionnaires were %97 & %88. All data classified through descriptive statistics. Multivariate tests or MONOVA and Regression are used for data analysis, through inferential statistics. The results showed that there was significant relationship among all of TQM variables and Morale Dimensions. Also, there was significant predictive relationship among Information and Analysis, Process Management, Customer Focus with Morale Dimensions.

Keywords: Total Quality Management (TQM), Morale Dimensions, Teacher, Schools, Iran

Introduction
During the last few decades, there have been outstanding changes inside and outside the organizations together with management views and these changes have made it necessary to establish orders based on modern management patterns. (Delqoshaei and et al 1382). Nowadays, management is in need of different tools to promote quality and one of these tools, is TQM is a culture which needs to change into a tool. It means that we should create the concept of TQM in all the teacher minds so that they can change that
concept into practice after sometime, and enhance the quality in the organization (Jalali and Aghaei, 2006). Keng-Boon and et al (2007) believe that TQM is a way to manage an organization in which management is based on the cooperation of all members and aims to achieve the long-term objectives through getting the satisfaction of all customers and organization staff on the other hand. Nowadays TQM has gained such an important status that all developed and developing countries have provided all their facilities and equipment to enforce that form of management in all parts of their organization and some have gained great successes in this regard (Armistrong, 1991; Chandwick, 1995; & Abdolmalec, 2000).

TQM is a way which can brings up changes in the education system; it is a philosophy with continuous improvement which can provides a set of practicable tools and techniques to meet the present and future desires of any educational system. Therefore this management as a quality – oriented approach makes fundamental changes in education and leaves deep affects on approaches intended to improve management (Yazdkhasti et al, 2009, p.177). Harrington & Barker (2002) state that total quality management not only is used in manufacturing organizations but also organizations in 21 century have faced great changes in their own structures.

TQM is a rational approach which emphasizes on group responsibility continuous improvement cooperation and flexible plans (Torani and et al 1387. p.177),

This research is an attempt to find out the relationship among TQM variables and morale through investigating the teachers views.

TQM variables are as following.

Leadership: A procedure through which managers run and direct their organization and make changes to make promotions in the system as a result of which teachers on their volition cooperate to make improvements.

Strategic planning: To investigate how plans and objectives are made to guide and direct educational activities.

Customer Focus: To investigate how educational systems consider customers expectations (students and education service users) and how they analyze their expectations.

Information & Analysis: To investigate how educational systems gather information about school activities and analyze the information to give it to lead managers, teachers, staff, and students.

Human Resources Management: To investigate how teachers in the process of being employed show their potentialities to reach the educational objectives.

Process management: To investigate how overall process and procedures of educational systems. Like need-based planning, offering services, controlling and supporting activities are done (Yazdkhasti and et al (1388)).

Studies related to TQM variables show that there is a positive relationship among TQM and other variables in the organization (Job satisfaction, efficiency, commitment).

Morale is a term most frequently used by everybody however there is no clear cut definition for that and those definitions suggested so far are not comprehensive enough.

Wiles, quoting (Abbaszadeh and Galavandi, 1384) defines morale as a mental and emotional reaction in a profession, so morale is the abstract which cannot be observed rather it can be observed by careful analysis of persons behavior Davis: quoting (Abbaszadeh and Galavandi 1384) defines morale as group and individual understanding of everybody from his Job environment, and their orientation to cooperate to achieve organization objectives.
Morales dimensions discussed in this paper is as following:
Identification: This term shows common objectives, that are to what extent personal expectations match organization objectives.
Belongingness: This term shows how bureaucratic expectations match personal needs.
Rationality: This term shows how bureaucratic expectations match organization objectives.
Therefore, organization member's morale is dependent on personal needs and organization objectives match. (identification)
Personal needs and bureaucratic expectations match (affection) and bureaucratic expectations efficiency to achieve organization objectives. Abstracts of studies which can nearly match our topic are below.
Ahmadyfard (1376) includes that open and relaxing atmosphere of schools can have a positive effect on teacher's morale.
Hoseinpoor (1376) argues that making a bilateral relationship between staff. Organization and morale are one of the positive effects of TQM.
Farsi (1382) states that there is positive correlation management principles and TM.
Jung Ying (2003) argues that Job satisfaction, organization commitment and morale are caused by performing TQM Steven and et al (2004) and Karia and et al (2006) in separate studies showed that TQM makes some improvements in views about jobs such as (affection, job satisfaction, organization commitment and morale dimensions.
Keng -Boon and et al (2005) reported that improvement in group work customer orientation, job satisfaction is the result of applying TQM.

Research hypotheses
- There is a relationship among TQM variables and TM.
- There is a relationship among TQM and identification.
- There is a relationship among TQM and belongingness
- There is a relationship among TQM and rationality.

Research method:
Our research method is correlation and the population of this study includes all male and female teachers in Naghadeh guidance school in 1388.1389. sample size was considered 150 individuals according to the statistical population and two categories of teachers size was enough as statistical power was higher than 0/8and level at significance was close to zero which was confirmed in hypothesis analysis.
Through stratified random sampling 150 teachers was selected giving each sex a proportional share to gather data, we used two questionnaires made by the researcher about TQM variables and morale.
The questionnaires were validated by management science experts and the reliability of them was 0/97 and 0/88.

Findings:
Hypothesis 1: There is a relationship among TQM variables and morale dimensions.

Result in table 4 showed that there is a positive and significant relationship between all variables of TQM and rationality and hypothesis 4 was proved. However among all the variables of TQM just process management showed a predictive relationship with rationality ($p=0.03$).

Discussion and conclusion
Some organizations have come to this conclusion they will not be able to survive and profit unless they change their needs and wishes and meet the customers end and stand the market pressure Worldwide changes in micro Electronics , Information technology revolution in distance communication have made international competition difficult such changes have raised customers' expectations high. Customer's knowledge, along with their own understanding has added to their power of what to choose TQM can increase the power and activities of organizations and have made it easy for organizations to satisfy their customer's needs. Data analysis of hypothesis one showed that there is a positive and significant relationship among process management and all dimensions of morale. (p=0/02).

The results gained showed similar findings to what had already been shown in the studies of (Amir Farsi, 1382) (Jing Xing, 2003) (Keng-Boon et al, 2005).

Data analysis in hypothesis two showed that there is a positive and significant relationship among all the components of TQM and morale similarity (r=0/64).

However among all the variables just information and analysis showed a predictive relationship with morale similarity (p=0/04) the results of this hypothesis is similar to those of Steven et al (2004) Caya, et al (2006). The results of hypothesis three showed that there is a positive and significant relationship among all variables of TQM and morale affection (p=0/00) (r=0/62) our third hypothesis was completely proved. However there were only predictive relationship among Information and Analysis, Focus on Customers and Morale affection (p=0/02) (r=0/01). The results were similar to the findings of (king, et al, 2005) Jing Ying (2003).

The results in our hypothesis four showed that there is a positive and significant relationship among all variables of TQM and morale rationality (p=000) (r=0/5) our fourth hypothesis was completely proved. However there was a predictive relationship among process management and rationality (p=0/03) the results of this hypothesis was similar to those of (Amir Farsi 1382), (Steven et al 2004) (Karia, et al 2006). In conclusion we can say that morale is of great importance because it can represent all human relations in the organization and needs further studies be done in that regard morale is need of ongoing consideration and includes all emotions and way of thin king of human beings and is effective in producing more for fit.

Academics in the real world: Likes and dislikes

Dr. Ali Shirazi
Ferdowsi University of Mashhad, Mashhad, Iran
Director of Center for Management & Market Studies

A brief autobiography of the author
Dr. Shirazi is an assistant professor and director of the Center for Management and Market Studies at Ferdowsi University of Mashhad, Iran. He has authored several books and articles and directed a number of major research projects in Iran and abroad. His research interests include organizational development, organizational culture and management transformation and education.

Abstract
A combination of economic and trade liberalization, technological advancement and globalization have significantly increased the complexity and uncertainty of managing organizations. Hence, many managers have sought the services of knowledgeable consultants to help them solve their organizational and managerial problems. Given the increasing role of consultancy industry in business transformation and improvement and the skills required to identify and retain the services of effective consultants, it is essential to understand the expectations and concerns of the industry key players. This paper aims to identify key factors that affect the satisfaction of Ferdowsi University of Mashhad academic and research staff when providing consultancy services to the outside organizations. An exploratory search revealed the importance of four groups of satisfaction factors, namely personal, political-social, client-consultant relations and project management. A questionnaire was designed, pilot-tested and distributed among the target group. The results revealed that while university staffs are satisfied with the personal factors, they are dissatisfied with the political-social factors when consulting client organizations. The findings are discussed and suggestions are made to overcome conflicts in consulting jobs.

Keywords: Consultancy, Consultant, client, satisfaction, motivators

Introduction
Drucker (1991) in highlighting the critical role of managers argue that managers are the most important factor in success or failure of societies and since we live in an information era, success is directly related to utilize the new knowledge and the most knowledgeable. However, as Forbes magazine (1995) estimates, an unprecedented advancement of knowledge over the last quarter of century has resulted in doubling of human knowledge every 18 months. In one hand, information, as the key managerial tool for decision-making is now readily and easily available to everyone, on the other, the volume and diversity of data and data sources and consequently diversity of specializations, are increased so fast and quickly that decision-making has become difficult and hazardous. Thus, managers faced with such uncertainty and competitive forces that see no other choices but to rely on the services of experts, particularly academic consultants, and this has caused the emergence of a new industry called consulting industry. This industry has experienced an astonishing growth in recent decades to the extent that management consulting
services fee of a few billion dollars in 1980s has increased to sixty billion dollars in the late 1990s (Greiner and Metzger, 1983, Czarniawska, 1998).

Identifying and hiring experienced and efficient consultants form thousands of consulting firms and independent consultants is one of the key issues and focus of research project in consulting industry and profession. Academic consultants employed in higher education sector are among the most knowledgeable and insightful consultants and hence are the most sought after consultants in the industry. Thus, identifying and understanding factors that affect the academic consultant satisfaction or dissatisfaction as well as barriers in consultants' job and ways to improve academic consultant-client relationships may assist the expansion of consulting activities by encouraging the academic staff and researchers to get involved in providing consulting services to organizations.

**External consultant role**

Kubr (1996) argue that consultants essentially plays two roles; informational role that involves the utilization of appropriate knowledge and experience to help client identify the nature of its problem, and process role that aim to help client organization to solve its problem by awareness about organizational processes. Schein (1999) in describing consultant role, refers to process consulting that highlights whatever goes on between helper and helped. He suggests that consultant is an organizational doctor. Argyris (1970) identifies three roles for management consultants, including collecting information, facilitating to identify possible solutions and instilling commitment in members to implement the chosen solution. While Turner (1988), Steele (1975), Burnes et al. (2003) and Werr et al. (1997) underline the learning role of consultant in today's competitive world, Larwood and Gattiker (1986) believe that consultant role is really nothing but to close the gap between consultant-client knowledge. As the result, if we agree that consultants' key role is to transfer knowledge and skills to client organization, we may deduce that they are change agent in organizations.

Despite an increasing recognition of the role of consultants in improving management decision-making and organizational performance, numerous criticisms have been laid against their role and efficiency. Arnaud (1998) describes consultants as opportunists. Shapiro et al. (1993) argues that the primary aim of consultants is to sign another contract before the current project is still in progress. De Burgundy's (1995) criticism goes even further, as he suggests that spending scarce resources for buying consulting services is useless and comes to nothing, except to keep some people employed. Stglitz (2001) refers to some projects in the Eastern Europe and developing countries where western consultants offered inappropriate solution for the local conditions which were either rejected, assessed inefficient or ended costing too much for the clients. Abrahamson (1991) accuses consultants for creating fads and new tools and techniques to prolong their contract. McKinley and Scherer (2000) believe that the language of consultants heighten the client's feeling of insecurity and uncertainty which may harm organizations, sometimes irreversibly and at a great cost. From this point of view, consultants are the main cause of consulting project failures. Table 1 shows a summary of writers and researchers' views on the role of consultants:
### Table 1. Views on Consultant's role

**Attractions and distractions of consulting jobs**

Consulting like other jobs has attractive and distractive aspects. Identifying these aspects and their management, in one hand, can help removing them during implementation of consulting projects, and in the other, bring about motivation in engaging in such projects. The most important attraction of consulting job are diversity, contact with client and transfer of knowledge and skills from client to consultants (Steele, 1975), taking part in organization success (Argyris and Schon, 1978) and mental challenge (Kakabadzeh et al., 2006). The factors that adversely affect consultant to perform its role are long work hours, criticism as a consultant (Kakabadzeh et al., 2006), worry about job security (De Burgundy, 1995), bureaucratic barriers, lack of management support for finding key problems and fidgeting about solving them (Williams, 2003), ambiguity in evaluation process and management emphasis on short-term rather than long-term objectives, ambiguity about consultant role (Weiss, 2003).

In a study by Hu and Gill (2000) regarding academic motivational factors in collaborating with organizations, two set of factors, including investment factors (e.g. salary increase, promotion,…) and consumption or internal motivators (personal satisfaction derived from solving problems, recognition,…) were identified. In other words, an academic consultant expects the client to satisfy his or her external and internal motivation at an acceptable level. Hence, since clients usually refer to university staff to solve their organizational problems and challenges, identifying and understanding factors that affect academic consultant satisfaction is essential.

**Factors affecting consulting projects**

In some management research, factors affecting phenomena, such as performance, are referred to as success criteria or failure criteria. There are different claims regarding the rate of consulting project failures, from 25% (Czander, 2001) to 80% (Zackrison and Freedman, 2003). Clients often complain that consulting project do not meet their objectives or are behind their stated schedules. Experts, on the other hand associate many factors with project failures, including lack of internal communication (Pries and Stone, 2004), consultant-client different views on effective leadership (Fullerton and West, 1996), consultants ability, organization's inappropriate interference and consultant-client relationship (Queen and Fisher, 1991), internal politics...
nuisances in consulting process, failure in assessing the real purpose of consulting project (Lister and Pirrotta, 1996) and lack of control and mismanagement (Smith, 2001).

Overall, factors attributed to project failures can be divided into four groups. The first group includes consulting characteristics, such as lack of competency (knowledge, ability and skills). The second group is related to technical problems, particularly ineffective management. The third group includes conflicting and unsustainable relationships between consultant and client that may have personality, behavioral or organizational causes. Finally, the forth group is related to political-social aspects of client organization, such as hidden goals or motivation and lack of readiness for change and resistance to change. Therefore, it is argued that if organizations pay adequate attention to fend off these deterrents or de-motivators, it is expected that both sides, i.e. consultant and client benefit from their mutual relationships.

Methodology

All academic staff at the Ferdowsi University of Mashhad who had been involved in providing consultancy to outside organizations through the Office of Scientific Cooperation between University and Society were invited to participate in the study. A random clustered method of sampling was used. Given that the total number of staff members involved in consulting projects (N=80), the error (ε =0.07) and the variance (σ²=0.033), the minimum sample number was calculated to be 38. The literature on consulting jobs, findings of previous studies and exploratory interviews with 12 academic staff in the population formed the basis for designing a questionnaire which aimed to assess dimensions and the extent of the university academic staff satisfaction in consulting projects. The questionnaire was tested in a pilot study and its Cronbach's Alpha was calculated to be 0.85. It then distributed among 50 academics of whom 42 completed and returned it. Descriptive statistics, t-test and regression formulae were used to analyse the collected data.

Findings

The results showed that the mean of length of service of the respondents was 15 years with the range between 3 to 28 years. The mean of number of projects academic were involved at the time was 2 with the range between 1 and 3. A t-test, using mean differences at 5% significance level, was performed to assess the respondents' satisfaction in consulting projects. The test used 3 as the value which indicates satisfaction for each variable included in the study. Table 2, shows the results for some of the variables. Letters "S", "A" and "D" denote satisfaction, average satisfaction and dissatisfaction respectively.

</tbody>
</table>

As seen in Table 3, the significance level for variables related to project management and consultant-client relationships is greater than 0.05 which implies that academics are somewhat satisfied with these groups of variables. In contrast, the significance level for the consultant personal characteristics variables is less than 0.05 which together with its positive mean difference suggests that academics are satisfied with this group of variables. Furthermore, political-social factor has significance level less than 0.05, but since its mean difference is negative, it may be said that academics are not satisfied with it. Finally, given that the significance level for all four factors together is greater than 0.05, it may be concluded that academics level of satisfaction with working on consulting projects for outside organizations is average.

Discussions and conclusions

The findings revealed that of 30 variables tested in the study, university academic staffs are somewhat satisfied with little more than half or 16 variables. Somewhat satisfied or average level of satisfaction means neither satisfaction nor dissatisfaction, rather an absence of dissatisfaction, as suggested by Herzberg's two factor theory of motivation. According to this theory, people feel satisfied with what they do when motivated by higher order needs or motivators, including achievement, recognition, advancement and growth (Herzberg et al. 1959).

Misconceptions, be real or fiction, about barriers in effectively delivering research or consulting project is the main reason for some academics to refuse to engage in these types of projects. The underlying cause of real barriers in consulting jobs that leads to academics dissatisfaction seems to relate to the structure of all centralized economy, including the overarching role of government in economic planning and activities, inefficient bureaucracy and lack of management accountability regarding their performance. In the private sector, barriers and challenges are more universal which include traditional organizational structure and management.
that are inflexible, risk-averse and resistance to change. Most consultants complain about management lack of support in implementation phase of consulting project, management interference and delays in paying the consultant fee, as agreed in the contract. Thus, as Greiner and Metzger (1983) argue, consultant-client relationships should be within the framework set in the contractual agreement. Furthermore, the findings showed that consulting projects do not usually lead to scientific publication or job promotion, primarily due to the confidentiality of these types of projects, it is therefore as suggested that university administration should set rules and regulations that provide promotional opportunities for academic consultants with credentials and earning capacity and also to encourage other potential academics to actively seek consulting projects. In doing so, the university meets one of its primary objectives that is to solve societal problems.

One revealing finding expressed by some academics in interview sessions and in the questionnaire was the unusually large number of consulting jobs that are commenced without a written contract. The experience has shown that providing consulting services based on oral agreements often cost the consultant dearly. Some young and inexperienced academics may commit themselves to demanding and complex projects for personal reasons or friendly favor, which if they go wrong or the client reneged on its oral agreement leaves them with little or no return on their efforts and time and no legal avenue to turn to. It is therefore suggested that academic consultants should thoroughly think through all aspects of a consulting job offer, including the fit between their expertise/experience and client expectations, client willingness to support the project both financially and administratively and a legally-binding contract that is signed by both sides. A consulting contract should include items such as complete personal information of the consultant and client, objectives and nature of the job, client expectations, unit of work in the client organization, organization liaison officers, length of project and its conditions, project progress methods and conflict resolution approach, payment date or a phase for the work done and contract cancellation conditions. The objective of signing such a consulting contract is to reduce ambiguity, risk and feeling of dejection when providing or receiving consulting services.

Abstract

The main purpose of present research is to compare the effects of self-esteem group training using behavioral and behavioral-cognitive approaches on social adjustment of students being resident in University of Isfahan dormitory. Purposing to approach this goal, 30 students of the dormitories were selected through voluntary sampling, and then randomly divided into three groups (two as experimental and one as control). The experimental groups were separately under self-esteem behavioral-cognitive and behavioral training for a period of eight sessions. The instruments of the research is Pope and his colleagues’ self-esteem inventory and social adjustment test which their reliability and validity are confirmed. The results of variance analysis show the effectiveness of different instructional methods, and significant increment of social adjustment and self-esteem. In other words, the approaches of self-esteem’s behavioral and behavioral-cognitive performed through a group approach have caused the enhancement of social adjustment of the dormitory’s students. Although the results indicated that the behavioral-cognitive instructions were more impressive than behavioral ones, but, regarding statistical viewpoint, those impressions were not significant. Also, the differences of self-esteem’s and social adjustment's score in three groups of behavioral-cognitive, behavioral, and control were persistent when being pursued.

Keywords: Social Adjustment, self-esteem, Behavioral-cognitive approach, Behavioral approach.

Introduction

As the most important sign of the psyche’s healthiness, the social adjustment is one subject which has drawn many sociologists’, psychologists’, and specially instructors’ attention. Social growth is assumed as the most important aspect of everyone’s character and a criterion for measuring everyone’s social growth is one’s compatibility with others. Social growth not only is impressive on compatibility of every individual with others whom the individual is in
interrelation with them, rather, has an impression on the individual’s later professional and educational success [1]. Goodestein and Lanyon have defined the adjustment as a coherent process in which the individuals’ training experiences cause their psychological needs, and also provide a possibility of acquiring capabilities and skills by them the individuals can fulfill their needs [2]. Whenever the physical and psychological equilibrium of individuals encounter disorder in such a manner that they for inconvenience, then, for making equilibrium, they will need to apply their inner talents and outer protections. Here, if they succeed to apply these new mechanisms and solve the relevant problems in favor of themselves, it is said that the adjustment process have taken place [2]. The aspects of adjustment include physical, psychological, social, and moral adjustments which the social adjustment settles of the top. The overture of achieving psychological, moral, and physical adjustments is social-adjustment [3].

The adjustment is one of the most important subjects being under consideration form the time of human appearance on the earth but having no significant and scientific record. The scientific research on adjustment began from 1984 when Ratsus and Loyd submitted a model for adjustment. In 1992, Lasarus and Fulkman went of their works and submitted a new model for adjustment. In the later years, the relationship among adjustment and other variables was inspected by other researchers including Spearman 1990, Mendouka 1981, Kan 1989, & Blarod 1992 which inspected the methods of enhancing adjustment through group and short term procedures and behavioral and behavioral-cognitive modes [4]. Spearman inspected the impression of group and short term consultancy and objective modes (Behavioral approach) on social adjustment, self-esteem, and control center and found that the relevant instructions could enhance the level of social adjustment in individuals [5]. Kan and his colleagues inspected the impression of a group protective program on depression, social adjustment, and self-esteem in adolescents of international schools. The results indicated there was a significant difference among test and control groups in depression, social adjustment, and self-esteem variables. In other words, the relevant instructions were effective in enhancing social adjustment and self-esteem, and decreasing depression [6]. Thus, adjustment and becoming harmonious with one’s real self and environment are a vital necessitation. The daily endeavors of all human beings revolve around this very adjustment, and every individual, consciously or unconsciously, tries to fulfill his/her diversified, and often contradictory, needs in the environment he/she lives. The point that is of importance is that an individual should proceed on the right was to achieve the adjustment, and one right one is enhancing self-esteem.

Mazlow believes that whenever we feel inner respect of respect ourselves, we feel inner security and self-confidence, and appreciate ourselves as notable and worthy entities; and in case of lack of self-respect we must well recognize ourselves, be adjustable, and fully and clearly distinguish our merits and Achilles’ heel. If we fulfill these needs, we will be able to proceed with fulfilling the most superior need that is self-actualization, and then can nurture all our talents [7]. Pope and his colleagues applied the mode of behavioral-cognitive for curing patient suffering with low self-esteem in the outpatient department, and arrived of useful outcomes. Furthermore, the same mode was applied for talented students who had a poor opinion of themselves, and again useful outcomes were obtained. Performing the relevant program was suggested to be
applied for children and adolescents of schools, students of universities, centers for social services, and private clinics [8].

Also, In Iran, some researches on the bilateral effects of self-esteem and social adjustment have been done which among all the impression of self-esteem on students’ social adjustment with the classes’ atmosphere in com province was measured by Falsafi Nejad who found that the self-esteem [positively] impressed the adolescents’ social adjustment with classrooms’ atmosphere [9].

In his research, Sedighi concluded that behavioral-cognitive instructions of self-esteem would have not increased the students’ social adjustment [10].

Regarding the above mentioned cases, the moil purpose of this research is to inspect the effectiveness of two approaches of behavioral and behavioral-cognitive of self-esteem on social adjustment of female students resident in the dormitory, and also giving answer for the following questions:

A) Is the behavioral approach effective on enhancing social adjustment?
B) Is the behavioral-cognitive approach effective on social adjustment?
C) Which of these two approaches are more effective in enhancing social adjustment?

The Research Method

Based on semi-experimental method of pretest and posttest types with experimental and control groups, the scheme of the research is a follows:

• Sampling population & Sampling Method In this research, the statistical universe is the female students’ entire resident in University of Sasha dormitory, i.e., 2532 persons. The sampling method is voluntary introduction, e.g., from amongst the students resident in University of Isfahan dormitory, 30 volunteers were selected through interview as the sample, then by lot, ten persons were assigned to experimental group No.1 (Behavioral-cognitive group), ten to experimental group No-2 (Behavioral group), and ten to control group.

Instruments

For inspecting the rate of the students, self-esteem, Pope and his colleagues inventory of self-esteem was applied in this research. The inventory has 60 questions and assesses self-esteem through the give scales of general, educational, familial, physical, and social; furthermore, has lying measuring scale. Reliability coefficient of the research has been calculated by Ghaffari and Ramezani (1994) as 0.76, by Emami and Fatehi Zadeh [11] as 0.85, and by Mohaghegh as 0.73 [12].

For inspecting the rate of students’ social adjustment, the test of social adjustment provided by researchers. The test has 90 questions and give scales of inter-individuals adjustment, personal adjustment, educational adjustment, intimate relations adjustment, and mood adjustment.
The test was normalized by the researchers through testing on 40 persons, and its reliability coefficient was calculated as 0.76 using Crownbach’s alpha. The stages of formation the test are as follows:
A: Investigating several records and texts, determining social adjustment factors, gathering questionnaires, and performing the test.
B: performing factorial analysis on the questionnaire.
C: Inspecting the test and rewriting the questions.
D: Determining the test’s reliability coefficient applying Crownbach’s alpha coefficient.

- **The Method of performing the Research**

The independent variable of the research includes & group educational sessions of self-esteem for the two experimental groups applying behavioral-cognitive and behavioral approaches which performed through step-by-step instructions together with students’ and instructors’ guide books. Behavioral and behavioral-cognitive for self-esteem were held as follows:

### Self-esteem’s behavioral sessions

</table>
After performing the pretest and selecting and replacing the subjects in experimental groups and control group, the sessions of self-esteem group instruction for experimental groups were held. The control group received no therapeutic program but was tested via pretest, posttest, and follow-up test. Making coordination with consultancy center of the dormitory, for restraining intrusive variables, it was arranged that no instruction for enhancing the students’ self-esteem would be performed. The modus operandi in educational sessions was in such an arrangement that at the commence of every session a brief of the previous discussions would be submitted through cooperation of the members of the group, then, new discussions would have been raised by instructor. Thence, the members of the group individually explained the brief subject of the session and what they had learnt, and at the end of the session, an assignment would be determined.

- **Statistical Method**

  In this research, the test of multivariable variance analysis (Monona); and for statistical operations, the SPSS software was applied.

- **Findings**

  After extraction the results; group’s average and standard regression of test and control groups in the pretest, posttest, and follow-up were calculated [Table 1].

Just look as in Table1, numbers’ average of test’s group than evidence’s group has increased in posttest.

</table>

In conformity Table 3 concluded that both methods behavioral, cognitive behavioral have a balance on increasing of social adjustment of daughter students and meaning different did not find about effect one method on the other.

**Discussion and Conclusion**
Adjustment and self-respect, as two factors in forming students’ mental hygiene is the most important. Mental hygiene has the high effect on education, communication, and students’ future life. Any students which go to university, see environment and culture different with her/his life.
and perhaps in this life new environment and on the other hand many texts books, different among high school and university environment, missing parents and family, and communication with opposite genus applies to learn adjustment suitable methods, otherwise not only student would not successful, but also he/she would has the problem in his life and family in future. Enter to university is the most important period in life for every student. Everyone pass commotions of competition when coming to university look new problems and it is very important that he/she should know that how face with them. Of course, this problem for daughters are most important than others.

The research results show that self-esteem group training with behavioral method increased students social adjustment. This result is the same researches of Spearman, Falsafi Nejad, and Kān and his colleague [5, 6, and 9]. But this result is in the opposite Sedighi’s research [10]. Sedighi faced that behavioral-cognitive training of self-esteem doesn't increased social adjustment in students. Perhaps, this opposition rises of different samples. In this research use from university’s students which have the high level of understanding than cognitive techniques than students in school. On the other hand, perhaps this disharmony rises of training has given different. This point should be noted that social adjustment is a relative concept and intercultural, and it depends to cultural, historic and social class condition. Social adjustment includes a vast array of topics and perhaps influence on self-esteem in some aspects of adjustment. So behavioral-cognitive training of self-esteem is not more effective than self-esteem behavior training about social adjustment training. In addition, behavioral-cognitive and behavioral training increase self-esteem of students. This result is the same Pope and his colleague research [8].

Youth ages who need to know their personality, know their attachments and abilities, obtain social skills, learn communication skills, know needs of others, learn life method with others, and be very active in social activities and these needs meet in group. Group training, give this chance to young people that obtain this needs. The results of this research, are obtained from satisfy of young students need in groups and this cause the more adjustment of them. In principal, group work has more attraction. It gives positive reaction to group’s members, and increase motion in group work. Also, group members feeling the more undertaking than doing group tasks and while perform group tasks desirable; meet their self-esteem [11]. Findings show that not only behavioral and behavioral-cognitive methods are not heavily for students but also students understand session discussion. With more meetings, increased motion of group members such that there weren’t test after second group session and student worked actively at the end.

Finally, propose to use of behavioral-cognitive methods because turn to different dimensions, both behavior and cognition. The problems about social adjustment among students are more and these problems may have be bad effects on the students in present and future. It is proposed that group training programs held for self-esteem and social adjustment, if training periods be longer that obtain exactly results.

This is important that with increasing self-esteem can amplify other positive characteristics of the individual such as social adjustment, positive self-imagination, comparison skills, educational progression, and ideas control.

Abstract

According to many researchers, the path to a sustainable future is ability to innovate: to create knowledge, convert it into viable products and services, and apply it for the profitable growth of an enterprise, the vitality of a nation’s economy, and the advancement of society. Furthermore, it is argued that because the multiplier effect of knowledge; the more it is shared, the more it grows, and individuals are now demanding a new style of leadership using organizational intelligence. This paper aims to find the relationship between Knowledge Management and organizational intelligence in Tehran science and technology parks. According to a convenient sample size of 119 experts, we found that there is significant relationships between these two fields of study especially in the dimensions of Strategic perspective & Solidarity.

Keywords: Knowledge Management, Organizational intelligence, Science and Technology parks

Introduction

The European Commission states that universities have a great responsibility in relation to their stakeholders such that they could maximize the social returns of investments. Despite the increase in the outside demands for more information and transparency in the utilization of public capital, most universities in developing countries still do not pay any attention to filing informative outside reports (European Commission, 2005, 391).

On the other hand, although the topic of knowledge management has attracted many academics and executive managers in the recent years but little information has been obtained from the public and academic sectors (Kherqani and Selseleh, 2007, 43). In the following, some examples of studies on knowledge management in different organizations will be discussed.

On the contrary, Spender (2008) argued that the future of both knowledge management and organizational learning is actually a return to a past when our theorizing was more robustly grounded in what we now choose to ignore, managers’ experiences and morally burdened practices as they apply their imagination to creating organizations.

Spender (2008) appealed to the basic formulation of individual capacities as a mean to build a foundation for strategic planning. Spender (2008) further argued that these capacities are the massively important engines of our society and economy, and that indeed there are no more important human artifacts, for our ability to organize absolutely delimits our ability to shape the human condition. Malhotra (1998) also agreed that inflexible organizational structures could not cope when the ground is shifting as rapidly as it does in today’s markets. He suggested that as part of the reinvention process that any organization must fulfill to maintain itself competitive, managing tangible and intangible assets are crucial to succeed. Any business living system needs to new itself in order to continually exist. Part of that renewal process comes from investments in tangible and intangible assets. These two types of assets have the ability to create value.
Allee (2003) and McElroy (2003) argued that the new foundation of the new knowledge economy is its people and their intelligences. They also highlighted the importance of technology to connect people and processes. Similarly, Cross and Parker (2004) defined this connectivity process as a social network, which will be the centre of execution strategy and performance and can have a substantial impact on performance, learning and innovation. This social web will keep the knowledge flow and will hold the organization together. Mendelson & Ziegler (1999) developed the Organizational IQ model. This model measures a company’s ability to quickly process information and make effective decisions. It provides strong results that have both economically and statistically significance, providing confidence on the development of the organizational IQ concept.

Matheson and Matheson’s (1998) nine-principle model correlates IQ with performance, with smarter organizations significantly getting a high IQ score. These organizations not only perform better but more consistently. Organizations in which the principles are strongly rooted are better able to adopt decision-making best practices and to achieve superior results. The model fits very well with the purpose of this research as it allows the researcher to examine the processes through which Hispanic entrepreneurs make strategic decisions and make them as effective as their operational process.

**Literature review**

In an empirical study in the Ministry of Entrepreneurial Development in Malaysia, the relationship between human resources, related issues, responsibilities and technological aspects and knowledge management was investigated. This study concludes that the said ministry does not have any particular knowledge management strategy. Of course, this study explains that knowledge exists in this ministry and it is projected in the processes and guidelines of the ministry and also the functional processes and databases. The results from this study show that the staff members of this ministry still feel that the head of the department or heads of the divisions are responsible for knowledge management in the department. Only 48.3 percent of the staff members feel that all staff members are responsible for knowledge management. To succeed in managing public services, all staff members should be responsible for various types of knowledge management which exist in their organizations (Rooney and Hearn, 2002, 26).

Another study on knowledge management in the governmental organizations investigates how to develop knowledge management and also how to determine the nature of the culture of knowledge sharing in an organization. The results of the study suggest that sharing knowledge in governmental organizations is a unique and very important challenge and government organizations are typically hierarchal or bureaucratic and that precludes the smooth sharing of knowledge. The authors state that most people are disinclined to share their knowledge with others. They keep their knowledge to themselves so as to get a promotion by virtue of the power of their knowledge (Lee and Choi, 2003, 260).

The results from another study on knowledge management in governmental organizations in the Carlton University in Canada showed that initiatives that are undertaken with relation to knowledge management in governmental organizations are profoundly political and have a great effect on the agents in the public sector and the group of clients in the public sector (Schein, 1988, 51).
Wug has also conducted a thorough research on knowledge management. He investigated how knowledge management could play a significant role in governmental offices especially in the four main following areas:
- Improving decision making in the organizations of the public sector.
- Helping organizations of the public sector to effectively participate in decision makings.
- Creating social and mental capacities
- Knowledgeable work force sophistication

He asserts that the presence of a cohesive knowledge management in governmental organizations is an important issue. Such an approach to the society encourages people and institutions to be more diligent and hardworking and as a result provides for more stability and a better quality of life for the citizens (Wug, 1999, 32).

- Another study on knowledge management in governmental organizations of the Entrepreneurial Development Department of Malaysia investigated the relationships between organizational components (i.e. organizational culture and structure, human resources technology, and political orientations) and Knowledge creation and knowledge transfer capabilities in the Ministry of Entrepreneurial Development in Malaysia. The results show that there is an important relationship between some of these variables and the capacity to produce and transfer knowledge. Therefore, it is necessary to take into consideration some of these factors that have an important relationship with knowledge management (Skyreme, 1998, 18).

- In a study that was conducted in a university in Madrid, 40 respondents who were among the main decision makers of the university were investigated. The respondents had to evaluate the indices from a range of 1 to 3 in the Linkert Scaling and to assess the potential barriers at the disclosure of each index. The results indicate that qualitative information was more important and also the intellectual capital was a suitable tool for selecting university strategies. It was also mentioned that the best way to enhance the intellectual properties in the public sector is improving the viewpoint of the government toward universities as active agents of spreading knowledge in the society (Sanchez and Elena, 2006, 543).

- In a research carried out in a university in the United States, learning by doing was investigated as a form of intellectual capital. It was stated that the customer’s capital can be studied in universities, as well; and a successful partnership between universities and organizations outside universities is viable only when the intellectual properties of both parties increase (Garnett, 2001, 78).

- Also in a study that was conducted on a few universities of Spain with the purpose of helping them identity, measure and manage implicit knowledge, it was found out that the first stage in this endeavor is to first have an accurate definition of the organization’s objectives and then to identify the implicit aspects of the organization. Meanwhile, a causal relationship should exist between them and for each implicit aspect there should be defined and developed a set of indices. Ultimately, a periodical inspection should be conducted to ensure accommodation to new challenges (Sanchez et al, 2006, 81)

- According to Viedma (2003), individuals’ possessions and organizational assets and the existing relationship between them can influence the process of value creation. Therefore, the supervisors and managers have difficulty defining such cause and effect relationships (Viedma, 2003, 215).
The research algorithm
In this study we intend to offer a methodology that determines the existing strengths and weaknesses for the purpose of (en route for) improving the components of knowledge management. For this purpose the following steps in this research have been considered:
1- The definition of knowledge management elements: in this step, the required constituents of research shall be identified from the works of researchers through an in-depth surveying of the literature and methods of measuring knowledge management. In this research, the required data for measuring the expected and perceived knowledge management constituents were obtained using the Chang’s 6 dimension knowledge management questionnaire (Choy Chang, 2006).
2- Measuring performance and constituents’ degree of importance (weight) in knowledge management: here, a questionnaire was developed and distributed among the study population in order to measure the performance and the degree of importance for the constituents of knowledge management. The study population was comprised of all the managers and experts of the Tehran science and technology parks. Since the population size of the study was about 300 individuals, therefore, 170 questionnaires were distributed among the managers and experts of the Tehran science and technology parks using the Morgan’s sampling method. Ultimately, 103 questionnaires were responded to and thus, provided the base for the analysis.
3- Integrating the assessors’ opinions: many of the methods such as arithmetic mean, median and mode can be used for integrating the assessments of different decision makers. Since the mean method has been widely used in many researches, thus, it will be likewise used in the present research to integrate the experts’ opinions.

Conclusion
Organizational intelligence does not represent the “IQ” of managers, similar to managerial cognition, nor is it the sum of the individuals. The assessment of organizational intelligence goes beyond the cognitive perspectives. Since, organizational intelligence develops from and is embedded in the day-to-day activities of the organization, its assessment involves social, emotional, behavioral and cognitive dimensions. In this sense, organizational intelligence is a multidimensional and multifaceted concept involving the recursive interplay of cognitive, behavioral and emotional capabilities of organizations. The results suggest that not all of the knowledge management factors require the same attention and that the main concern should be based on their importance and performance which can save organizations a lot of unnecessary costs. Thus, investing in the two factors that contribute to the efficiency of information systems and the senior management’s commitment to the principles of knowledge management can earn the organizations the most achievements in the short run.

Abstract
As far as businesses are concerned, the internet has been subject to a variety of experimentations that seek to determine the viability of using the internet to improve business practices in various industries especially in computer industry in Malaysia. One particular aspect of business is that the internet marketing has a great impact on computer industry in Malaysia. This research paper is concerned with making a critical examination of the impact of internet/online marketing on computer industry in Malaysia in enhancing consumer experience. It is understood here that the internet/online marketing is essentially an instrument that can be used for business purpose to increase the customer benefits and decrease the cost of the computer industry or increase the profit of computer industry and also get the customer more loyal to the company by providing good services to the customer and meet the customer requirements. The use of the internet/online marketing in computer industry in recent times has increased in the realm of business. Various companies within the computer industry are now starting to understand the benefits of using the internet/online marketing activities. In this academic research paper, a comprehensive examination will be made in relation to the positive and negative impacts of the internet as a marketing tool for the computer industry in Malaysia. An examination must be made of how the internet affects the marketing activities of the companies that exist in the computer industry and derive the computer industry to the success. Upon doing this, it would then become possible to determine the impact that the internet/online marketing has on computer industry in Malaysia marketing.

Keywords: Customer satisfaction, customer trust, customer behavior, computer industry/computer related product, online marketing

Introduction
The primary aim of this research paper is to critically examine the Impact of online (internet) marketing on computer industry in Malaysia in enhancing consumer experience. The growth of the internet has led to a serious mass of consumers and firms participating in a global online market or e-commerce. Internet has been used as a commercial medium for transaction across the borderless world in computer-mediated environment. The rapid growth of internet usage has transformed its function beyond as a medium of communication to a brand new market arena (Ricciuti, 1995). The internet is an instrument that can be used for many purposes. In recent times, there has been an intense use of the internet in the realm of business, especially marketing.
The computer industry is capable of benefiting extremely from the use of the internet, including various companies in the computer industry that are keen on marketing their services to a wider range of people and also consumer and client can get the benefits to decrease the cost by using internet. The dramatic increase in internet and the detonation of its usage have facilitated the development of electronic commerce, which is described as the movement of buying and selling, or the trading of products, service and information between and among the organizations and individuals all the way through computer networks including the internet (Laudon and Traver, 2001). When investing in online/internet marketing, strategic thinking will bring to the best rewards (David Scanlon 2009). Multimedia systems are being developed for a surprising and ever increasing number of applications. The major revolution is the internet, which is really used for marketing products and services. According to a statement from e-Gain Communication an approximated 6.6 billion USD worth of merchandises are currently being existing on the Internet/online marketing for more than 200 million users. 35 million of them are assumed to be involved actively in the online marketing world. This represents a vast would-be the online ventures by business organizations and the participation of net users exponentially. Connectivity has increased quickly in both developed and developing countries; with one of the greatest growing regions being Asia. Malaysia is currently spending $5 billion on building a Multimedia Super/great Corridor. In Malaysia, the development of Multimedia Super Corridor (MSC) has concerned much attention on the development and accomplishment of Multimedia. In this regard, the use of multimedia in marketing products and services had improved in the local business activities. It is highly assumed that online marketing services can support retailers in expanding new markets as well offering real time dealings and processing feedback. They present extensive products and company information to their clients and also offer value added consumer services. The expansion of the internet has increased the attractiveness of online shopping. However, many internet users stay away from shopping online due to security and privacy concerns. Despite this though, online sales or online marketing continue to develop as internet-based businesses become more complicated; indeed many users stay involved in online shopping. Understanding possible markets is thus important for businesses investing in electronic commerce. (Amichai-Hamburger, 2002) indicated that the behavior of internet users plays a significant role in their online behavior. Moreover, (Hills and Argyle, 2003) reached similar viewpoints. They found that individual internet use correlates with individual personality differences. (Kotler, 2003) asserted that personal factors are the main persuade on buyer behavior. Thus, understanding the personality differences between these two groups (internet shoppers or online purchasers and non-internet shoppers or non-online purchasers) is really important to businesses. Understanding the personality of potential online customers can help businesses accurately target prospective markets. Internet commerce or online marketing involves the sale and purchase of products and services over the internet (Keeney 1999). It was touted to have huge sales prospective, with earlier hope of over $1 trillion by 2002 (Burke 1997; Mehler et al. 1997). Yet, these expectations have fallen well little of the $1 trillion calculate approximately, with the U.S. Census Bureau reporting that U.S. e-commerce sales and online purchasing in 2002 equaled only $43.5 billion and $70 billion in 2003. However, online expenditure is growing. Retail e-commerce sales in the second quarter of 2004 were just about $15.7 billion and boost of 23.1 percent from the second quarter of 2003 (U.S. Census Bureau 2003). E-commerce sales and online selling in the second quarter of 2004 accounted for 1.7 percent of total sales, while in the second quarter of 2003 e-commerce sales and online selling
were 1.5 percent of total sales (U.S. Census Bureau 2003). Electronic commerce or online marketing is a regular term now a day and used by the business executives and common peoples around the world. In fact many clients or consumers now think it is stylish to shop online and even perform online trade. However, the correctness of the internet for marketing to customers depends to a large scope on the characteristics of the products and services being marketed (Ahasanul and Ali Khatibi, 2007). Thus the internet offers several features (capacity, speed, precision and convenience) that help firms attract a large number of potential customers and clients. Consumer uses the internet different reasons ranging from only gathering information to purchasing product online. Buying through internet and online has more fun, safer, and quicker and they were more self-assured about their ability to buy online. Although, purchasing online is still a small segment of internet usages, most analysts be expecting it to increase dramatically once consumer feel satisfy and safe about their online purchases and protection of their privacy in online purchasing (Ahasanul and Ali Khatibi, 2007). Establishing and maintaining made to order communication with customers during the transaction can be expensive. Such as this kind of communication channels can be used to gather important customer feedback and to measure customer satisfaction, either they are satisfied or not. However, most consumers gather information on products, make cost comparisons and then go or visit a local store to make purchase. Internet marketing is becoming a more and more significant strategy for the company to promote advertises and interact more customer online. This is especially true in the environment of Malaysia where internet shopping or online purchasing is still new and consumers are less familiar and often more sceptical towards online shopping, but slight is known about them. Therefore, in order to know and understand consumers need and want, it is very important for us to have a survey and study to find out the impact of the internet marketing in computer industry in Malaysia towards customer satisfaction (Ahasanul and Ali Khatibi, 2007). This paper would examine the positive and negative impacts of the internet as a marketing tool for companies within the computer industry in Malaysia. In order to do this, an examination must be made of the effect that the internet has on the marketing activities of the companies that exist in the computer industry first, and only then can the impact of the internet on the marketing for the computer industry can be properly assessed and determined. The internet is a huge global network of computers used to exchange data (Deitel, Deitel and Steinbuhler, 2001).

RESEARCH QUESTIONS

Following are five research questions:

1. Will the online marketing change the consumer behaviour in computer product customers in Malaysia?
2. What are consumers readiness pattern to buy computer related products online in Malaysia?
3. What is the Malaysia general public’s view about online marketing in computer products?
4. Does the online marketing of computer industries perform better than offline in Malaysia?
5. Do the online computer customers satisfy or not in Malaysia?
Literature review

Customer value in e-Commerce
Since a customer has more than enough stores to choose from online, what are the key values an online store in computer industry can offer to win the customer? The most relevant studies that take customer value as one of the main concepts in the e-Commerce and online marketing context in computer industry in Malaysia. Screening alternatives to form consideration set, providing information for selecting from consideration set are transaction cost, entertainment, social interaction, and personal security (Alba et al. 1997). Retailer risk (NS), product price, valence of experience (Chen & Dubinsky, 2003) are also can include to consideration set in online marketing in computer industry. Usefulness, ease of use, and enjoyment of the site is very important (Childers et al. 2001, Davis et al. 1992) in online marketing in computer industry for customer. Satisfaction, effectiveness, and efficiency are the overall value of the customer (Toe et al. 2003).

Customer Loyalty
Zeithaml (2000) states that previous studies viewed customer loyalty as being either behavioral or attitudinal. The behavioral approach is that customers are loyal as long as they continue to buy and use a good or service (Woodside et al., 1989; Parasuraman et al., 1988; Zeithaml et al., 1996). Reichheld (2003) states that the strongest evidence of customer loyalty is the percentage of customers who were enthusiastic enough to refer a friend or colleague to a particular good or service. The attitudinal approach is that customers feel a sense of belonging or commitment to the good or service. Baumann et al. (2005) noted that Day (1969) four decades ago introduced the concept that loyalty has both behavioral and attitudinal dimensions.

The behavior approach includes criteria such as repeat purchase, share-of-wallet, and word of mouth referrals, whereas the attitudinal approach consists of criteria like commitment, trust or emotional attachment. Baldinger and Rubinson (1996) examined the link between attitude and behavior and found that 'the stronger the attitudinal commitment..., the more likely consumers were to remain loyal' thus the use of an attitudinal measure would also indicate the behavioral dimension of loyalty.
Loyal customers are undoubtedly important because they contribute to the profitability of the service providers (Anderson and Mittal, 2000; Anderson and Sullivan, 1993). They visit a website more frequently than a newly acquired customer and can be served at a reduced operating cost. They provide free word-of-mouth advertising and are likely to pay regular prices. In a recent update on e-loyalty, Reichheld and Schefter (2000, p.107) observed that contrary to current beliefs 'price does not rule the Web; trust does. According to the authors, referrals are extremely important in e-services and may count for half of the acquired customers for some services. Furthermore, referred customers were found to ask for advice and guidance from the loyal customers who recommended the service to them, thus reducing the company's costs for providing help.

The Impact of the Internet on Marketing for the Computer Industry
It is theorized here that the internet has commenced a transformation of the global and domestic markets and it did this by effectively shaping and reshaping relationships within the supply chain and by creating changes that are systematic in the method by which consumers to their shopping,
the way prospects are reached, the way transactions are completed, the way customers are provided with services and also the way in which business is performed (Joseph et al., 2001).

The internet has a huge effect on marketing especially in computer industries, the computer industries’ marketing way has been changed by coming the internet in the market place and they could increase their marketing ability and also increase their profits and increase the benefits to customers. The internet totally changed the market place to a new revolution era and brings a lot of positive impact in marketing aspect.

Overview: impact of online marketing in computer industry in Malaysia

Online marketing has brought a big influence in computer industry in Malaysia and changed the way of business in computer industry. Online marketing in computer industry in Malaysia affects positively, if the industry provides good customer service in internet and online marketing and also the quality of online marketing also important in Malaysia. Computer industry has made his computer business more wide to the marketing and sales online. The online customers in computer industry require high satisfaction and trust in Malaysia. The computer industry in Malaysia tries to increase the online customer and make the customers more loyal to the industry, so the computer industries have to add more services in online business and try to less the online customer cost and also design a business site very simple and familiar for customer. The online customers in computer industry in Malaysia are very careful and want the security in fast then try to do the business online, because they are still not sure 100 percent about the online and internet business and feel it little risky, so they will make sure about the security. Therefore, the computer industry should increase the security in their business site and the quality of their online products. There are some variables that can make the online customer more loyal to the computer industry and satisfy the online customers in computer industry in Malaysia which include the followings: E-service quality, cost to do the online business, customer service in online business, security, privacy information, and design of the site, or customer satisfaction and customer trust to the industry.

Security

Kalakota and Whinston (1996) define a security threat as a circumstance, condition, or event with the potential to cause economic hardship to data or network resources in the form of destruction, disclosure, modification of data, denial of service, and fraud, waste, and abuse. Despite the fact that security positively influences intention to purchase online (Ranganathan & Ganapathy 2002; Salisbury et al., 1998), it remains one of the major concerns (Kiely 1997; Mardesich 1999; Mayer et al., 1995). Many consumers are still reluctant to release payment card information to online merchants, fearing a loss of control over their accounts. Merchants and financial institutions, in turn, are concerned about the costs associated with online charge backs and fraud. To alleviate customers’ fears, many B2C Websites offer alternate forms of payment (e.g. telephone ordering) and/or accounts with ID’s and passwords (Ranganathan & Ganapathy 2002). Bélanger et al., (2002) found that the presence of security features on an e-commerce site was important to consumers, and discuss how consumers’ security concerns may be addressed by similar technology protections as those of the business, such as encryption and authentication. In this study, the features evaluated within the attribute of security include: (1) whether the site provides encryption, (2) whether the site requires the user to set up
an account with an ID and password, and (3) whether a confirmation screen is displayed after the completion of the purchase to ensure accuracy.

Privacy
Privacy in e-commerce is defined as the willingness to share information over the Internet that allows for the conclusion of purchases (Belanger et al. 2002). B2C Web sites gather information about visitors via explicit modes (e.g. surveys) and implicit means (e.g. cookies) (Patterson et al. 1997), providing the necessary data for decision making on marketing, advertising, and products. However, many users have concerns over potential misuse of personal information (Brown & Muchira, 2004; Hair et al., 1995; Ranganathan & Ganapathy, 2002; Torkzadeh & Dhillon, 2002). For example, a Business Week/Harris poll of 999 consumers in 1998 revealed that privacy was the biggest obstacle preventing them from using Websites, above the issue of cost, ease of use, and unsolicited marketing (Green et al. 1998). An IBM Multi-National Consumer Privacy survey in 1999 showed that 80% of the U.S. respondents felt that they had lost all control over how personal information is collected and used by companies. Seventy-eight percent had refused to give information because they thought it was inappropriate in the circumstance, and 54% had decided not to purchase because of concerns over the use of their information collected during the transaction (Belanger et al., 2002). A study by Forrester Research supports these findings, showing that two-thirds of consumers are worried about protecting personal information online (Branscum, 2000). To address issues of privacy, many Websites display privacy policies (McGinity, 2000). Also, independent companies (e.g. TRUSTe) can verify, audit, and certify privacy policies (Ranganathan & Ganapathy, 2002). In this study, the features evaluated within the attribute of privacy are: (1) the use of a privacy statement, (2) the merchant's policy on selling customer information to third parties, and (3) the use of cookies to collect personal information.

Trust & Trustworthiness
Trust is the willingness to rely on an exchange partner in whom one has confidence (Prasarnphanich, 2007). Trust consists of two distinct dimensions: credibility and benevolence (Prasarnphanich, 2007). Credibility refers to the extent to which the buyer or supplier believes that the other party has the required expertise to perform the job effectively and reliably (i.e., an ability of the partner to deliver as promised). Benevolence refers to the extent to which the buyer is genuinely interested in the other partner’s welfare and motives to seek joint gain (Prasarnphanich, 2007). This benevolence dimension is consistent with the issue of privacy and security concerns that vendors do their best efforts to protect customers’ personal information and prevent any personal losses due to their interaction with the vendors (Prasarnphanich, 2007). The benevolence dimension of trust can exist even when the objective credibility of vendors is less than perfect. For example, customers might feel that the vendor is still concerned with their personal welfare, even though the vendor’s services are somewhat unreliable (Prasarnphanich, 2007). Shopping factors focus on customers’ feelings and perceptions during and after the shopping experience. Factors determining this include convenience, trust and trustworthiness of Web merchants, and delivery time (Bélanger et al., 2002; Keeney, 1999; Nielsen, 2000 Patterson et al., 1997; Torkzadeh & Dhillon 2002). The prototypical online consumer leads a wired lifestyle and is time
starved, suggesting that online shoppers may do so to save time (Bellman et al., 1999). This indicates that the overall convenience of the shopping experience is very important as well as the amount of time it takes for the product to be received. Trust is of importance during the actual shopping experience because if the consumer does not trust the merchant to make good on their purchase a transaction will not take place. Three features of each attribute (convenience, trust, and delivery) will be evaluated using a conjoint analysis to get a preferred feature within each attribute as well as determining an overall ranking of each attribute, including an overall importance score of each attributes.

Customer Loyalty
Zeithaml (2000) states that previous studies viewed customer loyalty as being either behavioral or attitudinal. The behavioral approach is that customers are loyal as long as they continue to buy and use a good or service (Woodside et al., 1989; Parasuraman et al., 1988; Zeithaml et al., 1996). The behavior approach includes criteria such as repeat purchase, share-of-wallet, and word of mouth referrals, whereas the attitudinal approach consists of criteria like commitment, trust or emotional attachment. The attitudinal approach is that customers feel a sense of belonging or commitment to the good or service. Baumann et al., (2005) noted that Day (1969) four decades ago introduced the concept that loyalty has both behavioral and attitudinal dimensions. Customer loyalty has been recognized by a large number of authors as one of the key topics in Internet that deserves a great deal of attention. According to Griffin (1996), one of the most exciting and successful uses of this revolutionary technology may be the Internet's role in building customer loyalty and maximizing sales to your existing customers. One of the reasons for the importance of loyalty in the online context according to Rayport and Sviokla (1994) is the changing role of the content, the context, and the infrastructure in the marketplace. Loyal customers are undoubtedly important because they contribute to the profitability of the service providers (Anderson & Mittal, 2000; Anderson & Sullivan, 1993). They visit a website more frequently than a newly acquired customer and can be served at a reduced operating cost. They provide free word-of-mouth advertising and are likely to pay regular prices. In a recent update on e-loyalty, Reichheld and Schefter (2000, p.107) observed that contrary to current beliefs 'price does not rule the Web; trust does. According to the authors, referrals are extremely important in e-services and may count for half of the acquired customers for some services. Furthermore, referred customers were found to ask for advice and guidance from the loyal customers who recommended the service to them, thus reducing the company's costs for providing help.

Confidence
Trust is defined as the dimension of a business relationship that determines the level to which each party feels they can rely on the integrity of the promise offered by other. The trust is identified as being an antecedent to commitment, being the motivation to stay within the relationship and an important element of relationship marketing (Ahasanul Haque and Ali Khatibi, 2007). Some authors suggest that for a customer to enter into a transaction’s must fell confident that the merchant will deliver, making trust an order qualifier for purchase decisions. Online buyers have fewer security worries, appreciate the quickness and flexibility of online buying and see the web as making buying easier. Web sites must be made simple and easy to
use, because non-users are not very confident that they can buy online successfully (Ahasanul Haque and Ali Khatibi, 2007).

**Customer services**

Commentary, that it is often repeated in terms of gaining benefits from the internet is in terms of marketing logistic, whereby online buyers gain temporal advantage by ordering online and delivered over internet (Adam Stewart, 2002). Electronic marketing broaden the marketing scope of internet users and allow buyers to make transaction online. Some researchers, specifies that specific knowledge of the impact of attribute performance on satisfaction is, therefore, a basic requirement (Adam Stewart, 2002).

**Customer expertise and familiarity**

Expertise or product knowledge and expert in processing of the product is the understanding of the attributes in a product or service class and knowledge about how various alternatives stack up on these alternatives. Customers’ expertise facilitates their learning of new and more complex types of information (Ahasanul Haque and Ali Khatibi, 2007). The two major components of customer expertise are expertise and familiarity. The customers who are more innovative and knowledgeable with regard to the internet and its uses are more likely to buy online from the computer industry in Malaysia than less innovative and knowledgeable customers (Ahasanul Haque and Ali Khatibi, 2007).

**Product Value**

Minimizing product cost and maximizing product quality are major factors in e-commerce success (Keeney 1999). Total cost includes product cost, taxes, shipping, Internet, and travel costs (Keeney 1999). Quality is an intrinsic property of a product. Product quality is the expected standard of product or service excellence (Jarvenpaa & Todd 1997). Brands and retailers that are well known and well regarded from the traditional channels may translate to quality on an online channel. The question becomes how consumers will assess product quality when they are unfamiliar with the retailer or the product brand (Jarvenpaa & Todd 1997). Kalakota and Whinston (1996) stress the need to provide independent evaluations of goods and services to convince consumers of the quality of the merchandise sold by the Internet merchant on the web. Thus, the end result for the consumer should be a feeling of gratification with the purchase once completed. Torkzadeh and Dhillon (2002) combine these two objectives (product cost and product quality) into an Internet product value measure (used in this study). The features of the product value attribute to be evaluated are: (1) post purchase feeling of customer gratification, (2) perceived product quality, and (3) overall product cost.

**Conceptual framework of the study**

In line with literature review and the purpose of study described in the beginning of the paper, the conceptual framework of this study was configured as illustrated in figure 1 (See Appendix). In this framework security and privacy information as the antecedents will affect trust and trustworthiness, (H1, H2). Besides, trust and trustworthiness has a relationship with loyalty in online marketing as the consequence (H3).
Hypothesis

H10: There is no significant correlation between customer satisfaction and usability & site design.
H11: There is a significant correlation between customer satisfaction and usability & site design.
H20: There is no significant correlation between customer satisfaction and cost effective.
H21: There is a significant correlation between customer satisfaction and cost effective.
H30: There is no significant correlation between customer satisfaction and customer service.
H31: There is a significant correlation between customer satisfaction and customer service.
H40: There is no significant correlation between customer satisfaction and product customization.
H41: There is significant correlation between customer satisfaction and product customization.
H50: There is no significant correlation between customer satisfaction and E-service quality.
H51: There is significant correlation between customer satisfaction and E-service quality.
H60: There is no significant correlation between customer satisfaction and product value.
H61: There is significant correlation between customer satisfaction and product value.
H70: There is no significant correlation between loyalty in online marketing and customer satisfaction.
H71: There is a significant correlation between loyalty in online marketing and customer satisfaction.

METHOD

Procedure
Data was gathered through a well designed structured questionnaire. The survey was personally administered by the researcher so as to have better communication with the respondents. This reduces incorrect answers which might lead to wrong findings and analysis. The total population for this particular study is all the literate Malaysian and the foreigners in Malaysia; these are those who can read and write and hence they are capable of using internet and its facilities. These are the individuals who can get access to internet and make a proper use of the service. A convenience sampling (non-probability sampling) was used for this study. This type of sampling method was used because it gathers information from members of the population who are conveniently available to provide it. 300 questionnaires were distributed among the respondents of this study and due to difficulties of different cast and nationality the researcher could successfully collect 105 questionnaires back and hence the sample size used for data analysis and findings was 104 respondents, and the area where the research has been done (Selangor, Kuala Lumpur, and Penang), mostly at the universities and public places likes coffee shops, and… in Malaysia.

Questionnaire design
The instrument used for data collection for this study is a self-administered questionnaire. This questionnaire was comprised of 38 questions related to internet marketing and consumer experience in computer product. The questionnaire was divided into five parts which are loyalty
in online marketing, security, privacy information, trust & trustworthiness, and demographic respectively.

The respondents were given options to choose in answering the questions. The options were as follows: Option 1;

choose from the given items and Option 2; choose between 1 to 5 where, 1 stands for strongly disagree, 2 for disagree, 3 for neutral, 4 for agree, and 5 for strongly agree.

RESULTS

Respondents Demographic Profile
About 150 questionnaires were distributed to different respondents for data collection and from those 150 questionnaires 100 have done by interviews and 50 by e-mail. Out of those 300, 104 questionnaires were returned to the researcher. This marks a 69.33% response rate. Among the returned questionnaires, 59 have purchased the computer related products online at least once and 45 had never done online purchase before due to a number of reasons. This means 56.73% of all the respondents have engaged themselves with internet/cyber space to purchase the computer related products online at least once.

The demographic profile of respondents showed that, the sample consisted of Male respondents (online purchased of computer related products) were 40 male which are 67.8% of all the respondents and 19 female which are 32.2% of the respondents. 66.1% of the respondents are singles, 27.1% of the respondents are married, and 6.8% of the respondents are divorced. 11.9% of the online computer related product purchasers have high school and below qualification, 13.6% of the online computer related product purchasers have diploma qualification, 28.8% of the online computer related product purchasers have bachelor degree, 35.6% of the online computer related product purchasers have master degree, 6.8% of the online computer related product purchasers have PhD and 3.4% are professional certificate holders. 20.3% of the online computer related product purchasers are Malay, 16.9% of the online computer related product purchasers are Indian, 18.6% of the online computer related product purchasers are Chinese and 44.1% of the online computer related product purchasers are others (foreigners).

Hypotheses testing

Hypotheses Testing
Probability t-test from the regression analysis table results also justifies the relationship between customer satisfaction and usability and site design in Malaysia. The test gives the p-value of 0.0337. Since the p-value is less than 5 percent we can reject null and accept alternative, meaning that usability and site design is significant and it influence customer satisfaction individually in the population, because the p-value is less than 0.05, and in this test individually we reject null hypothesis and accept alternative hypothesis. Probability from the regression analysis table results also justifies the relationship between customer satisfaction and cost effective in Malaysia. The test gives the p-value of 0.000. Since the p-value is less than 5 percent we can reject null and accept alternative, meaning that cost effective is significant and it influence customer satisfaction. Probability from the regression analysis table results also justifies the relationship between customer satisfaction and customer service in Malaysia. The test gives the p-value of 0.9305. Since p-value is almost 95.6 percent which is higher than 5
percent, we cannot reject null, meaning that customer service variable cannot influence customer satisfaction individually in the online marketing in Malaysia, because the p-value is more than 0.05, and in this test individually we accept null hypothesis and reject alternative hypothesis. Probability from the regression analysis table results also justifies the relationship between customer satisfaction and product customization in Malaysia. The test gives the p-value of 0.3264. Since p-value is almost 32.6 percent which is higher than 5 percent, we cannot reject null, meaning that product customization variable cannot influence customer satisfaction individually in the online marketing in Malaysia, because the p-value is more than 0.05, and in this test individually we accept null hypothesis and reject alternative hypothesis.

Probability from the regression analysis table results also justifies the relationship between customer satisfaction and e-service quality in Malaysia. The test gives the p-value of 0.0588. Since p-value is almost 5.8 percent which is higher than 5 percent, we cannot reject null, meaning that e-service quality variable can not influence customer satisfaction individually in the online marketing in Malaysia, because the p-value is more than 0.05, and in this test individually we accept null hypothesis and reject alternative hypothesis. Probability from the regression analysis table results also justifies the relationship between customer satisfaction and product value in Malaysia. The test gives the p-value of 0.9591. Since p-value is almost 95.9 percent which is higher than 5 percent, we cannot reject null, meaning that product value variable can not influence customer satisfaction individually in the online marketing in Malaysia, because the p-value is more than 0.05, and in this test individually we accept null hypothesis and reject alternative hypothesis.

Insert table 1 here
Probability from the regression analysis table results also justifies the relationship between loyalty in online marketing and customer satisfaction in Malaysia. The test gives the p-value of 0.0023. Since p-value is almost 0.23 percent which is less than 5 percent, we can reject null, meaning that customer satisfaction variable can influence loyalty in online marketing individually in the online marketing in Malaysia, because the p-value is less than 0.05, and in this test individually we reject null hypothesis and accept alternative hypothesis.

DISCUSSION

From the analysis result done at the earlier part of this chapter, demographic factors were examined and their effects on e-commerce or online marketing in computer industry in Malaysia were analyzed critically. Gender and marital status were not included into this demographic factors analysis because there is no much significant difference between gender and marital status in online marketing in computer related products purchaser. Age, education, and ethnicity showed the difference and effect on online marketing in computer related products purchaser in computer industry in Malaysia and showed that they are more satisfied and find the online business with good security and good IT services with computer industry and their behaviour is good and will increase in future by adding some good effective resources in online business in computer industry. Young people have seen to be major users of internet and e-commerce services and online computer related products purchasers, individual aged 30 years and bellows accounts for 76.3% of all online computer related products purchaser and older individuals’ accounts for 23.7% only. Education as well makes a distinct difference on online marketing level in computer industry, diploma, bachelor degree and masters degree holders’ accounts for 78% of
the online computer related products purchaser in Malaysia, and only 22% is accounted by other education level groups. Ethnicity also makes a distinct difference on online marketing level in computer industry in Malaysia, Malay and others (foreigners) have seen to be major user and online computer related products purchaser and they accounts for 64.4% of the online purchasers of computer related product in Malaysia, and Indian and Chinese only 35.6% is accounted so I understood that these groups are more comfortable, more satisfy and more save on online purchasing in computer industry in Malaysia and they also find some positive effect in online business in computer industry in Malaysia.

The analysis of these hypothesis shows that, loyalty of customer in online marketing in computer industry in Malaysia is influenced by trust and trustworthiness; and Trust & Trustworthiness influenced by privacy information and security has seen to have no significant effect/influence on trust & trustworthiness in computer industry in Malaysia, but jointly both (privacy information and security) effect/influence on trust & trustworthiness; So jointly all the variables have a significant effect/influence in loyalty in online marketing in Malaysia. Furthermore, in this study the main is that the all independent variables jointly have seen to have a significant correlation with loyalty in online marketing or have a significant effect/influence on loyalty and this analyzes showed that the online computer customers trust and they have good behaviour to computer industry in Malaysia. So totally this study found out the online marketing in computer industry in Malaysia very effective and positive to the online computer products customers.

IMPLICATIONS

The practical implication and contribution of this study to the body of knowledge comes from the survey and findings of the study. Online marketing players (computer industry) in Malaysia have started to take initiatives to understand their online clients and/or customers (online purchasers) as far as their perceptions, attitudes and habits are concerned. According to the demographic analysis of the findings, the sector should re-look their strategies so as to incorporate all users of internet and ICT services regardless of their education or age and ethnicity. They should use different strategies and tactics to tackle different groups of customers and hence online marketing and e-commerce adoption in computer industry in Malaysia will be a success story. Its undeniable fact the internet technology and e-commerce requires huge investment in terms of monetary capital and knowledge/human capital. Therefore, online marketing players in computer industry in Malaysia must really look into prospective adopters and take respective measures to make sure that they adopt and make use of internet and e-commerce services in the country.

From the conducted survey we have seen some important factors which impact of online marketing or influence of online marketing in computer industry in Malaysia. Therefore the sector must survey each of the factors in details and see how they can take advantage of each factor in increasing online purchasers and e-commerce usage in computer industry in Malaysia. This can only be achieved with more research on each factor and put the findings of the researches into practical use and hence accelerate the rate of online purchasers in computer industry in Malaysia.

Online marketing and e-commerce awareness is still not reached to develop countries among Malaysians. No one will adopt or use e-commerce/online marketing in computer industry if he/she doesn't know about it. Therefore,
the sector and government must take strong measures to increase awareness among the internet users and online purchasers and later on to non-users of internet. These measures will increase internet users and hence the same will apply to online purchasers or e-commerce users. ICT and internet/online security was ranked as the highest hindrance towards online marketing in computer industry in Malaysia. Every internet user and online purchaser needs to feel secured when using the service or otherwise they will not use the service. Online purchasing and e-commerce need personal information and banking information of an individual, this makes it so important for internet and e-commerce service providers to assure security to their clients and customers while and after using their services. By dealing with this security threat, confidence on internet and e-commerce services will grow among internet users and online purchasers in computer industry and hence it won't be a threat to those who are using internet and e-commerce services and even to those who are adopting online marketing and e-commerce. Survey showed that, those who have adopted online marketing and e-commerce they don't feel very secured when doing online purchase and e-commerce (online transactions) and those who are not using e-commerce and internet services are failing to adopt because of the security reasons.

CONCLUSION
The primary motive towards undertaking this study is impact of online/internet marketing on computer industry in Malaysia in enhancing consumer experience. The main objective of this research paper is to explore the various positive and negative impacts of the internet on marketing in the computer industry in Malaysia in enhancing consumer experience and also consumer shopping behaviors to determine the viability if the internet as a tool for marketing for this computer industry in Malaysia. Thus the study examined the actual usage of internet and e-commerce in computer industry in Malaysia as well as going into questioning individual internet users and online computer related products purchaser on how they perceive the level of e-commerce and online marketing in computer industry in Malaysia. Secondary and primary data were used in conducting this research in making sure that every detail is correct and valid.

The purpose of this research is to investigate the effects of security and privacy information on trust & trustworthiness and loyalty in online marketing. Data were gathered from 104 respondents who are the literate Malaysian and the foreigners in Malaysia that are able to read and write and hence capable of using internet and its facilities. The results showed that there is a significant correlation between trust & trustworthiness and security and privacy information. The results also revealed that there is a significant correlation between loyalty in online marketing and trust & trustworthiness. The results of this study will be useful to the online marketers in Malaysia in order to enhance the loyalty of their customer and consequently generate more revenue.

Department of Management Germi Branch, Islamic Azad University, Germi, Iran

Abstract
The purpose of this study is to examine the Managing Intellectual Capital of Small and Medium Size Enterprises in Iran. For this purpose we develop and test a model for the managing of intellectual capital. We used an examination of the literature provided the foundation for developing a model to illustrate the various facets an organization must consider when managing intellectual capital. The Population of this study was Ardabil Province SMEs’ employees and Senior Management and data gathering instrument was interview and a questionnaire. Findings indicated that although most of the aspects of the Model were present in the company, conscious management of intellectual capital was not occurring. Metrics was one characteristic frequently mentioned in the literature, but not evident in practice. Behavioral changes and socialization were two characteristics that emerged strongly from the interviews, but were not widely addressed in the literature. From the perspective of the theoretical model greater attention should be given to behavioral changes and the importance of socialization; and from the view of the practice model, management needs to address the issue of metrics.

Keywords: Intellectual Capital, Human Capital, Organizational Capital, Relational Capital, innovation, knowledge, leadership

Introduction
Intellectual Capital (IC) has been defined as the combination of intangible resources and activities that “allows an organization to transform a bundle of material, financial and human resources in a system capable of creating stockholder value” (European Union, 2006). IC can be both the product of R&D activities and the enabler for creating greater value from R&D; IC is more than the sum of these three elements; “it is about how to let the knowledge of an organization work for it and have it create value” (Roberts, 1999).

Intellectual Capital is the combination of an organization's Human, Relational and Organizational resources and activities (European Commission, 2006). Human Capital is defined as the knowledge that the human resources (teachers, researchers, PhD students and administrative staff in this case) would take with them if they left the institution. Organizational Capital is defined as the knowledge that stays within the institution at the end of the working day. It comprises the governance principles, the organizational routines, procedures, systems, cultures, databases, publications, intellectual property, etc. Relational Capital is defined as all resources linked to the external relationships of the institution such as “customers”, “suppliers”, R&D partners, Government, etc. (Sanchez and Elena, 2006). Intellectual capital is acknowledged as a valuable asset, and the knowledge foundation of intellectual capital is generated by input from the human capital, capital internal to the
organization, and from knowledge external to it. Although initially respondents identified the value of the organization as residing in the monetary area, it was later acknowledged that it was through the intellectual capital of the business units that value was generated, and that the sustainability and success of the business units would be achieved (Cook & Brown, 2005). Knowledge is the key to building intellectual capital. As the 20th Century came to a close, attention began to focus on the contribution knowledge makes to a business. There is a realization that in the 21st Century it will be through knowledge that organizations will have the means to thrive in an increasingly competitive environment. Knowledge permeates all areas associated with operating business both internally and externally employee knowledge, internal structural knowledge and Knowledge of external environment. Recognition of the value of intellectual capital, and accepting it as a means to generate wealth, points to intellectual capital being an area requiring greater attention by practitioners and academics (Berg, 2009).

To obtain competitive advantage in Iran, it is crucial for small and medium sized enterprises (SME) to utilize knowledge efficiently and to enhance their innovation potential. Thus, managing their specific “Intellectual Capital (IC)” is increasingly important for future-oriented organizations. Furthermore, reporting those intangible assets to customers, partners and investors systematically has become a crucial factor of success in the context of the globalization process. Conventional balance sheets and controlling instruments have lost some of their value because IC, i.e. value-adding knowledge, internal processes and structures as well as important relationships to customers and partners, are not considered so far (Alwert, 2006).

The purpose of this research is to determine how intellectual capital is managed to enhance its potential to increase wealth. Organizations may be unaware of the extent and importance of their intellectual capital for future sustainability, and this research is designed to highlight the importance of intellectual capital.

The central question examined in this study is “how does the approach taken by an organization Iran to manage intellectual capital align with the characteristics of the Intellectual Capital management Model?”

**Methodology**

When undertaking research it is necessary to determine the method of enquiry that is appropriate to the question. Quantitative research and qualitative research, alternatively viewed as the positivist and interpretive approaches, or a mixture of quantitative and qualitative methods of inquiry, are particularly apt for research in the area of social sciences (Creswell, 2003). The positivist approach is based on the traditional scientific method and seeks to prove hypotheses and test theories in situations where absolute truth or a form of it can be seen to exist. Research questions are closed ended.

In this study, two methods of data collection were employed interviews with both senior management and employees, and a questionnaire to those employees who were not involved in the interviews. Nine senior managers of selected SME areas were interviewed to discuss the management of intellectual capital. Eighteen employees were interviewed to gain an insight into their perspectives about knowledge sharing. To obtain a wider sample of employee views, 70 questionnaires, using the same questions as those asked in the employee interviews, were distributed to other employees in the selected business areas.

Interviews based on well crafted and, where appropriate, open-ended questions can serve as a critical source of evidence. It is important for the interviewer to be able to evaluate the responses
during the interview, particularly to seek opportunities for further explanation. Key participants are often critical to the success of a case, as they not only provide the case investigator with insights into a matter, but can also suggest sources of corroboratory evidence and initiate access to these sources (Yin, 1994). The use of the questionnaire for non-interviewed staff was an efficient way to expand the scope of the research. It gave a level of anonymity not available to participants in the interviews and provided questionnaire participants the opportunity to freely express their views. Questions for the interview and questionnaire were drawn from the literature (see Table1) and designed to encourage interviewees to talk about the various issues put to them. The analysis of the data collection involved the identification of themes and sub-themes and was undertaken using a coding method to link themes with sub-themes derived from the Intellectual Capital Management Model.

The business identified for this case study was determined as a result of analyzing the annual reports of 38 Iran organizations with interest focusing on reference being made to intellectual capital. Ardabil Province Small and Medium Enterprises (APSME) were selected for the study on the basis of its focus on innovation, knowledge, and leadership.

Findings and Conclusions
Three components human capital, internal capital, and external capital were the preferred indicators for understanding intellectual capital. It was recognized that the intellectual capital value of the organization was generated by the knowledge and contribution of employees. No business unit had a strategy for managing intellectual capital, but it was recognized that the capabilities available to a business were a key to its competitive advantage. There were no identifiable measurements directed towards intellectual capital to indicate its value, and measuring intellectual capital was regarded as probably difficult to implement. Codification of knowledge was an area that needed to be addressed. New products and services were emerging, and innovation was recognized as important for the future growth of the business units.

Increasing knowledge was recognized as important by all participants. Reading was at the top of the list of ways of increasing knowledge by employees but not by the chief executives. Both groups regarded interacting with people as an important way to increase knowledge. On-the-job learning was acknowledged by the chief executives and employees surveyed as a way to increase knowledge, but this method was not mentioned by interviewed employees. Sharing of knowledge was not an issue, and regarded as the norm. Chief executives do not favor rewards. From the employee perspective, the majority of those who were interviewed favored rewards while almost half of those who completed the questionnaire were against the giving of rewards. However, everyone viewed recognition as an acceptable reward for knowledge sharing.

There was no evidence of an explicit strategy for managing intellectual capital as part of the corporate strategy. As a result little management of intellectual capital occurred in the business units. It was agreed that if the management of intellectual capital was addressed there was a strong likelihood of the business units being more innovative. With minimum management of intellectual capital taking place the measurement of intellectual capital was also not occurring.

It is through the knowledge of employees that intellectual capital is developed. Employees at APSME were valued for their knowledge input, as was the knowledge of those external to it, and with whom the business units had developed mutually beneficial working relationships. Sharing knowledge did not appear to be an issue for employees, and the view taken by management was that sharing knowledge was an expected outcome of employment. Knowledge creation emerged
from sharing knowledge, and in turn encouraged the development of ideas leading to innovations that generated wealth for the business units. The offering of incentives for sharing knowledge was rejected by the majority of the chief executives, along with a large proportion of the employees surveyed. However, many of the employees interviewed favored the giving of incentives. From a nonmonetary perspective, all respondents indicated that recognition and acknowledgement for sharing knowledge was appropriate. A substantial investment had been made in technology, apparently tending to view it as a means of storage rather than for accessing and sharing knowledge.

The capabilities of the organization, and the skills and competencies of employees were highly regarded by management. Attention was given to the importance of ongoing training to further develop and grow employee skills. However, to maintain a competitive positioning it was seen as necessary to be continuously increasing knowledge. Reading emerged top of the employee list as their way of increasing knowledge, but the chief executives were not inclined to give such high recognition to reading. Courses, conferences and seminars were higher on the chief executives’ list.

All respondents pointed to the importance of interacting with others as a valid and important way to increase knowledge. This suggests that the process of socialization was an acceptable and effective method of increasing knowledge.

Although considerable knowledge had accumulated over the lifetime of the organization it was signaled by the chief executives that insufficient attention had been given to codifying knowledge, and this was an area that needed to be addressed. The protection of intellectual property was regarded as critical at APSME, but beyond protection there was no evidence of it being managed with a view to enhancing any potential financial return. Respondents identified a need to be more entrepreneurial, and also for commercialization of innovations in order to gain maximum exposure for new products and services.

Developing good working relationships with customers and suppliers was recognized as critical for the future of the businesses. Several of the business units worked collaboratively with other organizations. It was acknowledged that developing good relationships with the government, and the community was important.

The chief executives and the employees expressed positive views about the restructuring of APSME. In the smaller business units employees were recognized for their contribution and this was impacting positively on their attitude to work. Employees were more accountable and taking ownership and responsibility for their actions. Some concerns were raised about an element of competition occurring among a few of the units when they should be focusing on competing with external organizations. It was also felt that some regrouping of business units was necessary, because the small size of some of the units had been broken down to a point where they were not operating viably.

The findings align well with the components in the Model derived from the literature. However, although the majority of components were present there is no evidence that the management of intellectual capital was taking place either at the corporate level or in the business units.
The following table provides a summary of responses to questions put to the participants, with links to the literature.

14 How is the intellectual property of the company managed? 

Questions to Employees

1 What are your views on the dividing up of APSME into numerous companies? 

Kanter (1996), Ireland et al. (2001), Tidd et al. (2001). The responses were on the whole very positive.

2 What challenges do you face working in an innovative environment? 

Kanter (1996). Most found the environment stimulating.

3 How do you increase your own knowledge? 

Senge (1990), Drucker (1994), Spender (1999), Brown and Duguid (2000). Reading was top of the list.

4 What difficulties do you think arise through expecting people to share their knowledge? 

Nonaka (1991), Clarke and Rollo (2001). There may be some resistance by those who felt threatened through sharing, but responses indicated sharing was part of the job.

5 Where does the most effective exchange of knowledge take place? 

6 Should incentives be offered to encourage the sharing of knowledge? 

Wenger and Snyder (2000), Gamble and Blackwell (2001). Many interviewed were in favor, while those who responded to the survey were generally against incentives.

7 How do you go about obtaining knowledge when you require it? 

8 What is your job title?

9 What is your highest educational qualification?

Table 1 - Summary of Questions to Research Participants, Link to Literature, and Responses

In reiterating that despite its acknowledged importance, intellectual capital was not being managed at APSME, it seems likely that the company was not alone in this failing at the time. In fact, any reading of the literature would reveal examples of other companies elsewhere that while exhibiting a number of components of the Intellectual Capital Management Model were nevertheless failing when it came to the effective overall management of intellectual capital. Aspects of the research reveal the need to address the adequacy of the Model (Figure 1). Considerable comment was forthcoming about behavioral changes that had resulted from the restructuring of the organization into smaller business units, changes that were having a positive impact on the operational activity within the business units. Positive behavioral changes were noted by the chief executives, and also by a number of employees, leading to the conclusion that a smaller working environment had the propensity to offer greater opportunities for employees to participate more directly in the operational activities of the business. Employees also commented favorably on the acknowledgement of their contribution to the business units, and in some cases the actual uptake and development of ideas they had put forward. Although APSME had been recognized as an innovative organization prior to the restructuring, additional positives emerged from the restructuring in the shape of the enthusiasm of employees to pursue the opportunities afforded them, and their desire to help make the business units successful. The inclusion of
behavioral change in the Model, as a component of internal capital, signals its importance to the management of intellectual capital.

Figure 1- Intellectual Capital Management Model

It was evident from the research that socialization within the business units was a positive contributor to operational activities, and to ways in which knowledge was increased and knowledge sharing took place. Sharing knowledge was an expectation of the work environment, and this occurred during on-the-job training, at meetings, formal and informal, when networking, and when involved in work-related sports/social activities. Contrary to being seen as time wasting, socializing had a valuable contribution to make to an organization’s operation. Socialization as a component within internal capital has been added to the Model.

This study both confirmed and extended our understanding of issues in the intellectual capital literature. It also provided further evidence of the need to spread the message of intellectual capital management much wider, and in particular to extend it from the academic and research environment to that of the everyday contexts of management and employees in industry. It was a test of theory and practice.

Consequently it is recommended that academics and practitioners work more closely together so that theoretical development and research is more readily transferred into the practitioner world. The importance of intellectual capital to an organization mandates more formal functional recognition in order that the outcomes can contribute meaningfully to the corporate strategy.

Abstract
Most of the time management techniques involve changing the work habits or behaviors of a single individual. Important in work efficiency occurs simply because the individual decides to institute personal changes in himself. However, effective time management must take into account the other’s behavior when they can be seen as inhibitors or enhancers of work efficiency at the movement. Other competitors/peoples are trying to create obstacles for the smooth relationship between management and employees. In this regard one important component of time management is a technique that effectively increases the work efficiency, namely, skillful delegation. So authority is delegated for the performance of specific operating tasks, as well as, the discharge of management responsibilities. In this context, the performance of all organizational activities depends on the skillful delegation of authority from superiors to subordinates.

Key words: Enhancement, Efficiency, Employee Skills, Delegation

1. Introduction
As an organization grows and becomes larger, the number of management levels increases. This vertical expansion requires that the proper scope and type of authority rest with those who are responsible for carrying out assigned tasks. Achieving this mission depends upon the “delegation of authority” (Trewatha & Newport, 1982).

In a managerial context, delegation is a sharing process where a superior entrusts certain authority to others. Authority can be delegated for the performance of some specific operating tasks, as well as for the discharge of management responsibilities. The need for delegations is easily seen in organizations that are growing in the terms of operations and employments levels. In such growth situations, managerial jobs become more demanding, with a smaller proportion of time going to the solution of an ever increasing number of problems (Moorhead & Griffin, 1989). Through delegation, however, the manager can spend less time on specific routine activities and place greater emphasis on non-programmable managerial decisions that have to be made for successful operation of the organization. In turn, the authority delegated to new employees grants them the permission to perform assigned duties. Consistent with the delegation of some aspects of the management functions, managers will have even more time to concentrate on pressing management problems. These points are summarized in table No 1.

We should also note that the delegation of authority does not in any way relieve managers of their original responsibilities since each manager still retains ultimate responsibilities for all
work delegated to others. Similarly, delegation does not reduce the manager’s overall authority since delegated authority may be withdrawn at any time. Withdrawal of this type does not delegated generally happen, as the original intent of delegation if to share assignments with others so that work can be accomplished more efficiently (Milkovich & Boudreau, 1988; Varma & Aggarwal, 1999).

Delegation is a planned activity and cannot be left to chance. It must be undertaken rationally: however, entrusting part of the operational and/or managerial work to others is not without its problems (Milkovich & Boudreau, 1988; Varma & Aggarwal, 1999; Terry, 1974).

#### 2. Definition of Delegation

Delegation is the process of assigning responsibilities for work activities to subordinates. The importance of effective delegation was underscored by a pioneering management scholar, L. Urwick, who observed, “Without delegation, no organization can function effectively, yet lack of the courage to delegate properly and knowledge of how to do it is one of the most general causes of failure in organizations” (1944:51) (Varma & Aggarwal, 1999).

This viewpoint is supported by a close examination of the benefits of successful delegation. Proper delegation enhances the quality of work, the capabilities and commitment of the employee, and the efficiency and the power of the manager (Varma & Aggarwal, 1999; Terry, 1974).

#### 3. Problem Statement

Today management facing the problem of delegation at different time in organization, in this regard the famous presentation can overcome the problem of delegation. The proven payoffs of effective delegation, why do management observers such as Urwick express frustration at the lack of delegation in most organizations, basically, it is because delegation, like most management skills, seems attractive in principle but is often discarded in practice. Several management surveys have collected the reasons managers give for not implementing sound delegation principles (Preston and Zimmerer, 1978; Newman and Warren, 1977). The following three broad categories are organized and presented under:

**3.1 Attitudes about Subordinates**

Ineffective delegators believe their subordinates are not competent enough to accomplish the work, are not interested in taking on more responsibility, or should not be involved in tasks or responsibilities typically performed by the “boss”.
3.2 Personal Insecurity

Many managers fear they will lose the recognition and rewards associated with task accomplishment, are unwilling to share their expertise or “trade secrets” feel that they alone must know all the details about projects assignment to them, or are unwilling to assume the responsibility for mistakes subordinates make.

3.3 Personal Preferences

Non-delegating managers often prefer to do some mundane and routine tasks themselves, prefer doing delegate-able work alone rather than taking time to train their subordinates, or feel compelled to put in the longest hours in the work unit.

However, as Urwick correctly observed, even if a manager demonstrates the willingness (courage) to delegate, effective delegation also requires skillful implementation. Ineffective delegation can undermine every one of the potential benefits described earlier. It may actually increase the manager’s work load, it may increase a power struggle between the manager and the subordinate, it may lead to the manager’s losing touch with what’s going on in the organization, and it may reduce the quality of managerial decisions. Therefore, it is imperative that the following necessary elements of an effective delegation process be considered (Varma & Aggarwal, 1999; Terry, 1974).

4. Benefits of Skillful Delegation

The following points can throw lights on the subject matter of skillful delegation for enhancing work efficiency in the organization (Gupta, 1984):

1. Delegation increases the personal discretionary time of a manager, thus allowing more effective management of their time.

2. Delegation helps develop the capabilities and knowledge of subordinates so that their own effectiveness is increased, thereby increasing the effectiveness of their manager.

3. Delegation demonstrates a manager’s trust and confidence in subordinates, which leads to more effective performance and better interpersonal relationships for all.

4. Delegation enhances the commitment of subordinates to the task and to the organization. Participation in decision-making improves morale, understanding of the work, and motivation to accomplish tasks.

5. Delegation often improves the quality of decisions by bringing to bear information from subordinates who are closer to the day-to-day problems than the manager in the present environment.

6. Delegation increases the efficiency of both the manager and the organizations by getting work done with less expensive resources.

7. Delegation enhances the personal power of the manager within the organization.

5.1 Increasing Response of Skillful Delegation

In the light of the problem statement, we are of the opinion that most of the delegators response can be enhance with different aspects suitable at the time of delegation that vary from manager to manager (Terry, 1974; Gupta, 1984; Drucker, 2003). Some of them are as under:
5.2 Time Suitability is the essence of Skillful Delegation

Regarding time suitability every managers must decide when it is appropriate to involve their subordinates in performing tasks or making decisions. The answers to the following five basic questions can help a manager to decide. These questions are appropriate whether the assigned task will be delegated to one person or a group of persons:

a. Is subordinates background information or expertise sufficient?

Subordinates in many cases may actually be better qualified than their managers to make decisions and perform tasks because they are more familiar with customer preferences, hidden costs, manufacturing processes, and so forth. They are closer to the actual day-to-day operations.

b. Are subordinates committed to the success of the Task/project clearly?

Participation in the decision-making process increases commitment to the final decision. When employees are to given some latitude in performance of a task (e.g., what, how, when they do the work), they must be involved in the decision-making process to ensure their cooperation. While their participation will increase the time required to make a decision, it will substantially decrease the time required to implement it.

c. Are subordinates’ capabilities matching with delegation?

Delegation can quickly get a bad name in a work group if it is viewed as a mechanism used by the boss to get rid of undesirable tasks. Therefore, delegation should be consistent and should reflect an overall management philosophy emphasizing employee development. Enhancing the abilities and interests of subordinates should be central in delegating tasks.

d. Are subordinates sharing with other the common Values?

If subordinates do not share a similar point of view, unacceptable solutions, inappropriate means, and outright errors may be perpetuated, requiring close supervision and frequent monitoring. Articulating a clear vision and set of objectives for subordinates is crucial. Managers have three things about the job to tell to those to whom they delegate it: what, how and why. Research has found that important people are always told why, but less important people are often merely told what and how. Subordinates can tell how managers rate them by the message they deliver. It must include why.

e. Is sufficient time for an effective job of delegating?

It takes time to save time. To avoid misunderstanding it is imperative that managers spend sufficient time explaining the task and discussing acceptable procedures and options, as well as arranging opportunities to check on progress and ask questions (Varma & Aggarwal, 1999; Robbins & Coulter, 2002).

The above five considerations allow managers to make informed decisions about when to delegate. They also are useful in deciding which form of delegation is most appropriate for a decisions or a problem. That is, having decided to delegate a task; managers must then decide whether to involve only a single individual or a team of subordinates. If the decision is made to form a team, it is also important to decide how much authority it should be given (for example, to only investigate the problem and explore alternatives, or to make the final decision), and whether the manager should participate in the team’s activities. The following analytical frame-
works are presented for choosing the best from the various forms of delegation according to the organizational environment.

5.3 Cultural Background is basic for delegation

The second important factor in delegation is the cultural background of the employees in the organization because most of the employees not ready to comprise on their cultural values. These hurdles can obstruct the routine flow of delegation in the organization. For this consideration the management is taking help from behavioral school of management / contemporary management school to provide knowledgeable information for solving the personnel problem of various natures in the organization [9]. For example, within Pakistan, we are having four provinces along with the Federally Administered Tribal Area, where management style varies from province to province and specially for tribal area the management style totally changed.

For effective management, every organization tries to select proper man for the proper job to increase the efficiency and also make them efficient for current contemporary problems arising in the organization. The best example of cultural based management is available in the Tribal Agencies, where the routine District Coordinating Officer name changed with the name of Political Agent and as well as all other official designator name changed with the area. This is simply for to culturally control the people of the area, because they demand changed in every phase of life due their own sky of Malik/Sardar of the tribe.

In the light of above factor the delegation output can be increased by the cultural background knowledge of the group/area/community by changing the style of management. At the end we conclude that management is not culturally bound where it vary from area to area, from country to country and from province to province.

5.4 Educational background identity is the roots of delegation

Educational background is playing the role of roots for delegation in the sense that delegation without educational background is just like organization without finance. For effective delegation the employee’s basic education is required at time of selection. Organization is multi-functional business activity, where employees can develop coordination with one another on the basis of educational qualification. Without education the employees look likes a blind having no vision and information needed for the same assignment. In this regard the personnel department is doing justice in form of advertising it with the help of techniques of Job Description and Job Specification. These techniques are the valuable aspects of evaluating the employee’s performance through the process of delegation in the light of matching with their educational perspectives (Varma & Aggarwal, 1999; Gupta, 1984; Anderson, 1977).

For Effective Delegation the Following Guidelines Can be considered BY EVERY Manager

Question 1: Should I delegate to specific subordinates?

Question 2: Should I direct my subordinates to form a group?

Question 3: Should I delegate decision-making authority to the group?

Question 4: Should I participate in the group?

For effective delegation the manager can use any one from the above listed question in the light of task he is going to perform at the movement. These questions will help him positively
because subordinates nature, capabilities, influence and affiliations are known to the manager. With reference to the task to be delegated the manager will be concise what to do and what is needed at the movement from the required delegation process that will minimize/short the period of delegation as well as the efficiency of the delegation.

The above question satisfactions vary from manager to manager in the light of the assignment in respect of which the delegation is made by the manager. Some suitable solution is as under:

First question satisfaction need that the employee’s possess relevant information of skills. Whereas personal development and time is not a crucial factor as from this delegation conflicts would not arise.

The second question possible solution may be that interaction will clarify and increase motivation. Interaction will not be the subject matter of conflict and disagreement among the groups under the available time cycle.

Where the third question can reveal that the group formation will save the time of the employees needed for its motivation and will provide sufficient information and talent among the group members.

Final question satisfaction lies in giving information about the group leadership feelings and flow of ideas for increasing the group productivity. Group participation based on effective delegation among them and will not disrupt the leadership existence among the groups (Varma & Aggarwal, 1999; Hackman & Oldham, 1975).

6. Principles of Delegation

When the decision has been made to delegate a task and the appropriate form of delegation selected, the management of delegation has just begun the process properly (Gupta, 1984). For the positive outcomes/benefits of delegation in this discussion are contingent upon managers to follow these eight principles throughout the delegation processes:

6.1 Delegation must be certain and clear

Managers must clearly specify the limitation of subordinates’ tasks (e.g., gathering information only, or making a decision), their expected level of performance, their deadlines for reporting, and the constraints under which they will be operating. It is also important to specify the level of initiative expected. No other oversight in the delegation process causes more confusion than the failure to clearly delineate expectations regarding the level of initiative expected or permitted. At least five levels of initiative are possible (Oncken and Wass, 1974; Webber, 1981):

1. Waite to be told what to do.
2. Ask what to do.
3. Recommend, and then take action on the recommendation.
4. Report after action has been taken.
5. Act independently, with no follow-up necessary.

6.2 Participative Management Practice in the assignments

Subordinates should be allowed to participate in determining when and how the delegated task will be accomplished and, when possible, what the assignment will be. Bernard (1982)
formulated an “acceptance theory of authority” in which he proposed that people will accept and fulfill assignments only if four conditions are met. First, they must understand what they are being asked to do. Second, they must perceive that the assignment is consistent with the purpose of the organization. Third, they must believe that the assignment is compatible with their own interests. Fourth, they must be able to perform the assignment. This formulation underscores the importance of two-way communication during the delegation assignment process.

6.3 Authority and responsibility go parallel

This is the oldest and most general rule of thumb in delegation. It is common for managers to assign work but avoid matching the responsibilities with discretion to make decisions and with authority to implement those decisions. Simply stated, employees are often not empowered to accomplish the task. Managers also must take care not to delegate more authority than responsibility, i.e., to empower employees too much. This mismatch leads to lack of accountability and potential abuse of power by subordinates. Although managers always must maintain final accountability for delegated tasks, they must be certain that subordinates are given prime accountability for their actions.

6.4 Delegation within the organizational structure

Another general rule of delegation is to delegate to the lowest organizational level at which the job can be done. By definition this increases efficiency (lower labor and information-collection costs), and it frequently increases effectiveness (better understanding of the problem). In delegating a task down more than one level in an organization, it is important that the manager follow the organizational chain of command, that is, delegate through subordinates, not around them. Also, all individuals affected by the decision must be informed that it has been delegated.

6.5 Support availability for delegated tasks

Managers should continually provide relevant information as it becomes available to subordinates who have been delegated the tasks. In addition to that, it is important to announce publicly when subordinates succeed at their task assignment, but not publicly blame them when they make mistakes. It is apparent that Rewards should occur in public; while discipline should occur in private.

6.6 Focusing on results

Every manager should not supervise too closely after the task has been delegated. Every subordinate should have a right to make choices. Managers should review and evaluate the results of the assignment, not the means used to accomplish the task, as long as company policy and ethical standards are not violated. Giving free environment to subordinates for exercising initiative assignments regarding how the tasks may be tackled is important source of innovation in company procedures.

6.7 Continuity in Delegation

Managers should delegate continuously to busy the subordinates and overcome the chances of over work or time pressure. Continuous delegation can improve the satisfaction of the manager and subordinate’s personal desire for development. Manager and subordinates relationship can enhance from continuous delegation.
6.8 Close-circuit delegation practice

Managers should avoid discussing the issues of upward delegation with the employees. If employee fail to follow what the demand, then the manager should not directly involve him in the subordinate task given to him, if he involves himself in the subordinate task, then always the subordinates will try to get the attention of the manager, while this will develop the opposite relationship among the manager and subordinates. This practice will encourage the subordinate not to work but always busy the manager in the assigned task. So manager will not share with the subordinates, but always to ask what have you done so far? Try to communicate a manager’s expectation regarding initiative and responsibility.

7. Conclusion

The discussion on skillful delegation highlights the time suitability benefits for the management in the form of time management/minimizing unnecessary workload/shifting responsibility and the personal growth and development of the subordinates in the form of job security/promotion/tension free life in the organization. This process develop interrelationship among the manager and worker for the future security of capital flow cycle of the owner’s equity in the market (Hackman & Lawler, 1971).

- Effective delegation another aspects helps the manager to counterbalance the number of stresses by developing number of supportive and developmental relationships with the subordinates for the future continuity of good employer and employees relationship.

- Skillful delegation develops a sense of team work which is the name of organization/ work group in any society. This team work approach is needed for the surplus production for today Global village. Without team work concept, again the societies may go back to the jungle era, by having no information about the others living in the same world.

- Delegation also develops trust among the participants in the organization for their mutual benefits and satisfaction. Positive delegation brings fruits in the form of good decisions made by the manager and subordinates through skillful dealing for the achieving the desired objectives in the organization, which in return give life/continuity to the world management.

- With the help of delegation, management can encounter the plague of the World Social, Technological, Political and Business Problems, with in the region, and outside the region toward result-oriented involvement among the different nations, countries, blocks and groups, and individual organization.

- With the help of delegation, the manager can resolve the conflict among the participants in the organizations, by developing smooth relationship among them. Proper allocation of resources/funds is feasible with the help of proper delegation of authority net working availability in the organization.

- Delegation another good aspect in the form of interpersonal competence can eliminate number of problems attached with organization as well as with the individuals. This type of problems can be eliminated without going in the rigorous form of applying these techniques, but simply by introducing delegation interpersonal relationship among the participants for achieving the desired objectives. This principle is always quoted by most of the World famous ruler like Kamal Atta Turks etc.
• Skillful delegation provides good coaching and counseling environment to the organization members namely, manager and subordinates. With the help of this environment, every business problems can be fully discussed, among the different delegated net working channel for the future decision. Because with the help of discussion all possible aspects of the problems can be dig out and final solution will be forwarded for future necessary action.

• Delegation motivate and energize employees to influence others opinions in the organization for the constructive efforts.

• Delegation eliminates the communication gap among the organization participants that provides the understanding environment which puss the organization toward succession (Zand, 1972).

At last, we conclude that delegation play an important role in the World Culture Adaptation which are introduced in the name of social accreditation. In Pakistan, the whole country is divided into four different cultures namely, Pathans, Punjabi, Sandhi and Baluchi. Every culture delegation process varies from one another in the name of communication gap between them. This communication gap create number of issues/problems among themselves, which need attention on the part of academicians to overcome these different gap in the name of religion, culture, resources allocation.

From delegation point of view, every group is known by its own adaptation coming from the first day of its inception to this universe. For example, Pathans can be controlled by sincerity and devotion to ward their cause, while Punjabi are motivated by bribe response toward their cause, while Sindhi are sleped with by conspiracy and Baluchi are controlled by showing brotherhood towards their cause. All these are called delegation techniques that are helpful in managing this different group of peoples in the organization as well as in the texture of world politics.

Delegation from sex point of views also different, because, male group are showing very cold response towards his superior, while female groups are showing very active response towards her superior, because of man dominated society responses. This picture is frequently available in the culture of Pakistani societies, while in the advanced countries the results may vary from country to country on the bases of their cultural values implementation in their own country, one cannot conclude a major change in this regard. As per-Odden H. Hall, “Structural relationships are not once and for all prescriptions are “rule of the game”, which are adjustable to changing situations and the changing desires of the participants”.

Ethics in Banking: Employees in Turkey

Vedat AKMAN Ph.D
Kadir Has University

Abstract
This study aims to explore the influence of age and gender towards variables components affecting bankers perception of ethics in Turkey. Self-administered questionnaire with scale of 1-5 was used to measure bank employees perception of ethics with reasonable good score on Cronbach's realibility test. With Cronbach alpha of .621 (which could be greater than .5 for a satisfactor analysis), the reliability of the instrument is considered adequate for this study. Thus, we proceeded to our analysis successfully. Results showed that age and gender were not significant determinants to factors affecting bank employees perception of ethics in Turkey. During the years 1997-2002 twenty banks were taken over by the Turkish SDIF (Savings Deposits Insurance Fund) resulting in systemic banking crises associated with structural deficiencies. Unethical behaviour in the banking sector played a crucial role. (Hortaçsu & Günay, 2010)

Keywords: Bank Employees, Bank Managers, Business Ethics, Banking Sector, Turkey

1. Introduction
The importance of ethical behavior in the banking sector is especially important. (Brickley et al, 2002) In the banking sector alone there are seventeen categories of unethical behavior associated with honesty (lies and deception, theft and bribery), integrity (espionage, fraud and abuse), social responsibility (enivromental harm, safety and invasion of privacy), accountability and fairness (conflict of interest, insider trading, unfair trade practices and bad judgement in management decisions). (Mitchell et al, 1992) The key words here are trust, reputation and moral obligation. Among the Banks Association of Turkey's (BAT) general requirements for member banks are honesty, accountability,fairness, compliance with the laws, impartiality, reliability, transparency, socially responsible and fighting with laundering of crime-originated assets and insider trading. The Banks Association of Turkey (BAT) is among the 15 professional associations generally accepted as public bodies having either codes of conduct on its website, have ethics commission or Professional ethics rules listed on their websites. (TYEC Report Vol.I-II, 2009) The Banks Association of Turkey (BAT) officers are subject to the Council of Ethics for Public Service Regulation. (TYEC Report Vol.I-II, 2009) The Banks Association of Turkey also has Ethics Commission that works like Disciplinary Committe in way that inspects written applications on unethical behaviours. There is no Disciplinary Committee or Honor Committee but Board of Directors is in charge of the disciplinary process. (TYEC Report Vol.I-II, 2009) BAT web-site classifies ethics in banking under the heading of "Good Practice in Banking" under four sub-framework of ethics regulations (Code of Banking Ethics, BAT Ethical Commission Code of Principles and Procedure of Conduct, and Principles and Conditions Governing Advertisement and Promotions of Member Banks of the BAT). (TYEC Report Vol.I-II, 2009)

2. Background
Determinants of ethical decision making in the literature on banking ethics include; (Green,1989; Fergeson, 2004; TBB 2006 ; Stein and Yassa 2005; Chiami and Fullenkamp 2002; Provis, 2001; Lynch, 1991; Taylor, 200; Drennan, 2002; Argandona, 1999; Uche, 2004; Knights and O'Leary,
2005; Harvey, 1995; Kitson, 1996), on social responsibility and ethics in banking (Carse, 1999; Souter et al., 1994; Brickley et al., 2002), demographic characteristics (George and Mallory, 2001; Zeithaml et al., 1996; Ross, 2004; Zeithaml et al., 1996), managerial influence on ethics (Snell, 1995); banking environment (Carse, 1999); management and organizational structure (Touché Ross 1988; D’Aguila, 2001; TEDMER (Turkish Ethical Values Foundation); code of ethics in banking (Soutar et al., 1995; Murphy et al., 1992; Schwartz, 2001); Examination of banks failures across the globe shows that the unethical behavior has an important role in banks failures. (Aktan, Massod and Yılmaz, 2009)

2.1. Literature
In professional ethics literature researches are categorized in two main approaches conceptual and empirical. (Preble and Reichel, 1988) Our research approach is empirical which places emphasis on examining prevailing banking employees ethics perceptions and attitudes in Turkish financial and banking sector. There is a full body of literature on ethical behavior and decision making models in banking sector; (Brickley et al., 2002; Carse, 1999; Souter et al., 1994; Chiami and Fullenkamp, 2002; Frenkel and Lurie, 2003; Bernard 1989; Fried, 1981; Mitchell et al., 1992; Carse, 1999; Khan, 2002); unethical behavior in banking (Mitchell et al., 1992); ethical education (Sims, 1992); banking law (Ferrel and Weaver, 1978; Hortacsu and Ozkan, 2008); banking failures (Carrasco, 2006; Simpson and Kohers, 2002); job definition (Knights and O‘Leary, 2005); information (Cemalcilar ve Önce, 1999; Erdal Özkol vd., 2005; Shenkir, 1990; Leung and Cooper, 1995; Bok, 1998; Jones, 1992; Loeb, 1998; Ward, Ward ve Wilson, 1996; Loeb and Bedingfield, 1972; Mcnair and Milam, 1993). Demographic characteristics in banking (George and Mallory, 2001; Zeithaml et al., 1996; Ross, 2004; Zeithaml et al., 1996); Surveys and scenarios (Snell, 1995; Soutar et al, 1994; Dawson, 1997; Liedka, 1994; Randall and Gibson, 1990) especially on Turkish banking sector; (Catalca, Aktan and Soydan, 2008; Fort and Hayward, 2004). Unfortunately ampiric studies on Turkish banking system concerning ethics is very limited and not sufficient. So there is a huge need in the literature on ethics research.

3. Methodology
3.1. Sample
For this study, thirtytwo self-administered questionnaires were collected from bank employees in Istanbul. Snowball sampling method was used and participation to our survey was voluntary. Prior to performing the necessary statistical analysis, frequency distributions were tabulated for each item to ascertain possible response bias. In addition, a visual inspection was also performed to identify possible anomalies. All respondents were asked to respond each 21 statements. A five-point response scale was employed (1= "strongly agree" to 5= "strongly disagree") for all items indicating their belief about that particular situation. Our analyses included descriptive statistics, correlations and regression analysis. Correlatons were calculated to gain an initial understanding of the relationship between the variables.

3.1. Instruments
Our survey instrument consist of 21 statements that describe a specific event that has some kind of ethical choice connotation. It is conducted in Turkish for clarity, readability and understandability by the Turkish banking sector respondents. In addition, respondents were asked to provide demographic data about themselves. The data collected from the survey was analysed by reliability test, frequency analysis, factor analysis and regression analysis ANOVA test.
Our hypotheses will be tested. The hypothesis is stated below:
H0: Age and Gender is a positive determinant of attitude towards bank employees ethics.
H1: Age and Gender is not a positive determinant of attitude towards bank employees ethics.
In order to test the hypotheses factor analysis was used twice. Our first factor analysis was done to the 20 questions in order to gain the factors related to the ethical variables. Our second factor analysis was done to gain the important factors for the demographic issues. The variables for each factor analysis was retained for regression analysis. The article continuous with the two different factor analysis and then the regression analysis is done to test our hypotheses.

4. Analysis and Results
4.1 Reliability Test
When reliability analysis was tested with the 20 questions included in the questionnaire the cronbach alpha was found to be 0,621 which means that the data collected is consistently reliable to be analysed.

4.3 Factor Analysis

With our factor analysis, we use a technique to identify the smallest number of descriptive terms to explain the maximum amount of common variance in a correlation matrix. (Hill and Petty, 1995). In our analysis factors with Eigen values greater than 1.0 are retained.

4.3.1 Factor Analysis for Ethical variables (FA#1)

Inspection of scree plot and Eigen values enabled the analysis to reduce the 15 ethics components for bank employees into six factors.

Factor 1: Work Environment Factor

Factor one Work Environment Factor has 5 components included such as;

Q1. The rights which are provided to me in my workplace are enough and protective
Q2. I believe that I am working in an honest workplace
Q4. I believe that my work environment is transparent
Q20. An effective communication is very important at workplace
Q21. I believe the **golden rule** of having a **good communication** is to **respect others**

**Factor 2: Social Responsibility Factor**

Q3. The **social responsibility** projects in my **workplace** are **sufficient**

Q5. At workplace **enough importance** is given to **business ethics**

Q12: I think that everybody working in the corporation I work in does his/her job in a responsible professional manner.

**Factor 3: Encouraging Factor**

Q16: I don’t think that it is right in terms of business ethics to **talk behind others’ back**.

**Factor 4: Compelling Factor**

Q14. **No discrimination** or **no preferential treatment** at my **workplace** takes place

Q15. I find it **unethical** the use of **child labor** (under 18) or **unfair work conditions** in my **workplace**

**Factor 5: Administrative Factor**

Q13. I encounter some problems arising from **lack of knowledge** in my **workplace**

**Factor 6: Personality Factor**

Q17. I find it **unethical** for co-workers to **blame each other** for things they **did not do**

---

4.3.2 Factor Analysis for Demographic Issues (FA#2)

Inspection of scree plot and Eigen values enabled the analysis to reduce the 5 components (Age, Gender, job, Education and Sector) into two main factors.

**Factor 1: Age Factor**

First factor includes age.

**Factor 2: Gender Factor**

Second factor includes gender.

These two factors will be used as the dependent variables and factor analysis #1 factors will be taken as the independent variables in the following regression analysis.
4.4. Regression Analysis

Analysis of our Hypothesis is seen in the table below.

<table>
<thead>
<tr>
<th>Dependent Variable</th>
<th>Independent Variable</th>
<th>Significance rate from ANOVA</th>
<th>Relationship</th>
</tr>
</thead>
<tbody>
<tr>
<td>Age (F1 of FA#1)</td>
<td>Factor 1: Work Environment • Good communication and respect others</td>
<td>.072, .019</td>
<td>slight relationship, strong relationship</td>
</tr>
</tbody>
</table>

Table 4: ANOVA Analysis Results

The ANOVA done for this analysis shows that if the significant value is greater than 0.05 which means that the independent variables (bank employees ethics components) do not explain the total variation very well according to the dependent variable (age and gender) the null hypothesis is rejected, meaning that there is no relationship between age and gender and its components.

The ANOVA done for this analysis shows that if the significant value is smaller than 0.05 which means that the independent variables (bank employees ethics variables) do explain the total variation very well according to the dependent variable (age and gender). So we accept the null hypothesis, meaning that there is a relationship between age and gender and bank employees ethics and its components.

The ANOVA done for this analysis shows that if the significant value is above 0.05 which means that the independent variables do not explain the total variation according to the dependent variable (age and gender). So we reject the null hypothesis, meaning that there is no relationship between age and gender and bank employees perception of ethics and its ethical components.

5. Conclusion

This study explored the influence of gender and age towards factors affecting bank employees ethical perception in Turkey. Self-administered questionnaire with scale of 1-5 was used to measure attitudes towards bank employees perception of ethics. The reliability test resulted with a cronbach alpha of 0.621 show us that the data is consistently reliable to analyse especially for factor analysis and regression analysis.

Regarding the frequency distribution of the data 9.4% of the respondents were at the age of 18
through 25, 34.4% through 26 to 30 and 12.5% through 31 to 35. Cumulative percentage of age shows that almost 56.3% of the respondents were at the age through 18 to 35. 41% of the respondents were female and the rest were male. 96.9% of the respondents were university graduates.

Factor analysis was done twice for different reasons. The first factor analysis (FA#1) was tested for the 21 questions included in the questionnaire related to components making bank employees perception of ethics. The second factor analysis (FA#2) was done to gain the important factors for the demographic issues. Each variables from factor analysis were retained for the regression analysis.

According to the results of regression analysis age and gender factor has insignificant relationship with the compelling factors excluding work environment especially “good communication and respect for others”. There is a strong relationship there. Age and gender factor has a strong relationship with work environment only and not others. Age and gender factor has insignificant relationship with the other factors.

Recent findings in the literature pointed us to the fact that, open to conflict, most previous research in the field were dominated by normative approach. (Hosmer, 2000) There is a lack of empirical research on the topic which this paper hopes to cover by generating facts through empirical research to provide useful data to solve some of the conflicts regarding ethics in banking sector.

6. Discussion

So our current findings with five components under factor one and their relationship to factor two with two components (age and gender) which is trying to establish positive correlation among them. In our case they are age and gender. Our result confirms that work environment is the key factor. When we take into consideration the current working conditions of banking sector in Turkey and PA’s and their role in enforcing, our result is suprising.

Our current findings where age and gender negatively correlated with perception of bank employees ethics.

Impact of Organizational Politics in the Implementation of Self Assessment Manual in a Higher Education Institution

Samina Chaudhry

M.Phil, Bahria University Islamabad

Abstract
This paper is about the implementation process of Self Assessment Manual (SAM) and development of Self Assessment Report (SAR) in a higher education institution which has been developed by the Higher Education Commission (HEC), Pakistan. This study will examine past practices of evaluation and development of teaching and learning methods being used in a higher education institution and step wise sessions of the implementation of process of SAR. The objective of this exercise is to ensure the quality and institutional effectiveness. This paper will also discuss the role of power, collective and individual interest and conflicts faced during the implementation of the Self Assessment Manual (SAM). This will be seen through the lens of a metaphor “organization as a political system”. In the end suggestion will be given for future strategies.

Keywords: Impact; Organizational Politics; Implementation; Self Assessment Manual; Higher Education Institution

Introduction
Quality assurance is one of the core elements of higher education systems development for which universities of the world are carrying out various projects on building a quality culture in higher education (Apps, 1988; Duke, 1992; Edwards, 1997; Field, 1996). Higher education institutions are now striving hard to enhance the quality of education for institutional effectiveness by introducing various assessment criteria; these criteria help in developing the quality of the educational programs of an institution. Higher Education Commission (HEC) of Pakistan is taking steps to transform Pakistani institutions into world-class places of learning and advancement of knowledge, in order to create a modern, progressive, tolerant society and maintain the quality of higher education (Ameen, 2007:1).

The Higher Education Commission (HEC), formerly the University Grant Commission, is the regulatory body of higher education in Pakistan. It also facilitates the development of higher educational system in Pakistan. Its main purpose is to upgrade the Universities of Pakistan to be centers of education, research and development; to make these universities a place of learning, HEC is working with them on faculty development, curriculum development and revision, scholarships, conferences travel grants, research collaboration and publications, digital libraries and collaboration with international universities. The creation of HEC has had a positive impact on the quality of higher education in Pakistan as it is continuously making efforts on higher education infrastructure development and quality of teaching and learning (hec.gov.pk).
In this endeavor HEC has developed a Self Assessment Manual (SAM) which has eight criteria which are Program Mission, Objectives & Outcomes, Curriculum Design and Organization, Laboratories and Computing Facilities, Student Support and Advising, Process Control, Faculty, Institutional Facilities, Institutional Support to assess whether quality standards are being met by the academic programs. Higher Education Institutions are directed to implement this manual in all their departments; each program shall undergo self assessment every year.

Self assessment is a way of evaluating the educational programme and quality improvement. Through self evaluation, the educational institution assesses its strengths and weaknesses. Management, teachers and students are a part of this self evaluation. To implement this project Quality Enhancement Cells in higher educational institutions were established and have been made responsible for planning, coordinating and follow up on these activities of self assessment in the higher educational institutions as per the guidelines of HEC.

This University under discussion is one of the universities which started this project in 2004 by implementing the Self Assessment Manual in its Islamabad campus. In this process the previous practices were evaluated and discussed with management, staff and students of the institution. These practices consisted of student’s evaluation by filling up of the forms and teachers class observations by the head of the departments. SAM was introduced through various workshops and training sessions at the campuses and campus directors were directed to work on the criteria given in the manual. During this implementation and introduction process the team faced various challenges and problems which will be discussed in this paper through the lens of organization as a political system.

**Literature Review**

Every organization has some sort of a political environment which gives rise to many under currents which define the relations between various actors and there are certain characteristics which are common in a political system and in an organization “Organizational politics is a systematic way of focusing on relation between interest, conflict and power. Organizational politics arises when people think differently and want to act differently” (Morgan, 2006). Organizational politics is linked with power struggle, conflict over the source of power/influence which is planned and directed effort to actualize warring interest in a workplace (Mintzberg, 1983). Politics refers to the structure and process of the use of authority, influence and power to effect definitions of goals, directions, and major parameters of the social system (Wamsley and Zald, 1973).

The evidence of politics in an organization can be seen when people have difference of opinion/interest, influence each other and have special interests; sometimes it is beneficial for an organization and sometimes not. Interest can be personal, task related and organizational. But the fact remains the same that politics does exist in an organization in the form of social influence when one individual or a party has some sort of power, special interest or different opinion, which are the trait of a political system.
First of all we need to find out about what is social influence which gives authority or power to managers working in an organization. Social influence is when one does something which affects others working in that organization in any way, like asking your subordinate to do something or your supervisor for a favor. The net result is that in one way or the other one has exercised control by influencing them. There are tactics for this influence which can be persuasive, inspirational, collaborative, pressure, exchange, consultation and coalition. All these tactics can be used but it depends upon the status of the people involved (Greenberg, Baron, 2009), (Steve L McShane, Mary Ann Von Glinow, Radha R Sharma, 2006). Employees are normally aware of the organizational politics / influences and use these tactics where they deem it necessary; although they do not invoke sanctions against those who influence others but they use the tactics that are common and acceptable in daily routine affairs of an organization. (Mintzberg, 1983) but soft tactics like persuasion are more effective than hard tactics like assertiveness. (Steve L McShane, Mary Ann Von Glinow, Radha R Sharma, 2006).

This influence leads to authority and power which can be legitimate, reward related, coercive, economic, personal and expert (Fred Luthans 2008 page 281-286), (Steve L McShane, Mary Ann Von Glinow, Radha R Sharma, 2006 p 372-376) and that can be used by managers or individuals of an organization to get the things done. Individual also make use of power in a selfish manner which is the biggest problem in work environment and that is what organizational politics is. This refers to those individuals who give importance to their own interest instead of an organization. (Greenberg, Baron 2009 page. 47). Power involves a relationship between the person who is influencing and the one who is being influenced (Fred Luthans 2008 page. 287) and there are certain characteristics which can be dependency, uncertainty, personality, intelligence, and age. So whatever type of power and individual possesses has an effect on the organization and its politics.

Another important factor in organizational politics is human resource management activities such as annual appraisal, selection and rewards etc (Greenberg, Baron 2009 page 499-500) where managers use their influence and authority to get the things done.

Power can also be one of the reasons of conflict, power struggle which can be due to authority, relationship or resource; it depends upon the person who has more power whether it be formal or informal and who determines another’s fate and not vice versa. (Morgan, 1997). People in power sometimes use this authority or official capacities for seeking personal interests which ends up in conflicts.

Longman Dictionary of Contemporary explains the meanings of conflict of interest as “a situation in which you cannot do your job fairly because you will be affected by the decision you make” (www.idoceonline.com/dictionary/conflict_1). There are various types of conflicts e.g. interpersonal (personal differences, information deficiency, role conflict, environmental stress) (Fred Luthans 2008 page 260) personal, professional, official, and can also be due to incompatibility (Mellinkoff’s Dictionary of American Legal Usage, West Publishing, 1992, p.104-105) which can develop into conflict of interests. So there can be various reasons of conflict (Michael McDonald) http://www.ethics.ubc.ca/people/mcdonald/conflict.htm
Conflict is also the result of organizational politics it can be organizational, personal and intergroup which can result in stress and frustration and can have positive and negative impact on individual’s performance and organizational goals. (Fred Luthans 2008 page 256-258).

As Mintzberg says that there was a time when organizational politics was normally associated with executives (top down influence) is now different from that and employees can also influence managers. It is a process of mutual influencing of the individuals of an organization and everyone has some sort of formal and informal power that allows him to exert influence for his interest. There can be various influence groups like CEO, managers, staff and support etc, but they have different power, interest and influence which then results in conflict of interest in an organization. In this study we will examine the effects of the organizational politics on organizational performance.

**Background**

This study is about the implementation of Self Assessment Model in a Higher Education Institution which was established in 2000 with one campus in Islamabad and till 2007 it established six more campuses in various cities of the country. The university and its other campuses are offering several courses at Bachelors, Master, M. Phil and PhD level with a student body of more than 18,000 and 1700 faculty members. As the time passed the organization realized that there are issues related to teaching and learning, faculty, curriculum development, assessments and other issues linked to these areas.

Like every other university it has a system of teaching and learning, curriculum development, faculty hiring, research facilities and other facilities for the students. In 2003 Higher Education Commission (HEC) in its endeavor to enhance the quality of higher education institutions, developed a Self Assessment Manual and declared it mandatory for the institution to implement it to make its programs more effective. To this end all the programs offered by a university will undergo an assessment every year to come up to the levels of international quality education patterns. HEC then developed Quality Enhancement Cells (QEC) in every higher education institution with a responsibility of implementing the SAM to ensure quality of education.

To this end awareness sessions were held for all tiers of management after which the program teams were nominated by the departments. Then with the help of QEC member, Mission, Objectives and Learning Outcomes were developed by the program team of every department. Information was collected regarding Curriculum Design and Organization, Laboratories and Computing Facilities, Student Support and Advising, Process Control, Faculty, Institutional Facilities, Institutional Support; including filling up of the faculty and student’s assessment forms. This process took a year to complete the SAR of every department which was sent to the Rector and the assessment teams were approved by the Rector. These teams were sent to the departments to assess the implementation of eight criteria against the information provided in the SAR.

Assessment teams gave their comments in an exit meeting and the department was asked to also prepare a future plan, which was to be checked by the QEC for future references and development. With this first cycle of the SAR was completed.
Objectives of the study
1. To give a brief account of the past practices
2. To identify the implementation issues of SAM and preparation of SAR
3. To suggest the possible measures for future implementation

Research Design
A multi-method approach will be used to collect the data for this study based on training sessions, interviews, discussions, observation and experience of the author.

Organizational Politics Assessment
Power/Influence
As it was discussed earlier that social influence gives authority or power to managers working in an organization. It is when one does something which affects someone else in any way like asking your subordinate to do something or your supervisor for a favor. The net result is that in one way or the other one has exercised control by influencing them. There are tactics for this influence which can be persuasive, inspirational, collaborative, pressure, exchange, consultation and coalition. A great deal of power or influence comes from the designations or job title an employee holds which are referred to as legitimate power. In this institution while implementing the SAM sometimes power was a blessing and sometimes it was a big hurdle.

At the time of the awareness session of SAM, first group to be introduced to this concept was the top management (Deans and Directors of every department) of this institution in which they were also asked to nominate the program teams consisting of three people from each department. The documents (hard and a soft copy of SAM) were also handed over to the top management to be passed on to the program teams also. Difficulty faced in this process was that the top management was not able to use their authority as they were either too busy in their own work or were not interested in this work. They were unable to coordinate with the Quality Enhancement Cell Team and their department as they were too senior for this task and used their influence in passing on this task to the Head of the Departments (HODs).

Another issue was the question of the extent of involvement of the deans and directors in this process which was not clear and not mentioned in their job descriptions, so the management decided that the QEC will coordinate with the Head of the Departments for the implementation of SAM. HODs were not comfortable with the idea of being supervised by the Deans and Directors and thought that they themselves should be supervising the work being done in their department and in some cases the HODs were not even sure that were they suppose to be reporting to the deans and directors or not. In this case organizational politics effected our timeline to a great extent as the HOD could not even say all these things to anyone, probably it was their integrity and authority which was being challenged / was at stake in this situation.

After the meetings with the Head of the departments which took more time than expected; finally program teams were nominated and another round of individual orientation sessions had to be conducted for them. The reason for this delay was the lack of incentive for these teams, their interest and non availability of the documents sent to the top management to be passed on to them. Head of the department used tactics by perusing the teams and using personality influence;
authority in this case was a big hurdle in the implementation of SAM. Some of the senior HODs were of the opinion that this was a futile effort and will not make any difference in the situation and improvement of the intuition; they were trying to use the influence of their age and experience which is another way of influencing people as they had no personal interest in the beginning. This lack of interest on the part of senior management trickled down to the program teams and it became a common factor in some of the departments.

On the other hand as authority is recognized because people accept it for the reason they have a direct contact with their senior manager which is considered to be legitimate power, helped in the completion of this project due to the coalition and coordination skills of the HODs. These HODs also had the reward power and the teams working on this project were told that they will get some kind of recognition which gave them motivation to work on this manual. Some of the teams worked for their annual appraisals and increments from their managers. Here the use of reward power worked to some extent, there were some people who were not happy with this incentive given to some people and avoid helping these program teams in their work.

Few teams worked because of the coercive power which was noticed during the development of Mission Statement of the department where all the mission statement were copy pasted from the internet as they had to finish the work given by their HOD. Another negative impact of power in writing the SAR was the fact that department did not want to disclose their observation or put in negative things and actual facts/practices like retention of teachers, salaries, promotions and resources for the departments in practice. As they were answerable to their HOD for this and putting the actual facts might have gone against them so they had to write what they were told.

Another source of power or influence was the control of technology through which one can assert influence. In the development of SAR where some help was required by the technology savvy people, the team was forced to use some tactics like pressure and pursuance and also influence from their HODs. Thus the technological power in the hands the of one department or person made them feel superior/powerful over others which created a political issue.

**Conflict and Interest**

Conflict and interest arises not only in situations but also in the ways individuals behave when they come across some kind of disagreement it can be task, personal, interpersonal and organizational. Conflict styles of individual shape the social environment as discussed in the case of power and influence. In this study conflict was also one of the areas faced during the implementation process. Some managers either to satisfy their own concern or to satisfy their seniors created the situation of conflict. Some of the team members had personal interest in this task as they thought that they will get some extra benefit and recognition by doing this work, which never happened.

HODs had their own angle of interest as they had to prove their ability of leadership to the top management by being the first one to complete this project. But they did not realize that the teams nominated consisted of senior people who were already engaged in some other management and research tasks, which created a conflict between their work and the
responsibility given. As they refused to work on this extra assignment, it created a situation of conflict between them and the senior management.

Some nominated team members did not even have appropriate writing skills which they did not want to disclose as this might go against their interests and turn out to be a source of conflict between them and the management, which delayed the process of SAR. Using their influence of age and personality some senior people allocated this work to their juniors who were unable to even understand the SAM.

Personal interest also played a vital role in this project as some team members wanted to prove their worth in their department by taking up this project. They collected all the data required for this SAR which included the filling up of forms from the students and teachers which was not sufficient. Some team member had to face work-family conflict as they wanted to tackle both family and work together and unable to resolve both, which caused delay in the completion of this report and decisions made by managers in response to these workplace events had important consequences. Personal differences amongst the members of one department also created role conflict which had both negative and positive effect on the completion of this report.

**Conclusion and Discussion**

Organization politics does have an effect on the ways in which an individual responds to various situations. With an awareness of the potential approaches employees can deal with the issues like power, influence and conflict which can provide employees with tools that can help shape their own work climate. After assessing the role of organizational politics in the implementation of SAM, it was suggested that the organization for future work might like to consider the following suggestions for the improvement and implementation of SAM in other campuses and in the second round of assessment in Islamabad campus.

The role of senior management may be defined in the implementation of SAM so that there is no conflict of power and interest; as power is not the act of changing others but it is the potential to take people along.

Teams members who are working on this project may be given some incentive and recognition so that they should work whole heartedly and not to just complete the work by cutting and pasting. Their time in this work may be counted as research work and some teaching load may be taken off from them. Their only interest was their career not of the organization

Coalition and coordination should be used instead of coercive power and in case of family work conflict some standby arrangement should be provided to the team member.

As this is the process of institutionalization so there should be some policy designed to integrate self assessment process in organizational mission, so that each department should start this work as a regular process and from day one allocate this task to those people who are capable of handling this work and have appropriate writing skills.
At the time of exit meetings it was realized that due to some influence and interest the team members did not mention the actual issues of the departments to the top management and resultant management was unable to solve these problems. This was their own personal and career interest and they were not bothered about the organization. On the other hand there were some dedicated people in two departments who were not concerned about their promotions they were task oriented and just doing this work for their own satisfaction and due to task interest and wanted to achieve organizational goals.

In short politics and power are common in organizations. People come to work with a variety of goals, not just one. These goals sometimes create conflict and interest which can then affect the use of power. Organizational politics does have impacts on work environment which are decision making and development of leadership skills. Organizational politics can have both positive and negative effect on work environment and this can be controlled by the management so that it does not negatively affect the work in an organization. As power is a way of solving the issues of interest and conflict in workplace.

Abstract
Industrialization is considered an engine for development but today industrialization need a marvelous status from its day of inception and require the latest technological advancement side by side its competitive aspect from investor’s and consumers point of view to match with the current global change in demand. For updating the status of advancement in the industrial sector of the Province and as well as in the country, it need research oriented incubator for introducing modern technical know-how, management competency, increased production and overcoming the status of depressed local and international markets for fabricated goods. In this research paper the scholar is going to point out the real status of industrialization in the province and to pin point the forces responsible for its backwardness, not only from investor’s profit oriented motive but from economic perspective of the Province. It is not wise to imagine how it will be if a country does not have small and medium enterprises in the economy. Without the services of small and medium enterprises, the populace will not get supplies of food and other essentials and manufacturing sector will not get cheap raw materials and supplies, and the whole economy will come to a standstill. A country may survive without large enterprises, perhaps at a less efficient level, but a country cannot survive without small and medium enterprises.

Keywords: Industrializations, Small and Medium Enterprises, Supervision, Management, Credit Policies

1. Introduction
From 1947 the status of industrialization in Pakistan was very poor because at that time the country profile was totally agriculture based economy. In the first day of 1949-50 the share of industrial sector in GDP was around 8% by having simple industries of cotton ginning, rice husking and flour mill in the country. The status of industrialization was very poor but that time
government was also not serious for industrialization. The situation of SMEs is one of a rather loose integration within the mainstream of the national economy. Many recent studies undertaken by local & international agencies indicate that although SMEs display the potential for expansion, but numerous hurdles were present in the sector. In Pakistan as in other countries the recognition is growing that small scale industries are important for the development of social and economic sectors. However in spite of the growth of this awareness not much attention was paid to this sector. “Research has revealed that nothing contributes more to the flourishing of small enterprises than the favorable policy context” (Anderson, 2000). This is totally lacking in Pakistan and reflects apathy to one of the most potential sector of the economy (Bangash, Shafiquallah, Amjad and Shehla, 1995; Burstiner, 1979).

Pakistan’s comparative advantage was the skill that its people had in many fields of small & cottage industry. It people were famous for hand crafted products whether in metal, woolen, cotton and wood work. But this comparative advantage over time fritted away & was not exploited or developed (Khan, 2003). There was no tradition of institution building. No guilds and associations that would foster the skill and pass it on to the next generation have developed. There were no laws requiring the skill or recognition of skill, hence the national industrial development suffered.

Pakistan’s economic development policies favored capital-intensive technology choices, ignoring the fact it would create unemployment. Even the subsidized credits for small enterprises stimulated more capital-intensive technologies (Nizamani, 2000). This situation is further compounded by the fact that Pakistan ranks relatively low among other Asian Countries in such areas as per capita number of science & technology personnel and low on R&D (Khan, 2003).

Considerable work was undertaken on Small Enterprises (SEs) in 1990s by UNDP, who allocated research projects on SEs & Micro enterprises to UNIDO and ILO. Similarly a World Bank funding research was undertaken by the Institute of Social Studies Advisory Services for Bankers Equity. The Donors Coordination Group on promotion of the SEs set up in 1993 organized a series of activities for SEs promotion (Bangash, Shafiqullah, Amjad and Shehla, 1995). A series of measures were intended under the Eight Five Year Plan (1993-98) to stimulate the growth of SE sector focusing on improving their productivity and enhancing product quality and standards through training in vocational & technical skills and up gradation of technology and modernization. The impetus to the SE sector came from this new focus, which culminated in the Government’s decision to set up another Small Industries Development Organization (SIDO) in October 1998 called SMEDA- Small & Medium Enterprises Development Authority. Now the SMEDA has introduced its own policy for SMEs in 2002, to introduce the structural change in this sector (Khan, 2003).

2. Problem Statement

At the time of partition in 1947, there were few industries in the newly established Pakistan, but particularly in Khyber Pakhtunkhwa. There was no single industry. So the Government of Pakistan faced a lot that how to industrialize this newly created under-developed part of the country. In this regard, the Government established “Small Industries Corporation” for the whole West Pakistan to develop and promote the cottage and small industries, to create skilled labor, to reduce the rate of un-employment and to feed the new coming industrial units. This corporation
had to cover a vast area; priority was given to such places where there was greater potential for the new industry (Nizamani, 2000).

Followings are the main problems face by the Province:

- Lack of ability to supervise and direct others.
- Lack of capital, in indication of poor financial management.
- Lack of ability in sales promotion and sales management techniques.
- Lack of ability to collect bad debts and to curtail unwise credit policies.
- Lack of Regulations and Taxation Problems.

Number of the indicators showing the failure of SMEs in the country, especially, in Khyber Pakhtunkhwa, regarding its geographical location, because the Afghanistan War started in 1979, during this period the whole process of development was hampered due to geo-political relation failure with the neighboring countries. Up till now, the province is suffering from the burden of Afghan Refugees in every phase of life, especially in the business sector. Due to this crisis the indicators are as under (Khan, 2003):

- Declining sales record over several fiscal periods.
- Progressively higher debt ratios.
- Increased operating costs.
- Deterioration of working capital ratio.
- Reduction in profits (or increasing losses).

3. Government Role for Industrialization for SMEs

After the disintegration of the one unit in 1971, and after Khyber Pakhtunkhwa, becoming a province, realizing the fact that small and medium scale industries are a breeding ground for small entrepreneurs as well as for large industries (Khan, 1990). The Government of Khyber Pakhtunkhwa established the “Sarhad Small Industries Development Board, on 1st July, 1972, with the same objectives and role as that of small industries corporation previously for promotion and development of cottages and small industries in the province” Khan, 1990).

Now, side by side, the Government of Pakistan has introduced “SMEDA” in October, 1998, a federal level agency with the challenge of developing SMEs in Pakistan. SMEDA is not only a policy advisory body to the Government of Pakistan but also a one-stop-shop for its SME clients. It is a relatively new organization, based on a futuristic structure geared to provide business development services for small and medium enterprises. Nation-wise statistics dealing with business failures reveal that managerial inexperience and incompetence account for almost 90% of small business failures (Soomro, 2002).

3.1 The emergence of small industries corporations

After 1972, the institutional support functions for the micro and small scale sector were delegated to the provinces, to be managed by a Provincial SIC. The Punjab and Sindh acquired a Punjab Small Industries Corporation (PSIC), and Sindh Small Industries Corporation (SSIC), respectively. KHYBER PAKHTUNKHWA acquired a Sarhad Industrial Development Board.
3.2 Sarhad Small Industries Development Board (SSIDB)

SSIDB is engaged in developing and promoting small and cottage industries by providing training and overhead facilities, like access to bank loans, development of industrial plots/estates, and expertise and guidance to intending entrepreneurs. SSIDB was established in 1972.

SSIDB is basically a promotional organization with the following main objectives:

a. Manpower training-upgrading of skills and development of handicrafts production;
b. Model pilot projects-with common facility services, consultancy and extension services;
c. Industrial infrastructure-establishing, colonizing and maintaining Small Industrial Estates;
d. Advisory services-appraisal, technical assistance, financial advice and sponsoring loan applications to banks / financial institutions (Shah, 1986).

3.2.1 Model Projects

Since 1972, SSIDB has established 12 model pilot projects throughout the Province. These include woodworking, sports goods, leather goods, ceramics, electronic, agricultural light engineering and metal project centers. In these model projects the following has given some sort of projection to the province (Khan, 1985; Pleitner, 1989).

3.2.2 The Pak-Holland Metal Project

The innovation of the project has been to use the traditional master apprentice system to skill the masters who can then skill their apprentices in turn. The program estimates approximately 3000 graduates based in 2500 workshops as the beneficiaries (Anonymous, 1997).

3.2.3 Pak-German woodworking center

The Pak-German Woodworking Center (PGWC) set up in 1971, is one of the oldest foreign collaborations. Its objectives were to provide a two-year training course, establish a common facility service and a technical extension service and credit. The German component of this project was Rs. 6 million (Anonymous, 1997).

The degree of industrialization in all of these regions is negligible, in the case of PATA and the FATAs because of the mountainous terrain and the remoteness of these areas.

4. Problems of Industrialization of SMEs in Khyber Pakhtunkhwa

From the day of Independence, Pakistan is known is an agricultural country, but now the efforts are being made towards its industrialization. It is clear from the very first day that Pakistan is an industrially backward country. While the Province of Khyber Pakhtunkhwa having no industrial base from the day of independence. This backwardness of the region is due to certain problems, which handicapped its industrial growth. The major problems faced by the industries in the province are highlighted as under (Anonymous, 1997; ibid; Anonymous, 2001):
4.1 Government Policies and Regulations
For every area development some basic criteria are highlighted in advance for eliminating the obstructions creating elements will be cleared. In this regard, the Government Policies and Regulations are not matching with the available SME sector in the province. To boost the process of industrialization in the area, initially a specific package of incentives is granted to that area. However, in 1986 the government decided to establish an industrial estate in Gadoon Amazai. In this regard the government announced certain incentives for the investors. Here the problem is narrated in two ways cycle completion. One on the part of the investors, was that they have collected financial assistance/loans on the name of the said industrial estate in Gadoon Amazai, but really this financial/loans facility was diverted to the established area of the country, namely, Karachi, Faisalabad, and other developed area of the country. All this was done in the paper records, but nothing was available on the ground. Another aspect of the problem was that the Federal Government withdrew these incentives. These withdrawals of the financial packages, the investors of the said area become frustrated and they started withdrawal of their investment from the active industrial side of the Province. This has created an atmosphere of distrust among the investors, which directly hate the SMEs sector in its development stages.

4.2 Political instability/day night change of Government
The political instability and constant changing in policies is another problem faced by the investor of this province. Different ruling parties have different policies towards industries and there is no consistency and continuity in the policies for the growth and development of SMEs, such problems seriously damage the industrial activities in the Province. For SMEs development constant policies measures are needed, which are disturbed by the day-night change of the government. First, the province is backward due to number of issues which is not feasible at this stage to discuss but on the other hand, the government bias positions can double the problems, which directly hampered the growth of SMEs in the area.

4.3 Location Disadvantage
Unfortunately, the Province of Khyber Pakhtunkhwa is in disadvantageous position due to its geographical location. It is 1700 km away from the sea port, which makes the logistics problem, that double the cost of production. Due to this for flange area position, the products of the Province industrial estate may not be able to export to the country main markets like Karachi and Lahore.

4.4 Competitive Problems
The manufacturers of Khyber Pakhtunkhwa cannot compete with the manufacturers of the other provinces of the country due to certain local disadvantages and other factors. First, it is highlighted, that the people of Khyber pakhtunkhwa are not trust worthy, this information has paralysed the industrial environment. Secondly, the people are not socially well behaved in dealing with the different supplier and contractor that directly damage the flow of growth of SMEs in the area. For all these issues, the investors are hesitating from investing in that area of the country. Usually in Khyber Pakhtunkhwa investments are made in small units and produce goods at a smaller scale for the local markets. Because of these factors Khyber Pakhtunkhwa manufacturers are facing all these problems in competing with other provinces manufacturers, which in reality slow down the industrial progress in the province.
4.5 Karhano Markets/Bara Market Impact
The boundaries of Khyber Pakhtunkhwa touch the boarders of Iran and Afghanistan. The borders trades with these two neighboring countries are very close and impossible to stop this illegal boarders crossing. Peshawar is situated close to these boarders, which has proved its result in the form of new illegal markets in the area. Secondly, the misuse of Afghan Free Trade Transit resulted in the form of different illegal markets specified for foreign goods, which having direct affect on the local products production. In these illegal markets prices are comparatively low (due to no payment of taxes), as a result the local manufacturers are discouraged because people prefer to buy the imported goods at a low cost rather than to buy the local goods at higher prices due to high cost of production. Thus these illegal markets are a serious problem for the industries of the province.

4.6 Miranshah/ Zhoeb Markets Impact
Miranshah Bazar and Zhoeb market both are playing a very bad role in the progress of the province, because, all this area is paralysis by the imported goods on low prices. These goods are crossing the boarders illegally without any custom duty that directly showing the effect on the overall prices of the goods available in the markets. First, accesses to these areas are very simple and easy for importing these smuggled goods. Secondly, no proper system of trade application is needed for maturing the transactions. All these process are completed in vernacular methods that having no integration with the modern business techniques application. So these two boarder trades have impaired the local markets with the import of foreign goods. All these illegal smuggled goods are further transported to the different part of the province and also in the whole country.

4.7 Infrastructure Facilities
From the time of partition, Khyber Pakhtunkhwa industrial sector are having no remarkable position in the history, but still this continue in the same status quo form, no proper developments have been made in the industrial sector. Khyber Pakhtunkhwa lacks infrastructure as is evident from the following:

- Shortage of electricity and expensive electricity being 14.57% for both FATA/Khyber Pakhtunkhwa against its share of 13.54% for Khyber Pakhtunkhwa alone and 15.54 for both Khyber Pakhtunkhwa consumption of electricity is 7.1% below the national average 8.46% below Punjab 14.89% below Sindh (Anonymous, 2002).
- Shortage of gas supply being 2% of the total in the country.
- Inadequacy/lack of railway services in Khyber Pakhtunkhwa. The share of railway tracks in the Province is only 6.2% of the total.
- The share of Khyber Pakhtunkhwa in roads is only 5.1% of the total in the country (Industrial Perspective of NWFP, 2001).

On the basis of all the above statistics it is concluded that Khyber Pakhtunkhwa is substantially lacking infrastructure.
4.8 Frequent Breakdown of Electricity
The Khyber Pakhtunkhwa electricity power generation capacity from hydel is 69.07% and from thermal is 62.48% and 32.81% of the total as against Khyber Pakhtunkhwa and FATA consumption of 14.5% that is 44.40% of its own generation. The average cost of fuel alone is 95.82 paisas/KWH in thermal. Moreover, whereas Khyber Pakhtunkhwa is made to pay the full price of generation etc, the insufficient supply of electricity that is 8.14% against its share of 13.5% and frequent breakdown of electricity has also slowed down the industrialization process in the province (Anonymous, 2002).

4.9 Lack of Capital
One of the major problems of industrialization in Pakistan and specifically in Khyber Pakhtunkhwa is the lack of capital. In large scale industries like steel and iron, chemical, automobile etc, the amount of capital required per worker is quite high. In industries like textile, carpet, sugar, paper board etc, require huge amount of capital to establish and expand these industries. On the other hand the government and financial institution allocation of funds for the province is not sufficient to establish these capital intensive industries.

4.10 Lack of Financial Institutions Facility
At present the financial system of the country lacks the desired orientation regarding the SMEs support. The problems of comparatively low allocation, delays in granting sanctions and non availability of funds in time, keep the level of investments in industries at minimal. The banking institutions are not sufficiently active in looking after the financial needs of the lagging areas like Khyber Pakhtunkhwa (State Reporter, 2008).

Another serious related problem that most of the banks headquarters are located in one province namely Sindh (Karachi), so most of the industrialist is unable to go to Karachi for loan availability, therefore, provincial office should be given enhanced loan sanctioning powers. This practice is not sufficient for industrial sector and side by side the coddle formalities develop a gap and lastly it prove unprofitable from investor’s point of view. This will facilitate speedy disposal of cases locally and would save the business community, particularly small and medium ones from unnecessary complications and delays. Furthermore, it has been observed that in some cases funds are not disbursed due to lack of budget allocation for the Province.

5. Role of SMEs in Economic Development
SMEs have been getting immense recognition the world over due to their pivotal role in economic development. Frequently quoted, as the ‘backbone’ of an economy, SMEs contribute towards employment opportunities and revenue generation; promotion of craftsmanship; equitable wealth distribution; resource mobilization and development of an entrepreneurial culture. SMEs are considered the hub of innovation and as the only hope for the survival of local artisans who have been carrying unique skills over generations of national and international buyers.

Despite their significant contributions to the country’s GDP and export revenues, Pakistan’s SMEs are still unable to achieve their maximum potential and are in dire need of ‘hand-holding’
and support services. Our economy has experienced severe downslides during the past years due to factors beyond domestic policy making. But the SMEs always kept on going, accommodating the workforce from the non-productive industrial units and yielding positive results in the face of all adversities. Due to their small and thus manageable structures and limited scope of operations, SMEs manage to reallocate resources and survive in adverse economic conditions. But even then, their remarkable services to the country never earned them the recognition they merit. SMEs have always been short of business support, regulatory and financial assistance. This is mainly due to the absence of a conducive legal, social, economic, and institutional framework resulting in their lack of access to formal financing sources. Recently, the government has made efforts to create conducive operating environment for SMEs and provide them access to the formal banking sector. As part of these efforts, the formal financial sector has been undergoing a major restructuring exercise over the past two years (Anderson, 2000).

5.1 The Edge of SMEs over Large Scale Industries

Pakistan is a labor surplus economy with scarce capital resources. In view of this factor, the development of small and medium scale industry has specific effects on the balanced and dynamic growth of the country. It has a number of advantages over large scale industries are as under (National management Consultants, 1995):

- It generates more jobs per unit of capital.
- It is more capital efficient.
- It is strongly integrated into the domestic economy.
- SMEs use a high percentage of local raw materials.
- Most of local consumable products are produced by small and medium scale industries.
- It taps resources at grass root level.
- Promotion of SMEs induces rapid growth of large scale manufacturing in the long run.
- Regional cohesion and sustainable development.
- Generation of innovation and diversification of the economy structure.
- Civilization inclusion.
- New technologies for the knowledge-based society.

Small and Medium Enterprises or SMEs have always existed in all countries of the world. That’s where any form of business begins, either it is manufacturing or trading, it must be the SME. In the recent past, there has been an increasing realization of the importance of SMEs as the vehicle for economic growth. In 1998, the Small and Medium Enterprise Development Authority (SMEDA), was established by the Government of Pakistan, for the first time, to develop the links between the local industrialists and government. The objective was to provide a new impetus to the economy through an aggressive sector development and SME support programs.

The need for SMEs is dictated by the age of specialization in which we are now living. Large-scale enterprises find it more practicable, more economical and, therefore, more profitable to sub-contract their ancillary production to small and medium size units functioning independently. In the engineering sector, for example, it is closely a better policy to entrust the production of simple components to SMEs. One such unit could be producing just one
component with a high degree of specialization to turn out products of high quality and standard specifications. Such dedicated production is possible only through sub-contracting to smaller units that have the advantage of specialized skills and economies of scale, which make them cost-competitive with production efficient.

SMEs play a key role in the modern market economy. Small businesses are the monolith fundament of every prosperous and effectively functioning state. They possess a number of plus points, which place them in the centre of the economic and social goals of society. The sector of SME is expected to provide feedback for all type of mega projects in the country (Carson and Gilmore, 2000).

During the last 30 years, the general economic situation has undergone a number of profound changes which have given rise to a phase of marked uncertainty and instability. Following the crisis of the 1970s, some of the factors that had hitherto driven economic growth were called into question. In particular, the role of large firms in the industrialization process was rethought. Until the 1960s, while acknowledging the specificity of individual countries, interpretation of industrial development stressed the tendency of firms to increase in size. In the changed economic circumstances of today, however, it is the capacity to adjust to a rapidly changing market that is most important. At the company level, therefore, flexibility- as the ability to respond appropriately to market trends- is vital. As a consequence of these various factors, there has been growing interest in small and medium-size enterprise (SMEs), especially those which are most innovative in terms of technology and processes, whose main source of flexibility is precisely their medium or small size. It plays the following economic role in the province:

1. Employment Generation.
2. Poverty Alleviation.
3. Contribution to Job Creation.
5. Women’s Employment Opportunities.
6. Innovation and Inventions.
7. Provision of Services to Local Community.
8. Technical Manpower and Suppliers for Large Formal Sector.
9. Role of SMEs in Exports.
10. Safety of Local Artisanship.

6. Forces Responsible for SME’S Backwardness in the Area of Khyber Pakhtunkhwa

Industrialization tended to concentrate in developed parts of the country reflecting high level of regional and urban concentration of manufacturing industry. Initial growth in income inequalities and functional inequalities badly affected backward areas (National management Consultants, 1995; Price, 2006).

Uneven geographical distribution of industries in the country and imbalanced regional industrialization, not allowing fiscal concessions and incentives to favor location in industrial units in backward areas also contribute to the problem. These are as under:
6.1 Change of Government Adversely Affect Industrial Policies

In Pakistan, we are having the problem of system instability which directly hitting the economic policies of the country. But specially the SMEs are vulnerable to such change, because, the large industries are having some protection in the form of political shelter, while the SMEs are organized by the lower/middle class of society that are having no proper shelter from the political system of the country.

Economic policy distortions including over-regulation, price interventions affecting both outputs and inputs, high tax rates and poor tax administration, trade restrictions, poor credit accessibility and inadequate infrastructure are adversely affecting the industrial policies.

6.2 Unpredictable and Depress Market Conditions

Local market are suffered from the state unpredictable policies implementation on one side, while on the other side, the foreign goods/smuggled goods are freely coming in the markets that dark the future of the local market. Today, market forces were allowed to promote industrial production, commerce, banking, insurance, shipping etc. clustered in certain localities and regions, leaving the rest of the country in a state of backwardness. Disparities between the regions widened the capital and labor flow from the backward to the relatively more developed regions.

6.3 Physical Hindrances to the SMEs in Khyber Pakhtunkhwa

Following are the primary reasons causing physical hindrances in growth of SMEs in Khyber Pakhtunkhwa:

a) Private sector development in industrial and mineral sector remained minimal till 1980s.

b) Khyber Pakhtunkhwa suffered from location, financial, technical, skilled manpower and infrastructure setbacks.

c) Entrepreneurial culture and experience is virtually non-existent.

d) Subsistence agriculture approach could not absorb higher population growth, which led to unemployment and poverty.

e) Khyber Pakhtunkhwa is landlocked and is over a thousand miles away from Karachi sea port. As it is highly dependent on the south for both of its inputs, raw materials and markets, higher transportation costs make it difficult for Khyber Pakhtunkhwa industry to compete.

6.4 Impact of Incentive Packages withdrawal by the Government

From time to time, the Governments of Pakistan, announcing different packages for the development of the area. For example, Gadoon Free Industrial Zone, for ten years tax free zones. Such type of Fiscal and monetary incentives had been allowed to the investor’s of Khyber Pakhtunkhwa. Along with other backward areas of the country which included the following:

a) Income Tax holiday.

b) Exemption of custom duties on the import of machinery.

c) Sales Tax exemption.
d) Investors in Gadoon Industrial Estate had been allowed the following special incentive by the Federal Government in the lieu of eradication of poppy cultivation from the areas.

e) Duty free import of machinery, raw material and components.

f) 10 years income tax holiday.

g) Loans at 3% mark up for fixed investment.

h) Sales tax exemption, and

i) 50% rebate in electricity charges.

These incentives have accelerated the pace of industrialization in the Khyber Pakhtunkhwa, which reached to private investment level of Rs. 60804.886 million, out of which 50.43% has been attracted in the four industrial estates established by Sarhad Development Authority (SDA) at Peshawar, Hattar, Gadoon Amazai and Nowshera (Shahzad, 2002).

Premature withdrawal of these incentives resulted in the closure of industries; besides withdrawal of incentives, other problems are:

1. Over capitalization
2. Management in-efficiency resulting in high financial cost
3. Absence of relevant technical know-how
4. Shortage of raw materials
5. Depressed market
6. Lack of working capital
7. Drop in cash generation
8. Poor cash management
9. Outdated machinery, resulting in low production efficiency
10. Increased production cost, mainly due to high electricity charges
11. Increased overhead costs due to high freight charges

7. Conclusions

From the above discussion, the researchers conclude that industrialization of SMEs is playing the role of nursery for the Large Scale industries in the Province as well as in the country. From the study we concludes that the Government on one side and investor’s on the other side, will play the role of incubator of development for the SMEs in the region to meet the future consumer’s demand and the global market requirements. The role played by SMEs in the region for employment, capital flow, poverty alleviation, manpower development and regional cooperation is the highlighted contribution to the province. The whole world economic development reveals that SMEs are the engine of growth and provides raw materials to the large scale industries in the country. Statistical data of the developed countries highlighting the role played by SMEs are remarkable in every phases of life development. All the problems pointed out in the region are self created and need attention from the policy maker in the initial stages to take start toward the development of SMEs in the area.
In this regard the cooperation execution among SMEDA and SSIDB are important to share their views and suggestions contribution among themselves will play the role of bridge among the government and the concerned area investors. This chain of cooperation among the two contending participants can give the new direction of development to the backward sector of the province and sick industrial units in the region.

Next in this regard, the educational institutions can play very important role in the development of the province as well as in the overall economic sector of the country. All public and private sector universities, Vocational institutions, and Technical Training centers can contribute in the form new formula, skilled personnel, and technical manpower planning for future of the country economic requirements that can double the progress of the existing working units and reactivate the sick units in the region.

One important issue that can practically motivates the investors to join the industrial sector by providing technical assistance in the form of feasibility report of the potential sector identification of the part of the provincial government. This professional task can be accurately performed by the government expert groups by providing free services to the investors. This department/ organized group will work independently in the whole province to develop different feasibility report of the potential area product wise and will be projected in the workshop held by the state to introduce the different sector feasibility report to the investor to come and join the industrial sector by providing this technical support to the individual less capital holder investors. This is very good ideas sharing forum to the industrialist in own home to take start for new ventures. The role of SMEDA and other government authorities are not giving fruitful result for motivating the individual investors. Most of the investor is unable to make proper feasibility of the sector to invest their capital accurately. Most of them leave the project incomplete and lost the whole capital and declared defaulter by the bank and also by the market suppliers.

Finally, we want to divert the attention of the authority for introduction of SMEs subjects in all professional/ technical schools, colleges and universities. For this purpose, the entrepreneurial project can be developed by the scholars of different institutions to provide helpful guidelines to the individual investor according to his own choice area. Most of the professional graduate can shine their efforts by introducing different form of consultancies by offering services on payment basis to the non technical industrialist that having dual aspect function in the name of job employment to graduate and on the other side valuable services to the investor’s on low payment. This practice can contribute a lot the province and as well as to the nation economy.

Abstract
The main objective of this research is to investigate how the term ‘integration’ is defined by highly educated foreigners. Integration might not mean the same for different people. The way how individuals define the term, might be connected to their personal process and experience of integration, which is why the expatriates’ personal experiences will be taken into consideration. Additionally, the study wants to determine whether expatriates have a desire to integrate, what makes them feel integrated and at what point of their personal integration process the individuals are standing right now. As the study is conducted in Denmark, with expatriates living in this country, the Danish host society and its distinctive characteristics seem to be an interesting and important issue to include in the research paper.

Key words: Expatriates, Danish Host Society, Integration, Facilitation, Adaptation,

Introduction
In times of globalization as well as the internationalization of the labour market, people cross borders all the time. Reasons for migration include for instance “money and fortune (work)”, “love and family” as well as “danger and persecution” (Nygaard 2009:Slide 9). People migrating for work reasons are often called ‘expatriates’. They cross borders for short business trips or longer foreign assignments, but the category might also include foreign students or people who try to find a new job in a foreign country by their own initiative. Expatriates can provide valuable knowledge for the host country, which would be especially important for a country like Denmark (Tung et al. 2008; Expat Study 2007). Due to its size, Denmark struggles to keep up with the high speed of modern technology and to educate skilled workers in all fields (Expat Study 2007). Hence, exchanging knowledge with other countries and attracting highly skilled workers is crucial (Oxford Research 2007). However, attracting is not the only challenge. As the global “war on talent” (Tung et al. 2008) is getting more serious, retention becomes even more important. No talent should be lost to another company or country. (Tung et al. 2008) In this respect, Denmark might have more problems than competing countries, for example, due to its culturally rather homogeneous society (Tung et al. 2008), its language and its comparatively high income taxes (Roseveare and Jorgensen 2005). Furthermore, Denmark, just as many other Western countries, is facing demographic challenges. The population is aging and its percentage of immigrants from developing countries is increasing. Thus, the workforce in general and the highly skilled in particular, is declining, a tendency which might have a negative impact on Denmark’s productivity and competitiveness. (Roseveare and Jorgensen 2005) Consequently, it
seems important to satisfy expatriates in their professional as well as private situation in Denmark for a long or even permanent time.

Nevertheless, expatriates seem to get considerably less attention and support by the Danish government and society than other groups of foreigners. This is even more astonishing when considering the Danish immigration statistics. In 2008 about 6,000 foreigners came to Denmark for asylum or family reunion, the groups which are in the focus of the political and public discussion of integration. However, in the same year about 70,000 (Nygaard, 2009) foreigners came for work or study reasons and, still, they are rarely included in the integration activities of the government. Expatriates, just as any other groups of foreigners, bring their cultural heritage with them, which will come into contact with the host country culture. These cultural differences might lead to problems and could be one of the reasons for the often reported ‘failures’ of expatriates on international assignments (see e.g. Forster 1997). Expatriates are primarily business people having a job to do. A great part of expatriate literature deals with expatriates doing business in foreign cultures, how they fail and can be trained to do better. However, expatriates are also private individual shaving to cope with the changes in their live and with their personal situation in a foreign country. In this research, therefore, their integration as a private individual is of interest, rather than their skills of doing business in a foreign country. Nevertheless, the integration of the expatriate as a private individual could be of high interest for a variety of stakeholders. This could be businesses relocating or employing foreign workers as well as countries relying on the expatriates’ knowledge and skills. Hence, in order to predict possible problem areas, it seems important to understand the psychological and social processes an expatriate goes through when living abroad (Morley et al. 2006).

This inclusion of the psychological aspect of cultural barriers and the interdependence of willingness and adaptation has not been widely discussed in the literature (Selmer 2000). It seems as if the literature tends to assume that expatriates are willing to adjust and therefore focus on the ability to do so, on the underlying processes or on the obstacles that they might face. However, especially expatriates that come for a limited time to a foreign country might not be willing to change; rather they might want to remain a home country orientation (Berry et al. 2002; Gudykunst and Kim 2003). In order to successfully retain expatriates, it is important that they feel satisfied with their situation. Hence, knowing what makes them satisfied is crucial. In order to integrate them, knowing whether they want to integrate, what would make them feel integrated and how this could be achieved seems fundamental. Accordingly, the depth of desired contact with the dominant society and culture needs to be studied. This paper wants to make a contribution by giving expatriates the chance to explain what integration means to them, whether and how they want to become part of the local culture and society and how they experience this process of integration in Denmark.

Literature Review
Expatriate research has had a growing interest, especially due to the rapidly increasing amount of multinational corporations and globalization of business (Morley et al. 2006). Furthermore, an enormous amount of academic literature regarding cultural contacts exists. Parts of this literature deal with expatriates specifically but also literature on immigrants and other sojourners has delivered important insights for this research. Studies about expatriates or other cross cultural
contacts seem to be conducted from various perspectives. Kim (2001), for example, highlights that studies on adaptation have been carried out with different perspectives in the length of intended stay in a foreign culture. According to her, studies with a longer term perspective, are often analyzing immigrants and refugees migrating to a new cultural environment (see also e.g. Van Tubergen 2006; Fair 2008). On the contrary, studies with a rather short term-perspective are focusing on temporary sojourners and expatriates (see also e.g. Torbiörn 1982; Oberg 1960; Selmer 1998-2007). This paper, however, agrees with researchers such as Kim (2001) on the importance of combining these two perspectives and applied, as explained above, a broader definition of expatriates. Gudykunst & Kim (2003) suggest that foreigners who intend to stay permanently might have a greater motivation to adapt to the local culture than expatriates or other sojourners who only spend a limited amount of time in the host country. Moreover, in the attitude the foreigner encounters in the host society might vary. It might for example be more accepted that temporary sojourners act in divergent ways than if permanent sojourners do so. (Kim 2001) Hence, it seems interesting to examine the differences and commonalities of these two groups of expatriates. Furthermore, much of the existing literature on cross-cultural adaptation can be perceived as either looking at the macro or at the micro level of cultural contact. At the macro-level, researchers study the changes that groups of individuals from different cultures go through when coming in contact with each other. On the other hand, studies conducted at the micro-level, focus on the “intrapersonal and interpersonal experiences” (Kim 2001:15) of individuals entering a new culture. Although not done by many studies yet, researchers such as Berry et al. (2002), Berry (2001) and Kim (2001) highlight the importance to combine these levels when analyzing the adaptation process of an individual entering a social group in the host culture environment. In this research work, the focus lies on the micro-level considering the cases of individual expatriates. However, the receiving cultural environment, in this case the Danish society, as a group and its influence on the adaptation process of the expatriates is taken into consideration. Moreover, many studies use existent theories such as Berry’s (2001) (see point 3.2.4) to find tendencies in migrating cultural groups (e.g. Ward and Rana-Deuba 1999). Berry’s work seems highly valuable and received a lot of attention and affirmation in the literature. However, according to Ward (2008) due to its established relevance and its strong developed framework it might constrain new research in its development. She therefore requests researchers to “think outside the Berry boxes” (Ward 2008:106). For this paper, Berry’s theory seems a valuable framework that provides a good insight into the research topic. However, in accordance with Ward, many other researches and theories are included. Furthermore, the expatriates are not simply tested in which of Berry’s acculturation strategies they fit best; rather, they are asked to give their own definition of integration. These definitions might develop a new perspective on acculturation strategies and might even display hybrid forms of Berry’s existing strategies.

Expatriate ‘integration’ theories
The objective of the paper is to find a definition of the term ‘integration’ and to ascertain what integration means to expatriates. The author of the present paper, thus, is very open to all kinds of different perspectives on that term. At this point it therefore considers the different terms the literature uses to describe processes that occur when individuals come into contact with a foreign culture and environment. Different authors use several common terms for these processes such as ‘adaptation’ (e.g. Berry 2001; Berry et al. 2002; Kim 2001; Gudykunst & Kim 2003),
‘adjustment’ (e.g. Torbiörn 1982; Oberg 1960) and ‘acculturation’ (Hofstede and Hofstede 2005; Berry et al. 2002; McGuire and McDermott 1988). However, some authors, such as Ward (Searle and Ward 1990; Ward and Kennedy 1992) or Kim (2001) use the terms in an interchangeable way, mixing especially the terms adjustment and adaptation. Based on the lack of clear differentiation between the existing terms, some authors, such as Kim (2001) combine them into the term ‘cross-cultural adaptation’, which she defines as “the dynamic process by which individuals, upon relocating to new, unfamiliar, or changed cultural environments, establish (or reestablish) and maintain relatively stable, reciprocal, and functional relationships with those environments” (p. 31).

The word ‘integration’ does not seem to be widely used in the literature. Nevertheless, it is the one which is most frequently used outside academic literature and therefore seems to be the most suitable term to use for this paper. Nonetheless, the experience of private conversations with expatriates showed that ‘adaptation’ is used quite frequently too. Due to the existence of several terms in the literature, in the following these terms will be presented in order to give an overview.

**Adaptation**

Kim (2001) defines the process of adapting to a foreign culture as a “life-changing journey” and as “a process of ‘becoming’ – personal reinvention, transformation, growth, reaching out beyond the boundaries of our own existence” (p. 9; original emphasis). Thus, according to Kim, the longer-term contact with a foreign culture, the insights made and the involved process of adaptation lead to changes in the individual. Cultural as well as cross-cultural adaptation is described as a process of learning through communication. (Kim 2001) This process ultimately leads to assimilation through interplay of learning and “unlearning” (Kim 2001:51) of cultural habits. Berry et al. (2002) understand adaptation as a process that eventually results in an outcome. They define it as “the long-term ways in which people rearrange their lives and settle down into a more-or-less satisfactory existence” (Berry et al. 2002:369). This outcome can vary from positive to negative. Whether the eventual adaptation outcome is positive might be connected to the acculturation strategy (further described in point 3.2.4), with integration being the most and marginalization the least successful (Berry et al. 2002). Hence, other than it might be implied in the common use of the word adaptation in non-academic conversation, adaptation does not necessarily mean that people change in order to fit better to their environment (Berry et al. 2002).

**Adjustment**

Torbiörn (1982) defines ‘adjustment’ as a concept “generally used to express a dependent relationship, in which changes take place in the individual as a result of new conditions in his surroundings” (p. 54). He focuses on what he calls ‘subjective adjustment’ and connects it to the ‘satisfaction’ of the individual. Satisfaction is achieved when “the demands he [the individual] makes on his surroundings or on himself are fulfilled” (Torbiörn 1982:55, my own emphasis). Subjective adjustment, when connected to the concept of satisfaction, can thus be defined as “changes which the individual actively engenders or passively accepts in order to achieve or maintain a state in which he can feel satisfaction” (Torbiörn 1982:55). According to this, a subjectively well adjusted expatriate would be satisfied with his overall situation of living in a
new cultural surrounding. Similarly, Hippler (2006) defines adjustment as “the general satisfaction with one’s life in the new environment” (p. 67). Hence, according to Hippler (2006) the adjustment of expatriates is heavily connected to the environment they live in. Different aspects of the host environment require adjustment. Accordingly, Ward and Searle (1991) explain that the literature deals with both a psychological and a socio cultural dimension of the adjustment of sojourners in foreign countries. These dimensions are related but have to be observed separately from each other as they are predicted through different variables. The two dimensions will now be explained briefly (following Searle and Ward 1990; Ward and Searle 1991; Ward and Kennedy 1992):

**Psychological adjustment**
Psychological adjustment refers to subjective feelings of well-being, psychological as well as emotional, and satisfaction. It is therefore also connected to the attitudes of the expatriate and influenced, for example, by the expatriates personality and social support.

**Socio Cultural adjustment**
The socio cultural domain relates to the individual’s ability to “fit in” or negotiate interactive aspects with the host society” (Ward and Searle 1991:210; original emphasis). Everyday situations must be managed by the expatriates. How well this is done can depend, for example, on the cultural distance between the home and the host culture, the ability to speak the host country language, cultural knowledge and interactions with members of the host society. Selmer (1998) explains that for psychological adjustment, attitudinal changes must be made whereas for socio cultural adjustment, behavioral changes are necessary. According to the literature, before achieving adjustment, an expatriate might go through a process of culture shock. Expatriates and other foreigners are influenced by their cultural heritage, which will in many aspects differ from the cultural norms they meet in the host culture. These differences can result in culture shock. A name frequently used in connection with the concept of ‘culture shock’ is Kalervo Oberg, who was one of the first using the term in the 1950s. He described culture shock as “the anxiety that results from losing all our familiar signs and symbols of social intercourse” (Oberg 1960:142). Culture shock is often described as a process divided into four stages, developing during the stay of the expatriate. The first three stages are ‘honeymoon’, ‘crisis’ and ‘recovery’ and the last one is called ‘adjustment’ (Oberg,1960:143). At this last stage the expatriate accepts the customs in his new environment and even starts to enjoy them. Other authors, such as Hofstede and Hofstede (2005) or Torbiörn (1982) describe culture shock as one of the stages of acculturation or adjustment, similar to stage two which Oberg (1960), calls ‘crisis’. Most literature on culture shock treats it as a negative phenomenon. However, some authors, such as for example Adler (1975), provide an alternative view on the concept of culture shock, suggesting a positive side, consisting of “cultural learning, self-development, and personal growth” (p.14).

**Culture**
One characteristic of being an expatriate is living in a foreign national culture. Hence, expatriates and their integration might be influenced by the respective host culture. In order to understand this connection, it seems important to have a closer look at the concept of culture.
Defining culture

Culture as a concept is not easy to grasp as the amount of varying definitions in the literature shows. Hofstede and Hofstede (2005) provide an often cited text where they define culture as “the collective programming of the mind that distinguishes the members of one group or category of people from others” (Hofstede and Hofstede 2005:4). Describing people’s culture with the analogy of computer programs shows that the way people think, feel and act is influenced by their “software of the mind” (Hofstede and Hofstede 2005:3). This software develops through the environment in which the person grows up, the people it interacts with and the experiences it makes. It is a process of learning; people are not born with a certain predetermined culture. As stated in Hofstede’s definition above, culture is always, at least partly, shared with others; it is a “collective phenomenon” (Hofstede and Hofstede 2005:4). Hence, culture is closely connected with communication because without communication culture cannot be transmitted (Gudykunst & Kim 2003). Similarly, Ting-Toomey and Chung (2005) refer to culture as reinforcing the boundaries between an in group and an out group based on a shared identity and culture inside one group. They define culture as “a learned meaning system that consists of patterns of traditions, beliefs, values, norms, meanings, and symbols that are passed on from one generation to the next and are shared to varying degrees by interacting members of a community” (Ting-Toomey and Chung 2005:28).

Culture is a group phenomenon and a shared culture can be attributed to different kinds of groups. Trompenaars, for instance, mentions national, regional, corporate or professional culture (Trompenaars 1993:7). In this paper national cultural differences are in the focus. However, one should keep in mind that in many nations several societies live together which not necessarily share a common culture (Hofstede and Hofstede 2005). Schein (2004) suggests three levels of organizational culture which can be applied to the concept of culture in general (Harris et al 2003). The three levels are ‘artefacts’, ‘espoused values and beliefs’ and ‘underlying assumptions’ (Schein 2004:25). They differ in their visibility and are therefore often displayed in form of an iceberg (see for example Watson 2006). According to Schein (2004), artefacts are surface manifestations and would lie, in the analogy of the iceberg, above the surface of the sea. Those manifestations could contain for example the language, architecture or certain customs of a culture. Values lie deeper but are still more visible than the underlying basic assumptions. These are deeply rooted and include assumptions about how a society works and about human nature. They are not visible and mostly taken for granted. It is very hard for outsiders, such as expatriates, to access them, understand them and even to adapt to them. (Schein 2004)

Cultural contact and its barriers

As described above, national cultures differ from each other. However, cultures are complex concepts and one cannot assume that two expatriates from the same country carry the same cultural heritage. Thus it is not an easy task to compare cultures and evaluate their degree of differences and the possible barriers that might result. The literature provides attempts to differentiate cultures through a variety of dimensions (see for example: Hall and Hall 1990; Trompenaars 1993; Hofstede and Hofstede 2005). Cultures show attitudes or patterns of behaviour that are characteristic for the respective dimensions. (Gudykunst and Kim, 2003:54). Hence, understanding the possible dimensions can help to understand differences between these
cultures and the actions of their members. Torbiörn (1982) on the contrary presents an alternative way to differentiate cultures from each other, namely through analysing three aspects of culture: language, religion and living standard, which should be understood in a broad way. According to his study, these three dimensions can affect the strength of the cultural barrier and are connected with several aspects of the expatriate’s life abroad. He names aspects such as for example the orientation of the expatriate to spend his leisure time more with home or host country nationals and the expatriate’s satisfaction.

In case of intercultural contact, cultural barriers can occur when “cultural differences affect the individual’s ability to understand or accept and adopt another country’s norms” (Torbiörn 1982:119). Torbiörn (1982) furthermore suggests that an expatriate’s “willingness and ability to adopt the host country’s norms” (p.119) reflect the level of cultural barriers between the home and host culture. Hence, cultural barriers are a psychological phenomenon. Torbiörn (1982) furthermore suggests that in the specific situation of contact, the individual from one of the two cultures might experience a higher cultural barrier than the other. This could for instance be the case when the cultural difference affects values that are more central or fundamental in one culture than in the other. (Torbiörn 1988) It seems relevant to note that, just like cultures, cultural barriers are not static. Cultures change, barriers can shift and expatriates can find ways to adapt to cultural norms that they perceive for themselves as barriers (Torbiörn 1982).

Furthermore, some authors (Berry et al. 2002) argue that the greater the distance between the two meeting cultures, the more difficult the process of acculturation will be. Similarly, Waxin (2006) suggests that adjustment is more problematic the bigger the cultural distance between the home and the host culture. On the other hand, Torbiörn (1982) argues that regardless how big the cultural barriers are, in the end it seems possible to deal with the host culture. Similarly, but referring to cultural distance in general rather than to real barriers, Selmer (2007) found that for expatriates both a distant and a similar culture might be equally challenging to adapt to. However, as Selmer admits, the findings are the results of one single, exploratory study with all its limitations. The issue might need to be studied further, for example in different cultural settings or over longer terms (Selmer 2007). On the contrary, Ting-Toomey and Chung (2005) suggest that foreigners entering a new culture, expecting a low cultural difference, might experience rather high levels of problems and frustration. According to them, the assumed cultural similarity could lead to a failure to see the existing differences, resulting in insensitive behaviour. In accordance with this, Khan-Panni and Swallow (2003) suggest that when entering a culture perceived as very similar to ones own, experiencing differences might result in quite a shock as these differences were not expected.

**Denmark and its integration policies**

However, according to McGuire and McDermott (1988), the majority of studies on acculturation fail to consider the characteristics and behaviours of the host country and host society. In line with that, Berry (2001) observes that acculturation processes not only affect the non-dominant culture. Hence, research should consider the reactions of the dominant culture. The individual expatriates settle down in a new country and get in contact with the dominant society, thus, the dominant culture and its attitude towards integration might influence how individuals can integrate. Hence, it seems highly relevant, at this point, to consider the host culture and its
attitude towards integration. As Denmark constitutes the host in this case, its culture and attitude towards integration will be discussed in the following.

How Denmark defines integration

When looking at how expatriates who are currently living in Denmark define integration it seems highly relevant to consider the Danish definition of the term as well. This will be done in the following. The Danish definition of integration seems to have a focus on economic integration. In short, this means that foreigners who have a job are integrated. Hence, expatriates are basically excluded from the whole debate on integration as they, when they come to Denmark already have a job or at least are highly educated. Thus, the definition of integration and the discussion about it focuses on immigrants, non-Western in particular.

According to the Danish Ministry of Refugee, Immigration and Integration Affairs and the integration law, integration consists of three general columns: job, education and becoming part of society (Nygaard, personal conversation, 06 October 2009). In 2005, the Ministry developed an integration plan which, again, shows a clear focus on economic integration. The plan, however, seems to lack a clear statement towards multiculturalism and diversity in Denmark. Social and cultural issues are hardly mentioned, except an aiming towards a general recognition of basic “values of society such as democracy and equality between the sexes” (Ministry of Refugee, Immigration and Integration Affairs 2005:1).

On the other hand, there are institutions that include customs and culture in the discussion. In the integration policy of the Municipality of Copenhagen (2006) integration is defined in terms of adaptation and acceptation. According to them, foreigners should adapt through learning the language, living according to national laws as well as respecting the customs and culture of the dominant group. At the same time, the dominant group is requested to accept the minority’s culture and customs as long as these do not contradict democracy and human rights. The minority group should furthermore not be obliged to take over the dominant culture. (Municipality of Copenhagen, 2006)

Another insight on how Denmark defines integration might be gained through a study conducted by ‘Dansk Center for Integration og Analyse (DCIA)’ to analyze what the Danes’ expectations of integration are. Their idea was to make it easier for foreigners to “become Danish enough for the Danes” (DCIA 2009c; own translation). In focus has been the discussion about the differences and problems between Danish and Muslim culture. This, on the one hand, makes the results of the study not fully valid for an expatriate study and one the other hand shows, again, where the focus in Danish integration discussion lies: on immigrants, especially those with an Islamic background. Nevertheless, the results of the study seem interesting for this paper as they show the Danish attitude towards integration. The survey finds three main aspects of integration (DCIA, 2009a): to speak Danish, to work and to follow the law. Furthermore, the study points out that, for the Danes, everyday life is where foreigners have to integrate. Danish culture on the other hand does not seem to be in the focus in the respondents’ definition of integration as only 10% of the respondents see it as a prerequisite of integration (DCIA 2009a:11). The aim of the study, to make foreigners ‘become Danish enough for the Danes’ seems questionable as it could...
be understood as aiming towards assimilation, something that does not seem to be consistent with the actual findings of the study.

As seen in the discussion above, the question of whether Denmark favours assimilation or integration is not entirely clear. This corresponds with the findings of the Eurobarometer (2000) which describes Denmark as a “polarised country” (p. 25) in which a large part of the population is intolerant towards minority groups but at the same time it has one of the largest percentages of actively tolerant people inside the EU. Furthermore, the study describes the Danes as rather open towards foreigners in comparison to other EU countries. According to Hedetoft (2006b), the main strategy in political and social practice is assimilation. However, according to the Eurobarometer (2000) the majority of the Danish population does not expect foreigners to give up their own culture, except “those aspects of their cultural life that violate domestic legislation” (p. 48). Hedetoft (2006b) also admits that, besides these assimilationist practices, there is a new discourse on integration and diversity. While the assimilationist strategy is broadly accepted by several political parties, it is mainly supported by the Danish Peoples Party (Hedetoft 2006b), a party known for its anti immigration attitude (Bjørklund and Andersen 1999). Some other political parties are starting to foster a diversity discourse; however, with a mentality to take advantage of diversity and the different backgrounds foreigners bring to Denmark. (Hedetoft 2006b).

Lassen (2009) differentiates the political and media discourse from the reality on the Danish labour market. According to him, there seem to be two realities when talking about integration in Denmark:

1. Integration in Denmark is a big problem
2. Integration in Denmark is a big success

The first reality refers to the media and political reality which is focusing on problems in the different cultural and religious backgrounds of foreigners in Denmark. The second reality, however, refers to the ongoing success in integrating immigrants into the labour market and the educational system. (Lassen 2009) According to Lassen (2009), the difference in these two realities stems from different attitudes towards immigrants. The public discussion is challenging immigrants to become like Danes and if they do not, integration failed. On the other hand Danish companies seem to be welcoming immigrants as they are, figuring out a way how they can work together in the future. In Lassen’s argumentation it shows that the Danish media seems to have a strong influence on the public opinion about integration. Gudykunst and Kim (2003) might agree as they suggest that mass media can have a strong influence on the host society’s attitude towards a certain cultural group or foreigners in general. According to Lassen’s (2009) two realities, it seems that Denmark is not necessarily as focused on homogeneity and assimilation as the media and political discussions often try to communicate. Hence, when looking at the situation for foreigners in Denmark it seems crucial to always remember what reality one is looking at. Regarding the three main columns of the integration law mentioned above, Denmark seems to have made big steps in achieving the first two points, job and education. In order to fulfil the third point, integration into society, Denmark is working on different projects, for instance in cooperation with NGOs. Moreover, there are awards and projects around the issue of
diversity. (Nygaard, personal conversation, 06 October 2009) Hence, Denmark seems to be shifting towards a focus that could also reach expatriates.

The situation for expatriates in Denmark

Denmark wants to attract expatriates, especially those who bring special knowledge in certain areas. As in other European countries many immigrant workers were invited to Denmark in the 1960s. However, when around 1973 the borders were closed down for them, for a long period only vulnerable immigrant groups such as refugees entered Denmark. These people came to Denmark often rather lowly educated and with rather distant cultural backgrounds. In the late 1990s the government decided that change was necessary (Nygaard, personal conversation, 06 October 2009). The new legislation therefore focused on two issues (Nygaard 2009, slide 17):

1. “Turning the general profile of immigration”
2. “Closing the competence gap”

The government’s integration plan tried to aim at a “better balance of immigration” (Ministry of Refugee, Immigration and Integration Affairs 2005:1), meaning that the number of expatriates should exceed the number of vulnerable immigrants. Here it seems as the group of highly skilled expatriates is the preferred kind of foreigner. The plan seems to have worked out as today the number of foreigners coming to Denmark for work or study reasons exceeds the number of foreigners coming to seek asylum because of family reunion by far (Immigration Service 2009) while just a few years ago the opposite was the case. Interestingly, although the number of expatriates coming to Denmark is significantly higher than the number of immigrants, they seem to get considerably less attention. Press, politics and governmental institutions almost exclusively focus their discussion on immigrants coming to Denmark as asylum seekers or for family reunion. One could conclude, that integration, rather than assimilation, of certain groups of foreigners might be ‘more allowed’. There are several possible reasons for that. Firstly, highly educated expatriates might be perceived as ‘better’ foreigners, constituting a resource for Denmark and contributing to its system and, thus, nobody wants to perceive them as a problem. On the contrary, immigrants or refugees are perceived as a threat to the Danish welfare system as they receive support without having contributed (Hedetoft 2006b). Secondly, foreigners from a culture close to the Danish culture might be allowed to integrate rather than assimilate. A reason for this might be that, according to Torbiörn (1982) cultural barriers face two ways. Hence, the lower the cultural barriers the higher might be the acceptance of partly differing values. Finally, expatriates might get less attention because they either have a job or are well educated enough to get a job quickly and are therefore not covered by the Danish definition of integration. Due to the lack of attention and support, expatriates group up in order to help themselves and to get their voice heard in the society. Different initiatives, from expatriates for expatriates exist such as ‘Worktrotter’ or ‘Foreigners in Denmark’.

Additionally, there are companies offering their services to expatriates as well as to companies hiring expatriates. Most of them are relocation companies such as ‘Relocation Scandinavia’, ‘Alldenmark Relocation’, ‘Gateway to Denmark’, to name just a few. Others offer their service to the spouse of expatriates such as ‘Spousecare’. However, more and more Danish institutions seem to realize the importance to support expatriates. The network ‘Expat in Denmark’ is run by the Danish Ministry of Economics and Business Affairs together with the Danish Chamber of
Commerce, the Copenhagen Post and the Danish Bankers Association. Its aims are to facilitate networking, to support expatriates with advice and knowledge as well as to make their stay more successful. (Expat in Denmark 2009) Moreover, the Danish Ministry of Integration seems to understand the need for highly skilled expatriates in Denmark. After succeeding in opening the borders for them first initiatives were recently developed such as a project called ‘welcometo.dk’. This is a joint project of different unions and the municipality association, aiming at supporting expatriates in areas such as “Contact with authorities, Workplace culture, Family matters, Acquisition of language and culture” (Welcometo.dk 2009).

Conclusion
Conclusions will be made regarding two main points, firstly, the definition of integration and, secondly, the influence Denmark as the receiving society might have on this definition.

How expatriates define integration
According to the findings of the study, expatriates define integration as related to the following aspects: local language skills, a social network, acceptance and respect towards the local culture, compliance with the law, a job and a feeling of belonging and satisfaction. The findings furthermore suggest that, for expatriates, integration is a question of attitude and of individual choice. The expatriates clearly reject the idea that, in order to integrate, assimilating into the host culture could be necessary.

The literature could not provide a clear definition of the term integration or the processes that occur in cross-cultural contact. The findings of the study show that the term ‘adjustment’ comes closest to the expatriates’ definition. Adjustment points towards accommodating differences in order to achieve satisfaction whereas adaptation seems to imply more radical changes, ultimately leading to assimilation. Most expatriates are willing to change in order to integrate, however, only in superficial or practical aspects, aspects that they can chose themselves and aspects that they like. They do accept and understand the fact that the local culture is different and they are eager not to offend anybody. However, radical change and giving up fundamental aspects of one’s own culture are not defined as integration. Especially when change is imposed and affects one’s private domain, it is rejected. The findings furthermore suggest that changing towards the local culture or sticking to one’s own are not the only options; rather an international culture could develop too. Many of the expatriates are open to balanced change and to mixing cultures in a way that suits them best as an individual or as a family. Similar conclusions can be drawn regarding the attitude towards the local language. The expatriates agree with the literature on the importance of language for adapting to and integrating into a new environment. However, their eagerness to learn the host country language does not necessarily include a willingness to step away from their home country language or other languages they are used to speak in their private domain. Hence, defining one’s own culture and the way one desires to integrate is very individual and about being able to make choices. Regarding the expatriates’ social network, the preference towards home country nationals, suggested in the literature, could not be confirmed; rather the opposite was true. Similarly, the possibility to merge ‘members of the local society’ and ‘members from third cultures’ into a universal ‘the others’ could clearly be rejected by the findings. The differences between these two groups, especially in the degree of difficulty to
make friends with them, are too big and require a separate assessment. As the findings showed, most of the expatriates do want to integrate into local society rather than being separated. However, due to the closed circles of the Danes, which were suggested by the literature and confirmed by the study, some expatriates only succeeded to integrate into the existent expatriate society.

The found definition does, to an extent, go in line with Berry’s acculturation strategy called ‘integration’. Both concepts point towards a maintenance of one’s cultural heritage as well as towards the establishment of contact to people with other cultural backgrounds than one’s own. However, the borders between integration, assimilation and separation seem less clear in real life than in theory. The findings suggest that choosing the right acculturation strategy is an individual process of finding an outcome most suitable and satisfying for the individual expatriate. This research tried to build a bridge between research on temporary sojourn and longer term immigration of high educated foreigners by including expatriates who came to Denmark in order to follow their Danish partner. The findings of this study, do not suggest major differences between expatriates with or without a Danish partner. The same applies for the comparison expatriates with a more or less distant culture. Only a slightly lower openness towards change and towards learning the local language for expatriates with a temporary stay was found.

Overall, the findings regarding the expatriates’ attitude and satisfaction as well as their ability to deal with the foreign environment suggest that they succeeded in integrating. The responsibility for this achievement seems to lie with the expatriates themselves. They are the ones that have to deal with their changing situation and in order to do so, the right attitude is perceived as crucial. However, in accordance with Berry’s theory, in order for the expatriate to integrate, there exists a demand on the receiving society to allow for integration and support the expatriates’ efforts, for instance, in learning the local language and building a social network with the locals.

**Integration in Denmark**

This work tried to include both the individual perspective of the expatriates and the group perspective of the Danes as a receiving society. The findings suggest, that, in theory, the Danish definition and the definition given by the expatriates show many similarities. Both point towards language skills, job, and compliance with the law rather than towards assimilation. However, the expatriates seem to be influenced by the public and media discussion on foreigners in Denmark which displays cultural differences as a problem.

Due to this existent public discussion on integration, Denmark, as receiving society, seems to have an influence on the expatriates’ definition of the term. Many of the expatriates were very opposed towards assimilation because they felt that Denmark tried to impose its culture on them. Hence, a pressure to assimilate creates refusals in the expatriates. The more influence the receiving society tries to get on the process of integration of the expatriates, the less they seem to be willing to take over the culture. Pressure seems to create refusal, with the result that expatriates then rather want to integrate while keeping their culture. Another influence of the Danish society is their characteristic of being a rather homogeneous and closed group. The attitude of the expatriates towards the Danes in general is predominantly positive and most of the expatriates show no desire to live separate from them. However, the reported difficulties to make
closer friendships with the Danes seem to put this issue even more in focus when defining integration. After having failed to make friends with Danes, some expatriates give up, shifting their focus towards integrating into an expatriate society. For a country like Denmark, relying on the skills and knowledge of foreign expatriates, these findings might contribute to first ideas for possible measures that government and companies could take in order to help integrating and retaining expatriates. For example, the findings implied that contact to locals is seen as a crucial support for integration. In conclusion, Danish institutions could start programs and initiatives bringing Danes and expatriates together more frequently and in a way that builds a tie between them. Companies, at the same time, could implement or extend programs of mentorship for foreign employees. Furthermore, it seems recommendable for the government to be aware that their political and media discussion reflects on how expatriates understand the Danish definition of integration. Initiatives in order to guide the discussion in a more positive direction and in order to make their highly skilled foreign workers feel more welcome might be taken.

Further research possibilities
Due to the breadth of the field of expatriation and intercultural contact, as well as the exploratory character of this research, it intended to, and could, only contribute with a small insight. To truly understand how expatriates in general, and different groups of expatriates in particular, define integration as well as to develop useful insights for governments and international companies in practice, the area would need to be studied more in-depth and from different angles. For this reason, in this last point of the research some limitations of the study and recommendations for future research will be made, firstly, regarding cultural aspects, secondly, regarding the individual backgrounds of the interviewed expatriates and, finally, regarding the inclusion of formal business expatriates. The study had its limitations regarding the amount of cultures that met. It studied expatriates currently living in a single receiving country, Denmark. Hence, the expatriates’ answers might have been influenced by their integration process in Denmark and its distinct characteristics. The study is aware of and did consider the influence Denmark might have. However, for future research and in order to truly understand how Denmark’s distinct characteristics influenced the expatriates, comparing the results of this study with findings from another country seems highly recommendable. The same research in, for example, a country with a much more multicultural society, might deliver different insights into the concept and underlying processes of integration as well as the resulting definitions of the term. Similarly, different cultural groups could be compared when coming to Denmark. In connection to that, it might be interesting to measure the degree of cultural distance of these groups as well as to the receiving society by means of the dimensions provided in the literature (see for example: Hall and Hall 1990; Trompenaars 1993; Hofstede and Hofstede 2005). To consider the perceived cultural distance, as done in this research, turned out to be a good measure to understand the expatriates’ attitude towards the host country, but it is not necessarily a clear measure for cultural distance. In relation to the receiving society it seems furthermore relevant to note that all expatriates are currently living in Copenhagen and only one of them has been living in another part of Denmark before.

So when talking about integration in Denmark, this might be influenced by Copenhagen. Integrating into other parts of Denmark might be different. Hence, further research is encouraged to compare definitions of and experience with integration in Copenhagen and in other parts of
the country. Regarding the background of the interviewed expatriates it seems relevant to point out that all of them were fluent in English and had a rather international background and attitude. Many of them had experience of living in foreign countries and eight of them are living with a partner of a different cultural background. Hence, their attitude towards the contact with a foreign culture as well as making friends with host or third country nationals might be different to expatriates with a less international background. Furthermore, coming back to the characteristics of Denmark as a host, being fluent in English already facilitates to make first contacts with the locals without needing to speak their language. The majority of the Danes have quite good English skills, arriving in a country, however, were English skills are less common might be different and might have an influence on the possibilities of, or obstacles to, integration.

Abstract

K-anonymity provides a model to protect the confidentiality of the individual. It presents the data in such a way that for each single tuple there are k same types of tuples in the released table. In this paper, we calculate the total data loss in a table after applying k-anonymity. A measure is given that can calculate data loss for any value of K. Similarly the probability of threats is also measured after applying K-anonymity. This work also measures the strength of security. These measurements help a Database Administrator or Security Officer to select the value of K for applying K-anonymity based on the security and data loss requirements of an organization. It is proved that K-anonymity is directly proportional to data loss and security, and inversely proportional to probability of threats.

Key words: K-anonymity, Quasi-identifier, Data Loss, Probability of Threats

1. INTRODUCTION

Currently different organizations such as hospitals publish their raw non-aggregated data (also called micro data), for research purpose or a variety of different reasons. However, such data may contain private information as in the case of medical record, where identities of entities should be kept secret. In 1996, TIME/CNN conducted telephone poll in United States in which 88% of the respondents replied that medical information about themselves should not be released without their permission. In a second survey, 87% people said to restrict organizations from giving out medical information without a patient’s permission. People prefer that employees and directly involved people can only have access to their records and organization should be bounded by ethical and legal standards to prohibit further disclosure of their data (Sweeney, 1997).

Currently, the leakage of health information is rigorously regulated in many jurisdictions. Organizations are required to apply privacy protection to health data earlier to their revelation to researchers. For example, the Health Insurance Portability and Accountability Act (HIPAA) in the United States, and the Personal Health Information Protection Act (PHIPA) in Canada, are some of the well known privacy regulations that protect the confidentiality of healthcare information.

In order to protect the data of respondents, data holders often remove or encrypt explicit identifiers such as names, SSN and phone numbers before releasing (Ciriani, Foresti and
De-identifying these attributes, however, provide no warranty of anonymity. Released information often contains other fields, such as birth date, gender, and zip code which can be linked with external information to re-identify the individuals’ private data (Ciriani, Foresti and Samarati, 2007).

L. Sweeney estimated that 87.1% of the US population can be uniquely identified by the combination of their 5-digit zip code, gender and date of birth because such records can be linked to publicly available database such as voter lists and driving records. To prove her point, Sweeney re-identified a series of supposedly anonymous medical records including one belonging to William Weld (Governor of Massachusetts at that time) (Sweeney, 2002)

Consider the medical data given in the table to be published by a hospital.

<td>29</td>
<td>American</td>
</tr>
<tr>
<td>3</td>
<td>Chris</td>
<td>13053</td>
<td>23</td>
<td>American</td>
</tr>
</tbody>
</table>

Table 3: Publicly available table/voter list

For example, Zip Code, Age, Gender and Nationality can be linked to the Voter List in Table 3 to identify the name of a person. Thus it identifies the corresponding tuple as pertaining to “Bob, who is a 29 years old man living in Zip Code 13067 of United State of America and he is a patient of heart disease”.

In order to overcome the possibility of a privacy breach, some researchers tried to de-identify the data by using techniques such as sampling, swapping and adding noise to the data while maintaining an overall statistical property of the result. However, this compromises the integrity or truthfulness of the released data (Adam, and Wortman, 1989), (Samarati, 2001), (Willenborg and DeWaal, 1996)

L. Sweeney proposed a model called K-anonymity to protect the respondents’ identities and release truthful information. She suggests to change the data in such a way that for each tuple
in the released table, there are at least k-1 other tuples with the same value for the quasi-identifier” (Sweeney, 2002). L. Sweeney presented Minimum Generalization Algorithm (MinGen) that uses Generalization and Suppression (Sweeney, 2002). It produces K-anonymity with minimal data loss, but they do not measure the amount of data loss. K. Lefevre, D.J. DeWitt and R. Ramakrishnan proposed Incognito Algorithm (Lefevre, DeWitt and Ramakrishnan, 2005) which provides a model for k-anonymization technique called full-domain generalization. To guarantee the minimality of the anonymization, Incognito uses bottom-up breadth first search on domain generalization hierarchy. The incognito algorithm begins by checking single attribute in Q1, discarding those generalizations that do not satisfy k-anonymity for a single attribute. Then it combines the remaining generalizations in pair, performing the same operation on pair of attributes (iteration 2) and so on until the whole set of attributes is completed. Major drawback of this work is that it returns the set of all possible solutions, and thus it is impractical to check all the information loss to find the optimal one. Xiaoxun Sun, Lili Sun and Hua Wang (Xiaoxun Sun, Hua Wang and Jiuyong, 2008), (Xiaoxun Sun, Lili Sun and Hua Wang, 2010) discuss data loss. They explain that the data loss ratio increases with the quasi-identifier size. When quasi-identifiers contain more attributes, more chances are there that two tuples are different and more chances that tuples will be generalized. This will increase the amount of data loss but they do not measure the data loss associated with the attributes of quasi-identifiers.

1.2 Research Objective:
A lot of research work has been done in k-anonymity and data loss e.g, in (Sweeney, 2002), (Lefevre, DeWitt and Ramakrishnan, 2005), (Xiaoxun Sun, Hua Wang and Jiuyong, 2008), (Xiaoxun Sun, Lili Sun and Hua Wang, 2010), (Zhang and Yang, 2010). But no one has focused on the measurement of data loss in a column and/or table by applying K-anonymity. This research work measures the actual data loss and probability of threats in a table after applying K-anonymity.

2. BASIC DEFINITIONS
This section defines some terms that are used in this paper.

2.1 Quasi-Identifiers:
A set of attributes Q in a private table T that can be joined with external information to re-identify an individual’s record (Dalenius, 1986), (Samarati, 2001). Examples of common quasi identifiers are dates (such as birth, death, admission, discharge and visit dates), location (such as zip codes, region) and gender (Eman, Brown and Abdelmalik, 2008), (El Eman, Jabbours, Sams, Drouet, and Power, 2006)

2.2 Generalization:
It is the replacement of the original value by a semantically consistent but less specific value (Sweeney, 2002).

2.3 Suppression:
Data is suppressed in this technique. Suppression can be at cell or tuple level (Sweeney, 2002).
2.4 Domain Generalization:
Constructing a more general domain from existing domains is called Domain Generalization (Lefevre, DeWitt and Ramakrishnan, 2005). For example, consider a domain of Zip Code 23145 which is generalized into 2314* by ignoring the least significant digit.

2.5 Domain Generalization Relationship:
A domain generalization relationship is defined as \( D_t \preceq DD_j \) to denote that domain \( D_t \) is either identical, or a domain generalization of \( D_j \) (Lefevre, DeWitt and Ramakrishnan, 2005). If there is an edge from \( D_t \) to \( D_j \), \( D_j \) is called the direct generalization of \( D_t \). Domain generalization relationship is transitive, that is,
If \( D_t \preceq DD_j \) and \( D_j \preceq DD_k \), then \( D_t \preceq DD_k \).

2.6 Domain Generalization Hierarchy:
It is defined to be the set of domains that is totally ordered by the domain generalization relationship \( \preceq D \) (Lefevre, DeWitt and Ramakrishnan, 2005). A Domain Generalization Hierarchy can be considered as the nodes in a chain of direct generalizations.
- Edges – direct generalizations
- Paths – implied generalizations

This paper proposes two measures to calculate Data Loss and Probability of Threats after applying generalization and suppression

3. K-ANONYMITY
K-anonymity is a very famous technique for the protection of data. Here we take an example and apply the anonymity technique for different values of K (i.e 2-anonymity, 3-anonymity, 4-anonymity etc)

Consider a hospital’s data given in table 4.

<table>
<thead>
<tr>
<th>Zip Code</th>
<th>Age</th>
<th>Gender</th>
<th>Nationality</th>
<th>Condition</th>
</tr>
</thead>
<tbody>
<tr>
<td>02110</td>
<td>30</td>
<td>M</td>
<td>Pakistan</td>
<td>HIV</td>
</tr>
<tr>
<td>02028</td>
<td>25</td>

<td>F</td>
<td>France</td>
<td>Viral</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
<td>Infection</td>
</tr>
</tbody>
</table>
Table 4: Hospital Data

In the above table, there are four quasi-identifiers, which are Zip Code, Age, Gender and Nationality. By applying generalization hierarchy to each attribute of quasi-identifier we get the following tree:

Levels

Zip Code

< 40 = 40 4 = 50

Gender

< 50 = 50

Nationality
In each variable of quasi-identifier, domain generalization is constructed from existing one. So in Domain Generalization Hierarchies (DGH) edges and paths are made. That is directly and indirectly relationships are constructed from one level to another. Now we can apply generalization hierarchies to achieve K-anonymity. i.e, 2-anonymity, 3-anonymity and 4-anonymity.

**2-Anonymity:** Achieving 2-anonymity using generalization hierarchies on the given data, in table 4 we get

<table>

Table 7

5. MEASURING DATA LOSS AND PROBABILITY OF THREATS ASSOCIATED WITH K-ANONYMITY

Here we measure data loss and probability of threats of each cell of the attribute of quasi-identifier such as Discrete variable, Continuous variable and Categorical variable associated with K-anonymity. Then we will find data Loss and probability of threats at each column level and then table level.

5.1 Data Loss Measure:

The data loss measure is used to calculate how much data is lost after applying K-anonymity? For Data loss measurement different formulas will be used according to the value of quasi-identifier.

5.1.1 Discrete Variables:

Variables that can only take a finite number of values are called discrete variables. To measure Data Loss of discrete variable such as zip code we count the number of missing digit(s) and will divide it by the total number of digits. For example zip code 02110 contains 5 digits. Mathematical form of formula is

$$D_{ij} = \frac{M}{T}$$

Here ‘i’ represents row, ‘j’ represents column. ‘M’ denotes missing digit(s) and ‘T’ denotes total number of digits.

5.1.2 Continuous variables:

Variables that can take an infinite number of possible values are called continuous variables. To calculate Data Loss for continuous variable, such as Age, we use the distance formula.

$$D_{ij} = \frac{|B_i - A_i|}{A_i}$$

$A_i$ is the actual value and $B_i$ is the anonymized value.
5.1.3 Categorical variables:
A variable that has two or more categories is called categorical variable. To measure Data Loss for categorical attribute, for example Nationality and Gender, we consider its level that is, current level and maximum level. Such as

\[ D_{ij} = \frac{C}{G} \]

Here ‘C’ is the current level of generalization and ‘G’ is the Maximum level of generalization.

5.2 Probability of Threats Measure:
The probability of threats measurement is used to calculate the chances an intruder may find to anonymize individuals. In other words, we can say that how much the released data is secured? For this purpose, different formulas are used according to the nature of quasi-identifier.

5.2.1 Discrete Variables:
We use the following formulas to calculate Probability of Threats for discrete variable

\[ P_{ij} = \frac{1}{10} \]  
(if one digit is missing)

\[ P_{ij} = \frac{1}{100} \]  
(if two digit is missing)

While Security is measured with the following formula

\[ S_{ij} = 1 - P_{ij} \]

Here ‘P’ denotes Probability of Threats and ‘S’ denotes Security.

5.2.2 Continuous variables:
To calculate Probability of Threats for a Continuous variable, we use the following formula

\[ P_{ij} = \frac{1}{\text{generalized value}} \]

For example, if we generalized 21 to 40, then its probability of threats will be

\[ P_{ij} = \frac{1}{40} = 0.025 \]

5.2.3 Categorical variables:
To calculate probability of threat for categorical attributes, the formula is

\[ P_{ij} = \frac{1}{\text{No. of leaf node(s) of that generalization}} \]

For example, if we write ‘Pakistan’ as ‘Asia’ (Asia contains 3 child node), then

\[ P_{ij} = \frac{1}{3} = 0.33 \]

6. DATA LOSS AND PROBABILITY OF THREATS AT THE COLUMN AND TABLE LEVEL

Data loss at the column level can be calculated as following

\[ \overline{D} = \frac{1}{n} \sum_{i=1}^{n} D_{ij} \]

Here i = 1, 2, 3… n represent the number of rows in the jth column.
While probability of threats at the column level can be measured as following:
Similarly data loss and probability of threats of 4-anonymity will be

To find Data Loss of the entire table, we use the following formula:

\[ D_T = \frac{1}{m} \sum_{j=1}^{m} D \]

Here \( j = 1, 2, 3 \ldots m \) represent the number of columns.

Similarly to find Probability of Threats of the entire table, we use the following formula:

\[ P_T = \frac{1}{m} \sum_{j=1}^{m} P \]

Similarly the security of the entire table will be:

\[ S_T = 1 - P_T \]

We can apply formulae of data loss and probability of threats for any level of ‘K’ after applying K-anonymity. i.e. 2-anonymity, 3-anonymity and 4-anonymity. We will get different values for data loss and probability of threats for each value of K. First we apply data loss and probability of threats of 2-anonymity associated with Table 5.

\[ D_T = \frac{1}{m} \sum_{j=1}^{m} D \]

\[ D_T = \frac{0.22 + 0.33 + 0.18 + 0.18}{4} \]

\[ D_T = 0.23 \]

While its probability of threats and security will be

\[ P_T = \frac{1}{m} \sum_{j=1}^{m} P \]

\[ P_T = \frac{0.08 + 0.02 + 0.81 + 0.74}{4} \]

\[ P_T = 0.41 \]

\[ S_T = 1 - P_T \]

\[ S_T = 0.59 \]

Data loss and probability of threats of 3-anonymity will be

\[ D_T = 0.38 \]

\[ P_T = 0.27 \]

Similarly data loss and probability of threats of 4-anonymity will be

\[ D_T = 0.50 \]

\[ P_T = 0.21 \]
7. GRAPHICAL REPRESENTATION OF 2, 3 & 4-ANONYMITY

7.1 A graph is generated to plot Data Loss for different values of $K$

![Graphical Representation of Anonymity](image)

The graph shows that $K$-anonymity and Data loss are directly proportional to each other, that is, applying high $k$-anonymity will produce high data loss and vice versa.

7.2 Graph for Probability of Threats and Security

![Graphical Representation of Threats and Security](image)

Above graph shows that $k$-anonymity is inversely proportional to Probability of threats, that is, applying high $k$-anonymity produces low probability of threats and high security and vice versa.

8. COMPARISONS WITH $K$-ANONYMIZATION DATA STREAM BASED ON SLIDING WINDOW (KIDS)

If we compare our work with the ‘KIDS’ by J. Zhang, J. Yang (Zhang and Yang, 2010) they measure data losses for categorical attribute and continuous variable only. For continuous attributes,

$$DataLoss(u) = \frac{Uu - Lu}{U - L}$$
Here $U_l$, $L_l$ denote the Upper and Lower bounds of interval $I_l$ and $U$, $L$ denote the Lower and Upper bounds of $DG$. Consider a tree for age according to diagram of ‘KIDS’

```
1.80
/  \
1.40 40,80
/  \
1.20 20,40
```

As the value of “18” fall into the interval $[1, 20]$, so

$$\text{Data Loss} = \frac{20 - 1}{60 - 1} = 0.32$$

While our taxonomy tree for ‘age’ would like this

```
< =60
/  \
<=40  <=90
/  \
<=20 <=50
```

If we apply k-anonymity (i.e. 2-anonymity) and write $\leq 20$ in place of ‘18’, then our data loss for value of ‘18’ is

$$\text{Data Loss} = \frac{B_t - A_t}{A_t} = 0.11$$

Also ‘KIDS’ calculate data loss for the continuous variable such that value fallen in the same domain will produce same data loss. e.g for ‘16’ and ‘18’ it data loss will same
While every value may different data loss i.e data loss of ‘16’ and ‘18’ are different

9. CONCLUSION AND FUTURE WORK

In this paper, we introduced the concept of data loss and probability of threats for k-anonymity. We proposed different metrics to measure data loss and probability of threats for attributes of different types after applying k-anonymity. We proved that increasing the value of $k$ in k-anonymity, increases data loss and decreases probability of threats and provide high level of security and vice versa. This concept provides a way to measure data loss and security associated with k-anonymity that helps a DBA to anonymize the data as per the data availability and security requirement of an anonymization.

Abstract

One of the renowned agendas’ of the management study around the globe encircles the gender-biasness or non-biasness in performing the basic managerial functions. Pertaining to the factual studies, mixed views have been brought to light that whether male supervisors have a good relationship with male subordinates or female subordinates and whether female supervisors have good relationship with female subordinates or male subordinates. It is often assumed that cross gender supervisor subordinate relationships are better than same gender supervisor subordinate relationships. The involvement of subordinates in the four managerial functions namely planning, organizing, controlling and motivating are investigated to conclude the effects of gender on subordinate involvement in management functions by the supervisors. A sample of 1000 respondents were specifically chosen from banking sector to identify if gender of supervisor and subordinate has any effect on subordinates’ involvement across managerial functions. To achieve this, firstly, mean of male supervisor with same and cross gender subordinates is compared on the basis of their involvement in managerial functions through applying the split analysis. Results revealed that male supervisors involve male subordinates more in managerial functions than female subordinates. As for female supervisors they have the same level of involvement of both the genders across managerial functions but somehow these involvements are more towards the male subordinates.

Keywords: Supervisor, Subordinate, Gender, Managerial functions.

1. Introduction

Gender in an institutionalized system of social practices consists of males and females who are different in socially significant ways and they arrange inequalities in terms of those differences (Ridgeway & Loven, 1999). Also, the gender is one of the most important components in a supervisor-subordinate relationship (Ragins, 1999). The supervisor’s relationship with the subordinate is not only important for the subordinate but for the organization as a whole. It is the most important relationship expressed in an organization.
(Shockley-Zalabak, 1988). The immediate supervisor is the most important person to a subordinate as he/she is the primary source of receiving information (Foehrenback & Goldfarb, 1990). According to Sias (2008) and several other studies, supervisor and subordinates are physical objects and physical characteristics like gender, age and race that have an impact on their relationship.

The gender of subordinates may also influence supervisory ratings. Shockley-Zalabak (1988) found that females subordinates are not thought to be successful than male subordinates by their supervisors as well as by themselves. A few studies showed that supervisors evaluate males more highly than females (Rosen & Jerdee, 1974). Other studies have shown biasness that females get favored in evaluations (Bigoness, 1976). Frank and Drucker(1977) showed no differences in evaluations of males and females. All these studies inform one about the inconsistency in the findings.

More prominence is required to actually explore the involvement of subordinate in management functions by the supervisor in same and cross gender supervisor- subordinate relationships. The fundamental management functions, which are planning, organizing, controlling and motivating involvement was used to determine the gender biasness faced by the subordinate. Various research studies marked that if subordinates are allowed to participate in decision making, it would increase their motivation and satisfaction (Locke & Latham, 1990).

Furthermore, the same and cross gender combinations (male-male, male-female, female-male and female-female) are highlighted and to study, which gender combination has the best relationship (Fix & Sias, 2006). Goh (1991) has the viewpoint that male supervisors prefer male subordinates rather than female subordinates. It has been seen that there are more male supervisor and female subordinates rather than female supervisor and male subordinates. The literature has witnessed the same and cross gender associations. Based on theses This research is based on the findings found in the extant literature. The research questions directing the investigation are:

Do female supervisors involve male subordinates more in the management functions and male supervisors involve female subordinates more in management functions?

Therefore, the propositions tested were:

P1: Male supervisors involve female subordinates more in the managerial functions rather than male subordinates.

P2: Female supervisors involve male subordinates more in the managerial functions rather than female subordinates.

2. Literature review

2.1 Gender

Gender of a person has been conceptualized in two ways: One is the physiological gender and the other is the social gender (Scott, 1986). Physiological gender considers biological sex that is whether an individual is a male or a female as for social gender of a person is the personality characteristic of an individual that is masculine, feminine, or androgynous (Spence, Helmreich, & Stapp, 1975). A few studies have found that social gender that are the personality characteristics like masculine, feminine are more important than the biological gender in predicting the likelihood of having a mentor and the functions of the relationship for both male and female subordinates (Scandura & Ragins, 1993). A person having a high score on
masculinity and low score on femaleness is known to have a masculine gender role and one being low in masculinity and high of femaleness are known as having a feminine gender role. Undifferentiated are those who are low in maleness as well as femaleness. As for a person high on both is an androgynous (Bem, 1974). Behavior should be similar to the gender of the supervisor as it is perceived favorably by the subordinates. If a female starts to behave like a male does so therefore she won’t be evaluated favorably (Gutek, 1988).

2.1.1 Same Gender Relationship

A few studies have shown that the same gender supervisors and subordinates enjoy higher quality relationships as compared to opposite gender (Fix & Sias, 2006; Varma & Stroh, 2001). Tsui and O’Reilly (1989) even found that gender similarity is the best predictor of subordinates’ performance. Pelled (1999) found that subordinates have difficulties in identifying themselves with supervisors of different gender and age. Vecchio and Bullis (2001) studied the supervisor-subordinate relationship within the US Army and found that gender dissimilarity lead to subordinates being dissatisfied. In contrast, Orbell, Dawes and Schwartz-Shea (1994) found that neither male nor females used gender to predict who could be trusted to cooperate.

2.1.1.1 Female- Female relationship

It has been viewed in many researches that females are more likely to prefer working for a man (Liden, 1985). Based on Terborg’s (1977) study, one explanation of female preferences for male managers may be that the male managers have more influence than female managers. Restraints like personnel policies and lack of authority appeared to be restricting female managers which makes them unable to provide support to subordinates. A few researches show that female supervisors mentor females more than males (Ragins & Scandura, 1994) and females subordinates also give preference to female supervisors (Kram, 1985).

2.1.1.2 Male –Male relationship

There are the evidences and numerous investigations in different researches, it has already been revealed that the male supervisors involve rigorously huskier to their male subordinates in comparison of the female staff as Goh(1991) found in his study that male supervisors’ always tend to involve male subordinates to handle the managerial functions.

2.1.2 Cross Gender Relationship

2.1.2.1 Female-Male relationship

In the research conducted by Williams (1999) on effect of gender of supervisor and subordinate on perceived mentoring, it was concluded that female subordinates would receive the least mentoring behavior from female supervisors. As for male subordinates, they receive the greatest mentoring from female supervisor. O’Neill and Blake-Beard (2002) explored that relationship between female supervisor-male subordinate is affected by physiological as well as social gender. The factors affecting the relationship are gender stereotypes regarding females, power perspective that male mentors are more influential and have more power, organizational demographics that there are few women in upper management, relational demography that
people are more drawn towards those similar in demographics, sexual liaisons and gender behavior.

2.1.2.2 Male-Female relationship

An interesting study by Goh (1991) showed that male supervisors provide less supervisory mentoring to female subordinates as compared to males and women are not as assertive as men and they place greater emphasis on their home life. Biasness towards women by male supervisors is really common which has been noted in the literature. If a female performs well on their job so it is taken as good luck or extraordinary effort rather than appreciating their talent, which does affect the supervisor’s future behavior towards the subordinate (Heilman, 1983). As for male it has been observed that male’s success is attributed to his ability specially when being evaluated by a male supervisor (Kaufman & Shikiar, 1985).

Other works showed that female subordinates preferred male supervisors and this preference was situational rather than due to gender difference as they thought of male supervisors to have more influence in an organization. The differences were not based on individual characteristics rather were based on experience and restraints (Liden, 1985; Terborg, 1977). Female subordinates perceive more barriers in acquiring a mentor/supervisor than males as they think that mentor would be unwilling to form a relationship with them and people would misunderstand their relation as being sexual rather than professional (Ragins & Cotton, 1991). According to the research conducted by Varma and Stroh (2001) females have low quality relationship with male supervisor.

2.1.3 Supervisory behavior of male and female

Powell (1990) found in his study that male and females are similar as supervisors. There is no difference in their management style. The supervisory as well as task and people oriented behavior was the same with no gender differences. In another research done by Trempe, Rigny, and Haccoun (1985), it was concluded that even in the blue collar workers, the gender of the supervisor and subordinate is less important to the perception and satisfaction of the subordinate where as upward influence (doing something for the workers) is important to the subordinate’s perception and satisfaction. Neither the interaction nor the stereotyping affected the subordinates.

Found were also the differences between male and female supervisors. Witherspoon (1997) showed key differences between male and female supervisors. Men are more argumentative, give their opinions and don’t share any personal information. They tend to take over decision-making discussions and are critical towards ideas of other people. They follow an autocratic style.

As for females, they believe in nurturing roles, they interrupt for explanation, and more supportive towards other speakers. They also try to avoid conflict by compromising and talking through problem. These qualities are in favor of females as young girls are socialized to be cooperative, understanding, supportive, interpersonally sensitive and flexible, they are more inclined to develop different managerial styles when they grow up and assume leadership positions in organizations. These qualities are more in line with organizations which value information sharing, participative decision making, developing relationships, and resolving conflict in non confrontational ways. Another point of view by Donnell and Hall (1980) regarding men and women managerial work styles is that females don’t share relevant data with colleagues and don’t provide feedback to subordinates. According to Baird and Bradley (1979), female supervisors communicate differently than male supervisors. They provide information to their subordinates; they are more open to ideas, form interpersonal relationships with employees,
encourage effort by subordinates, monitor employees and are more concerned about their morale. As for male supervisors, they show more of a dominant behavior. They are more relationship oriented (Fairhurst, 1993). Another point of view of a research by Maier (1992) is that to be the best supervisor men should learn good qualities of women and vice versa.

There are many researches on mentorship provided by the supervisor to the subordinate in relation with gender but there is no specific research to date that has explored the involvement of subordinate in managerial functions by the supervisor in same and cross gender supervisor-subordinate relationships. Therefore, this study has enlightened to investigate supervisor-subordinate relationship by looking at the involvement of subordinates into the managerial functions i.e. planning, organizing, controlling and motivating by the supervisor.

3. Methodology and Data Collection

The personal survey method was used to collect data where respondent personally visited the respondents to get the questionnaire filled.

3.1 Sampling technique and Sample size

Quota sampling technique was used to ensure that each type of relationship under study must be given equal representation. It was also ensured that respondents are at the similar designation level across categories to avoid any hierarchical effect.

1000 subordinates of banking sector participated in this research out of which 500 were male and 500 were female with the following distribution:
- 250 male subordinates with male supervisor
- 250 male subordinates with female supervisor
- 250 female subordinates with male supervisor
- 250 female subordinates with female supervisor

The reason for selecting banking industry was the availability of female subordinates and female supervisors.

3.2 Instrument of data collection

To test the impact of gender on supervisor-subordinate relationship, the instrument of data collection was established based on involvement of subordinates in the management functions by the supervisor.

A five point Likert item was used in the questionnaire ranging from strongly agree (5) to strongly disagree (1). As for in the reverse statements strongly agree (1) and strongly disagree (5). 5 depicted strong supervisor-subordinate relationship and 1 depicted weak supervisor-subordinate relationship.
3.3 Content Validity:

The various items of the managerial functions of planning, organizing, motivating and controlling were established using various established instruments and the contents were shared with various subject experts from academia and industry.

3.4 Reliability:

The reliability of the instrument was tested by measuring cronbach’s alpha for each item. The overall cronbach’s alpha of the instrument was 0.92. The four same and cross gender supervisor- subordinate relationships were studied namely male supervisor with male subordinate, male supervisor with female subordinate, female supervisor with male subordinate and female supervisor with female subordinate.

4. Econometrical Technique and Research Findings

Keeping in view the propositions, comparison of mean technique was applied through split analysis after transforming the non parametric data into parametric one.

As one can see in Table 1, the findings revealed that male supervisors involve more to male subordinates than the female ones in all planning, organizing, controlling and motivating functions, while female supervisors on the other hand involve somehow also more to male subordinate than the female ones in all stated functions. Thus, the proposition that male supervisor involves female subordinates more in managerial functions than male subordinates failed to be accepted. Similarly, proposition that female supervisors involve male subordinates more in managerial functions than female subordinates failed to be rejected.

Both the findings concluded the same investigations that it is the male subordinates which are preferred to be involved by the supervisors in the managerial functions no matters if they are male or female.

5. Conclusion and Discussion

This test verifies and concludes that male supervisors involve male subordinates more in management functions. Male supervisor’s relationship with male subordinate is much stronger and better than male supervisor’s relationship with female subordinate while female supervisor relations ship with male subordinates is also found somehow better.

The results of this study identified that out of the two gender combinations of supervisor and subordinates that are male supervisors with male and female subordinates and female supervisors with male and female subordinates; male supervisors involve male subordinates more in planning function than female subordinates. Similarly, the male supervisors involve male subordinates also in organizing, controlling and motivating functions more than female subordinates.
The same finding were revealed in case of female supervisors with male subordinates that the female supervisors tend to involve male subordinates more in all management functions than female subordinates.

The findings regarding male supervisors involving male subordinate’s more than female subordinates is in accordance with the study by Goh (1991) in which male supervisors preferred male subordinates rather than female subordinates. The findings for the female supervisors where they involve male subordinates somehow the same way as the male supervisors do, is also in accordance with the research by William (1999) where he concluded that female supervisors/mentor prefer male subordinates much more than female subordinates. Since, there is the preference for male subordinates as revealed by both the male and female supervisors hence, this investigation shows the importance of the gender difference and that it does have an impact on the involvement of subordinates in the managerial functions in the banking field.

Efficiency Studying of Marquitz model based on portfolios of land, currency and stocks

DR. MOHAMMAD HOSSEIN MOSHREF JAVADI
FACULTY OF MANAGEMENT, UNIVERSITY OF ISFAHAN,
MAHMOUD TAHMASEBI KAHYANI
GRADUATE STUDENT OF MANAGEMENT, UNIVERSITY OF ISFAHAN, IRAN

Abstract
There are various choices for investing. One of the main concerns of investors is combining assets in order to obtain the highest return and the lowest risk in which it is expressed in the framework of an investment portfolio in Marquitz theory. The main goal of this study was to investigate the investment in three assets including: Stock, land and currency and then to compare combination, return and real risk of these assets with those extracted by Marquitz model. The results showed that there were significant differences between the real investment, i.e. combination, return and real risk of assets, and Marquites outputs. The results also indicated that Marquites model has the least efficiency in predicting return investment when the market faces with the lack of a logical and correct analysis on the assets by investors.

Keywords: Marquitz theory, efficiency of portfolio, risk and return, investment portfolio.

Introduction
Investment means passing from current resources by the prospect of access to future return which has a risk proportional to the expected return. All investors have wealth that is resulted from offering their services in the working market, money, received loan or savings. Individuals try to improve their future consumption through economizing in today consumption and savings. Investors try to manage their wealth and assets effectively in order to be able to obtain highest return on these investments. They try to get advantage from factors such as inflation, tax and other factors related to decreasing of assets value by protecting them through investment.

The investment term can involve an extensive range of activities. This term may involve investment in deposit certificate, bonds, common stocks or stocks of common funds. Although those who invest professionally apply other assets like certificate of purchasing of documents, certificate of purchasing option and stocks selling with the proportion of their level of risk.
acceptability. These assets along with foreign exchange assets are known as financial assets. In contrast perceptible assets like gold, valuable goods, dwelling or housing and other physical assets are known as non-financial assets.

The investor can choose the type of his investment according to his characteristics such as: proficiency, amount of available information, income and other factors. But one of the most significant factors that investors consider in investing is the amount of risk associated with investment and also amount of their risk acceptability in the investment (Jones, 2008).

The probable asset risk and return is usually different than what has been expected, therefore the higher the variability of return, the higher the risk of investment. Many risks have been recognized in financial literature that each of them has its own special definition. Risk is divided in to two types through a typical classification: systematic and unsystematic. Systematic risk is a risk that is influenced by total conditions of the market, but unsystematic risk is related to conditions of assets' market at a more micro level. The significant point that could be said about investment is the relation that these markets have with each other. They can affect other markets through their variations. This relation occurs not only in one scope but in other scopes and assets as well. For instance, non-financial asset like A can effect on financial asset like B.

Relations of three assets of land, currency and stock are studied in this paper with regards to the framework of Marquitz model and as a unit portfolio. Then the efficiency level of this model in inter-relation among such assets will be tested with regards to their risk and return.

The theoretical framework of Marquitz model will be presented in the next part. Subsequently, the literature review will be studied. Following that, research hypotheses and research methodology are presented. Finally data analysis and results will be explained.

**Theoretical framework**

Investment decisions are placed around two main questions, choosing of assets and allocating of the amount of assets in an investment basket. Now if assets have risk, another issue will be created, that is determining total of bonds with maximum desirability which means to have the highest amount of return with the lowest risk. In 1952 Marquitz presented a primary respond to such questions. The technique that he has presented as called Mean Variance that is according to basic substitution between the risk and the return. He states that an assets portfolio is efficient
when it has the highest return at a specific level of risk. Marquetz and Toubin were the first ones who in addition to return, insert risk as an important factor in investment. they also considered and student method of minimizing risk with regards to return on asset Iin the bigining, this model did not attract too much attraction, but gradually, the financial accepted is seriously. Today after fifty years, so many model have been formed as remodeled based on that. At first this model attracts low attention but gradually the financial society accepts it severely and today many models are built or reconstructed based on it after fifty years.

One of the major factors in Marquitz model is diversity of investment. In fact diversification is a fundamental issue in finance scope. Common logic always state that don’t put of all your eggs in one basket. Marquitz model explains the concept of diversification or non-diversification with the introduction of statistical concept of covariance or quantitative correlation. Substantially many modern discoveries in finance literature originated from the concept of objective diversity and offer new applications for this concept (Philip, 2007).

Another important issue in Marquitz model is this risk. In this framework risk is defined as the probable deviation from the expected return. However, several studies have been performed that show return's standard deviation could not be considered as a precise criterion for risk, unless there exists a logical reason to accept that return distribution is a symmetrical distribution (Falker, 2005). Moreover, there are evidences which state that return distribution function is not symmetrical (Chen, 2008).

Marquitz in his theory, has inserted assets return variance, return of each assets, the weight of them in the portfolio and relationship link between these assets as of mayger variable. Summarized and conceptual diagram of these variables is shown in the following table.

| $W_i$ | weight of each assets in the portfolio |
| $\sigma_i^2$ | variance of return of each assets in the portfolio |
| $E_i$ | return of each assets in the portfolio |

$i= 1, 2, 3,\ldots, n$
Table 1- Variables of Marquitz mod

</tbody>
</table>

Marquitz states return of an assets as the sum of weight average of its assets' return.

$$E_p = \sum_{i=1}^{n} W_i E_i$$

Also, Marquitz uses portfolio variance for the risk of a portfolio. In addition to variance of each assets, he inserts the relationship among them that is summarized as of the following.

$$\delta_p^2 = W_1^2 \delta_1^2 + W_2^2 \delta_2^2 + \ldots + W_n^2 \delta_n^2 + 2W_1W_2 \text{Cov}(1,2)$$

$$\delta_p^2 = W_1^2 \delta_1^2 + W_2^2 \delta_2^2 + W_3^2 \delta_3^2 + \ldots + 2W_1W_n \text{Cov}(1,n) + 2W_2W_n \text{Cov}(2,n)$$

Marquitz has pointed out that the best portfolio is one with maximum return and minimum risk. In fact we can present a linear programming model for it.

$$\text{Max } E_p \quad \text{Min } \delta_p^2$$

Subject to

$$\sum_{i=1}^{n} W_i = 1 \quad \sum_{i=1}^{n} W_i = 1$$

$$0 \leq W_i \leq 1 \quad 0 \leq W_i \leq 1$$
Another step in the process of investment management is evaluating of portfolio's performance. So we can utilize it as a mechanism with self-control for effectiveness of investment management process. Evaluation of performance includes two basic actions, the first step is to determine the desirability of portfolio and the second step is whether such return is resulted from chance or is created as a result of proficiency. The main opinion in comparing of portfolio's performance is the comparison of performance of the portfolio with the return of one or more suitable portfolios. Among the most important criteria related to evaluation of the portfolio's performance we can refer to Jenin, Treiner, Sharp and $M^2$. The purpose of this article is to compare the obtained variables of Marquitz model and its real amount in a portfolio consisting of stocks, land and currency for the period of 1999-2007. The portfolio evaluation model that is used in this article is based on Sharp criterion.

Research Literature

The issue of an efficient portfolio and its experimental performance is one of the basic considerable issues in financial markets discussion. Most investors are familiar with models of assets allocation. Although Marquitz model seems understandable, its implementation, is encountered with complexities. This model states that access to an optimized situation which has maximum return and minimum risk is possible with having of assets return and their fluctuations and correlation among them (Brian, 2008). But how should this model be justified for the investors? Marquitz has introduced expected maximum desirability method in order to recognize optimized portfolio for solving of this problem. Following this topic, this issue has been proposed that whether a precise selection among portfolios would be resulted in expected maximum desirability or not by means of Marquitz model and its implementation (Chen, 2008). Afterwards various studies have been performed about whether Marquitz model is resulted in maximum desirability or not.

Moradoghlu et al, (2005) have studied portfolios' performance and have reached to this conclusion that models which are based on probable prediction of investors have a better performance than those which are based on experimental data and models. Other studies have been done about clarifying of portfolio's efficiency. Branch et al (2009) have combined an active
and multi-purpose algorithm in order to attain a solution for portfolio's optimization. They have performance this study with the purpose of gaining of a convex collection and so they have applied linear programming algorithm and then have merged minor and major responses. Miguel et al. (2009) have performed a study for optimization of portfolio and finding of an optimized portfolio in which their emphasis has been on solving the common minimum variance. But these researches exerted limitations based on which weight of portfolios is lower than a certain threshold. Alexander (2008) has tried to precede market's index by concentrating on active managers in portfolio industry and by using of Roll model with minimizing variance. Chen (2008) has used a multinomial programming model for choosing portfolio that considers interaction between expected return and the value subjected to danger along with the possibility of interfering investors' preferences. Results of it show that solving of problems the traditional model is possible.

Buhm and Venzelber Gerd (2005) have studied performance of efficient portfolios in finance markets with heterogeneous investors including logical merchants, noisy merchants and chartists other and results reveal that logical investors preferred based on CAPM model.

Hypotheses of research

Hypothesis 1: assets weight of land, currency and stocks in real investment portfolio is equal with amount of it in Marquitz model.

Hypothesis 2: total assets collection return of investment portfolio of real stocks, currency and land is equal with the amount of it in Marquitz model.

Hypothesis 3: in case of choosing a portfolio based on Marquitz model, lower risk will be obtained.

Hypothesis 4: Marquitz model based on assets of land, currency and stocks during 1998-2006 is efficient in Iran.

Hypothesis 5: passing of time affects portfolio's efficiency.
**Methodology of research**

Obtaining passive amounts in hypotheses is necessary for testing them. These amounts are obtained through collected data and also through Marquitz model. Passive variables are of the following as that group A is obtained through Marquitz model and group B is obtained through real data.

Table 2- Required variables of the problem

<table>

</tbody>
</table>
The above information and variables have been obtained through the existing data based on which these variables are extracted. Statistical information about these variables is given in appendix 1. Now, we form Marquitz model by this data to reach necessary results and then extract existing variables that are given in table 2.

As it has been described in the theoretical framework, Marquitz model for constructing investment portfolio and for the purpose of decreasing or minimizing risk, is defined as the following:

$$\delta^2 = W_A^2 \delta_A^2 + W_B^2 \delta_B^2 + W_C^2 \delta_C^2 + 2W_AW_B \text{Cov}(A,B) + 2W_AW_C \text{Cov}(A,C) + 2W_BW_C \text{Cov}(B,C)$$

Now obtained variables from table 3 are inserted in the model, just $\delta_i$ are inserted to achieve $W_i$.

$$\delta^2 = W_A^2 (0.197^2) + W_B^2 (0134 + W_C^2 /0813 + 2W_AW_B (0.0301 + 2W_AW_C (0.0248 + 2W_BW_C (0.007))$$

Data variance in $\delta^2$ which means the risk should be minimized and to do this we should minimize the whole model. It is necessary to apply quantitative models and so we use linear programming. This model is represented below.

$$\min S^2 P = 0 / 197W_A^2 + / 0134W_B^2 + / 0813W_C^2 + / 0602W_AW_B + / 0496W_AW_C - / 0144W_BW_C$$

S.T

$W_A + W_B + W_C = 1$

$0 \leq W_A, W_B, W_C \leq 1$

The model’s response is as of the following through the program.

Table 4- Weight of assets based on Marquitz model

<p>| | |</p>
<table>
<thead>
<tr>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>$\min S^2 P$</td>
<td>0/06</td>
</tr>
<tr>
<td>$W_A$</td>
<td>29%</td>
</tr>
<tr>
<td>$W_B$</td>
<td>0</td>
</tr>
<tr>
<td>$W_C$</td>
<td>71%</td>
</tr>
</tbody>
</table>

Now we can test the first hypothesis. The obtained result indicated that weight of assets based on Marquitz model is different from weight of assets based on real investment according to the obtained data. As it is observed none of the weights are equal with each other and all of them are different from each other. In fact the first hypothesis that test weights of investment in two models is generally rejected.
We should gain investment return based on Marquitz model and real return of this portfolio in order to evaluate the second hypothesis. The portfolio return in Marquitz model is obtained from weight average of assets return.

$$E_p = \sum W_i E_i$$

The return is as the following according to Marquitz model:

$$E_p = \sum W_i E_i = (29\% \times 0/43) + (0\% \times 0/58) + (71\% \times 0/01) = 0/318$$

The real return is obtained as of the following:

$$E_p = \sum W_i E_i = (37\% \times 0/43) + (58\% \times 0/20) + (0/5\% + 0/01) = 0/2756$$

Now we can evaluate the second hypothesis too and the result is that return of total assets based on Marquitz model is different from the obtained weight according to this model and real amount of these assets. As it is observed return in Marquitz model is equal to 0.31 percent and in the real model it is equal to 0.27. In fact the second hypothesis is rejected too.

$$E_p : 0/31 \neq 0/27$$

In order to test the third hypothesis we should obtain the amount of risk formed Marquitz model and then compare it with the obtained risk. Based on Marquetz model:

$$S_p^2 = (0/37)^2 (0/43)^2 + (0/58)^2 (0/01)^2 + 2(37\%)(0/58)(0/0301) + 2(0/37)(0/05)(0/0248) + 2(0/58)(0/05)(-0/007)$$

$$S_p^2 = 0/052$$

We can compare this number with the obtained number from Marquitz model based on minimization and analyze the third hypothesis. In fact these two amounts are equal to some extent. It means that we can confirm the third hypothesis optimistically.

We can represent a table like the following in order to reach to the result of the fourth hypothesis and compare amount of obtained variables from both portfolios with each other.
Table 5- Comparing of amounts of variables

<table>
<thead>
<tr>
<th>Variable</th>
<th>Marquitz model</th>
<th>Real amount</th>
<th>equality</th>
<th>inequality</th>
</tr>
</thead>
<tbody>
<tr>
<td>$\delta_p^2$</td>
<td>0/06</td>
<td>0/052</td>
<td></td>
<td></td>
</tr>
<tr>
<td>$E_p$</td>
<td>0/1318</td>
<td>0/2756</td>
<td></td>
<td></td>
</tr>
<tr>
<td>$W_A$</td>
<td>29%</td>
<td>37%</td>
<td></td>
<td></td>
</tr>
<tr>
<td>$W_B$</td>
<td>0</td>
<td>58%</td>
<td></td>
<td></td>
</tr>
<tr>
<td>$W_C$</td>
<td>71%</td>
<td>0/5%</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

It is necessary to calculate performances of two portfolios for confirming or rejecting the hypothesis and then compare the amount of performance of the portfolio based on Marquitz model and the real portfolio of market. To do this we can use performance criterion of portfolio which has been presented by Sharp. This criterion shows a combination of performance of portfolio which is called ratio of reward to variability (RVAR) that is shown in the following.

$$RVAR = \frac{E_p - E_F}{\delta_p}$$

$E_p$ = return of portfolio

$E_F$ = mean return without risk

$\delta_p$ = risk of the portfolio

$E_F$ is obtained from the annual return mean in the time period of 1998-2006. RVAR for two portfolios is as the following.

$$RVAR_1 = \frac{0/1318 - 0/13277}{0/2449} = -0/00396$$

Reward to variability based on Marquitz model

As it is obtained the real amount of RVAR is higher than Marquitz model. By considering the obtained amount we can conclude that Marquitz model is not efficient with required to the above data and the time period.

For testing the fifth hypothesis and the effect of time on the model, data is divided into three periods of 1998-2000, 2001-2003 and 2004-2007 and efficiency of Marquitz model is evaluated separately in these three periods. These results for the three time periods are illustrated in the table below.

</tr>
</tbody>
</table>
The above data reveals that efficiency of the portfolio based on Marquitz model is decreasing by passing of time. It has been increased in the third period intensively with regards to the second period, while its amount has been lower between the first and second period. In fact passing of time has resulted in increasing of inefficiency of Marquitz model to a high extent.

**Discussion and conclusions**

This article has studied the amount of efficiency of Marquitz model in Iran's market during period of 1998-2006. Its purpose was to examine whether it was possible to obtain a better performance by relying upon a theoretical model in the real market of Iran with three assets of land, currency and stocks. Five hypotheses were tested in this study that four of them were rejected and it showed inefficiency of Marquitz model in this time period. The fifth hypothesis has been confirmed, it showed that effect of time is resulted in more inefficiency of Marquitz model. One of the reasons of such inefficiency of Marquetz model could be attributed to the investment in Iran's market, which is not a suitable process as the investors make decisions by chance and based on their individual experiences. We may consider this difference of return as a result of chance.

This study has been faced with limitations including nonseparation of professional investors who are familiar with Marquitz model and unfamiliar with it. This could be a research topic about whether the amount of efficiency's difference of this model is existed among individuals or not.

Abstract

This paper addresses the concept of institutional care for children tracing its earliest forms from “Egyptian temples” to “Xenodochia” of Greece to the present form of formal care provided in the light of the International Conventions regarding children rights. Provisions of Care by establishing formal Institutions is one of the most important service which has been granted in the conventions for those children who have lost their primary caregivers. Institutional Care for the children aims to reduce the vulnerability of children to different risks, abuses and exploitation. It also provides shelter, food, education, recreation and other welfare services. However, the findings of different researches identify the implications of the institutionalization on children. It was a desk-based exercise; researchers have made an effort to take on a systematic overview and analysis of existing literature. The secondary data was collected from libraries, government & Non-Governmental organizations, civil society organizations, internet and other available sources. However the findings of different researches identify the implications of the institutionalization on children and the discussion made in the article concludes with these sociological implications. It also invites the researchers to make scientific investigation about the effects of residential care services being provided in the country.

Keywords: INSTITUTIONAL CARE ; CHILDREN

INTRODUCTION:

The concept of institutional care in not new. Historical record presents its presence. Initially they were established in Egyptian temples. However, “Xenodochia”, were the first homes established in Greece and later on this tradition was practiced in the middle Ages. Varazdin which is a city of Croatia has a long tradition of hospices or Xenodochia as institutions for accommodation and care of disabled, poor and elderly citizens, and occasional travelers. Preserved documents also show that these institutions existed till 1454 (Piasek).

During the period of the industrial revolution, "institutionalization" was introduced in many countries of Europe for the care of disabled, poor and aged. An expansion and development of
the role of government were observed for the establishment of institutions, which was seen as a private domain previously.

In traditional societies, as well as pre-industrial Europe, joint families existed predominantly. In the joint family set up protection is provided to all members and more to children at familial level. The family provides them the material and emotional security, education and vocational training.

The approaches and ways to safeguard children exercised in the old order have ceased to be effective now. The modern ways of life have given rise to a series of problems in relation to children particularly the orphans, the physically and mentally handicapped, the destitute who were formally cared for in the family. It has created new avenues of caring of children. It is estimated that about 1.5 million children in the Central Eastern Europe and Commonwealth of Independent States (former USSR) live in public care. In Europe and Central Asia, over one million children live in residential institutions. In 93 countries of sub-Saharan Africa, Asia, and Latin America and the Caribbean, the number of orphans (children aged 0–17 who have lost one or both parents) was estimated to be 143 million at the end of 2003; of those children 15 million were orphaned by AIDS, more than 12 million of them in sub-Saharan Africa. Asia has the highest number of orphans. They had different causes of illness, with 87.6 million children (Children without Parental Care, 2006).

In Pakistan, institutions are existing in public as well as private sector. They are functioning as orphanages and children homes. Adoptions and informal foster care are not common but are other forms of care are practiced in the society (Children without Parental Care, 2006).

THE CONCEPT & DEFINITION OF INSTITUTIONAL CARE FOR CHILDREN.

In general sense the word “care” is referred as an object of concern or the provisions of what is necessary for the health, welfare, maintenance, and protection of someone who needs it. While the institution is society or organization founded for a religious, educational, social, or similar purpose. It is also referred as a place where residential care services for people with special needs- destitute, disabled, or mentally ill. The term child care includes all types of education and care services provided to young children by public or private sector organizations.

The term children without primary care is generally defined as “those who are deprived temporarily or permanently of their first source of protection” (UNICEF). “Generally the children without primary care are kept in any child-welfare facility which either primarily or incidentally provides full-time room, board and watchful oversight to six or more children through 18 years of age outside of their own homes” (Regulatory Services). The concept explained as “a child care institution”, an establishment which provides care & accommodation wholly or mainly to children. The definition is applicable to private voluntary and governmental children’s institutions including Madarsas (religious institutions) and some specialist establishments for children requiring therapeutic support or for disabled children (Rehman & Arshad, 2009).
INTERNATIONAL & NATIONAL LEGAL FRAMEWORK REGARDING INSTITUTIONAL CARE OF CHILDREN:
Every child has the right to be looked after and protected by his or her parents or family. A child who has lost his family or separated from his or her family due to some reasons, or whose family can cause serious danger to his or her health or development. He/she gets the right of alternative care. The children without parental care are vulnerable and at a higher risk of discrimination, inadequate care, violence, abuse and exploitation.

The United Nations Convention on the Rights of the Child often referred to as CRC, determines the civil, political, economic, social and cultural rights of children. Article 20(2) of the CRC accord the right to “alternative care to those children who are temporarily or permanently deprived of their family environment, as well as in their own interests, for other reasons, cannot be allowed to remain in that environment, State parties are required to ensure alternative care for such children in accordance with their national laws. Article 20(3) of the CRC provides that alternative care could include, inter alia, foster placement, Kafala of Islamic law, adoption, or if necessary placement in suitable institutions established for the care of children.

The 1986 UN Declaration on Social and Legal Principles relating to the Protection and Welfare of Children contains provisions for institutional care and also reinforces the CRC. In cases where a child is unable to be cared for by his or her parents or legal guardians based on national laws and procedures, alternative care in a family environment must be provided by the State (Dacanay, 2006).

However, article 3 of the International Convention on the Rights of the Child (CRC) guides that the Institutions providing caring services are responsible to ensure the safety and protection of children residing in the institutions through adoption and practice of the standards established by competent authorities, particularly in the areas of safety, health, the number and suitability of staff, and competent supervision (CRC, 1989).

CHILD CARE SERVICES IN PAKISTAN:
In Pakistan, approximately 30 percent of population lives below the poverty line where basic needs, especially those of children, remain unfulfilled. Government institutions working to safeguard the rights of children like many other government institutions lack adequate funding and other deficiencies for delivery of services.

In Pakistan, the parents take the responsibility of caring of their children. Extended and joint families are still in existence although their role is diminishing. The trend in the urban areas, however, is promoting the nuclear family. In this way, parents remain as the only caregivers. “The joint family system with the change that overtook with progressive inroads into the economy of self sufficiency in rural areas and with the divergence into cellular units in urban areas has increasingly failed in giving adequate material and emotional protection to the child. The old order has changed the social institutions and individual logged behavior”. (Rehman & Arshad, 2009)
However, in families where children live with one or both of their parents and they are unable to provide the necessary parenting or protection to their children, the child care role may also be taken on by the joint family. This helps the child to remain attached with his/her family, peers and neighborhood which is necessary for his/her psycho-social and emotional development.

Children in Pakistan face a variety of serious challenges ranging from malnutrition, poor access to education, health facilities and exploitation in the form of child labor. They become victim of violence at home; school as well as they also faces sexual exploitation (Overview, 2004). Besides this, there are some other factors behind their vulnerability. Lack of parenting skills, neglecting attitudes, illegitimate births, trafficking and poverty are among the significant factors underlying the admission of children to institutions.

According to UNICEF report, Children without parental care find themselves at a higher risk of discrimination, inadequate care, abuse and exploitation, and their well-being is often insufficiently monitored. Many children are placed unnecessarily and for too long in institutions, where they receive less of the stimulation and individual attention needed to grow their full potentials. Inadequate caring environments can impair children’s emotional and social development and leave them vulnerable to exploitation, sexual abuse and physical violence (Children without Parental Care, 2006).

A research study by Save the Children, UNICEF and Government of the North West Frontier Province in three districts of NWFP found that corporal punishment is widely used to discipline children in homes and educational institutions. According to the findings, an overwhelming majority was the victim of corporal punishment which includes hitting with an object (shoe, brick, iron rod, knife, etc), smacking, kicking, punching, hair-pulling and ear-twisting. (Disciplining the Child: Practices & Impacts, 2005)

Frequent natural disasters and internal displacements due to terrorist activities in different parts of the country generally and tribal areas adjoining to Afghanistan as well as province of Khayber Pakhtun Khawa (NWFP) are presenting an awful situation faced by the children. Moreover, in 2005 & 2008, devastating earthquakes and the history’s worst flooding in 2010 have added in the difficulties for children. The after-effects of a disaster can disrupt the lives of children leaving them disabled, orphans and destitute.

To deal with the challenging issues of children, several interventions have been made to ensure the survival & development of children and provide them a protective environment. National Commission for Child Welfare (NCCWD), its provincial & district level chapters, child welfare cells in Social Welfare, Police & Prison Departments and the establishment of Child Protection & Welfare Bureau (CPWB) are the governmental efforts to protect children from harmful elements of society. Social Welfare Departments at provincial level are amongst those focussing on children. These departments are providing caring services to the children by establishing and administering Child Care Institutions throughout the Pakistan.

In Pakistan, the services for children without care include children homes:

Table No.1 shows that the institutional care services for children are mainly targeting those which are without care. They are babies, destitute, poor and needy girls, mentally and physically disabled children.

Besides residential services in both public & private social welfare sector. Another major formal residential care system also exists in Pakistan. Which is administered by one of the most significant, influential and prominent faction of the society. These institutions provide services in religious schools (Madarsas). Though the initiatives have been taken by the government of Pakistan to provide institutional care to the children without care even then the families in both urban and rural areas trust the Madarsas more for education, shelter and training. There are an approximate 28,000 Madarsas in Pakistan with only 8,000 of them registered (Chandran, 2003). According to the Human Rights Commission of Pakistan (HRCP) 2002 report, by March 2002, there were around 600,000 students in 6,000 registered Madarsas with more than 250,000 students in Punjab alone (State of Human Rights, 2002).
SPARC (Society for Protection of the Rights of the Child) in its report states that an amount of $225 million has been earmarked to modernize 8,000 madrassas over three years. The modernization program as hoped could also help spread consciousness about AIDS. Yet, the same report says 14 per cent of all child-abusers in 2007 were clerics. SPARC activists cite two specific cases to illustrate sexual abuse of children and their brutality in religious seminaries (SPARC, 2008).

A recent development regarding child protection has taken place by the Government of the Punjab-Pakistan by establishing Child Protection & Welfare Bureau. It provides its services as an autonomous body established in accordance to the Punjab Destitute & Neglected Children's Act 2004. The Bureau has been established to rehabilitate special and deprived children and those engaged in begging. Under the authority and supervision, several Child Protection Institutions have been established for the temporary and long term institutional care of destitute and neglected children in different parts of the province. These Child Protection institutions are contrary to the traditional concept of orphanages and welfare homes, children at these Child Protection Institutions are provided with high quality residential, educational, vocational and recreational facilities.

Several initiatives have also been taken by Non-Profit, Non-Government sector of Pakistan. A large number of child care institutions as orphanages are functioning in the country.

The earlier given situations and statistics show that a large number of children are residing in institutions whether administered by governmental or non-governmental organizations. Usually children are kept in these institutions. They are provided protection from different threats, dangers and risk and to reduce their vulnerability to different types of abuses, exploitation and maltreatment. A large number of child care institutions are already working in the country and
there is likelihood of further increase. However, the phenomenon has been seen with a different view globally.

**IMPACTS OF INSTITUTIONAL CARE ON CHILDREN**

The scholars and researcher have made their efforts to identify the impacts of institutionalization on children. The findings of some of them are presented below:

- Early studies documented the adverse effects that long-term institutional care had on young children’s emotional, social, and cognitive development (Goldfarb, 1945).

- In another study, it was pointed out that “In the long term, institutionalization in early childhood increases the likelihood that impoverished children will grow into psychiatrically impaired and economically unproductive adults.” (Frank, Klass, Earls, and Eisenberg)

- A research on the impacts of institutionalization reported that “The children we interviewed did not like living in institutions, and their comments included criticism of institutions for the absence of some essential qualities of parental care. The children clearly preferred other forms of surrogate care, which scored considerably higher on those prized qualities. Their comments indicate a wide gap between the blueprint for institutions found in professional writing and the reality of institutions as the children perceived it.” (Bush, 1980)

- The Child Health and Illness Profile- Adolescent Edition (CHIP-AE), a new standardized instrument, was administered to 63 adolescents living in group homes or institutions in Illinois. The CHIP-AE measured overall health and self-concept, emotional health and disorders, and achievements of social expectations in education and/or employment. Key findings of the study show that youth living in group homes or institutions take more risks, have more threats to achievements, and have poorer peer influences. It was also noted that it is crucial to help these youth to connect with an adult who can provide needed support and guidance. It is disturbing to think that the environments in which these youth live are not providing them with such adult guidance (Altshuler, & Poertner, 2002).

- In 1998, the impacts of institutionalization were assessed. The researchers studied 79 boys aged 12-17 years with histories of previous out-of home placement and serious and chronic delinquency. Study findings show that “Boys ran away less frequently from MTFC (Multidimensional Treatment Foster Care) than from group care, completed their programs more often, and were locked up in detention or training schools less frequently. MTFC boys had fewer criminal referrals than boys in group care from the time they were placed through the year after discharge from the programs (Chamberlain & Reid, 1998).

- The research undertaken by California’s Foster Care Information System, University of California, Berkeley in which up to 52,613 children under age six shows that “Compared with a primary placement in foster homes, group care for young children results in less stability, lower rates of adoption, and a greater likelihood of remaining in care.” “Given that placement into group care costs much more, provides less stability of care giving, and does not increase the likelihood of adoption, very young children should not be placed in group care(Berrick, Barth, Needell & Jonson, 1997).”

- Another research study in which comparison of 12 children’s homes to 12 specialized foster homes was made reported that “Residential caregivers were found to make far
greater use of inappropriate and ineffective techniques of control than special foster parents.” The study further highlighted that “The children’s homes were generally found to be markedly less child oriented than the special foster homes.” The results of the research confirmed that the role of residential caregivers involves a heavy emphasis on control and supervision; they further suggest that a greater degree of familiarity, reciprocity and social closeness characterized relations between special foster parents and foster children than existed between residential caregivers and the youngsters they looked after (Colton, 1992).

- Findings of a research study conducted by Health Promotion and Therapeutic Communities revealed that 83 percent of youths detained in juvenile jails of Pakistan are involved in different drugs (Khan, 2007).

DE-INSTITUTIONALIZATION

In the developed countries, the concept of “De-Institutionalization” and its importance has been realized. Due to this realization, different other options of alternative care have been introduced. Community Care, Foster Care and care by any other relative (Kinship Care) are such alternatives practiced in USA, Canada, Europe and Australia. However, in Pakistan, like several under-developed countries, social welfare services are rendered with a residual approach which focuses on underprivileged and indigent segments of the society.

DISCUSSION:
The concept of institutional care in not new. Historical record shows that the concept of institutionalization existed in the ancient Egyptian and Greek societies. The Egyptian temples, Xenodochia and tradition of hospices (institutions for accommodation and care of destitute and disabled, elderly citizens and occasional travelers) are examples of such institutions. During the period of the industrial revolution. Institutionalization was introduced and widely accepted in many countries of Europe.

As a result of the social changes in the society where the emotional ties between the family members have weakened, the residential care is considered the key response to give assistance to the children deprived of primary care. These institutions are providing material help such as food, better medical care and clothing as well as emotional and psychological support to the institutionalized children.

In present era, socially conscious peoples, communities, groups with the help of philanthropists and religious organizations initiated the concept of child care institutions. They strive to meet the needs of those children and to lessen their sufferings. Mostly, the institutional care is provided to the children who are deprived of their primary caregivers due to the death of their parents. The children whose parents are not alive are usually kept in orphanages and model children homes. With a little divergence, the concept of institutional care exists almost in all the societies of present era.
In Pakistan, a large number of institutions have been established without trained staff and scientific approach which include orphanages, madarsas and vocational training centers. They are springing up to take care of children deprived of parental care. The majority of the researchers which have made situational analysis of the phenomenon of residential care discovered that that the institutionalizations, if used unnecessarily, without proper planning and in the absence of skilled professionals, trained in case management makes severe psycho-social and emotional impacts on children.

CONCLUSION:
Before the independence in 1947, Pakistan was a part of the British colonial rule which was established in the 19th century. The British government introduced a system of governance in the subcontinent as delivery of services- education, health, sanitation and social welfare which was alien to the local people and society. The concept of formal Institutional Care for the underprivileged, needy, poor, destitute and deprived segments of society was also promoted by the British. This approach is still practiced in Pakistan.

The manifestation of the violations of protection rights is quite visible in Pakistan. The awful situation faced by the children which needs to be assessed by making interaction with those children living without primary caregivers, trafficked, exploited physically, sexually, emotionally, socially, and subjected to violence ranging from corporal punishment to sexual abuse and involved in various forms of child labor.

Although, institutionalization is seen as an important part of process of modernization in developing countries, involving again the expansion and improved organization of government structures (Institution). Ignoring its negative affects, child care institutionalization is frequently increasing in Pakistan, conveying their acceptance and recognition by the society. The researchers and child rights experts point out that prolonged Institutionalization, without rehabilitation plan have severe affects the children placed in institutions.

RECOMMENDATIONS:
Keeping in view the impacts of institutionalization on children, the following recommendations are made:

1. “Deinstitutionalization” of children which involves a long transitional process as the children are prepared to rejoin the society to play their social role. The authorities and stakeholders need to focus on the following strategies:
   a. The prevention of institutionalization. Other alternatives like foster care, community care and care by some other family members may be practiced.
   b. The prevention of unnecessary, prolonged and unplanned stay of children in those institutions which lack adequate and proper care facilities.
   c. The deinstitutionalization of those who are currently residing in the institutions or at risk to be institutionalized.
d. The identification of alternative care services by undertaking researches on the effects of institutional care

e. The creation of community-based services.

2. The concept of Case Management is needed to be introduced and made part of the curriculum. Guidelines for Case Management in Child Protection may be developed by the academicians, professional social workers and researchers in association with other experts who are working in this field.

3. Collaborative efforts of different public and private as well as corporate sectors are needed for the development and maintenance of Minimum Standards of Care which ensure the protection of children form the impacts of institutionalization.

4. Capacity building of the professionals and staff of Child Care Institutions is required which will enable them to make proper assessments, problem identification, planning and to manage the cases according to the principles of case management.

5. The relevant qualification, specialization, expertise may be included in the eligibility criteria while recruiting staff for the care institutions.

6. Considering the importance and acceptance of religious institutions by the community to a large scale, it is a matter of serious concern which needs to be addressed amicably for mainstreaming the students of these institutions.

Abstract  
Purpose of this paper is to explore the puzzles, paradoxes and limitation of civil society as a development agent in developing countries especially in Pakistani and Indian contexts. The concept of civil society is not new. In past many thinkers and philosophers focused their attention to refine the idea of civil society in comparison to the state and the market. Hegel, Ferguson and Fukuyama (Hall, 1995) were the champions of the idea of the civil society as a development agent and brought this idea in the limelight in the last two decades when the state failed to provide development assistance to the poorer of the poor in third world countries.  
Keywords: Exploring; Puzzles; Paradoxes; Limitations; Development Agent; Countries

Introduction  
In the beginning of the 21st century, we are very familiar with the idea of civil society as the home of culture, freedom, development, and the independence. The concept of civil society is not new. As the historical background to the development of civil societies shows that many philosophers and thinkers have tried and contributed to define and develop the idea of civil society with the comparison to the state and the market such as Hegel, Ferguson and Fukuyama (Hall, 1995). However, the definition and scope of civil society is still debated among different schools of thoughts. The role of civil society as a development agent came in the limelight in the last two decades when the state failed to provide development assistance to the poorer of the poor in third world countries.  
In this paper firstly, the concept of civil society will be discussed. This section will include the debate about the development and civil society and will also examine the emergence of civil society as a development agent in the last two decades. The final section will focus and discusses the limitations civil society organizations are facing in the field of development.

What is Civil Society?  
The term civil society is much debated and often defined frequently in contradictory ways. Without an answer to the above question it is difficult to recognize the civil society and without having a blueprint it will be hard to create a vibrant civil society. The idea of civil society has emerged in contrast to other organizational structures; state and market (Francis, 2002). However, the rise of civil society has been an evolutionary and gradual process.
Civil society as third sector is very important because it offers an alternative between state and market (Howell and Pearce, 2001). Many philosophers and thinkers have responded to the above question. There are many definitions of civil society but two of them are more quoted of all time famous authors; Marx and Walzer.

According to Marx:

“Civil Society is space, an arena, a sphere in which citizens associate with each other, independently with the state, creating a network of links and organizations to promote their collective identities and serve and represent their group interests” (Hall, 1995)

Walzer said:

“The words ‘civil society’ name the space of uncoerced human association and also the set of relational networks formed for the sake of family, faith, interest and ideology” (Walzer:1995)

It seems very clear that there is a sharp distinction between the state and the civil society. Civil society is taken as an arena where various activities take place which do not happen in the market and the state. According to Walzer, Civil society is a particular form of society. The voluntary, non-state, and non-market organizations are most natural form of civil society such as communities, friendship network, professional organizations and movements (Alexander, 1998).

According to the debate on civil society, there are three basic prerequisites for good civil society:

- Existence of rule-of-law
- Existence of strong organized non-state organizations
- Existence of balanced pluralism among civil society

And above all, there is a strong need to have enough social capital to keep the civil societies intact. The social capital or social glue holds groups and societies together and enables them to get things done. The social capital is the strength of family responsibilities, community volunteerism, selflessness, public or civic spirit and the moral element which underlies the civil society debate (Francis, 2002).

In short, civil society in a descriptive sense is a concept and in a prescriptive sense it is a theory and a model. The question is that can it serve as a model for development and social change?

It seems reasonable to suggest an affirmative answer to this question as civil society organizations potentially fulfill the following functional roles to achieve their political, social and developmental goals:

**Intellectual:** Adopt proactive approaches rather than reactive approaches to protect and promote their cause. They act as change agent and agenda setter.

**Advocacy:** Civil society groups help to bring the issues (such as; public health, women rights, child labour, education and so on) to the public and try to change the opinion.
Problem Solving: A variety of professional organizations as well as other community and advocacy groups work with different public and private organizations and provide technical support to those who are in need.

Service Provision: Many NGOs, CBOs, including religious and social service groups, provide direct services to the poor and needy. They have diversified activities from capacity building programmes to food distribution and from garbage collection to water & sanitation programmes.

Critics & watchdog: NGOs, journalists, and others can serve to monitor the activities of the both state and market.

Financial Support: Many philanthropic foundations provide funds to different organizations and independent think tanks.

Civil Society as a Development Agent:

In the early 1950’s, there was a limited role for market forces in the development arena and there was a central role of the state to deliver the goods. Through blue print approach many big infrastructure projects were introduced and executed in third world countries. Execution of the projects was almost in top-down fashion and the role of market and civil society was not very much significant. However, the concept of civil society as development and change agent was there and in many third world countries this function was carried out by socialist movements (Deakin, 2001). By the 1970s, the development states failed to bring prosperity and economic growth in poor and developing countries while the communist welfare states were un-successful to sustain themselves. The idea of a big push and structural change had also failed and the benefits were not reaching the poor. The developmental role of the third-world states was challenged from all sides in the 1980s and the state was seen as the part of the problem, not part of the solution. In many third-world countries, state was criticized on many grounds and the third world was characterized by lack of accountability, militarism, authoritarianism, corruption, wasteful investment and expenditure, distorting market forces etc (Howell and Pearce, 2001)

In the late twentieth century many third-world countries were ruled by military dictatorships. Antiauthoritarian civil society movements could be seen all over the world. However, the collapse of socialism across the Soviet Union and Eastern Europe closed the chapter of controlled economy and hegemony of the state. Therefore, the focus shifted from state to market and civil society organizations. For instance in the mid of 1980s, Bangladesh was ruled by General Irshad. Many antiauthoritarian movements felt that civil society could express their aspirations for freedom as citizens. They started to raise their voices for representation and minimizing the social and economic inequalities created by the state and the market (Karim, 1995). After a successful struggle, now Bangladesh has a vibrant civil society which is providing basic needs to poor people of the country. The story was same in different other poor countries but the results were different such as

The need emerged to revisit the relationship among state, market and civil society to provide development assistance and protect the people’s rights. The concept of civil society got more popularity and become more important as a development agent in the last two decades of the 20th century. Many developmental organizations, international donor agencies and development practitioners started to use this term more frequently in their work.
After the failure of top-down approach, donors started out with two implicit assumptions, that democracy contributes positively towards development and civil society is an important democratic check on the state (Howell and Pearce, 2001). Donors started to use their funds through civil society organizations. Non-government organizations (NGOs) and other civil society organizations (CSOs) came in the picture as active player to provide development assistance in third world countries.

Stiglitz (2000), emphasized the crucial role for state, market and the civil society and he also highlighted the poor governance, lack of accountability and corruption in third-world countries. In theory and practice, civil society does not allow the state and market to act exploitatively, abusively and to take socially irresponsible action against people (Alexander, 1998). Nowadays, civil society is extensively working in different fields of life from advocacy to service delivery. Civil society organizations’ role has emerged as a watchdog on both the state and the market. Civil societies protect the public interest from the market domination. Civil society organizations (CSOs) are raising their voices against the poor quality and over priced product and services and they are also trying to alleviate the socioeconomic inequalities created by the market.

The concept of corporate social responsibility (CSR) also emerged during this struggle. Now many multinational companies are working with the state and civil society organizations to provide public goods. However, this partnership has raised many questions regarding the relationship among state, market and civil society.

Many civil society groups emerged in the last two decades to address the need of the poor, vulnerable, and marginalized and they developed community based response to social problems. From animal rights to environmental degradation, all issues are taken up and properly responded by civil society. Many examples can be quoted in this regard such as Green Peace, CIVICUS, BRAK, AKDN, CRS, and CWS and so on.

In service delivery, civil society organizations are working in every walk of life. In the remote and deprived areas of third-world countries where market and state fail to provide basic facilities like water, sanitation, education and health services to their people. Civil society organizations are working with local people and providing basic facilities. Poor people are educated and empowered by using different participatory methods and techniques. Defiantly civil societies reduce some of the financial burden on the state (Howell and Pearce, 2001). World Bank and other multinational donor organizations and developed countries prefer to spend their funds through civil society organizations. Despite the fact that civil society can provide few successful models for development it remains state responsibility to provide decent basic public goods.

Today, civil society works as a pressure group on the state and significantly on the market too. Civil society organizations in Bangladesh like Grameen Bank, BRAK and many others who were basically involved in service delivery operations played a very significant role in last general elections. They rose up as a pressure group on the political scene of Bangladesh (Karim, 1995).

Shift in focus from service delivery to advocacy and lobbying has created a debate among development thinkers, practitioners, and activists. Civil societies as a whole are committed to
promote democracy in third world countries. With the passage of time they have founded positive relationship between development and democracy. In a democracy, the plans and actions of a government are often guided by opposition parties and the civil societies (Sekhar, 2003). Many issues like, lack of basic education, poor health, etc do not receive due attention from the political parties. These issues are taken up by civil society and they bring these issues onto the political agenda through lobbying, mass media, and judiciary. Most social services like basic education, water and sanitation, healthcare or even land reforms, all of them require political commitment and actions. All success stories in India such as public distribution system in Andhra Pradesh, land reforms in West Bengal, education in Kerala, and school meal in Tamil Nadu have a common characteristic that the all issues were raised by civil society and discussed in the parliaments of the respective states (Sekhar, 2003). Therefore, the direction and magnitude of the government action towards development programmes are determined by the power of civil society organizations. Through this process civil societies have achieved more confidence, popularity and importance.

Limitations:

Limitations of civil society as a development agent may depend on the specific situation and circumstances. Few significant limitations are mentioned here:

Insufficient Resources: If we define civil society as a non-government and non-profit then definitely civil society has no obvious sources of funds. Civil society organizations often lack the financial and human resources to carry out their programmes and projects. The sustainability of the programmes may be at stake due to the lack of both resources. Typical civil society organizations depend on members’ fee, donations drives, and services charges (Howell and Pearce, 2001). There is always a competition to get the funds from individuals as well as other business groups. Comparatively small organizations do not have appropriate skills to get their portion. Therefore, they always face the financial crunch.

The civil society organizations have very good ideas and plans and they implement these ideas at a small scale but due to the insufficient resources they often fail to develop on a larger scale and achieve greater impact. This makes them vulnerable and dependant on the state or other big donor agencies. This dependency can create some other issues and may result in diversion from the core mission and objectives.

Inefficiency: Insufficient financial resources are mostly a hindrance to attract the talent they need to perform efficiently. Most civil society organizations are operational at a small scale where they face the problem of professional human resource. Without having professional people they use motivational appeal to maintain their pace. Some times these organizations perform well but most of the time they work with minimum managerial skills and do not reach to the poorest of the poor. Nevertheless they still do better than government in reaching to poorer sectors.
Invisibility: State and market, both have better access and resources as compare to civil society. Third-world countries civil society organizations have medium size organizational structure where they contain typical four or five departments. Mostly they collect donations for their projects and intentionally they avoid spending this money on marketing or public relation activities. However, this creates ambiguities and uncertainties about their mission, objectives and programmes (JHIPFC, 1999).

Personalism: Civil society groups are generally dedicated to the public goods and they are mostly leader driven (JHIPFC, 1999). Sometimes the civil society organizations are more vulnerable when the leaders fail to provide their successor or if they leave the organization. This makes civil society organizations less reliable in the eyes of different stakeholders with a long term interest in the cause.

Regulations: State often introduces different rules and regulations to control the civil society organizations. For instance, state uses the tax exemption law to manage the civil society groups in its own way. Time to time State amends non-profit organizations registration laws and bonds them answerable to the state bureaucracy. After the nuclear tests in Pakistan and India, many civil society organizations protested against the test and asked the state to spend this money for the welfare of the poor people. State took very serious action against civil society organizations and they imposed many new laws on civil society groups to control and minimize their activities.

Donor Dependency: As we mentioned above that civil society organizations do not have obvious sources of funding. In many cases they try to get the funds from state or other multinational donor agencies. This partnership can create some other problems which may affect the project in future. For instance, State wants to gain popularity and political advantages. This can destroy the image of civil society organizations as they may be perceived as government agents or part of the setup. International donor organizations and donor countries have their own criteria, policies and objectives and small civil society groups in poor countries are often forced to alter their goals and objectives to suit the donor policy guidelines.

Mistrust: Many civil society organizations emerged during the 1980s. Many bilateral and multilateral donors put their funds in development sector through national and local NGOs and CBOs. Opportunistic NGOs also emerged to take the advantage of funding (Edwards and Hulme, 1995). They did a very good job on paper but in the field they had very little activity or they failed badly. These organizations developed good relationships with the donors because they knew the donor language, culture and systems. However, they were very distant from the local realities. General public in third-world countries took their programmes and projects as donor driven or based on westernized agenda. The mistrust and misperceptions about all other civil society organizations still prevails in many countries and without addressing this it seems difficult to gain the stakeholders’ confidence.

Institutional Capacity: Civil society organizations try to protect people’s rights and work for better and prosperous societies. This is the shared responsibility of all three sectors: state, market and civil society. Non-profit organizations are often insufficiently aware about the state process and what happens in the power corridors (JHIPFC, 1999). These civil society
organizations are also unaware about market mechanisms of business organizations (Howel and Peace, 2001). Without having this capacity it is hard to act as a watchdog and protect the rights of poor and deprived people.

Conclusion

Civil society organizations are getting momentum throughout the world and civil society organizations are also seen as effective vehicle for the delivery of the development assistance and other economic objectives. However, the civil society is not a homogeneous mass of organizations. There are a lot of contradictions and weaknesses within civil society. In most literature, the idea of civil society was presented as an opponent of the state. If serious progress is to be made in reducing poverty, ensuring social justice, achieving equality of life, and improving the quality of life for all people, then there is dire need to build a coordination and strong cooperation among different sectors. In other words, a new paradigm in social problem solving and sustainable development has arrived. The key to this new paradigm is the building of effective partnerships among state, market, and civil society organizations. Although, there are many challenges and limitations, but, the limitations on the part of one sector are nicely matched by the strengths of others. So it is needed to create win-win situation for all three sectors. The roles of the state, market and civil society have become mutually dependent to provide development assistance in third world countries.

Abstract
This paper reviews the intellectual capital and its measurements in communities especially in the developing countries. Moreover, paper proposes two new models to measure IC. These models based on monetary and financial perspective evaluate IC and designed according to the accounting rules. In these models, previous offered models including Stewart’ model of market to book value, Stewart’ model of Tobin’s q, lev’s model of residual income, and Skandia’ Navigator model have been used. In the first model, intellectual capital has been divided into human and structural capital with the employ of Skandia model. The second model examines the approximate of intellectual capital based on accounting profits and identifying intellectual capital return.

Keywords: Intellectual capital, Monetary and financial measurement, monetary model of Tobin Q, the return model of intellectual capital.

Introduction
Economics frequently asserts that land, labor, financial and/or other economic resources are necessary for an industrial enterprise (Sullivan, 1998). The changing trends during the last two centuries have shifted the emphasis from traditional economic system to knowledge intensive one and consequently, service based industries have taken the major share in the value creation process especially in developed societies. The organization can survive in the competitive market if it can identify the measures and manage thoroughly its actual and hidden capitals. Despite much attention which has been made in recent years to the issue of intellectual capital as a value-producer and influential on the function of organization, it seems that no single model for its measurement has been specified. Regarding the intellectual capital some researchers believe that no single model can be considered for its measurement, as the definition of intellectual capital is different in different societies. Intellectual capital should be defined according to the culture of each community and a model should be suggested. It is obvious that such remarks not only can solve the problems of intellectual capital but also can create duality and maybe these statements are the biased one. In the present situation in which all communities moved towards globalization and the matter of global village discussion is raised, in order to have meaningful reports and prepare intellectual capital management, some models should be designed that are approved by international standard makers for measuring intellectual capital. Otherwise the conducted extensive research would have no result (especially in developing countries) and as it is happened in the recent years many of the capital will be lost.

Intellectual capital
Intellectual capital refers to the sets of knowledge assets which affects organization’s developing competitive situation. In fact, from accounting perspective the intellectual capital, which moves in the line with the assumption of continuous activity of business unit, is of a great
importance. Nowadays, only those companies, which have a clear view regarding intellectual capital, are able to survive in competitive markets.

The intellectual capital should be regarded by the organization not only as a substitute for monetary and financial assets but also as a complement which today would have a greater position in relation to it. The research conducted by Brooking (1996) stated that IC almost represents the 62% value companies. The view of replacing intellectual asset and capital with other current asset and capital has made management to lose its interest in accepting the new findings. As it is clear, our managers are integrated with traditional asset and capital in which there is no specific way for their measurement.

Intellectual capital is not related to a particular type of organization or company from the management, measurement and disclosure perspectives. However, the extensive research reveal the position of intellectual capital in all organizations including profit and non-profit organizations, universities, institutions and other governmental organizations (Holland, 2006; ICAEW, 2003; Lev, 2001; OECD, 2006). Therefore, for designing intellectual capital measurement model the objectives of organization should be taken into account. In this way all the organization’s need would be fulfilled.

Educational and academic centres play a decisive role in producing organization’s intellectual capital particularly in the domain of human resources. Through training committed and expert human resources, they play a vital role in overall development of intellectual capital. Big companies in America and European countries like Microsoft and Intel have established research and development institutes in china and exploited number of Chinese which are expert in science and technology. In the recent years also these companies are educating the top students from different levels in china. While flourishing these talented students they decide to use them as their future employees. However, this action is not specified only to china. Generally, this issue shows the importance of intellectual capital and knowledge assets for pursuing the developing movement process of organization.

**Impact of intellectual capital on the performance of organization**

Based on conducted research there is a significant relationship between intellectual capital and financial performance of the organization. Globally, organization should enjoy competitive benefits and for obtain these benefits; the implementation of physical and financial resources as well as intellectual resources is needed. According to the carried out researches by Brown *et al.*, 1996; Chang, 1998; Collins *et al.*, 1997; Francis and Schipper, 1999; Lev and Zarowin, 1999 the role of intellectual capital is more dominant than the tangible capitals. In this way, one may also encounter great number of companies which can be mentioned as a successful companies like the above mentioned companies in which the profitability owes to their intellectual capital. In the similar study, which compares two big companies of Microsoft and IBM, the significance of intellectual capital was conspicuous.

Intellectual capitals are the key resources that lead to the better exploitation of other investments through the creation of performance, affectability, innovation and manufacturing capability. In the recent years, many studies on the relation of intellectual capital with organization performance have been conducted. The followings are the some examples of these studies.

1-Walker (2001) studied on the relationship between intellectual capital with the 3 functional dimensions on the organization which are profitability, productivity and market price. He has found the relationship between intellectual capital and the mentioned dimensions.
2- Roos, Roos, Dragonetti, and Edvinson (1997), through extensive research and experimental test has found that the increase and decrease (changes) in intellectual capital affects the organization’s financial performances increasingly.

Therefore, in order to obtain competitive advantages, the organizations need to increase and develop their resources strategically. It is not exaggeration to say that all the organizational capabilities are based on their knowledge and performance because this kind of knowledge and information gives the company identification, power, preserving and restoring the qualification and competence.

Measuring intellectual capital

Management is tied to measurement and evaluation since things, which have basis for measurement, would be managed. In general measurement is inevitable in effective management. A consulting center in Swiss conducted some studies in the field of intellectual capital and found that only %20 of the organization’s knowledge was used and the reason is known to be the lack of appropriate measurement of intellectual and knowledge capitals. To measure each capital, the created value (return) in it should be identified. In a simple definition, intellectual capital is defined as a difference between book and market value, and this difference indicates the intellectual capital return so that the whole organization value is more than what was reported earlier.

For better description of the matter, Sveiby’ measurement (1997) states that suppose a person is in charge of measuring stream’s water. Different ways may exist for measuring the water, but the measurer should pay attention to the measurement objectives and the consumers. He also believes that the risk of changes and the drying of the stream should be taken into account. Therefore, what is the purpose of measuring the intellectual capital? Perhaps the answer is to maximize the owners’ wealth through developing and optimal allocation of resources. General framework of intellectual capital is as follows (see Figure 1).

Who uses intellectual capital reporting? As it is, clear for improving traditional report, intellectual capital should be included. Therefore, measuring intellectual capital as well as other conventional reports can be used by a wide range of users such as managers, actual and potential investors, creditors, government agencies and so on. Intellectual capital with its gained significance would affect logical users’ decision-making about reports and financial statements.

Skandia’s intellectual capital model
In the former initiation of IC concept, Skandia was the first company (1994) that presented the IC of the organization. According to this model, the total market value of the company is based on two components; financial capital and intellectual capital. The following Figure 2 is the Skandia’s model which was proposed by Edvinsson (1997).

![Skandia Value Model](Source: Roos (2001))

Further, Edvisson (1997) has divided intellectual capital into two categories including human capital and structural capital. As it can be seen, there are some other classifications for structural capital. There are classifications, which are presented by other scholars over the issue of intellectual capital. One of the presented models which used the Skandia’ model, tries to measure two main parts of intellectual capital including human capital and structural capital.

Human capital is defined as a collection that includes knowledge, skills, innovation of organization and staff, and personal abilities to conduct the affairs assigned to them. Discussion of the human resources has long been proposed in accounting which is paid especial attention as the most important intellectual capital. One of the disadvantages in measuring the human capital is the fact that when the employee leaves the company, the human capital will leave consequently.

Structural capital as it can be seen, is a combined item and an organized capital which includes information and communication systems, software, database, trademark and anything related to organization’s knowledge capabilities which support human productivity. It includes...
those parts of intellectual capital which remains in the organization even if when the employees are outside the organization. In some other classification, customers capital is also reported separately which is considered as a sub-category of structural capital.

**Tobin’s Q measurement model**

Amongst several presented models, Tobin’s Q is the most interesting model. This model has derived from Stewart’s market value to book value model. In the market value to book value model as the simplest model, the difference between these two values is seen as intellectual value and while so simple, the disadvantages can be as follows:

1- **External factors are not considered in the book value resulting from the historical cost.** Due to a factor named inflation, asset value has changed. In this case the reported value as intellectual capital has been shown as a fact.

2- **Different adopted methods and procedures, which authorized the organization in the selection, would definitely affect book value of the organization.** In this case the intellectual capital may be more or less the fact.

3- **Value reduction in asset would also affect the intellectual capital measurement.** In this model possibly capital might be less than what is reported.

To solve these problems, a model named Tobin’s Q ration was designed in which the amount of this ration will be determined through the remainder of the division of the market value of the organization on the replacement value of organization’s assets. This model is more effective in measuring the intellectual capital and the high amount of Q is indicator of attention and investment in organization’s intellectual capital. However, this model can be criticized in the sense that firstly, it reports the value of the intellectual capital as a ratio and secondly it defines the value of intellectual capital very generally and ignore its components.

**Monetary model of Tobin Q**

This model seeks to remove some of its defects by following Tobin’Q. The difference between the market value of the organization and the asset replacement value of the organization would be intellectual capital based on the division derived from the overall value by Edvinsson. In Skandia model, two values of human capital and structural capital can be extracted. The current value of the future payments to pay the salary, wages and any expenses which the organization should go through that can be estimated and calculated is known as human capital. The remainder of total value of intellectual capital and human capital is structural capital. It should be explained that such capitals can be assessed in renewal period or rather they will be depreciated and generally they can be treated as capital expenditure.

For example, if the market value of organization is $14/000/000 and its recorded value is $1/800/000, based on conducted assessment, the asset replacement value is $2/400/000, in this case $1/600/000, the difference between the market value is known as intellectual capital. However, if the current value of the future payments for human resources is $1/000/000 (it is necessary to estimate this value for specific period and for example, it should enjoy the staircase increase), the value of structural capital can be $600/000. In this case, any spent expenditure for human resources or structural capital including salary, wages, employee services, research and development, software, marketing and etc can be used as a reduction in human capital or structural capital commitments.
This model not only considers the defects of Tobin’ Q ration but also tries to maintain the above-mentioned value through monetary assessing of intellectual capital and its division into human capital and structural capital.

The return model

The main problem in the area of intellectual capital measurement is the combination of this capital’s profit with other organization’s capital. Using the net profit of the organization is the model that can separate the profit of this capital from the other capitals of the organization. First, the profit before the deduction of tax and interest was considered but since interest is also one of the managerial decisions, the net profit became the basis.

One of the basic financial statements, which companies required to prepare, is the statement of profit and loss with which the net profit of the unit would be shown. It can be basis for measuring and assessing the intellectual capital so that the net profit of the unit would be compare to the reported net profit of the industry (the industry index), any remainder can be called intellectual capital. With the belief that the reported net profit of the industry is just from the usual capital and it does not include the intellectual capital. Now considering the fact that the company’s net profit and the net profit of the intellectual capital belongs to the specific intellectual capital book value and replacement value can be used. The book value or the assets replacement would be divided by the reported net profit through industry index and the remaining would be multiplied by intellectual capital’s net profit (which already has been calculated). The balance shows the overall value on intellectual capital. Although using the replacement value is difficult, it is more accurate than the recorded value. This model can be applicable first when there is an industry index; second, this index enjoys sufficient accuracy.

For example, if a company has recorded assets of $6000000 and the reported net profit by company and industry is $2000000 and $1500000 respectively, the gained remainder of $500000 can be identified the intellectual capital return or part of the intellectual capital’s profit. According to the industry index, the asset is divided by the book value or the net profit replacement. The gained result is 4. Therefore, it can be stated that the intellectual capital value equals 200000 as it is mentioned earlier, it is better to use replacement value that is more accurate instead of the book value.

The proposed models interpretation

As it is clear, no single model, possess an absolute measurement of intellectual capital. Therefore, the need would be searching models that are practical and operational. However, the combination of the previous presented models may also solve the problem.

The proposed models are designed based on the accounting rules and principles which are expected to be of interest for accounting professional societies. These models are also focused by management, because intellectual capital is measured by monetary and financial measures in such a way that management during preserving the existing and reported values will attempt to promote it. However, the non- monetary ways may evaluate intellectual capital components accurately. While management looks at the reports from monetary and financial perspective, thus it cannot be easily accepted. The monetary characteristic of these models will provide comparability for the users to comment on this part of capital.

The other advantages of this model are that they are easy to measure. In these models, accountants can easily calculate organization’s intellectual capital and the attempt is to fulfil the right of intellectual capital to some extent. This simplicity makes the intellectual capital report to lead the user’s intelligibility regarding the capital. Perhaps the intellectual capital return method
is the only method that tries to estimate intellectual capital through accounting profits. The other presented methods and models, reports and financial statement have received less attention

Conclusion

Many experts have studied the intellectual capital and designed many ways for its measurement. It is clear that all these models have some advantages and disadvantages. The presented models by this paper are not the exception to this fact and have some disadvantages. We hope that researchers, practitioners, and accountants seek to solve problems regarding the current models and provide the other optimal models, which are derived from accounting rules and principles. They also should be able to introduce the desirable models for measuring intellectual capital and make them necessary for performance. The subject of intellectual capital would be the center of attention when there is a legal and professional requirement for its measurement and disclosure.

Although the intellectual capital discussion is a new phenomenon but lots of attention is paid to it by developing countries to the extent that in the recent year big companies (which are located in the world developing countries) are not reluctant to maintain the physical asset. The reason to its being big, unlike the past, is not its assets but special attention to intellectual capital. The developed countries are transferring the industrial and risky occupations to the developing countries. They have found the importance of intellectual capital and moving towards management organizations. They try to manage global village or markets and make use of developing countries as their agents (employee). Training the specialist around the world can prove this claim.

We should exit the existing framework and oriented this significance capital, which abounds in Iran. This aim will not be fulfilled unless we identify this new capital, model or accepted optimized model for measurement (monetary and otherwise). They should be managed appropriately. In Iran, the government manages most of the organizations directly or indirectly. These organizations are regularly supported by outside resources. Resources restrictions should be taken into account and with the help of intellectual capital management, we should prevent the capitals to be wasted.

Abstract
The purpose of this study is to contribute to the body of knowledge within the area of environmental attitudes towards green marketing. Therefore, this study intends to identify the influence of safety and health concerns and self-efficacy on environmental attitude towards lead-free electronic products (green electronics) amongst lecturers. In this study safety and health concerns is conceptualized as the consumer’s concern for quality of life, health issues and the environment for humans and non-human species. While self-efficacy is conceptualized as how well one can execute required actions to deal with specific situations. Hence, through a self-administered questionnaire among 170 lecturers, from USM main campus and USM engineering campus the study found some revealing insights. Through the results of this study, safety and health concerns and self efficacy had a significant positive influence on lecturers’ environmental attitude. The theory of planned behavior Azjen (1985) supported the findings of this study, firstly, for safety and health concerns on environmental attitudes, which is related to behavioral beliefs part of the theory: The person’s beliefs that the behavior leads to certain outcomes and his or her evaluations of these outcomes. Therefore, attitudes are determined by behavioral beliefs. Secondly, for self-efficacy this is related to the concept of perceived behavioral control which is concerned with judgment of how well one can execute required actions to deal with specific situations. People’s behaviors are strongly influenced by their confidence in their ability to perform them.

Keywords: Green Marketing, Green Electronic Products, Safety and health Concerns, Self-Efficacy, Environmental Attitude, Theory of Planned Behavior.

1. Introduction
Polonsky (1994) defined green marketing in much broader way those of other researchers and it encompasses all major components of other definitions. According to polonsky (1994) green or environmental marketing consists of all activities designed to generate and facilitate any exchanges intended to satisfy human needs or wants, such that the satisfaction of these needs and wants occurs, with minimal detrimental impact on the natural environment. This definition incorporates much of the traditional components of the marketing definition that is "All activities designed to generate and facilitate any exchanges intended to satisfy human needs or wants"
Therefore it ensures that the interests of the organization and all its consumers are protected, as voluntary exchange will not take place unless both the buyer and seller mutually benefit. The above definition also includes the protection of the natural environment, by attempting to minimize the detrimental impact this exchange has on the environment. This second point is important, for human consumption by its very nature is destructive to the natural environment. (To be accurate products making green claims should state they are "less environmentally harmful" rather than "Environmentally Friendly.") Thus green marketing should look at minimizing environmental harm, not necessarily eliminating it.

Hence, Consumers who are aware of and interested in environmental issues are called green consumers (Soonthonsmai, 2007). These green consumers usually organized petitions, boycotted manufacturers and retailers and actively promote the preservation of the planet (Fergus, 1991). Ottman (1992) reported that consumers accepted green products when their primary need for performance, quality, convenience, and affordability were met, and when they understood how a green product could help to solve environmental problems. The knowledge gap on the uses and values of green products prevents consumers in committing themselves to any purchase decisions. In addition, Ottman (1993) argues that all types of consumers both individual and industrial are becoming more concerned and aware about the natural environment. Polls consistently show that a large majority of U. S. citizens have shown that saving the environment is a high priority to most American citizens, with public concern growing faster than any other issues (Schwartz & Miller, 1991). In a 1992 study of 16 countries, more than 50% of consumers in each country indicated they were concerned about the environment.

Thus, as the demand for electronic products by consumers is ever increasing, companies manufacturing high-tech electronic products are using state-of-the-art technologies to stay in the competition. However, the life-cycle of electronic products is short, therefore, technology rapidly evolves and people are constantly upgrading to new equipment and retiring their old equipment. Hence, high tech product demand worldwide has made the electronic industry today a very dynamic one and new products are launched everyday in the consumer electronics sector. The typical electronic product may contain more than 1,000 different substances, some of which are potentially hazardous to the environment and to human health. If old equipment is not properly recycled, these substances could seep into air, soil, and water, and have a direct polluting impact on the environment and an indirect polluting impact on humans. One of these hazardous substances is lead; Lead is an alloy that is used in soldering electronic components on (PCBs); it is mostly used on computer key boards, mobile phones, cameras, DVDs, etc… [Accessed on June-2006] Available from http://rethink.ebay.com/odcs/custom .

Hatija (2003) argued that given the many applications of PCBs (Polychlorinated biphenyl) in industries it is likely that products and equipment that contained PCBs would be disposed off as regular garbage. This is because there has not been much concern given to the disposal of hazardous household waste such as electrical equipment or products which are likely to contain PCBs in Malaysia. PCBs are made up of more than 200 related compounds these manufactured substances exhibits many ideal characteristics such as fire resistance, high stability. They also do not conduct electricity and have low volatility at normal temperature. These and other properties have made them desirable components in a wide range of industrial and consumer products. These same properties make the PCBs environmentally hazardous- especially their extreme resistance to chemical and biological breakdown by natural process in the environment. Due to their stability, PCBs have a high potential for bioaccumulation it is able to accumulate in aquatic environments such as lakes and rivers.
As early as 1985 tests conducted on shellfish collected from sea bed around Penang island showed PCBs content to be in the range of 400 - 600 ppb. The amount of PCBs detected exceeded the permitted level set by the Food and Drug Authority (FDA) of 300 ppb. In 1992, tests conducted on 25 rivers in Peninsular Malaysia for PCBs residue showed that the amount was higher in the rivers that flow through industrial or densely populated area. The amount of PCBs detected was found to be in the range of 2.1 - 0.9 milligram per liter. This exceeds the level in the Proposed Interim National Quality Standards for Malaysia, which sets a standard of 0.044 milligram per liter of PCBs in effluents (Hatija, 2003).

![Figure 1.1](Path of Lead (Pb) from Sn-Pb Soldered PCB to the Human Body via Drinking Water)

Figure 1.1 the way lead’s toxicity effect human health.

Source: Napp D. (1995) Lead-Free Interconnect Materials for the Electronic Industry, In: Proceeding of the 27th International SAMPE Technical Conference. Figure 1.1 shows lead’s toxicity effects on human health. These detrimental effects have led to several legislations on the restrictions of lead usage in electrical and electronic equipments (EEE) industry today globally.

Therefore, this study attempts to sheds some light on the problem of the pollution (which is caused by the disposal of electronic products as regular garbage at the end of the products life cycle) by revealing the dark side of high technology, polluted drinking water, waste discharges that harm fish and wildlife, high rates of miscarriages, birth defects, and cancer clusters in another word it has a direct impact on the environment and an indirect impact on the consumer via drinking water (Napp, 1995). Since, lecturers are considered relatively heavy users of...
electronic products, due to their profession and technological consumption their environmental attitude towards green electronic products is the focus of the study. Therefore, this study intends to identify the influence of safety and health concerns and self-efficacy on lecturers Environmental attitude.

2. Literature Review

2.1 Safety and Health Concerns

Safety and health concerns are defined as the consumer’s concern for quality of life, health issues and the environment for humans and non-human species. However, it seems that given the broad problems that are defined as environmental issues, the probability that individuals will be affected by one or more of these issues is high (Dunlap, 1989, Mitchell, 1990). In addition, there is also evidence to suggest that people believe environmental conditions are worsening for example, (water pollution, and air pollution) (Dunlap, 1990; Dunlap & Scarce, 1991). Thus, the diversity and intensity of environmental problems as experienced by the public, are themselves proposed as an explanation for the widespread nature of environmental concern. According to Wall (1995) safety and health concerns are considered the strongest predictor of attitude and behavior; her findings lend support to those researchers who claim that increasing concern with health and safety are becoming prominent factors in shaping people’s attitudes towards the environment. It also supports the self-interest notion that behavioral motivation increases with perceptions of personal risk.

However, Rundmo (1999) carried out a study aiming to analyze how health attitudes, environmental concern and behavior are influenced by risk perception. A self-completion questionnaire survey was distributed among Norwegian residents in 1996 and 1997. Respondents belonging to five sub-samples participated in the study and a total of 1124 replied to the questionnaire. Perceived risk was measured by asking the respondents to assess how ‘safe’ they felt from a health injury caused by specific sources of environmental and health risks. The questionnaire also contained indices of health attitudes, environmental concern, and behavior, including health behavior, environmental behavior as well as consumer behavior related to, i.e. purchasing 'green' products. The findings of the study concluded that the respondents felt most unsafe regarding chemical food additives, infected food, industrial pollution and risks related to traffic behavior. Attitudes towards health promotion were strongly associated with health behavior and environmental concern significantly affected environmental behavior. There was also a strong correlation between the different types of behavior. Attitudes and environmental concern explained 40% of the variance in environmental as well as consumer behavior. In a number of studies, environmental concern has been found to be a major determinant of buying green products (e.g., Brombacher & Hamm, 1990; Grunert, 1993; Van Dam, 1991) another determinant is concern with one’s health (e.g., Von Alvensleben & Altmann, 1986; Langerbein & Wirthgen, 1987).

2.2 Self-Efficacy

Is related to the concept of perceived behavioral control, and this concept is most compatible with Bandura’s (1977, 1982) concept of perceived self-efficacy which is concerned with judgment of how well one can execute required actions to deal with specific situations. People’s behaviors are strongly influenced by their confidence in their ability to perform them. Self-efficacy refers to a person’s belief in his or her capability to perform a task as referred to by Bandura (1997), and Wood, and Bandura (1989). Carvone and Peak (1986) has related self-
efficacy to diverse outcomes such as problem solving, learning achievements (Campbell & Hackett, 1986), adaptability to new technology (Hill, Smith, & Mann, 1987), and training effectiveness (Earley, 1994 and Gist, 1987). However, this study identifies self-efficacy expectations as a person's beliefs concerning his/her ability to successfully perform a given task or behavior Bandura (1977). Hence, applying the term to this study lecturers' self-efficacy is defined as judgment of how well can lecturers execute required actions that can influence their environmental attitude.

2.3 Environmental Attitude

Recent research suggests that despite high levels of “green attitudes” environmental concern has failed to translate into widespread environmental action (Roper organization, 1990; Dunlap, 1991; Wall, 1995). More than two decades of environmental attitude research has resulted in a multitude of studies dedicated to discovering the social determinants of environmental attitudes (Van Liere & Dunlap, 1980; Buttel, 1987). Much of the social scientific investigation of environmental attitudes in recent years, rather than remaining focused on demographic predictors, has turned instead to explanations for the widespread popularity of environmental issues. There is also evidence to suggest that people believe environmental conditions are worsening, concern for quality of life has given a way, in many cases, to concern about health issues, and life itself, for human and non-human species (Dunlap, 1991).

Maloney and Ward (1973) argued that during the last few decades, the relationship between human beings and the environment has been an important issue due to the fact that natural resources have been used up at a faster pace than they can be restored. Environmental problems are viewed by many as caused by faulty human behavior and psychology, therefore, can have an important role in the amelioration of these problems by improving ecological behavior (Maloney & Ward, 1973; Weigel & Weigel, 1978; Oskamp, 2000; Schmuck & Schultz, 2002; Schmuck & Vlek, 2003). One way to contribute to this is through the study of environmental attitudes (EA) that may underlie ecological behavior. “Environment concern” is the term typically used in empirical literature to refer to EA (Fransson & Garling, 1999; Dunlap & Jones, 2002). Many researchers use the two terms as synonymous (Van Liere & Dunlap, 1981; Dunlap & Jones, 2003), whereas others have differentiated them (Stern & Dietz, 1994; Schultz, Shrimer, Tabanico, & Khazian, 2004). Nevertheless, EA seems to be the preferred term in psychology, because environmental concern is viewed now as a general attitude (Bamberg, 2003), and EA are the psychological index term generally used (American Psychological Association, 2001). EA have been defined as the collection of beliefs, affect, and behavioral intentions a person holds regarding environmentally related activities or issues.

Based on the foregoing literature, it can be argued that safety and health concerns, is an important predictor of environmental attitude. Hence, on the whole the following hypothesis was developed:

H1. Safety and health concerns have a significant positive influence on consumer’s environmental attitude.
H2. Self-Efficacy has a significant positive influence on consumer’s environmental attitude.
3. Methodology

3.1 Sample

The population for this study consists of full time university lecturers from University Sains Malaysia. University lecturers were chosen from five main perspectives; Firstly, from an economic perspective according to Noor and Ainin (2005), university lecturers have the purchasing power which means they can afford to purchase high-tech computers and electronics for personal use and in utilizing research grant budget to purchase electronic equipment. Secondly, from a social perspective university lecturers are considered heavy users of computers and electronic products Majid (1999), either for their personal use or for teaching, involvement in research grants and consultancy. Hence, according to Hoe (2006) all academics of Universiti Kuala Lumpur Institute InfoTech MARA (UniKL IIM) are required to use the e-learning portal in their teaching activities, it is compulsory for Lecturers, Assistant Lecturers and Instructors to use at least 60 percent of the features available in the portal and upload at least 50 percent of the lecture notes to the portal. The usage of the portal contributes 10 percent to individual achievement in the annual performance evaluation.

Thirdly, from professional perspective university lecturers have the need for add-on peripherals such as a printer, modem, or storage system, which works in conjunction with a computer Sam, et al. (2005). In addition, for example university lecturers in University Sains Malaysia are all given one desktop personal computer, apart from desktop PC given by the University; some lecturers have their own notebooks bought using their own pocket money or grants. However, since the life-cycle of electronic products is short, according to information obtained from the School of Computer and Communication, USM, (2007) computers given to lecturers will be changed when the technology is already backward as compared to current trend, hence, every 3 to 5 years; new computers are supplied to lecturers. Fourthly, from a political perspective university lecturers are aware of government rules and regulations which can influence their use of green electronics. Finally, while environmental issues are not well known by the general public, university lecturers are considered opinion leaders and the more opinion leaders are valued and respected, the more likely an innovation is to spread (Lars Perner, http://www.LarsPerner.com (accessed online 2006). Respondents will be full time university lecturers from the university’s main campus and from the university’s engineering campus, based on academic staff statistics obtained from the University chancellery on January (2007) there are 898 full time university academic staff working on main and engineering campus. Therefore, by using the stratified proportionate sampling method a list of names of lecturers working in each school was obtained either from the university directory book or from USM website and once the population has been stratified into 25 major schools, 20% of the total number of academic staff working in each school will be drawn. Therefore, the target number of questionnaires need to be collected is 179. However, 175 were returned, 4 questionnaires were not returned and 5 were rejected due to incompleteness and were unusable. Hence, 170 completed sets will be used for the data analysis in this study there by giving a total of 95%.

3.2 Measurement of variables

3.2.1 Independent variable- safety and health concerns:

Health and safety concerns was measured by Wall (1995) using 1 statement stating “Our food is becoming unsafe because of food additives” respondents were asked to give answers from 1= strongly disagree to 7= strongly agree. Rundmo (1999) used 3 items to measure health and safety, respondents were asked to give answers from 1= most unsafe to 5= extremely safe. Therefore, the measurements for this variable will be adapted from (Wall 1995 & Rundmo

COPY RIGHT © 2011 Institute of Interdisciplinary Business Research
1999); this means the respondents will have to give answers to 4 items on a scale ranging from 1= strongly disagree to 5= strongly agree.

3.2.2 Independent variable- Self-efficacy: Self- efficacy was measured by Hill et al (1987) respondents will give answers ranging from 1= not at all true to 4 = exactly true. Therefore, the measurements for this variable will be adapted from Hill et al (1987) this means the respondents will have to give answers to 4 item statements. For example;” I understand to accomplish my task with minimum damage caused to the environment” or “I am confident that I am able to engage in positive environmental behaviors,” on a scale ranging from 1= strongly disagree to 5= strongly agree.

3.2.3 Dependent variable- environmental attitude:
The measurement environmental attitude will be adapted from Maloney and Ward (1973). This means the respondents will have to give answers to 10 items for this variable. A five point Likert scale ranging from 1= strongly disagree to 5= strongly agree will be employed to measure environmental attitudes.

4. Results and Findings
A total of 200 sets of questionnaires were distributed to academic staff working in 25 major schools in University Sains Malaysia main campus and engineering campus. The drop and pick technique method was used in distributing and collecting the questionnaires. The total of full time university academic staff working on main and engineering campus is 898. Therefore, by using the stratified proportionate sampling method a list of names of lecturers working in each school was obtained either from the university directory book or from USM website and once the population has been stratified into 25 major schools, 20% of the total number of academic staff working in each school was drawn. Two hundred questionnaires were distributed, target number of questionnaires (sample size) needed to be collected was 179, however, 175 were returned, 4 questionnaires were not returned and 5 were rejected due to incompleteness and were unusable. Hence 170 complete sets will be used for the data analysis in this study thereby giving a total response rate of 95%. Based on Hair et al., (2006) a sample size of 100 is considered sufficient to carry out the analysis (Table1 below illustrates the response rate).

4.1 Profile of Respondents

In terms of gender, 39.4% of respondents were females and 60.6% were male respondents, this indicates that the majority of respondents were male lecturers. In terms of age, 1.2% of respondents were below the age of 29 years old, while the majority of respondents 41.2% aged between 40 to 49 years old, followed by 38.2% of respondents were between the age of 30 to 39 years old, and the remaining 19.4% of respondents were above 50 years old. From ethnic background perspective, 72.4% of respondents were Malay, 11.2% were Chinese, 8.2% were Indians and 8.2% were other races. In terms of professional status, the majority 48.2% were lecturers, followed by 33.5% were associate professors, 17.1% were senior lectures and 1.2% were professors. Therefore, from the analysis it is apparent that the majority of respondents are in the lecturer category which are young and potentially holding more funds for research in future. In terms of years of experience,31.8% of respondents had working experience lower than 5 years, 17.6% of respondents had working experience between 5 to 10 years, followed by 31.8% of respondents had working experience between 11 to 20 years, and 16.5% of respondents had working experience between 21 to 30 years. Lastly, 2.4% of respondents had working experience above 30 years. From this analysis, it appears that the majority of respondents had medium to high number of years of experience; this reflects that during respondents’ years of experience on the job they will be liable to a number of research grants which will enable them to purchase electronic products for research purposes. This is supported by the following analysis on lecturers’ number of research grants awarded to them during their years of experience. However, in terms of research grants, from the analysis it appears that 81% of respondents have a research grant ranging from 1 to 32. This means that lecturers tendency to use computers and other electronics is high, this can be shown from the number of research grants awarded to them, which enables them to purchase electronics equipment and add on peripherals such as; printer, modem, storage system, which works in conjunction with a computer.

4.2 Factor Analysis – Safety and Health Concerns

The construct of safety and health concerns was analyzed using confirmatory factor analysis and items were forced into one factor. All items were accepted for safety and health concerns and all items dropped on a single component, explaining 70.04% of the total variance in the variable. Hence, none of the items were dropped and the mean for safety and health concerns was 4.20 which indicate that respondent’s safety and health concerns are high. The Kaiser-Meyer-Olkin measure of sampling is .82 which is considered marvelous. The Bartlett’s test of sphericity is significant at p<0.01. Table 2 below illustrates the range of factor loadings for safety and Health concerns.

4.3 Factor Analysis – Self-Efficacy

The following analysis was to analyze the construct of self-efficacy, confirmatory factor analysis was conducted and items were forced into one factor. All items were accepted for self-efficacy and all items dropped on a single component, explaining 60.15% of the total variance in the variable. Hence, no item was dropped, and the mean for self-efficacy is 4.05 which indicate that respondent’s self-efficacy are high. The Kaiser-Meyer-Olkin measure of sampling is .75 which is considered meritorious, meaning excellent and the Bartlett’s test of sphericity is significant at p<0.01. Table 2 below illustrates the range of factor loadings.

4.4 Factor Analysis – Environmental Attitude

The measurement for environmental attitude was adapted and modified to the Malaysian context to establish the dimensions of the study. Hence, this study utilized exploratory factor analysis was run twice to analyze the construct of environmental attitude, which will help establish grouping of items based on respondents’ perceptions i.e. USM lecturers. After running the first
factor analysis two items were eliminated due to cross loading. In the second running of factor analysis another two items were eliminated. The remaining six items grouped under a single component, explaining the total variance of (30.64%) in the variable, the mean value for environmental attitude is of 3.67 which indicate that respondents’ environmental attitude is above average. The Kaiser-Meyer- Olkin measure of sampling is .77 which is considered meritorious, meaning excellent and the Bartlett’s test of sphericity is significant at \( p<0.01 \). Table 2 below illustrates the range of factor loadings.

4.5 Reliability Analysis

The data obtained were tested for reliability using cronbach’s Alpha. The variables that were tested safety and health concerns, and environmental attitude. In this test, any item that was not significant will be deleted. According to Sekaran (2003) the closer Cronbach’s alpha is to 1, the higher the internal consistency reliability therefore, a reliability coefficient of 0.5 and higher is acceptable. The Cronbach’s alpha for safety and health concerns; is 85, For self-efficacy .77, and for environmental attitude; is 69. Hence, according to (Hair, Anderson, Tatham & Black, 1995) the generally agreed upon lower limit for Cronbach’s alpha is .70 although it may decrease to .60 in exploratory research. A summary of the reliability tests for the variables is shown in Table 3 below.

4.6 Descriptive Statistics

After carrying out the validity and reliability analyses, the items representing their respective factors were then averaged. The mean was applied as a measure of central tendency, which indicated that all variables were above their midpoint level as indicated in Table 3. Respondents safety and health concerns was the highest in rating (\( X = 4.19 \)), followed by respondents self-efficacy (\( X = 4.05 \)), followed by environmental attitude with a mean value of (\( X = 3.67 \)), which indicates that respondents attitude towards the environment was normal neither high nor low. A summary of Descriptive Statistics for the variables is shown in Table 3 below.

Regression between safety and health concerns and environmental attitude

Table 4 illustrates the regression between safety and health concerns, self-efficacy and environmental attitude. Hence, safety and health concerns exhibited a significant positive influence on environmental attitude, at β = -1.198, t = 2.766, p < 0.00. Therefore H1 is supported. The output for self-efficacy indicated a significant positive impact on environmental attitude at β = -0.323, t = 4.513, p < 0.00. Therefore, H2 is supported. The variation for two independent variables explained 16% of environmental attitude. This indicates that the higher the safety and health concerns and self-efficacy among lecturers the higher their level of environmental attitude.

5. Discussion

The result of this study indicated that respondents’ safety and health concerns strongly influenced respondents’ environmental attitude, this indicates that lecturers safety and health concerns towards the environment is high. This means that the higher the concern about safety and health the higher their attitude towards the environment. This study is in line with the findings of Wall (1995) who found that safety and health concerns ranked as the strongest predictors of attitude, findings by Wall (1995) lend support to researchers who claim that increasing concerns with safety and health are becoming a prominent factor in shaping people’s attitudes towards the environment. Thus, according to Wall (1995) the diversity and intensity of
environmental problems, as experienced by the public, are themselves proposed as an explanation for the widespread nature of environmental concern. This finding is supported by Dunlap (1991); Dunlap and Scarce (1991) who argued that there is evidence that environmental condition are worsening. Accordingly, Dunlap (1991) argued that concerns for quality of life has given way, in many cases to concern about health issues, and life itself, for humans and non-human species. Rundmo (1999) carried out a study aiming to analyze how health attitudes, environmental concern and behavior are influenced by risk perception. Rundmo (1999) concluded that respondents felt most unsafe regarding polluted food, infected food, and industrial pollution. The findings of this study are in line with Rundmo (1999), lecturers were asked four questions to measure their safety and health concerns. The first question; our food is becoming unsafe because of environmental pollution, the mean score for question one is (4.0). The second question; our water is becoming unsafe because environmental pollution, the mean score for question two is (4.31). The third question; I feel unsafe from getting a health injury caused by environmental pollution, the mean score for question three is (3.98). Finally question four; I feel unsafe consuming polluted food, the mean score for question four is (4.41). Therefore, the findings indicate that lecturers felt most unsafe consuming polluted food, polluted water, and getting a health injury caused by environmental pollution. Hence, concerns with safety and health are becoming a prominent factor in shaping people’s attitudes towards the environment.

In addition, the result of this study indicated that respondents’ self-efficacy did influence environmental attitude. Lecturers’ self-efficacy is strongly related to levels of participation towards environmental concerns. The findings of this study are in line with Wall (1995) who reported a mean score of 4.30 and concluded that efficacy/interest affects the levels of participation in environmental activities and will increase advantages associated with greater participation. Self-efficacy refers to a person’s belief in his or her capability to perform a task as referred to by Bandura (1997) and Wood & Bandura (1989). Hence, the relationship between self-efficacy and individual performance is strong. Carvone and Peak (1986) has related self-efficacy to diverse outcomes such as problem solving, learning achievements (Campbell & Hackett, 1986), adaptability to new technology (Hill, Smith, & Mann, 1987), and training effectiveness (Earley, 1994; Gist, 1987). For example, Hill (1987) carried out a study on the role of efficacy in predicting the decision use of advanced technologies; the case of computer use. The results indicated that computer efficacy beliefs made a significant contribution to the prediction of behavioral intentions. This study is in line with (Tella et al., 2007) her study revealed that self-efficacy and use of electronic information jointly predict and contribute significantly to academic performance of students. This corroborates previous findings by Tella and Tella (2003) and Pajares and Johnson (1996) that self –efficacy is a better predictor of academic performance.

6. Conclusion
This study has shed some light on the problem of pollution, which is caused by the consumption of high-tech electronic products and the disposal of these products at the end of the products life cycle. Hence, this study investigates the influence of safety and health concerns and self-efficacy on environmental attitude amongst lecturers because lecturers are considered relatively heavy users of electronic products. Due to their profession and technological consumption their environmental attitude towards lead-free electronic products (green electronics) is the focus of the study. However, through a survey among lecturers working full time in USM main campus and USM engineering campus the study found some revealing insights.
In terms of theoretical contribution, the theory of planned behavior (TPB) Azjen (1985) supported the findings of this study for safety and health concerns and self-efficacy on environmental attitude, which is related to the behavioral beliefs, and perceived behavioral control part of the theory. A person’s beliefs that the behavior leads to a certain outcomes and his or her evaluations of these outcomes. Therefore, attitudes are determined by behavioral beliefs, for any given behavior at a given time we will have a set of salient beliefs, for each belief we have an outcome evaluation and we also have belief strength. As for the concept of perceived behavioral control, it is concerned with judgment of how well one can execute required actions to deal with specific situations.

In terms of practical contribution, the results of the study for safety and health concerns and self-efficacy had a significant positive influence on environmental attitude. Hence, from the findings of the study it is recommended that marketers should constantly monitor and evaluate the needs and concerns of university lecturers by taking into account lecturers safety and health concerns and self-efficacy factors that lead to their levels of performance and achievement.

Abstract
We examined the relationships between sale employees’ felt job stress, organization commitment, job experience, and performance. Our results are reliable with the consideration view of stress. Employees with higher levels of emotional commitment and higher levels of job experience channeled felt stress more effectively into sales performance. Felt stress had neutral to negative effects on performance for employees with lower levels of commitment and job experience. Commitment, like stress, was more strongly related to performance when employees had more job experience. The results suggest that consideration of moderators of the stress-performance relationships important both theoretically and practically.

Keywords: Stress, Commitment, Job experience, Performance

Introduction
Stress at work place is a critical problem for employer employee and society. Problem at work are more strongly inter link with health complaints than are any other life stressor more so than even financial problems. Stress on individual generate strain on organization as whole and organization experiences stress as funding change s loss of programming, down sizing, mergers, and mostly strain individual coping skill. The national institute for health occupational safety and health (NIOSH) define job stress as the harmful physical and emotional responses that occur when requirement of job do not mach the capabilities, resources or need of worker. Katz and Kahn, 1966 and House and Litzman, 1970, represent stress theory when employees experience role of ambiguity and role of conflict are also refer to stressor.
Changes place worker unfamiliar job cause previously loyal worker to question their commitment to their employer and challenges worker to perform under stress. (Hunter, Bernhardt, Hughes, & Skurtowicz, 2001; Korczynski & Ott, 2005) Most research suggest that role ambiguity is needed negatively correlated with job satisfaction, job involvement performance tension propensity to leave the job and job performance variables.
The multidimensional approaches to the study of role ambiguity began with Bedeian and Armenakis (1981) and have continued with Sawyer (1992) and Singh, Verbeke, and Rhoads (1996). Based on their findings and the foundation provided by these works there are four (4) widely accepted dimensions to role ambiguity, which may be experienced by the role incumbents, and are based on the role incumbent’s perspective.

**Literature review**

Today’s Pakistani economy is facing a new challenges in marketing due to this global changes in big world managerial level employees is taking a competitive disadvantage but sales person employees is facing a stress. A theory of organizational role stress recommended that role stress may be dependent upon organizational structure and culture,(Schuler 1977).Organization culture is collected of values ,as well as sample of behavior, attitudes, supposition and artifact (Jackson,Schlacter,and Wolf,1995) Shared ethic between the sales force and organization give a out line or view of system for decision making and present a central theme to direct sales person ,behavior (Jackson,schlacter,and wolf 1995)

A study shown that sales people with low level shared ethic with their group may experience high level of tension and job nervousness (Posner, Kouzes, and Schmidt 1985).Main causes of organization stress are role of ambiguity, and role of conflict, between the most common researched construct in organizational behavior (Boles and Babin 1994: Sullivan and Bhagat 1992) and managing of sales force (Leigh, Pullin, and Comer 2001)

Role of ambiguity show when employees are ambiguous about their duties and proceeding required their jobs (Wallker, Chrchill, and Foed 1975) most important to feeling of attention (Onyemah 2008). Role of conflict show when employees distinguish that group opportunities and demands are mismatched and can not be all together satisfied (Walker, Churchill and Ford 1975).

It is occurs, for example when sales people suppose that their managers s hope and demand are not well- matched with their custumer hope and demands (Onyemah 2008)

One of study shown the stress negative influence an employee job satisfaction (e.g, Jaramillo and Solomon 2006).Extending of past research found the relationship between role conflict, ambiguity, and work family conflict with fact of job satisfaction related to gender .They establish that gender of the sales persons does effect the relationship of role conflict, role of ambiguity, and work family conflict on few of facets of job satisfaction. (Boles, Wood, and Johnson, 2003)

For example, as role ambiguity and role conflict harmfully affect satisfaction with recompense for male sales persons, female sales person’s satisfaction with pay not unfair by the role of ambiguity and role conflict. They also established work family conflict does not affect the male sales peoples satisfaction with coworkers, even it has negative relationship for female sales persons also while work family conflict is negative relationship with satisfaction with promotion and organization policy for male and female sales persons, no important relationship and was established for their female counterpart (Boles, Wood, and Johnson, 2003).

**Main Effect of stress**

Commonly, stress refers to an emotional experience related with anxiety, tension, and strain (cf. Cooke & Rousseau, 1984). A Study on stress features a mixture of approaches to its conceptualization, its background, and its belongings. Stressors can be understood as “stimuli that evoke the stress process” (LePine, Podsakoff, & LePine, 2005: 764). Workers subject to alike stressors may vary in the coverage to which they feel nervousness or tension as a result of personal experiences or accomplishments in their work setting (Parker & De-Cotiis, 1983). ). These types of feelings can be described as “strain” (Van Dyne, Jehn, & Cummings2002) or as
“felt job stress” (Motowidlo, Packard, & Manning, 1986; Parker & DeCotiis, 1983). Felt job stress refers to logic of time pressure, anxiety, and concern that is related with job tasks. The mere occurrence of stressors does not automatically lead to such felt stress. Individuals may suffer stressors or scatter their effects either cognitively or behaviorally, and thus felt job stress can be familiar both from stressors and from physiological symptoms. The attention theory of stress suggests that there should be a positive association between felt job stress and job performance. Extensive experimental research supports Easterbrook’s (1959) argument that although stress depletes an individual’s resources, it paradoxically has the effect of concentrating remaining resources on the task at hand (Huguet, Galvaing, Monteil, & Dumas, 1999).

Yet workplace-based evidence for a relationship between felt job stress and job performance is weak and conflicting (Beehr, 1995; Jex, 1998). In this section result of insufficient notice to the Sources of stress. LePine and his colleagues (2005) showed during meta-analysis that stressors that are hindrance-oriented (e.g., organizational politics, red tape, role ambiguity) are negatively related to job performance, but challenge-oriented stressors (e.g., high workload, time pressure, job scope). Encourage workers and can be positively associated to job performance even as they suggest other strains such as exhaustion and tiredness. There are likely to be restrictions to the range, even in reaction to challenges, within which improved stress results in the fruitful redirection of attention. Researchers have long recommended such limits: Yerkes and Dodson (1908) hypothesized an inverted U-shaped association between stresses and performance. Lepine et al. (2005) argued that countervailing negative sound effects of strains can accompany positive effects of felt stress consequential from challenges to achieve, even when hindrance stressors are not present. As persons devote growing awareness to symptoms of stress such as exhaustion, they may become less able to give the focused awareness to the task at hand that, attention theory suggests, will drive performance. The reason of the consideration approach implies not presently limits to the stress-performance association, but possible moderators of that association.

Attention theory distinguishes between jobs or task attributes that are to be responded to and attributes that are to be unnoticed. Individuals who feel stress organize their attention differentially, so that performance on attributes of the extent requiring an answer may increase even as responses to ignorable scope diminish sharply (Matthews & Margetts, 1991). The attention approach is complete significant when an assigned task has a high priority for an individual and when the task is familiar to the individual (Easterbrook, 1959; Matthews & Margetts, 1991). Organizational setting commitments and job experience are possible to moderate the stress performance relationship. Commitments (which leads individuals to struggle toward organizational goals) and experiences (which breeds task knowledge) each should guide individuals to focus more significantly on job performance under stress. We therefore turn next to discussions of these possible moderators and associated hypotheses concerning their effects on performance.

**Commitment as a Moderator of the Stress-Performance Relationship**

Commitment has been studied broadly and has been theoretically linked to work outcomes such as job performance and absenteeism. At least six meta-analyses address the relationship between Commitment and performance (Cohen, 1991; Jaramillo, Mulki, & Marshall, 2005; Mathieu & Zajac, 1990; Randall, 1990; Riketta, 2002; Wright & Bonett, 2002). Regardless of extensive research and strong theoretical reasons to expect that individuals with higher levels of organizational commitment will achieve better, verification of this relationship is, surprisingly, mixed (Mowday, Porter, & Steers, 1982; Wright & Bonett, 2002). Refinement
the commitments build helps to determine some of the incompatible results. For example, many studies of the commitment-performance association have used a commitment construct that encompasses both affective and calculative magnitude (Siders, George, & Dharwadkar, 2001). Studies straightening out these two magnitude specify that job performance should be unfair more heavily by affective commitment, “the relation strength of an individual’s recognition with and involvement in a particular organization” (Mowday, Porter, & Steers, 1982: 27) than by calculative commitment, which encompasses investments in continued employment and tends to control turnover (Meyer, Allen, & Smith, 1993). Subsequent this logic, we focus on affective commitment, which has been shown to be absolutely related to organizationally satisfied job performance (Siders et al., 2001).

Jex (1998), in work for more research on element that affect the stress-performance association, stable specifically to organizational commitment as a possible moderator of this relationship. The attention approach necessities the rationale for such an effect: according to attention theory, performance will be unfair by the extent to which workers under stress recognize key work tasks as attributes of a job that merit the expenditure of limited resources, relatively than as distractions to be ignored.

Commitment influences job performance during recognition and internalization. Affectively devoted individuals classify with an organization and so adopt attitudes and behaviors allowed by the organization in order to demonstrate a satisfying, self-defining association with it (Becker, Billings, Eveleth, & Gilbert, 1996). Further, they feebly accept the values and goals of the organization and exert effort toward these goals (Mayer & Schoorman, 1992; Porter et al., 1974). Workers who are highly dedicated to their organization are consequently more likely, when under stress, to direct their difficult task toward important work tasks and to reduce resources devoted to other activities.

Employees with low commitment, in contrast, may respond to felt stress by ignoring work tasks and with holding effort (Jamal, 1984, 1985). Several studies have provided indirect support for the idea that commitment influences the direction of attention under stress. Begley and Czajka (1993) showed that stress had negative effects on job satisfaction and a merged measure of job “displeasure” only when employees also had low organizational commitment. Similarly, Siu and Cooper (1998) establish that commitment moderated the effect of felt job stress on job satisfaction as well as on self-reported psychological suffering, such asstrain. And Jamal (1985).Previous reseches show the negative relationship between felt stress and supervisor assed job performance for individual with low commitments: Did not test with high commitment but he did not formerly test between two groups. No past researches have specially tested the effect of the stress-commitment interaction on job performance.

**Job Experience as a Moderator of the Stress-Performance Relationship**

Human capital theory (Becker, 1962) suggests that more experienced employees recognize better than employees new to a job, because they accrue skills in the job. Tenure in a job is positively connected with performance because “experience provides the medium for learning” (Schmidt, Hunter, & Outerbridge, 1986: 167). Schmidt and Hunter (2004) reviewed the general facts in support of the link connecting experience and performance. Experience has a bigger contact on performance when workers have relatively low tenure and still understand their jobs; the positive relationship between experience and performance typically declines as workers gain experience (Schmidt & Hunter, 2004)
The observe view suggests that experience and stress are likely to influence job performance jointly. Experience facilitate the cognitive simplification of job related routines and behaviors (Earley, Lee, & Hanson, 1990). Baron (1986) established that felt stress is more likely to facilitate aspects of performance that have been well learned, because individuals under stress are more likely to direct their notice to tasks that they understand. Usually, because job experience is linked with learning and increased capability, experienced employees under stress are more likely than inexperienced Employees to direct their attention to tasks that are middle to their job. Van Dyne and her colleagues (2002), for example, establish that hair stylists performed better under high job stress, theorize that the stylists focused on habitual actions. Van Dyne et al. did not, however, analyze the extent to which job experience moderated the stress-performance association, and the mean tenure of the workers they studied was quite high (six years). The attention view recognizes that less experienced employees could be less successful under stress. As Jex (1998) noted, less experienced employees are less able to direct their limited resources toward job tasks. Until employees have accumulated enough experience to understand how to do their jobs, stress may be negatively associated with performance. As competence grows with experience, the negative effects of felt stress on performance should diminish. Most of research examining the effects of experience has used job and organizational experience interchangeably, these two types of experience have differing theoretical implications with respect to our variables of interest and are thus not simple proxies for one another.

In difference to the limited empirical research into moderators of the effects of stress on workplace performance, the theoretical and empirical literature on the commitment-performance relationship and its moderators, including experience (Wright & Bonett, 2002), is general here we quit briefly from our focus on attention theory and felt stress to think the contact between job experience and commitment, for two reasons. First, even after many studies and several meta-analyses, evidence on the interactive effects of job experience and commitment on performance remains mixed. Our study sheds additional light on the argument. Second, we will return to attention theory in considering a three-way interaction between stress, commitment, and experience, and it is essential to include all lower terms (two-way interactions as well as main effects) in modeling such interactions (Aiken & West, 1991). Cohen (1991) theorized that the buildup of skills through experience positively moderates the effects of commitment on performance, screening that the commitment-performance relationship was stronger in late career than in mid career. Cohen’s meta-analysis did not differentiate affective commitment from other forms of commitment, but that of Ricotta (2002) specifically studied moderators of the relationship between affective commitment and job performance and, in contrast to Cohen’s, recognized no moderating effects of tenure. Wright and Bonnet’s (2002) meta-analysis, in contrast to both Ricotta’s and Cohen’s results, uncovered important, negative moderating effects of experience on the commitment-performance relationship. Per the logic of attention theory, higher job performance under stress results when individuals direct limited resources to tasks that are essential to job performance and ignore tasks that are not central to performing well on the job.

After the assessment of literature review present study has some questions for solve of those question we developed four hypotheses.
Hypothesis

Hypothesis 1.
High organizational commitment moderates the relationship between felt stress and job performance. Stress is positively associated with performance when commitment is relatively high and negatively associated with performance when commitment is relatively low.

Hypothesis 2.
Job experience moderates the relationship between felt stress and job performance. Stress is positively associated with performance when job experience is relatively high and negatively associated with performance when job experience is relatively low.

Hypothesis 3.
Job experience moderates the relationship between affective organizational commitment and job performance. The positive relationship between commitment and performance is of the greatest magnitude when job experience is high.

Hypothesis 4.
Job experience moderates the relationship between felt job stresses, high commitment, and job performance. The (expected) positive interaction between stress and commitment is of the greatest magnitude when job experience is high.

Research Methodology
We used qualitative technique for analysis of hypothesis. Quantitative and qualitative research methods can be distinguished. According to Merriam (1998) Quality or quantity methods researchers can control. Yin. (2003) both quantitative methods or statistics and numerical data based on where most results are truly felt as hard scientific data, distinguishes deal with research. quality social sciences where Jesus idea, and human behavior as in research with soft data is about.
The goal was not discover the relationship between stress and performances also check the commitment of sales person employees. For this purpose consequently individual semi structured interviews was chosen. The interview was conducted of all through face to face in the three manufacturing industries in Faisalabad. Interviews were conducted with in detail and outline the issues on the basis of fifteen questions were put through a comprehensive review of the literature, the interview questions that focus on three main areas: 1) Stress, (2) Performance (3) Commitment, job exper
Discussion and Practical Application

**Hypothesis 1.**

The sale employee’s behaviors show that 80% of sale employees feel organizational commitment create stress. This stress effect the sales person performance. Other 20% sales person’s sales employees do not agree those employees’s behavior. Sale person employees show behavior when employees have high loyalty within organization then they feel high stress. When employees have low loyalty within organization then they feel low stress. This stress always affect the performance. When employees show high loyalty within organization then they do hard work for organization. Basically they feel we are more loyal then other. When sales employees feel stress because they frustrated. When sales employees feel low loyalty within organization then balance their work. When they do not feel stress.

**Hypothesis 2.**

The result indicate the sale employees behavior 70% are behave job experience create a stress. This stress effect the sale person employees. Other 30% employees do not agree those employees behavior. Sale person employees show that high job experience employees feel high stress and low job experience employees have high performance with low stress.

The reason shows employees that high experience sale employees having high salary. He can not get this salary to other organization easily due to this he feels stress. When employees have low job experience then they feel stress because they can not get same job to other employer due to low experience. Due to this fear they feel stress.

**Hypothesis 3.**

Sale employees show their behaviors: job experience effect the employee’s commitment within organization and due to commitment effect the employee performance. Other they do not agree this behavior. When employees have more experience then show high commitment within organization. This high commitment improves the employee’s performance. Commitment and job experience have positive relationship.
Hypothesis 4.

The result indicates, job experience effects the high commitment and stress, and 70% employees act their behavior. When employee feel high job experience then he shows high commitment within the organization. Due to high commitment he can not balance at work then he feels stress. When employees have low job experience then they show low commitment within organization because they can do balance at work due to this they can perform better as compared to other.

Conclusion

This study examines the relationship between the stress and performance and also checks the moderating effect on both. Organizational commitment creates stress due to stress effect the sales person performance. When sales employees show high commitment then they feel more stress. Result also indicate high job create high stress. Job experience effect the employee’s commitment. High job experience employees have high commitment within the organization and low job experience employees have low commitments. Job experience effect the organizational commitment and job performance.

Abstract
This paper shall cover diverse aspects of Islamic Society and shall assist to prove on the basis of verifiable references that Islam is an integrated and a perfectly balanced religion. Its vision is not confined to daily issues of life but extends to explore ultimate problems of human life and destiny and thus working on high human ideals, considering morality to be the integrating factor joined to religion with a striking emphasis that economics, politics and law are related to religion through morality, thereby establishing spiritual, social, political and economic democracy. Islam being the only religion, presenting comprehensive outreach to solve issues ranging from an individual, family, rights, inheritance, status, economic welfare to the affairs of state using the rule and law of the administrative hierarchy prescribed by Quran.

Key Words: Religion, Society, Morality

Introduction

A Few Dimensions of Islamic Society

Islamic society is based on religion and morality contrary to the secular society which is based on materialism. Islamic society is therefore “Theocentric and ethico-religious, nourished by obedience and worshipping Allah. Its social philosophy is based on the belief to devote to the dictates of Almighty which in itself represents a comprehensive principle for the acquisition of
highest values and ideals. Such ideals tend the believer to the pursuit of truth, justice, love, austerity and selfless service to fellow-man.

Being an Ethico-Religious Society\(^1\) it is founded on Theo-centric ethical idealism, that rests upon (a) love for God, manifesting itself in the love for humanity, and (b) the fear of God manifested through the fear of Divine Judgment leading to the concept of life after death and ultimate destiny. It also assures the existence of an ideal example in the guise of the Holy Prophet Muhammad (peace be upon him) and the society that he established in Madina. Islamic society no doubt is a spiritually illuminated society where God is the Light of Heavens and earth, the Holy Prophet (peace be upon him) is the Light, Faith is the Light and the function of this Light is guidance by the virtue of which humanity is brought out of darkness into the light of faith and which shines from the dealings with the fellow-being. In the Heaven this Light shall be ahead of the faithful while they say: Our Lord! Perfect our Light for us\(^2\).

Regarding human dignity, Islam invites its members to noble actions because God, the Holy Quran, the messenger angel of Quran and the human race, all are noble. The norm governing Islamic conduct is also to behave nobly and it is the mission of Islam to lead its followers into the noble gate\(^3\) for the attainment of all the dimensions of human nobility. The Islamic society is thus a noble society\(^4\) An Islamic society lays emphasis on the family which is a unit of the society\(^5\) and which plays vital role in Islam’s social ethos\(^6\). It provides the first basic social environment to an individual where he or she could explore and exercise morality and which becomes significant in respect of an individual moral behaviour relating his community, country and humanity at large. Family is thus the foundation of Islamic Society which operates under certain ethical codes i.e. (a) marital piety (b) parental piety (c) filial piety namely uncompromising emphasis on: (a) chastity of the husband and wife (b) comprehensive parental benevolence, and (c) unflinching good will, devotion and respect of the children for their parents and all elders. Moreover, Islam admits chastity to be an absolute because without that no healthy society is possible. This fact accounts for: (a) the special rules of modesty which Islam has laid down for the women folk and which forbade promiscuous intermingling of sexes; (b) Islam allows conditional polygamy. On one hand it is in the acknowledgement of the women’s basic role as mother, wherein lies the fact that “the hand that rocks the cradle rules the world”. On the other hand it tells us that the spiritual and moral survival of a society may be a possibility as long as the women folk remain conscientious custodian of the community’s spiritual and moral values. The permission of polygamy is to avoid prostitution besides providing prop for the orphans by these additional women folk. It can therefore be said that Islamic society is a family based society.

Recognizing the unity of humanity and the ideal of human brotherhood\(^7\), Islam considers racialism, casteism, tribalism, class-ism, and dynasty-ism as nothing less than infidelity to God and treachery against humanity. All members of Islamic society irrespective of colour, language, race and dynasty are equal enjoying equal rights\(^8\). It is a society based on equality, non-racialism, strong feeling of brotherhood and a measure of harmony to be the building blocks of this society.

W. Montgomery rightly admits “One of the distinctive marks of Islam as compared with other religion is the variety of people and races who have embraced it and among whom there has grown up a strong feeling of brotherhood and a measure of harmony”\(^9\). Islam is ideologically an integralistic religion where the integrating factor is morality joined to religion whereas economics, politics, and law\(^10\) are related to religion through morality. Islamic society is therefore an integrated society. Apart from the principle of integration, its structural aspect is
also governed by the principle of “the balance”\textsuperscript{11}, implies the realization of different values in man’s life in a balanced manner. Similarly being Theocentric, ethico-religious, integrated and balanced, its vision is not confined day to day issues of life but extends to ultimate problems of human life and destiny and thus working on a high human ideals.

Moreover being the trustee of the mission of humanity for the realization of the vicegerency of God, it has to imitate God’s Attributes, among which is His attributes of creativity\textsuperscript{12} that leads us to the adoption of means for the improvement of human welfare in all aspects of life through the conquest of the celestial environment. Islamic society is thus an idealistic, dynamic and progressive society.

The Islamic society being egalitarian therefore establishes spiritual, social, political and economic democracy. It gives full spiritual freedom ignoring priesthood and spiritual feudalism. It also makes the acquisition of knowledge to be the prerogative and obligation of everyone including women without any distinction of family or caste. It also establishes political democracy by abolishing all secular views of government in which anyone may likely exercise tyranny and exploit the other. Similarly it establishes economic equality through the basic principle that “wealth should not be permitted to circulate among the wealthy only\textsuperscript{13}. This makes it imperative that economic system should be such as to provide equal opportunity to all members in order to secure decent means of earning. Likewise the disabled secure their livelihood honorably through the social welfare tax imposed by Islam. In Islamic social ethico, social justice has been referred in terms of absoluteness and comprehensiveness\textsuperscript{14} with special emphasis on moral, legal, economical and political justice.

The Islamic society is a merciful society which has been explicitly emphasized in Quran and the life of the holy prophet Muhammad (peace be upon him)\textsuperscript{15}. It shows that Quranic society is Altruistic as well because the very basis of the Quranic philosophy if life is the negation of all forms of selfishness and affirmation of love for humanity on the basis of love for God\textsuperscript{16}. God has imposed limitations endorsed by the holy Quran and has commanded the members of the Islamic society to adhere to them\textsuperscript{17}. It has thus organized human life under proper discipline and code of conduct.

Moreover the Quranic laws regarding international relations between Muslims and Nonmuslims and the Quranic ethics of war are based on absolute justice and regard for humanity. Similarly the holy Quran forbids the Muslims from compelling the non-muslims to change their religion thereby giving them freedom of conscience\textsuperscript{18}. Islamic society is humanitarian on the basis that they tend to do well to the non-muslims unless they are in a state of active warfare. The Quran condemns “Love of this world’s life”\textsuperscript{19} and forbids all vain spending and luxury and forbids from the luxuries of animal self thereby inviting to the love of values and the love of God which is the highest value and which manifest itself in the love for fellow beings.\textsuperscript{20} Thus the Islamic society is an austere society because the ideal of respect leads to austerity.

Moreover the Islamic society is a welfare society which the Quran refers to as “Falah”\textsuperscript{21} i.e. welfare both in the context of an individual and society at large as the collective welfare. The above mentioned are in brief features of the Islamic society founded by the Holy prophet (peace be upon him) which has not only preached by practiced and realized by the Prophet Muhammad (peace be upon him).

When this society assumes the form of the state, like in the first days in Madina, a Theocentric democratic welfare state comes into being which in a way may be called as
Government of God, through the rule of Divine Law, by the trustees of the mission of Islam, who function on the basis of their election by the persons of the character and wisdom among the Muslims and administer the state within the limits prescribed by God as servants of the people for their comprehensive welfare. Here Divine Law in the context refers to the existence of the fundamental political norms given by God and which are eternal and unchangeable that runs the Islamic state thereby ensures political stability in the total life of the community. Moreover it establishes the principle of the “Supremacy of Law” wherein no body, not even the head of the state is above the law.

Similarly “Governed by the Trustees of the mission of Islam” is another notion needs explanation that since the entire Ummah is under the obligation to promote what is good and eradicate what is bad and this is entrusted upon the state machinery of the Islamic regime to administer affairs not on political grounds but primarily closely in accordance to the dictates of Quran and Sunnah as an avowed mission.

The situation as how and who to decide the administrative hierarchy, Quran clearly states and pertain the matter to be decided in favour of those worthy of it through the will of people and not the hereditary monarchy. The Holy Prophet (peace be upon him) never exercised his absolute authority and wisdom for the sake of nomination among his descendents for becoming his successor after him but rather left the choice/office open, as a consequence of which Abu Baker (Radiallah) was elected through mutual consultation.

Regarding the condition of the electors, persons of Islamic character and pure wisdom are necessary who themselves are embodiment of good Islamic character and pure wisdom and those who elect them for the purpose must practically be devoted to Islam and must have the ability to understand the comparative merits of people, otherwise democracy is likely to change into mobocracy, as Walter Lippman remarks” Where mass opinion dominates the government, there is a morbid disintegration of the true functions of power”.22

Islam also recognizes the significance of the economic welfare of the people side by side the spiritual and moral aspects and in the light of the holy Quran it can be said that it is obligatory in an Islamic state that not only it shall ensure economic justice but economic welfare of every individual so that everyone may lead a life of dignity and honour. All human activities are organized in such a manner as to achieve the goal of dignified means of livelihood. It is this reason that Islamic society stresses not only upon the spiritual and moral reform of man but on the establishment of a healthy economic order. Islam does not allow wastefulness in any measure because bankrupt people and their families. A Muslim should therefore lead a life of spiritual grace, moral earnestness and material simplicity. Islam has established the institution of austerity and has rejected all wastefulness, luxuries and pagan ways of spending.

Islam rejects Capitalism where the prime motive always is to produce commodities for monetary benefits with selfish disregard for the interest of the fellow beings while Islam endorses the production of commodities to be utilized in the service of fellow beings through the supply of their basic needs. The former is against the will of God and anti-human while the later is according to the will of God and humanitarian and therefore becomes an obligation in the Islamic ethico-religious economic philosophy.

For healthy fulfillment of basic needs, Islam has provided a social welfare tax through Zakat for ensuring basic needs to those who are either disabled or un-employed. Another is voluntary economic welfare in the name of generosity to those in need to possible capacity
limits considering purely as the fulfillment ones right and not as the observance of a ritualistic charity.

Islam therefore ensures economic welfare for all, by adopting a methodical approach because economic sufferings emerge when wealth is concentrated in few hands as a result of the unquenchable lust for luxuries due to which weaker member of the society may be exploited. In case it continues unchecked in a society, it shall give rise to moral, economic and political corruption and may disrupt the moral and spiritual fabric of a community, finally leading to a great catastrophe. Quran dictates clear warning “And how many communities have we destroyed that became reckless in respect of (its way of livelihood).”

Abstract

This paper investigates the impact of external debt burden on the growth of agricultural and manufacturing sectors of the Nigerian economy. The main objective of this study is to examine the impact of external debt burden on the growth of agricultural and manufacturing sectors of the Nigerian economy. The external debt of Nigeria is analyzed using error correction mechanism (ECM). The study used annual time series data from 1980 – 2009, the result of the econometric analysis revealed that external debt contributes inversely to the growth of agricultural and manufacturing sectors of the Nigerian economy up to a point after which its contribution becomes positive. The use of externally borrowed funds for government projects must be closely monitored in order to ensure that they are applied efficiently and effectively.

Keywords: Impact; External Debt Burden; Growth; Agricultural; Manufacturing Sectors; Nigerian Economy

INTRODUCTION

Over the past two decades, external debt and capital flight have come to symbolize the two faces of the same coin in the development debacle. In many developing countries, these two phenomena have grown unabated, with the cumulative stock of capital flight markedly exceeding the stock of external debt especially in Nigeria (Ndikumana and Boyce, 2008). While the dramatic increase in external debt is to a certain extent understandable, especially given the recurrence of balance of payments crisis and external disequilibrium in the majority of low-income countries, the sustained increases of capital flight – the voluntary exist of private residents’ owned capital either for safe haven or for investment made in foreign currency – is less obvious, in part because the majority of the countries confronted with massive outflows of resources are also highly capital scarce.

All countries regard economic growth and development as their primary objective, this objective embraces the need to raise the income, economic capabilities and the standards of living of their peoples. To attain this objective, there must be a rise in national or per-capita income and product, in other words a rise in the production of goods and services in a country (Itesede, 2005). The goods and services so produced must be channeled to satisfy the basic needs of the people, otherwise development would not occur. Nevertheless, since the scale of production can only be increased in the long run, economic growth is considered a long run phenomenon (Kibritcioglu and Dibooglu, 2001). External debt is the debt incurred by government through the borrowing from international finance to support low productivity and
investment and to support balance of payment deficits which cannot be repaid when it fall due
Obadan (1996) opines that the seed of external debt problem was sowed in 1978 when the first
loan of 1billion US dollars known as Jambo loan was obtained. Therefore, one of the objectives
of this paper is to examine the impact of agricultural and manufacturing output on the growth of
the Nigerian economy.

Therefore, this paper examines the impact of external debt burden on the growth of
Agricultural and manufacturing output in Nigeria. The paper is divided into five sections. The
next section discusses some relevant literatures. Section III dwells on theoretical frame work and
methods. Section IV is concerned on the empirical result and discussion, while section V is the
concluding remarks.

LITERATURE REVIEW

In this paper, the review of related literature is undertaken; the review is done under the
following headings: (i) The rationale for external borrowing. (ii)Causes of external indebtedness.

THE RATIONALE FOR EXTERNAL BORROWING

Economic literature abounds with view on the importance of external source of finance
for economic growth and development (Todaro and Smith, 2006). To support this view, it is
common knowledge that shortly after the Second World War, the economies of most Western
European countries experienced rapid growth and development due in part to the injection of
foreign finance under the Marshall plan.

By the time of the termination of this plan in 1951, some 12.5 billion dollars have been
invested in the reconstruction of Western Europe. Even West Germany owed 16 billion marks to
the United States, France and United Kingdom between 1945 and 1953 and this was also used
for the reconstruction of the country. Much earlier during the 19th century, foreign capital
inflows played a critical role in the construction of Siberian Eastern railroad in Russia. This was
made possible through loans from British, German and Japanese financial interests. Foreign
capital has also made incursions into the privatization programmes particularly in developing
countries and even in Eastern Europe after the fall of the Soviet Union in the 1990s. Much of this
capital has been in the form of equity based investment on financial securities and they have
helped to raise the necessary finances for the development of these countries.

In other words, external resources play a crucial role in supplementing domestic
resources to meet a country’s set objectives (Todaro, 2006). Apart from supplementing domestic
savings, external capital inflow provides a country with foreign exchange, which is needed to
import the necessary machinery and technical expertise for the promotion of economic growth
(Nowzad, 2003). Viewed from this perspective, external finance plays a critical role in the
creation of the possibilities for more jobs, more investment and higher standard of living
(Friedman, 1984). This view is shared by Anyanwu (1997) to the effect that external borrowing
enables a developing country, for instance, to increase its rate of real investment in order to
stimulate growth.

CAUSES OF EXTERNAL INDEBTEDNESS

Hunt (2007) opines that a number of factors contribute to the increased size of external
indebtedness. One of the domestic causes of indebtedness in developing countries has been the
over ambition of public authorities to speedily boost economic growth and development in the
face of inadequate domestic capital formation through the rapid acquisition of foreign loans. In
the process, most of their governments, particularly military ones in the 1970s and 1980s,
allowed both the private and public sectors to secure credits from international capital markets whose rate of interest were less than concessionary. The public sector borrowings were usually higher because military authorities at that time found it easier and more convenient to borrow than to raise taxes that could have made them unpopular. By the end of the 1980s most developing countries appeared to have over borrowed and their output and export earnings were insufficient to meet their debt obligations.

The external factors, which have given impetus to the debt problem include the oil price shocks of the 1970s and 1980s, deterioration in the terms of trade of the less developed countries (LDC) and rising foreign interest rates (Kurumm, 2005). As a result of the oil price increase of 1973, most oil importing LDC had large current account deficits. At the same time, oil – exporting countries had large current surpluses, which were used at first to accumulate short – term liquid claims in the major commercial banks in developed countries. This deficit and surplus scenario led to a simultaneous demand for and supply of loan able funds by the importers and exporters of oil in the developing world. Consequently, oil importing countries financed their current account deficits through borrowing from the commercial banks where the surpluses of oil exporters were lodged. However, while some of the borrowing countries used the loans in financing high-return investments in the production of tradable, others did not. With time, the former reduced their current account deficits, paid off their debts and resumed normal growth. The later, which utilized the loans in maintaining pre-existing patterns of consumption, experienced serious debt problems as they could not liquidate the debts in the latter part of the seventies and earlier eighties (Adepoju, 2007). Nigeria is not an exception in this debt debacle as the country’s external debts were contracted for various purposes such as the financing of trade, balance of payment support loans, project – tired loans and loans for socio-economic needs of the people including infrastructures, health and education (Uniamikogbo, 1994). Onah (2005) informs that the first plan of Nigeria, which spanned the period between 1962 and 1968 expected about 41 per cent of the public sector investment, which totaled N653 million, to be financed from outside. The second plan (1970 -1975) envisaged 19.4 per cent foreign financing for the public sector. The third plan (1975 to 1980) and the fourth plan (1981 to 1985) envisaged limited foreign financing for the public sector. It was hoped that Nigeria’s oil money would provide the required foreign exchange for the last two plans through the application of foreign receipts, should revenue projections fall short of expected domestic expenditures. Unfortunately, Nigeria miscalculated. An unexpected slump in the oil business began in 1977 and Nigeria was forced to look for external loans if the development plans were to be completed successfully.

THEORETICAL FRAMEWORK AND RESEARCH METHODS

There are several theories that explain the export of capital particularly from surplus to deficit countries and its consequences. In this paper, we briefly articulate the classical/neo-classical, two gap theory. We would, nevertheless, base our analysis on the two-gap theory by adopting Ayadi’s (2003) model.

THEORETICAL FRAMEWORK

The theoretical basis of this study is the Two-Gap Theory, there are linkages between external debt and domestic management of the economy as economic agents borrow to fill the savings – investment gap, the fiscal gap and the foreign – exchange gap. The application of this gap-filling approach was most evident from the 1960s, 1970s and even to the present time when
governments were encouraged by donors to prepare development plans that provide estimates of exogenous savings needed to achieve given rates of economic growth.

Kindleberger and Herrick (1977) put forward the “two gap” approach to economic growth and development. The idea is that “savings gap” and “foreign exchange gap” are two separate and independent constraints to the growth prospects of less developed countries. To determine the size of the gaps, a targeted growth rate of the economy is postulated along with a given capital-output ratio. A savings gap is said to arise when the domestic savings ratio is less than the investment that is required to achieve the targeted growth rate. The economy can achieve the targeted growth by filling the savings gap by foreign loans.

The two gap theory can be explained in terms of national income accounting identities.

\[ Y = C + I + (X - M) \] ......................................................... 1
\[ Y - C + M = I + X \] ......................................................... 2

Defining Savings (S) as abstention from expenditure of income on consumption, i.e. \( Y - C = S \), we generate equation 3 which highlights the two gaps

\[ S + M = I + X \] ......................................................... 3

From equation 3, we obtain

\[ M - X = I - S \] ......................................................... 4

From equation 4, we have foreign exchange gap (M-X) = domestic savings gap (I - S). However, it is not likely that the two gaps must be equal. This is because even if a savings gap is not a problem; a trade gap could exist, thereby creating obstacles for a developing country to readily transform its domestic savings into foreign exchange. In that event, foreign resources would still be necessary.

Increases in savings and investment in an economy lead to economic growth (Hunt, 2007). Sachs (2002) argues that growth will not take-off until capital stock has risen to a given threshold. As capital rises, and investment and output rise, in a virtuous circle, the savings level will also continue to rise. After a given level, the rise in both capital and savings will be sufficient to engender self-sustaining growth. The reason for opting for external finance, as a means of ensuring sustained development rather than utilizing only domestic resources, is provided by the ‘dual gap’ theory. The theory postulates that investment is a function of savings, and that in developing countries, the level of domestic savings is not sufficient to fund the needed investment to ensure economic development. Thus, it is logical to seek the use of complementary external goods and services. The acquisition of external funds, however, depends on the relationship between domestic savings, foreign funds, investment, and economic growth. The guiding principle on when to borrow is a simple one. Borrow abroad so far as the funds acquired generates a rate of return that is higher than the cost of borrowing the foreign funds (Ajayi and Khan, 2000). In essence, by following this guiding principle, a borrowing country is increasing its capacity and expanding output with the aid of foreign savings.

Therefore, debt becomes indispensable when developing countries are faced with low domestic savings and balance of payment deficits. As a matter of fact, this deplorable condition
often occurs when there is gap in investment and domestic savings are not sufficient enough to bridge the gap that has been so created.

METHOD OF DATA ANALYSIS

It is important to describe the data used for the estimation before presenting the result. Data relating to external debt, manufacturing output, agricultural output, debt service and government expenditure is sourced from National Bureau of Statistics and Statistical Bulletin of Central Bank of Nigeria. Annual data from 1980 to 2008 were collected, this is to enable us have a considerable degree of freedom.

The time series data on agricultural and manufacturing output are subjected to Augmented Dickey-Fuller (ADF) test of stationarity. The model and functional form are linear; the results of the estimation are reported in tabular form.

Estimation methodology is of standard time series technique with variables that are tested for unit root. The Johansen (1991) error correction mechanism (ECM) estimation technique in the vector auto-regressive model is employed. The ECM estimation technique incorporates time series analysis within a dynamic framework that enables us to discern short run relationship between the variables. In the case of a set of K variables, for example, we may have cointegration relationships denoted by r, such that \(0 \leq r \leq K\), where K is the number of variable and this gives a K dimensional vector auto-regressive model.

MODEL SPECIFICATIONS AND DESCRIPTION OF VARIABLES

According to Ayadi (2003), external debt burden has dramatically limited developing countries’ participation in the world economy and debt servicing obligations continue to manifest as an impediment to economic growth and development. Debt burden has led to a limited accumulation of capital (depletion of international reserves) and a limited application of flexible financing policies to consolidate small and medium-sized firms. This directly affects employment and the provision of social services. Ayadi’s model is stated as:

\[
Y_g = a_0 + a_1 \text{DEBGDP} + a_2 (\text{DEBGDP}) + a_3 \text{DSEREXP} + a_4 \text{TOT} + a_5 \text{GCAP} + U_t \]

Where

\[
Y_g = \text{rate of output growth}
\]

\[
\text{DEBGDP} = \text{external debt to RGDP ratio}
\]

\[
\text{DSEREXP} = \text{debt service to exports}
\]

\[
\text{TOT} = \text{external shock (measured as terms of trade variability)}
\]

\[
\text{GCAP} = \text{growth rate of investment stock}
\]

\[
U_t = \text{error term}
\]

\[
a_0 - a_5 = \text{parameters}
\]
The inclusion of agricultural output, manufacturing output and government expenditure in this work is an improvement over Ayadi’s (2003) model.

The equation of estimation in this study is specified as follows:

\[ \text{Manuf} = F (\text{EXTD, DTSP, GEXPD}) \] \hspace{1cm} 6

Where

\( \text{Manuf} \) = is the manufacturing output of Nigeria \\
\( f \) is a functional notation \\
\( \text{EXTD} \) is the external debt of Nigeria \\
\( \text{DTSP} \) is the debt service payment of Nigeria \\
\( \text{GEXPD} \) is the government expenditure of Nigeria

Equation 6 shows that the level of manufacturing output in Nigeria is a function of external debt (EXTD), debt service payment (DTSP) and government expenditure (GEXPD).

The equation (6) is transform to operational form.

\[ \text{Manuf} = \beta_0 + \beta_1 \text{EXTD} + \beta_2 \text{DTSP} + \beta_3 \text{GEXPD} + U_t \] \hspace{1cm} 7

Where

\( \beta_0 \) is the constant term \\
\( \beta_1, \beta_2, \beta_3 \) are the coefficients of the explanatory variables. \\
\( U_t \) is the stochastic error term.

Since the equation 7 have unit root, it can further be expressed in first difference form as:

\[ \Delta \text{Manuf} = \beta_0 + \beta_1 \Delta \text{EXTD} + \beta_2 \Delta \text{DTSP} + \beta_3 \Delta \text{GEXPD} + U_t \] \hspace{1cm} 8

Where \( \Delta \) before the variable represent the first difference of the variable.

Equation (8) did not address long–run decision making, the procedure of differencing when variables are not stationary result in loss of valuable long run information in the data.
The theory of co-integration addresses this issue by introducing an error correction (EC) term. The error correction methodology is appealing because of its ability to induce flexibility by combining the short run dynamics and long run equilibrium model in a unified system while at the same time ensuring theoretical rigor and data coherency and consistency (Iyoha, 2004). An ECM takes the following form:

$$\Delta \text{Manuf}_t = \beta_0 + \sum_{i=0}^{\beta_1} \Delta \text{EXTD}_{t-k} + \sum_{i=0}^{\beta_2} \Delta \text{DTSP}_{t-q} + \sum_{i=0}^{\beta_3} \Delta \text{GEXP}_{t-g} + \sum_{i=0}^{\beta_5} \Delta \text{EC}_{t-1} + U_t \ldots 9$$

The expected signs of the coefficients a priori are

$$\beta_1 < 0, \beta_2 < 0, \beta_3 > 0$$

We also hypothesize that agricultural output is a function of the explanatory variables in equation 6.

$$\text{Agric} = F (\text{EXTD}, \text{DTSP}, \text{GEXP}) \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots 10$$

Where

- Agric is the agricultural output of Nigeria
- EXTD is the external debt of Nigeria
- DTSP is the debt service payment of Nigeria
- GEXP is the government expenditure of Nigeria

Equation 10 shows that the level of agricultural output in Nigeria is a function of external debt (EXTD), debt service payment (GTSP) and government expenditure (GEXP).

Equation (10) can be stated in operational form.

$$\text{Agric}_t = \beta_0 + \beta_1 \text{EXTD} + \beta_2 \text{DTSP} + \beta_3 \text{GEXP} + U_t \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots \ldots 10$$
Equation 11 shows the first difference and the error correction term as earlier define

\[
\Delta \text{Agric}_t = \beta_0 + \sum_{j=0}^{k} \beta_1 \Delta \text{EXTD}_{t-k} + \sum_{j=0}^{q} \beta_2 \Delta \text{DTSP}_{t-q} + \sum_{j=0}^{g} \beta_3 \Delta \text{GEXP}_{t-g} + \sum_{j=0}^{1} \beta_4 \Delta \text{EC}_{t-1} + U_t \ldots 11
\]

The expected signs of the coefficients a priori are

\[\beta_1 < 0, \beta_2 < 0, \beta_3 > 0\]

In order to avoid spurious regression, we need to discern the stationarity of the series. Stationarity could be achieved by appropriate differencing and this appropriate number of differencing is called order of integration. We use Augmented Dickey-Fuller (Dickey and Fuller 1979) tests to check the stationarity of the variables. The order of integration assists in the determination of subsequent long run relationship among the variables.

**EMPIRICAL RESULTS AND DISCUSSION**

There are no rules to select the number of lags, one can use any of the information criterions; in this study we utilize the Akaike’s information criteria (AIC), Hanna-Quinn Information Criterion (HQIC) and Schwarz Bayesian criterion (SBIC). Our choice of lags for the ADF test is based on HQIC and SBIC which suggest 4 lags as shown on table 1.

In Table 2, all the variables are stationary at their first differences, however, only external debt and debt service payments are stationary in levels. Table 2 shows the results of the Augmented Dickey-Fuller unit root test of stationarity, using the Microfit 4.1 for windows. Since all the variables are found to be stationary in their first differences, we proceed further to carry out a cointegration test, using the method suggested by Johansen (1985). This test enables us to find, if the residuals of the preliminary linear spline regression are stationary and the test procedure provides options for specifying the type of deterministic trend present in the data, we have assumed linear deterministic trend in the data.

COINTEGRATION TEST

The Johansen cointegration test (Johansen, 1991) is used to test for the number of cointegrating relationship for the two estimates, these are shown in tables 3 and 5 (see appendix). The Johansen’s method detects the number of cointegrating vectors in a non-stationary time series and allows for hypothesis testing regarding the elements of cointegrating vectors. We used the maximum likelihood Eigen value Tests to determine the number of cointegrating vectors (cointegration relationship) amongst the variables in the two estimates. The Johansen’s technique is chosen because it is a vector autoregressive based and there are clear evidences that it performs better than the single equation and the alternative multivariate methods (Olusanyan et al, 2009).

Following Johansen Cointegration Test approach, we reject the null hypothesis of no cointegration relationship in the four estimates. Table 3 has 2 cointegrating equations at 5 per cent significant level. Table 4 has 2 cointegrating equations at 5 per cent significant level (see appendix). These indicate that at least one cointegrating vector (i.e. r = 1) exist in each of the equation of investment estimation. It implies that the variables used in this study have equilibrium condition that keeps them in proportion to each other in the long-run.

MODEL I

Table 5 (see appendix) provides data for the short-run error correction coefficient estimates in model I. In the short-run results, the value of R² which is 0.95053 indicates that over 95 per cent variation of the agricultural output is explained by error correction model, the goodness of fit is quite favourable. The coefficient of external debt is -0.097407. This shows that there is an inverse relationship between agricultural output and external debt. The implication of
this inverse relationship implies that a heavily indebted country like Nigeria could not improve the agricultural output and hence it has adverse effect on the growth of the Nigerian economy. It is significant at 1 per cent level and this shows that external debt is relevant in explaining inverse relationship of agricultural output in Nigeria. This relationship in the result is in line with the a priori expectation stated in chapter three. The coefficient of debt service payment in the current year is 0.96474. This signifies that there is a direct relationship between agricultural output and debt service payments. In the current year, the improvement in the debt service payments of the country enhanced agricultural output and hence it impacted positively on the growth of the Nigerian economy. The coefficient of debt service payments in the previous year which is -3.3169 shows that there is an inverse relationship between agricultural output and debt service payment. This is because a large proportion of the country’s GDP is spent on the debt service payments and hence it fails to improve the level of agricultural output in Nigeria. The negative implication of the debt service payments on agricultural sector impacted a negative economic growth on the economy. It is significant at 1 per cent level and this shows a strong inverse relationship between debt service payment and agricultural output. The coefficient of government expenditure which is -0.031684 in the current year indicates that there is an inverse relationship between agricultural output and government expenditure. This inverse relationship implies that government wasted the meager resources on unproductive investment and hence it impacted negatively on the growth of the economy. It is significant at 10 per cent level and this shows that there is a weak relationship between agricultural output and government expenditure. The coefficient of government expenditure in the previous year is -0.34774 and this implies that there is an inverse relationship between agricultural output and government expenditure. This inverse relationship bore down on the wreck less spending of the government on investment that are not of interest to the country. The wreck less spending did not increase the level of agricultural output and hence it impacted negatively on the growth of the economy. This implies that the loans obtained by government to revamp agricultural sector crowds out government activities in Nigeria.

MODEL 2

Table 6 (see appendix) provides data for the short-run error correction coefficient estimates in model II. From the short-run error correction results, the value of $R^2$ is 0.46891. This indicates that over 47 per cent variation of the manufacturing output is explained by the error correction model. The goodness of fit is not quite good because of the low percentage of manufacturing output in Nigeria.

The coefficient of external debt, is 0.020208 indicates that there is a direct relationship between manufacturing output and external debt. This direct relationship means that improvement in the management of the external debt of Nigeria increases the level of manufacturing output, which impact positively on the growth of the economy. The coefficient of debt service payment is -0.012961. This shows that there is an inverse relationship between manufacturing output and debt service payments. The negative relationship equally impacts negatively on the growth of the economy. The coefficient of government expenditure which is 0.041175 implies that there is a direct relationship between manufacturing output and government expenditure. This direct relationship shows that an improvement on government expenditure improves the level of manufacturing output in Nigeria, which impacts positively on the growth of the economy. It is not significant at any level. This shows that there is a weak relationship between manufacturing output and government expenditure.
The production sector representing agricultural and manufacturing output do not generally perform well as indicated by coefficients expected signs. This is because external debt does make agricultural and manufacturing output to perform below expectation.

**POLICY IMPLICATION OF RESULTS**

The major policy implications of the results of this study is that since foreign debt has an insignificant direct effect on economic growth, money borrowed externally must be productively invested in growth generating ventures that could repay the debt on schedule. When foreign loans are spent on unviable projects, their effects on macroeconomic performance are low. The results also confirm the debt overhang hypothesis, such that high debt burdens have depressing effect on investments. However, sustained medium term growth of Nigeria’s economy would demand moderate increases in import of capital goods and other inputs. In order to sustain economic growth, investment must grow rapidly and directed towards tradable production and export especially in the agricultural and manufacturing sectors of the economy.

Both agricultural and manufacturing sectors can be stimulated by increasing the productive capacity of the economy through foreign loans. In this regard, there is the need to cushion government’s spending in the face of unpredictable and frequent oil price shocks.

**CONCLUDING REMARKS**

The results obtained from econometric investigation of the Nigerian debt problems undertaken in this paper can now be summarized with some concluding remarks and recommendations. The results obtained confirm and support the existence of the debt overhang hypothesis in Nigeria. Similarly, increases in resources outflow due to servicing of external debts result in serious depression of domestic economic activities in Nigeria in terms of contraction of agricultural and manufacturing output.

There is an inverse relationship between changes in agricultural and manufacturing output, but as a result of the external debt incurred in Nigeria. This indicates that the key to reducing foreign indebtedness is increased agricultural and manufacturing output.

Indeed, the study showed that the country’s agricultural and manufacturing output of the Nigerian economy has been depressed. The study also showed a crowded out effect on both public and private investments in the economy. Social services could not be provided in the country as a result of mismanagement of the externally borrowed funds. Undoubtedly, externally borrowed funds has created a problem of debt overhang hypothesis and puzzled the realization of economic growth and development of the country. It is interesting to note that externally borrowed funds though has a direct contribution to the growth of the economy, the contribution is very insignificant.

**RECOMMENDATIONS**

i. The use of externally borrowed funds for government projects must be closely monitored in order to ensure that they are applied efficiently and effectively.

ii. Investigations must be carried out periodically to ensure that the optimal debt ratio is not exceeded. That is, the debtor nations should not exceed the opportunity granted them to borrow more funds from the creditor nations.

iii. All the tiers of governments should ensure that there is general consistency of policies as they relate to the development of productive investment on agricultural and manufacturing output in Nigeria.

*Initially this study was presented at an International Conference. It is a refined version of the previous idea presented at the conference, submitted to IJCRB for publication.

Abstract
This study examines the affect of different demographic factors i.e. age, gender, marital status, education and monthly income on financial risk tolerance of investors. It shows how investors perceive return for risk taking. Data is collected from 150 respondents residing in Rawalpindi/Islamabad to analyze the association of financial risk tolerance scores (RTS) with demographic information. The results of the study reveal that demographic factors are significantly related to the RTS where RTS is an increasing function of education and income level and decreasing function of age, not being single and being a female. The study shows that education and gender are the most important factors that have strong impact on RTS.

Keywords: Financial risk tolerance, demographic factors, investor’s perception, financial risk tolerance scores (RTS)

Introduction
This study is conducted to find out how demographic characteristics of investors affect investors’ financial risk tolerance in Pakistan. There are several studies at international level to find out investors’ risk tolerance in reference to certain demographic and socioeconomic variables. However, in Pakistan, little attention has been paid to this concept. In this study risk tolerance as taken as dependent variable that reflects investors’ score on the risk assessment measure. However, independent variables are investors’ gender, age, marital status, income, education, and income. These variables were used as predictor variables in the analysis because they encompass the characteristics that practitioners and researchers have identified as suitable for assessment of financial risk tolerance. No past studies are available in Pakistan in context with
investor’s risk tolerance and Investors in Pakistan are not properly aware about the concept of risk tolerance. This study examines how a set of demographic variables could be used to measure investors’ attitude towards risk tolerance. Financial risk tolerance indicates the investor’s willingness to accept the variation while taking financial decisions. Whether in the realms of education, professional practice, or empirical research, risk tolerance is acknowledged as an important factor in savings and investments choices for retirement or other household goals. Risk tolerance evaluation is a key input in the formulation of individualized portfolios; academics and practitioners have not yet paid much attention to this variable. It is found that demographic characteristics could be used to forecast financial risk tolerance (Grable & Lytton, 1999).

Hallahan et al. (2004) conducted a research by using database to develop financial risk tolerance scores (RTS) through ProQuest questionnaire. They found a significant relationship between different demographic characteristics and RTS. Demographic characteristics have multidimensional affect on individuals’ routine life and specific impact while taking decisions especially which are concerned about financial resources. This study is conducted to address the problem of how demographic characteristics affect the perception of investors about financial risk tolerance.

Literature Review

Pakistan is a developing country with 180 million people. The changing global scenario created multiple challenges for public to improve the quality of life. Economic activities in the shape of investment decision are one of the essential elements of an individual in the recent age. Investor’s perception about financial tolerance could be linked with demographic features to have a clear understanding. Investors with different social class, education, gender and other demographic features reflect a varied behavior regarding financial decisions. Similarly, investment opportunities and financial regulation of a specific country could influence the risk tolerance behavior of the investors. This study examines the influence of demographic attributes and risk tolerance. A number of studies regarding investor’s perception of risk tolerance were undertaken across the globe. The degree of risk about which someone shows willingness to accept is known as individual risk tolerance (Young & O’Neill, 1992).

Baker & Haslem, (1974) investigated the impact of investors’ educational level on risk tolerance. It is also found that risk tolerance could be decreased with age (Morin & Suarez, 1983). In another study, it is found that there is a positive relationship between educational attainment and financial risk tolerance (Sung & Hanna, 1996). In addition, it is evident from the previous research that there is inverse relationship between risk tolerance and age (Palsson, 1996). While a negative relationship exists when testing the association between age and risk tolerance (Wang & Hanna, 1997). Similarly, it is reported that females were less risk tolerant as compared to male investors (Grable, 2000).

Carducci & Wong (1998) investigated the pattern how demographic, socioeconomic and attitudinal characteristics affect the financial risk tolerance in “everyday money matters”. Education is a third important factor which affects investors’ risk tolerance (Sung & Hanna, 1996). Similarly, income level could influence the investor’s risk preference (Grable & Lytton,
1999). Risk tolerance was linked with different personality attributes like gender, age, marital status, income and educational level, as well as more financial knowledge and expectations (John, 2000). The relationship between marital status and investors’ risk preferences is investigated towards investment decisions. People invest in money and capital market in order to earn some return on their investment (Bernasek & Shwiff, 2001).

Method
This study investigates the investors’ behavior towards “determinants” of risk tolerance. The respondents of the study consist of individuals who have invested their money in capital and money market. The study took the sample of 150 respondents. A structured questionnaire that contains a set of thirteen questions was used to measure each respondent’s risk tolerance. The questionnaire for this study consists of five demographic factors like investors’ income, marital status, gender, year of birth and education. Along with demographic questions the research instrument comprises of 13 questions to develop Risk Tolerance Score (RTS). The researcher used a modified version of research instrument applied by Hallahan et al. (2004).

Regression analysis is carried out to investigate the relationship among selected variables. RTS is dependent variable and independent variable includes individual demographic characteristics. In order to analyze the data, this study used the similar regression model as used by Hallahan et al. (2004). The model assumes that the RTS for individual \( i \) is a function of each of these demographic characteristics, i.e.

\[
RT_{oli} = \alpha_0 + \alpha_1 D_G + \alpha_2 D_{AGE} + \alpha_3 D_{MARRIED} + \sum \alpha_g D_{EDU} + \sum \alpha_h D_{INC} + \epsilon_i
\]

Where
- \( D_G \) is the gender of the respondent
- \( D_{AGE} \) is the age of the respondent
- \( D_{MARRIED} \) is a dummy variable that takes a value of unity if the respondent is married
- \( D_{EDU} \) captures the completed level of education of the respondent
- \( D_{INC} \) shows the respondent’s income

Results and Discussion
In this study Multiple Regression model is used to examine the relationship between different demographic characteristics and investor’s risk tolerance score. The results show strong relationship between independent variables and the risk tolerance score. The magnitude of the relationship between independent and dependent variables is manifested from the value of \( R^2 \) which is 0.934 i.e. 93.4% of the variance in risk tolerance score has been significantly explained by the five demographic factors. As \( F \) value is significant at the .0001 level, hence the independent variables accounts for significant variation in the dependent variable. The regression coefficients are presented in table 1.

{Insert Table 1}

In order to explore the relative importance of each independent variable t-statistics is used. The results of t-statistics reveal that education is the most important factor that makes significant difference in investor’s risk tolerance followed by gender, age, marital status and monthly income. Furthermore, an anomalous result of the study is that investor’s monthly income is least
important among all variables with respect to risk tolerance. The coefficient attached with income of investors is positive but weakly significant as compare to other variables.

These results are consistent to the previous studies that risk tolerance decreases with age (Morin & Suarez, 1983; Grable & Lytton, 1999). An important finding of the study is that both education and salary level of investors have positive impact on risk tolerance level. With higher level of education, investor’s had the higher potential to analyze the investment opportunity and can bear more financial risk. These results are steady with (Haliassos & Bertaut, 1995; Sung & Hanna, 1996; Carducci & Wong, 1998). Similarly, risk tolerance was linked with different personality attributes like gender, age, marital status, income and educational level, as well as more financial knowledge and expectations (John, 2000).

**Conclusion**

This study incorporates the affect of gender, age, education, marital status and monthly income on investor’s risk tolerance. This study provides evidence that various demographic factors have diverse affect on investor’s risk tolerance. It has been found that education and investor’s monthly income are directly proportional to risk tolerance score whereas age, gender and martial status have inverse relationship with it. Investor’s risk tolerance decreases as their age increase while other variables are held constant. These results are consistent to Morin & Suarez (1983) finding that risk tolerance declines with age.

An important finding of the study is that both education and salary level of investors have positive impact on risk tolerance level. With higher level of education, investor’s had the higher potential to analyze the investment opportunity and can bear more financial risk. Same is the case with investor’s salary level, as as their income increases they can broaden their investment horizon. With regard to marital status of investor, this study founds that married individuals are more risk averse as compare to singles. The underlying reason is that married individuals have greater family responsibilities that decrease their relative risk tolerance. Finally women are more risk averse as compare to men with respect to financial decision-making.

Abstract
This study aims to explore the concept of corporate social responsibility in the services sector of Pakistan. The government and corporate sector should work together to build the relationship between business and society. The concept of corporate social responsibility in Pakistan is at a very beginning stage. It needs awareness and change in the behavior of corporations and government. A structured questionnaire was used to explore the five dimensions of CSR in three sectors of the services industry i.e. Telecom, Education and Banking organizations. The data was entered into SPSS 16.0 for analysis. The results indicate that employees’ agreement reflects the highest scores as compared to other dimensions of CSR. Findings reveal a moderate response from the employees regarding selected dimensions of CSR in services sector in Pakistan. This study enables the different stakeholders to enhance their understanding by providing a direction for more research regarding CSR in developing countries like Pakistan.

Key words: Corporate Social Responsibility, Services Sector, Pakistan.

1.0 Introduction
Service sector plays a major role for economic growth and social well-being in the country. Service sector in Pakistan also experience an expansion due to changing global scenario. Corporate social responsibility (CSR) effects services sector due to direct link to the society. It requires that the company should focus on other values than profit and it is great responsibility of societal and environmental activities within and outside the company. The companies incorporated corporate social responsibility initiatives in response of government intervention,
demand from investor and consumer activism. It is reported that the services sector is more practical than the other sector in the country (Clarkson, 1988).

In Pakistan, the practices of social responsibility are very confusing because corporate sector blames to government for poor governance, political and economic instability in the country. It necessitates exploring the contribution of CSR for the well being of society and the employees of corporate entities. This study investigates the CSR practices in Pakistan especially considering the services sector. Because most of the companies in Pakistan don’t have the clear policies regarding corporate social responsibility. Services sector included corporate social responsibility as the part of their core values, vision and mission (Gillis, 2001).

This study aims to explore the concept of corporate social responsibility in the services sector of Pakistan. The government and corporate sector should work together to build the relationship between business and society. The concept of corporate social responsibility in Pakistan is at very beginning stage. It needs awareness and change in the behavior of corporations and government. Corporate social responsibility is getting more importance in different organizations. Companies start making CSR departments to implement CSR policies and guidelines from UNO and EU.

2.0 Literature Review

The study examines the CSR practices in service sector of Pakistan. It has experienced several crises due to inconsistent policies, unstable political environment and constant foreign intervention since its creation. The inception of 21st century came with multiple opportunities for the corporate sector to explore new markets throughout the world. The expansion in organizational size and scope poses a number of challenges in the recent age of high competition. Similarly, social pressure and globalization requires social responsibility from the corporate sector to ensure the interests of different stakeholders. It needs to monitor the corporate social responsibility from the corporate sector to meet the prevailing parameters. There a number of studies those investigate the CSR in the different parts of the globe.

Friedman (1970) argued that it is the social responsibility of business to practice the free competition without deception or fraud. Similarly, it is reported that management of the business organizations is required to honor the economic, legal, ethical and discretionary responsibilities (Carroll, 1979). Employees’ rights could be costly for the organizations but they should not ignore it to realize the greater profits (Jardins & McCall, 1985). It is found that factors of corporate social responsibility are important to enhance the organizational effectiveness (Zahra & LaTour, 1987). In addition, it is concluded that employer gave the financial compensation and benefits to employees with better work performance (Schiemann, 1987).

Bowen (1988) suggested that corporate sector should facilitate the employees and their families. The study reveals that the private and public organizations should develop the policies to support the family of the employees and involve them in decision making. Similarly, the relationship between CSR and organizational effectiveness was investigated (Kraft, 1991). In addition, the top management’s attitude towards CSR is examined and findings show that basic skills
employed took the corporate social responsibility but requires the consideration of economic and legal issues (Anderson, 1993). In addition, it is reported that positive reaction from external stakeholders could create positive effect on employee’s behavior (Riordan & Bill, 1997). Lankau (1997) found that flexible working hours could create the high level of organizational commitments and high level of job satisfactions. It is reported that there is a positive relation between corporate social performance and high level of job choice. Higher level of corporate social performance could attract the highly qualified employees for organizations (Albinger & Freeman, 2000). Similarly, employees’ rights as employee freedom, employee safety, and employee participation in decision making and employee privacy at workplace could be the foundation (Rowan, 2000).

Mujtaba & Sims (2006) reported that store managers were formally trained for ethical issues but there is no formally training for employees. It is documented that employee perception about organization is positive toward the job security, satisfaction behavior of citizenship because of corporate social responsibility. Employees not only react on wrong things but react on positive behavior of their organization in the presence of CSR (Rupp et al., 2006). Corporate social responsibility is beneficial for the corporate sector and employees. It is found that many business responses to demand of corporate social responsibility not in business operation but in management, staff and stakeholders (Fuentes-Garcia & Veroz-Herrado, 2007). Similarly, it is reported that internally and externally behaviors of CSR are almost the same thing. Internal behavior means legal and ethical compliance of employee checked by compliance officer and externally checked by CSR (Houghton et. 2009).

3.0 Methodology
This study examines the corporate social responsibility in the service sector of Pakistan. The population of the study is the employees of selected organizations from the services sector of Pakistan. The responses were collected from three sectors of the services industry i.e. Telecom, Education and Financial organizations. A sample of 500 respondents was selected for this study. A structured questionnaire was developed to record the response of the employee about the corporate social responsibility. Service sector was easy to approach and get data by using personal sources because the country like Pakistan have no trend to fill the questionnaires as a responsibility and send back to the researcher. Therefore data was collected through personally contact approach from the employees randomly.

Primary data was collected with the help of questionnaires from service sector of Pakistan. The questionnaires almost cover all the banks, educational institutions and the telecom companies. The questionnaire contains five main factors explaining the corporate social responsibility regarding employees. The factors of CSR include company information, physical working environment, employee’s agreement, flow of information and ethics. The responses were recorded on five point likert scale ranging from 1 to 5 (i.e. 1 stands for strongly disagree, 2 represents disagree, 3 for neutral, 4 is used for agree and 5 represents strongly agree. Data was organized and entered into SPSS 16.0 version to analyze the responses of the employees regarding CSR in Pakistan.
4.0 Result and Discussion

This study investigates the CSR practices in Pakistan especially in services sector. A total of 500 questionnaires were distributed among the employees of the service sector organizations. There were 250 completed questionnaires processed for the data analysis and the response rate was 50% that is reasonable to perform statistical analysis by using SPSS. Corporate social responsibility cover five important aspects which are related to company information, physical working environment, employee agreement, flow of information and ethics.

Respondents have the different experiences toward their jobs in the different organizational background. The results indicate that 50% of the respondents have an experience of 1 to 3 years, 32% with 4-6 years experience, 13% with 7-10 years experience and only 5% employees are working at their current organizations with more than 10 years experience. Similarly, 62.8% male respondents participated in the survey and 37.2% of the total respondents are represented by female segment. In addition, 42% respondents have MBA degree, 21% with MSc degree, 17% respondents have M.A. qualification, 14% of respondents are graduates with 4 years degree program and 4% respondents have M. Phil qualification.

The respondents represent the different organizations of the services sectors like education, financial and telecom. 70 respondents belong to the education sector which is 28% of the total respondents. 134 respondents represent the financial sectors as the 53.6% of the total respondents and only 46 respondents were from the telecom sector that is 18.4% of the total respondents. Size of the organizations is an important indicator. The results indicate that only 24 respondents which is 9.6% of the total respondents were belonged to the organizations with less than 100 employees and 226 respondents that is 90.4% of the total employees represents large organizations with more then 500 employees in the organizations. Descriptive statistics is used to explore the relative importance of different dimensions of corporate social responsibility in services sector of Pakistan.

Table 1 presents a snapshot of the kurtosis and skewness for the five dimensions of CSR (company information, Physical working environment, employee agreement, flow of information and ethics). The descriptive statistics for the selected dimensions of CSR are shown in table 2.

Table 2 reveals the results for the five dimensions of corporate social responsibility in the service sector of Pakistan. It depicts the descriptive statistics to reflect the relative importance of each dimension of CSR. The results show the perception of employees of services sector regarding different dimensions of CSR. It is found that employees are more comfortable to have company information. It is evident that more informed employees motivated and perceive better feelings regarding CSR; the mean for the company information is 2.81 with a standard deviation of 0.6 that is above average. Similarly, physical working environment is another aspect of the corporate social responsibility with reference to the employees. The results indicate that most of the employees are not happy with the physical working environment as it reveals an average of 2.6 with fairly greater dispersion. It is a responsibility of organization to provide safe working environment. It is reported that good physical environment could create positive effect on employees’ performance and better indication of CSR (Gist & Mitchell, 1992).
Employees’ agreement is also considered as an important indicator of CSR. The results indicate the perception of employees’ agreement as an average of 2.92 that reflects the importance of CSR at work place. Similarly, flow of information is another important aspect of corporate social responsibility for the employees. Fair flow of information could create positive feelings among employees to address the CSR. The results indicate a moderate feelings regarding flow of information among employees of service sector. Similarly, the fifth aspect of corporate social responsibility with reference to employees is ethics. The results show an average of 2.70 for the ethics to represent the CSR among employees of services sector. It is suggested that proper flow of information could enable the employees for participation in organizational decision making process (Dahl, 1985).

5.0 Conclusion
This study aims to explore the concept of corporate social responsibility in the services sector of Pakistan. The government and corporate sector should work together to build the relationship between business and society. The concept of corporate social responsibility in Pakistan is at very beginning stage. It needs awareness and change in the behavior of corporations and government. A structured questionnaire was used to explore the five dimensions of CSR in three sectors of the services industry i.e. Telecom, Education and Banking organizations. The data was entered into SPSS 16.0 for analysis. The results indicate that employees’ agreement reflects the highest scores as compared to other dimensions of CSR. Findings reveal a moderate response from the employees regarding selected dimensions of CSR in services sector in Pakistan. The study enables the different stakeholders to enhance their understanding by providing a direction for more research regarding CSR in developing countries like Pakistan.

Abstract
Unequal distribution of wealth is a common and the oldest economic problem. Concrete evidence of its existence in the early age of civilization is available. Still this issue subsists in all the economies of the world. Infaq (donation in the way of God) is one of the important tools provided by Islam to solve this problem. Qur’an has given special emphasis on it, and in many verses invitation of this wholly spending is given. Different examples in the life of wholly Prophet are available, with which this pious act can be institutionalized. It is the need of time to eliminate the poverty in Pakistan and other Muslim countries with the help of available Islamic economic tools.

Key Words: Infaq, Quran, Wealth.

1. Introduction
Since the early age of human civilization the problem of unequal distribution of wealth is exists in all parts of the world. From that time till today it can be found in almost all the economies of the world, regardless, of time and place. Its intensity may be different but its presence is an indispensable fact. This fact can be proved from the holly Qur’an. Qur’an has presented the
nation of Prophet Noah (S.A.W) as the initial stage of civilization, but at this stage also, society was divided in two classes. One class which has and the other which does not has, Qur’an has used the term *al-ma* (11:27) for the former. *Al-ama* means those people who have sufficient food and are almost self-sufficient, or the rich and elite class of the society. *Arzohna* (11:27) is the term used by Qur’an for those who have nothing, the people who are poor in appearance or lowborn. It means at that time, society was divided in two classes i.e. rich and poor.

This situation was not restricted to just the nation of prophet Nooh (S.A.W) only but remains same in almost all the nations described in Qur’an. Even Qur’an has formulated it as a universal truth, by saying that:

*And We sent not unto any township a warmer, but its pampered ones declared: LO! we are disbelievers in that which ye bring unto us. (34:34)*

It means that, problem of unequal distribution of wealth was common in all nations of the history and it is still present in almost all the nations of the world. This is the reason that, Qur’an has categorically ordered to the Muslims that:

*that it become not a commodity between the rich among you. (59:7)*

Qur’an on one side gives this clear cut order and on the other hand provides some meaningful techniques for the solution of this problem. Waqf, wasiyyah, Sadaqas, Qard Hassan and *Infaq* etc., are those instruments which Qur’an and Sunnah suggest to improve the unequal distribution of wealth. These are non-obligatory methods depending upon the willingness of general public. The basic objective of this paper is to highlight the role of Infaq in this regard.

### 2. Role of Infaq

Infaq is basically alternate name of pious spending (Siddiqui 1996) Whereas the importance of *Infaq* is concerned it is quite interesting that, order of *Infaq* is not just given to Muslims only, but this order is for all human being regardless of time, place, religion or any other thing. This fact can be clear from the following verse of Qur’an.

*And covet not the thing in which Allah hath made some of you excel others. Unto men a fortune from that which they have earned and unto women a fortune from that which they have earned (4:32).*

The first and the most important point is that Qur’an is addressing to the whole mankind in this verse, and the second point is that, only partial ownership of income and wealth is recognized by Qur’an. It means that, the mankind cannot claim the right of ownership on their total income and wealth. They can keep only that part of their income and wealth which is necessary for the necessities of life, as it is said at another place.

*These people ask you how much will be spend in the way of Allah? said everything beyond your requirements. (2:219)*

The basic objective of this pious spending is to uplift the poor segments of society. This is the reason that Qur’an has counted all needy people of the society as the most deserving people for this honorable spending. In this way each Muslim becomes the supporters of the other. It is quite interesting that Qur’an has counted it as the right of deserving people.
So give to the kinsman his right, and to the needy, and to the wayfarer. That is best for those who seek Allah's countenance. And such are they who are successful. (30:38)

In this way Muslims help each other without hurting the self respect of the others. It is an important fact that, both in Qur'an & Hadith the amount and heads of Infaq is not given. This fact gives extraordinary expansion to infaq for its application. it means that any amount to any needy person at anytime and anywhere can be given for any purpose. With that Qur’an has also imposed some conditions in this regard.

3. Conditions of Infaq

Qur’an has imposed certain conditions in this regard, these are as follows:

3.1 It should be for the pleasure of Allah and not for any showiness (92:20)

3.2 It should be for the goodness and without any expectations of reward and just for the consent of Allah (92:18-20) If the purpose of this act is something else then it will not produce any good results.

3.3 No aim of publicity should be there (4:37-38)

3.4 Hidden Infaq is much better than the open donations (2:271) because the self respect of receiving person keeps intact in farmer case, which is most important.

3.5 It should be before death (63:10), definitely after death there is no chance of doing this act.

3.6 It should be out of pure and scared income (2:267) that infaq does not have any importance which is done through illegal or haram income.

At here one important point should be kept in mind that, the aim of measures adopted by Qur’an and Hadith for this purpose is not to provide equal amount of facilities or bring them to the same level. Definitely it is impossible, on the other hand, basic aim is equitable distribution of wealth Ahmed (1955) it means that existence of inequality is a natural phenomenon, but it is not a chosen fact Moududi (1994)

4. Infaq Should be Develop as an Institution

Infaq can be develop as an institution in the light of teachings and practice of wholly prophet (P.B.U.H) different examples from his life can be given in this regard.

4.1 In one case prophet has assigned a job to some persons who have presented their services voluntarily, as in the case of slaves, who deserted enemy camp at Ta’if, he nominated a certain person or group of persons to look-after the physical or monetary cost of these people.

4.2 In another case prophet has made a general appeal on volunteering basis to do a certain job, as he did in the case of financing the destitute of the tribe of Mudar and in case of purchasing a well at a certain time.

4.3 It may be possible that, it will be made compulsory for the people that, they will provide maximum physical and monetary contribution to fulfill the requirements of any particular job. As it was did in the case of gazwa-e-tabuk. Hassan-uz-Zaman (1993).
These examples clearly mentioned that the scope of Infaq is expanded from micro to macro level and it may be on volunteer or compulsion basis. It is the need of time to follow these examples of wholly prophet to eliminate the poverty in Pakistan.

**Conclusion:**

Unequal distribution of wealth is a particular phenomenon of almost each economy Infaq can play a vital role to eliminate it. When all the people of state will help each, other just on brotherhood basis and keeping this fact in mind that they are following the orders of Allah for his consonant. Poor and backward people of society will get help and they will stand on their own feet. In this context government will play her role by institutionalized it. In this case poverty will be eliminated from the society up to a large extent.

Ahmed, Mushtaq (1955) *Business Ethics in Islam*, Islamabad

Abstract

Modem economics presents a concept of economic man on the other hand Islam gives the idea of an Islamic man. The former is based on a materialistic approach in which the basic objective of life remains just to get maximum satisfaction and maximum profit or any other form of utility. Man lives only for these objective, which is completely less human level. On the other hand latter is based on believe of Allah and high moral values and present a much better way of life as compare to the former.

Key Words: Economic Man, Islamic Man, Qur’an

1. Introduction

The term economic man was first used by Joseph Pseky (1995). Although it is a new concept in economics, but it is often associated with ideas of 18th century thinkers like Adam Smith and David Recordo etc. No doubt this concept in the raw form can easily be found in the writings of these thinkers, for example in the following quotation of Adam Smith, reflection of this modern concept can easily be found. He writes “It is not from the benevolence of the butcher, the brewer, or the baker that we expect our dinner but from their regard to their own interest”, Adam Smith (1986). It means that in a more or less form it was exist, but recently it has taken a concrete form. This concept was developing to show the rational behavior of individual decision making units i.e. a consumer, a firm and an industry. On the same line the concept of an Islamic man can also be drawn from the teachings of Islam. At many places in Qur’an and Hadith characteristics of
momineen are given, with the help of these qualities a concept of Islamic man can be derived. The basic objective of this paper is to analyze and compare these two concepts. For this purpose first the characteristics of an economic and Islamic man are discussed and then a comparison is made between these two.

2. An Economics Man

The concept of economic man is one of the basic notions of modern economics. It is assumed that each individual in a capitalistic society, whether he / she are a consumer, investor, worker or businessman is motivated by economic forces, hence will always act to obtain the maximum satisfaction for the least sacrifice or cost. This maximum satisfaction take different forms e.g. it may be maximum profit for a businessman, leisure hours for a worker and maximum utility from the consumption of goods for a consumer etc.

A consumer, a firm and an industry are the basic individual decision making units in a capitalist economy. Under this concept it is assumed that behavior of these units will be rational. Rational behavior means that, each of this unit wants to maximize his advantage. In the other words, when a consumer decides to purchase something he / she will spent all available resources in such a way that he / she will get maximum satisfaction from these items. If he / she dose the same then their behavior will be rational, and consumer will said to be in equilibrium position. In the other words achievement of maximum satisfaction is the primary goal of a consumer or economic man. In the same way when a firm decides to produce something in response of demand from consumers, then main objective of the firm will be to get maximum profit. For this purpose firm will made all efforts to maximize the difference between cost and selling price, so that she can get maximum profit. It will be rational behavior of firm / man. The same situation is with industry, which is the collective name of all firms. In the same line a worker wants to maximize his / her leisure and so on.

In this whole process there is no concept of God or moral values or the Day of Judgment or benefits of the others. The whole story is just based on me and my interest only, and no room is left for any moral values. Due to this situation an economic man is self—centered and self interested personality and never thinks beyond his self interest, Abdul Karim (2006). The approach of economic man is completely materialistic and he/she is always busy in calculation of his / her profit / loss in monetary terms. To get maximum advantage of this worldly life, becomes his / her ultimate aim and do not have any concept of life after this life. This type of thinking naturally restricted his/her life just for today and there is no concept of long term benefits.

3. An Islamic Man

The characteristics of an Islamic man can be derived from the qualities of momineen given in Qur’an and Hadith. At least in Qur’an more then sixty qualities are given in this regard. The term amale – saleha is used for those activities which are required by Qur’an and Hadith from momineen. An Amle - Saleh is any activity which results on the benefits of others or it creates equilibrium in the society or results on elimination of disequilibrium (Fasad) in the society. Since the limited scope of a paper cannot considerate the narration of all these characteristics, hence only the main qualities of momineen are discussed in following lines.

3.1 Iman (Believe)

The first and the most important demand of Islam from momineen is that, they should have believe on Allah, His books, His prophets, angles and the Day of Judgment.
It is not the righteousness that ye turn your faces to the east and the west; but the righteous is he who believeth in Allah and the Last Day and the angles and the scripture and the prophets. (2:1 77)

This believes create a significant change in his behavior and character, and changed the whole concept of life, and expands the scope of life. Man with iman lives with high moral values. Concept of life hereafter and accountability keeps him away from all bad activities. The activities which are harmful not for the society but also for that person who performs them.

3.2 Consent of Allah
According to Qur’an, the basic objective of the life of momineen is to get the consent of Allah.
Thou (0 Muhammad) seest them bowing and falling prostrate (in worship), seeking bounty from Allah and (His) acceptance. (48:29)
For this purpose they follow all the orders of Qur’an and Hadith.

3.3 Fear of the Day of Judgment
Another quality of momineen counted in Qur’an and Hadith is that, momineen keep hard believe on the Day of Judgment and accountability of that Day. This concept put them further away from each and every type of tyranny.

3.4 Living for the Others
According to Qur’an momineen live for the others. They are always ready to sacrifice their current benefits for the betterment of others. Even they are personally needy people but in this condition also they sacrifice for the others.
And find in their breasts no need for that which hath been given them but prefer (the refugees) above themselves though poverty become their lot. (59:9)

3.5 No Concept of Reward
Qur’an said, the momineen never have any desire of reward or thanks, they all do it only for the consent of Allah.
(Saying) we feed you for the sake of Allah only. We wish for no reward nor thanks from you (76:9.)
No materialistic reward is required by them.

3.5 Prohibition of Riba (Interest)
Since riba (Interest) is strictly prohibited by Qur’an & Hadith and momineen completely avoid the same, and do not involve in any such type of activity.

3.6 Infaq (Donation)
One of the most important quality of momineen is that, they donate all of their income in the way of Allah which is beyond their requirements.
And they ask thee what they ought to spend say: that which is beyond your requirement. (2:219)

3.7 Concept of Halal & Haram
Qur’an & Hadith have restricted momineen from particular type of activities which are termed as haram. Momineen strictly avoid themselves from these actions.
3.8 Care of Poor People of Society
In accordance with the orders of Qur’an & Hadith momineen take care of poor people of society. And feed with food the needy wretch the orphan and the prisoner, for consent of Allah. (76:8).
These are just a few characteristics of momineen described in Qur’an and Hadith which are specially mentioned because these are the base of comparison between these two concepts.

4. Comparison Between Economic Man & Islamic Man
In the light of above discussion it can be said that there is a wide difference between these two concepts. The main points in this regard are as follows.

4.1 Limited & Wide Concept
The concept of economic man is quite limited, which restricts the man just up-to this materialistic world, whereas an Islamic man has a quite wide horizon. He does not see the life just for this world but hereafter also, which will be a real and long lasting life.

4.2 Animal & Human Level
Economic man concept presents a just animal level of life, which is restricted to maximum satisfaction, profit or leisure etc., without any moral values. On the other hand Islamic man is a better concept which is based on high moral values and represents a human level of life.

4.3 Selfish and Opulent Way of Life
Self benefit is the limit of economic man thinking, he cannot go beyond this boundary. On the other hand the objective of life of an Islamic man is to serve the others for the consent of Allah.

4.4 An Open & Restrict Way of Life
The economic man is completely free to do anything under the rules of state. No other bindings can be imposed on him. But an Islamic man is under the Devine rules as well as the regulations of state.

4.5 Preference of Today or Tomorrow
The former man just believes on benefits of today and he is not ready to sacrifice his today for tomorrow. On the contrast Islamic man is always prefer the advantages of tomorrow by giving up the benefits of today. This is the reason that, a Muslim can easily sacrifice his life in Jehad (Fight in the way of Allah) whereas it is quite difficult for a Non-Muslim.

Conclusion
On the basis of above discussion it can be said that, the concept of Islamic man is much more superior then economic man. The latter is just a materialistic approach and completely barefoot from moral values. Negation of moral values put the human being on just animal level. This is the reason that, an economic man lives on animal level and just alive to get maximum satisfaction or profit or other advantages. No doubt he gets all these things in this world but in the life hereafter his share will be nil.

On the other hand an Islamic man lives with the believe on Allah and high moral values. He lives on human level, he also gets the advantages of this life but with that, he will be in a much better position in the second life.

Abstract
Saud Mand Tahreek (Movement) was established in 1925 in Badyoun (India) for the improvement of standard of living of Muslims of India at that time. This movement specially focused on the definition and nature of *riba* (interest) and tries to redefine this term. This movement become a separate school of thought and presented some basic points about the *riba*. According to them each and every type of increment is not *riba*, but it is a particular type of increase. Only that transaction will be a *riba* transaction which is based on exploitation of poor people. Otherwise the rest of transactions are not *riba*, particularly if it is based on mutual consent. Moreover the objective of this movement was to improve the economic condition of Muslims in the Sub-Continent at that time, for this purpose different measures were adopted by this movement. The objective of this paper is to analyses the efforts of movement and its results.

Key Words: Interest (*Riba/Saud*), Exploitation, *Hadith*, *Riba-al-Fadal*, *Riba-al-Nasia*.

1. Introduction

Sir Syed Ahmed Khan in his writings has refused to accept the traditional concept of *riba* (interest), and accepted the bank interest as lawful. It was the first revolt from the traditional school of thought in economic context. This point of view was further promoted on the plate-form of *Saud Mand Tahreek* (Movement). This movement was initiated by Mulana Iqbal Ahmed, Molvi Ikram, Syed Tufail Ahmed and some others in 1925 in Badayoun (India). They started a monthly publication under the name of “Saudmand” from the plate-form of this
movement. At the sometime some other publications were also issued, for example *Masla-e-Saud Aur Muslamanou Ka Mustaqbil, Jawaz-e-Saud Ma Fatawa & Masla-e-Riba Aur Tejarati Saud Ki Bahus*, etc.

2. **Contribution of This Movement:**

The basic objective of this movement was to improve the overall economic and social status of Muslim community of India, Molvi Muhammad Ikram (1927). This movement was mainly focused on improvement of economic conditions of Muslims in the Sub-Continent. It was a very crucial time for Indian Muslims. Their share in the commerce and trade was rapidly decreasing. In Indian civil service the share of Muslims was much less than their size of population. The overall conditions for them were very poor. One of the big reasons of this economic backwardness was that Muslims as a community were disgust from new economic set up established by British Government, due to the presence of interest in it.

Since *riba* (interest) is completely prohibited in Islam, hence they were quite wavering from it. It was the time when thinkers of this movement decided to bring Muslims close to new economic system. Definitely presence of interest was the main barrier in this regard. This is the reason that they started a campaign against traditional concept of *riba* (interest). For this purpose they put some basic questions about the nature, background and prohibition of *riba* (interest), e.g.

i. What is the definition of *riba*?
ii. Are the limits of *riba* can be determined?
iii. Due to which reason *riba* (interest) was prohibited and what is the demand of this reason now a day?
iv. Is *riba* (interest) completely banned or there may be some exceptions in it?, Molvi Muhammad Ikram (1927).

Since these questions were raised from the platform of this movement, hence it was indispensable for them that, they provide the answers of these questions. They have done the same, and in the regard they had created a separate school of thought, which is still alive and in many discussions the resumption of their arguments is still present. Hence it can be said that, this movement is alive in the form of their arguments, about *riba*. Mulana Iqbal Ahmed has answered these questions in such a manner, the Quranic term *riba* (interest) is a particular type of increment and there is not any explanation of this increment in Qur’an and Sunnah both. Moreover in the early period of Islam there was not any consonance on this term, even upto the time of *uima* situation was quite same. On this basis he concluded that, there is not any hard & fast rule in this regard. Due to this reason it is advised to Muslims that, they will leave anything about which they are doubtful about *riba* (interest), and take rest of the items, Mulana Iqbal Ahmed (1927).

In his opinion *Riba-al-Fadal* is just applicable in barter system and cannot be used in cash or credit transactions. Moreover exchange of money transactions also does not have any chance of *riba* (interest). Hence according to him concept of *riba* (interest) is just applicable on a particular type of credit transaction which is called as deferred sales. Except for this rest of the transactions are free from *riba* (interest). The nature of this transaction is that, buyer made a down payment to seller for the future delivery of goods or crops. If the seller provided the same within specified time, this transaction was completed and no extra charge was paid by the seller. But on the other
hand if he failed to do so, then he has to pay some extra amount to buyer. This additional amount was termed as *riba* (interest), it is just a form of exploitation. At here it should be remember that, this increment was not the part of agreement, but in case of failure of seller it was up-to the choice of buyer. Only this type of *riba* (interest) is prohibited by Qur'an. On the basis of analysis of different Hadith, he has pointed out that; *riba* (interest) is an increment which is like deferred sales transactions not more than that. According to him same type of *riba* (interest) was also prohibited in Turah. This type of increment is lawful only in Dar-ul-Harb but not in Dar-ul-Islam. Mulana Iqbal Ahmed (1927).

Syed Tufail Ahmed has raised some different points from the platform of this movement. His points were based on economic conditions of Muslims at that time, and on the bases of his analysis he recommended the Muslims to adopt new economic setup which was based on interest. These points were as follows;

i. Interest is the trading profit which is separate from *riba*, hence each and every increment cannot be termed as *riba*.

ii. Currency can be used in both productive and non productive ways, in the old days men did not know the productive use of money and consider it as medium of exchange only. But now a day currency is used for more productive way, hence it will be better to use it in more fruitful purposes.

iii. Analysis of different Hadith also bring them the conclusion that, only one type of increment is unlawful, which is based on exploitation of poor people. It is the reason that Qur'an has condemned the *riba* and appreciates *Sadaqas*.

iv. Credit for trading purpose and payment of interest on it are quite different matters from *riba* (Interest). It is lawful because it is based on mutual consent.

v. Since Muslims do not take interest hence they are getting double loss. They are losing interest on it, if they grant their money as loan to others, on the other hand they do not take loan on interest. Due to which, their share in trade is reducing rapidly.

vi. The one reason of collapse of big Muslim states is that, they did not take loan on interest from Muslims and ultimately by compulsion they had taken loan from other states and due to heavy interest gradually lose their sovereignty.

vii. On micro level same is happening with small Muslim trading class.

viii. Due to same reasons Muslims are coming out from industry and education, Syed Tufail Ahmed (1929).

No doubt there are some other scholars who have almost identical point of view about *riba* (interest) e.g. Mulana Abdul Hai Farngi Mehli, Allama Syed Abu-Ishaq Hanafi, Mulana Syed Nasir Hussain and Syed Najum-ul-Hassan etc. This movement on one side put the pressure on Muslims to involve in the *riba* (interest) transactions, and also suggest some other measures for the betterment of Muslim community. These suggestions were as follows;

i. It was advised to them that Muslims formed more and more cooperative associations for economic stability.

ii. Muslims were counseled by this movement that, they put their deposits in commercial banks and try to establish their own banks.

iii. Rich Muslims provide loans to poor so that they can stand on their own feet.

iv. It was recommended that, Muslims were purchased more & more life insurance policies so that, they can prevent them and their family from any unexpected emergency. Moreover
efforts were also made to reform Muslim cultural values and induced them to improve their working capacity, Mulana Tufail Ahmed (1926).

CONCLUSION

Saud Mand Tahreek which was established to improve the standard of living of Indian Muslims had given a new definition or concept of *riba*. According to them riba is an exceptional case and applicable to only those transactions which are result on exploitation of poor people. Only this type of increment is prohibited in Qur’an. But it is also an abstract concept because exploitation and poor both are relative terms and no concrete definition of these terms are possible. Hence the concept of *riba* of this movement is also baseless.

References

Abstract
In Qur’an the term *riba* is used for interest which is strictly prohibited by this wholly book. Muslim thinkers normally claim that “*riba* is that pre-decided excess amount which creditor receives from the debtor on his/her principal amount at maturity of loan. It is a well accepted definition of the term *riba*, but this definition restricts the concept of *riba* to debt transactions only, whereas the rent of all other assets except cash is considered as valid. It means that, reward of cash (one form of asset) is unlawful and rent of all other assets is legitimate. Muslim thinkers provide some justifications for this special treatment to cash. According to then if an item is depreciated with the passage of time then its rent becomes lawful. Moreover if during the transaction ownership of the asset will not change, nature of rented item will remains same then their rent is justified. In addition they said that, presence of element of risk and concept of *badal* (exchange), provide a legal base to rent. But the critical analysis of all of those reasons shows that none of them have any logical and religious base and the same situation is with this definition of interest, which can qualify any standard of reasoning.

Key words: *Riba* (interest), Depreciation, Rent

1. Introduction
*Riba* (interest) is an important Qur’anic term from economic point of view. A huge literature is available on the interpretation of this term. Instead of that, it is open fact that, still a lot of confusion exists about the nature & meaning of this term. Different scholars have different point of views in this regard. But it may be said that there is a concept on which almost a consensus
A prominent Muslim scholar has defined it in these words: "riba is the loan given for a specified period on condition that, on expiry of the period the borrower will pay it with some excess amount." Al-Jasses Abu Baker (1935) p. 470. It means that riba is possible only in debt transactions with that this addition should be part of agreement and received on redemption of loan, S. Abul A’ la Maududi (1997) p. 20. It doesn’t matter how small or large this excess amount may be and what is the purpose of loan and where this transaction has taken place PLD (1992) p.1.

According to this school of thought just excess amount on any debt transaction is termed as riba, whereas the reward of all other assets like houses, machines, offices and shops etc., is considered as lawful in the form of rent, M.N. Siddiqui (1968) pp.126-130. This situation gives a special status to cash and bifurcate it from other assets, because according to this concept rent of cash (which is one form of asset) is considered as unlawful and rent of rest of the assets is assumed to be lawful. This situation certainly raises questions about this special treatment. The supporters of this concept produce five reasons, for its justification. These arguments are as follows:

1.1 Depreciation

It is said that, depreciation is the main cause of rent. It is claimed that, due to depreciation rent of all assets, becomes lawful. All those items which lose their value due to use can be given on rent, whereas the consumable things cannot be given on rent, M.N. Siddiqui (1968) p.p. 178-181.

1.2 Changes in Ownership

It is assumed that rent of all those items is lawful whose ownership is not changed during transaction, e.g. ownership of all assets like houses, machines and offices etc., is not changed during the transaction hence these assets can be given on rent. Whereas in case of cash when it is given to others as loan then its ownership is changed hence its rent cannot be justified A.R. Killani (1991) p. 96.

1.3 Changes in Nature

Third arguments in this regard is that, rent of all those items is lawful which kept intact their nature during period of rent, e.g. machines, houses and offices, etc., remains in the same condition before and after letting, hence their rent is lawful. On the other hand if the situation is reverse then the rent of such items is prohibited, M. Taqi Usmani (1999)p.47.

1.4 Concept of Badal (Exchange)

A big argument in the favour of rent is badal. Under this concept it is agreed that since in case of letting any asset e.g. machines, houses, building, etc, the person who let these items receives rent in the form of cash and in exchange the person who hired these items get the temporary possession of these things. In this way they exchange the items or there is badal in the transaction. On the other hands in case of debt there is not any badal creditor pays a certain amount to debtor in the form of debt and did not receive anything in exchange, it means badal (exchange) is not completed hence this transaction is unlawful.
1.5 Presence of Risk

Propriety in this context is presence of risk. Since the owner of asset bears the risk of damage and destruction of his/her asset, hence he/she deserves the reward of it which is rent. Moreover, in perspective of Islamic law profit is subject to risk, M. Taqi Usmani (1999) P. 47.

2. Critical Analysis of Prevailing Concept of Riba.

Whereas this prevailing concept of riba is concerned, neither it has any logical base nor fulfill any standard of reasoning. The basic reason of groundless is that artificial bifurcation by which cash is separated from other assets. No solid reason can be given for this meaningless division. In all subjects e.g. economics, accounting and commerce cash is considered as compulsory part of assets. The most authentic reason is that Qur’an does not accept this meaningless bifurcation. The simple proof is that, Qur’an has used the term mal for all assets including cash. Qur’an has used this term at almost 86 places in the sense of assets including cash. Some examples from this wholly book is as follow:

(i) Chapter 2 verse 171: for all those items which are liked by human being.
(ii) Chapter 10 verse 88: for each and every asset including luxuries.
(iii) Chapter 26 verse 88: for all those items which are beneficial for mankind.
(iv) Chapter 104 verse 2: for the items which are countable and collectable.
(v) Chapter 90 verse 6: for the things which have a chance of wastage and destruction.
(vi) Chapter 27 verse 36, and chapter 17 verse: for the items which can provide help of any kind.
(vii) Chapter 68 verse 14: for the items used for affection.
(viii) Chapter 18 verse 34 & 39: in the sense of farms & gardens.
(ix) Chapter 4 verses 10 & 161: in the meaning of general assets.

Moreover, in the same sense it is used in chapter 19 verse 77, chapter 74 verse 13, chapter 111, verse 2 and chapter 2, verse 155.

Not only in these verses but in this context many references of other verses can also be presented where this term is used in Qur’an for assets including cash. However, at any place Qur’an is not ready to draw any boundary line between cash and other assets, and gives them same treatment. The same situation is with Hadith, any single Hadith cannot be presented in which this artificial bifurcation is recognized. This is the simple proof that basic assumption of prevailing and traditional thought is completely wrong, and do not have any logical base. Moreover, all reasons which are presented in justification of this artificial bifurcation are unable to validate this concept. The critical analysis of all these reasons is as follows.

3. Critical Analysis of Reasons

3.1 Depreciation: First Base of Rent

Whereas this most important argument is concerned its rebuttle is as follow.

3.1.1 In this context first and the most important concern it that, this argument cannot be proved from any verse of Qur’an or Hadith. In the other words depreciation as the base of rent can be justified neither from Qur’an nor from Hadith. Without any justification how it can be
said that it is the base of rent? This situation is not with just depreciation but with all other arguments which are presented in this regard.

3.1.2 The reason that, due to depreciation rent becomes lawful is completely died when it is observed that paper money or currency is also depreciated. It is an open fact and no one can deny it. Since it is argued that on the basis of depreciation rent becomes lawful then on this basis rent of currency i.e. *riba* should also be recognized. Hence it can be said that, this concept or claim is self-contradictory.

3.1.3 In the second chapter verse 27 (2:27) Qur’an has allowed trade and prohibited *riba*. For any trade transaction presence of a buyer, a seller and a commodity is must which is exchanged between buyer & seller. But in case of rent none of this condition is being fulfilled, on the other hand it has an extraordinary resemblance with *riba*. Hence, on this basis it cannot be acceptable.

3.1.4 Another objection on this concept is that, any correct method of calculation of depreciation is not yet discovered. Throughout the world its calculation is based on estimation. Simple question is that, when exact calculation of depreciation is not possible then how rent can be charged on it?

3.1.5 It is an open fact that with passage of time assets are depreciated and the amount of depreciation continuously decline. On this basis amount of rent should also be declined because according to this approach basis of rent is depreciation, but it is our common observation that, rent increases with passage of time which is quite opposite to this concept. Hence it can be concluded that rent is not charged on the basis of depreciation.

3.1.6 According to the theory, rent is charged due to depreciation, and then on this basis charged rent should be in the proportion of depreciation. But in real life it is not so, rent is always charged on market and never on the basis of depreciation. This open contradiction invalids the whole concept.

3.1.7 Another conflict between theory and practice is that, owner of the building receive separate amount of rent different parts of the building depending upon many factors. Whereas the whole building is depreciates at the same rate. Hence from theoretical point of view rent of each part of the building should be same because all parts are depreciating at the same rate. It means that rent is never charged on depreciation, and no reconciliation is possible between theory & practice, Farooq Aziz (2007) p.72.

3.2 Changes in Ownership: Second Proof of Rent

Just like first argument, this reason is also based on delusion. Under this point it is said that, in case of rent ownership is not changed in case of letting an asset whereas is case of debt it is changed. The real fact is, it is not so, in both cases situation is quite same both creditor and
owner of asset temporarily lose the ownership of their assets and sooner or latter it will return to
the owner. Hence there is no difference between these two transactions.

3.3 Change in Nature: Third Justification of Rent

It is just a baseless reason, because if it is accepted then on this basis bank interest will
automatically become lawful which is considered as unlawful under prevailing concept. The
reason is that, customers of the bank deposits money in the bank and bank returned them their
principal amount and interest in the same form. During this whole transaction nature of item
(currency) is not changed. Hence on this basis bank interest should be considered as lawful.

3.4 Concept of Badal (Exchange): Fourth reason of rent.

Like the other arguments it is also depends on fallacy. Actual fact is that, in case of
letting badal does not took place in its original sense because when any asset e.g. machine,
house, or building is letting out by the owner, he / she receives the amount of rent and his right of
ownership remains intact. Whereas the person who takes it on rent just get a temporary right of
use, and did not get the right of ownership. In real sense of badal (exchange) right of ownership
should be transferred which is not taken place hence this transaction is not qualifying the real
sense of badal (exchange). On the other hand in case of debt, it is claimed in this case no badal
(exchange) is taken place, because when creditor pays his cash to a debtor, he / she doesn’t get
anything against it, hence this transaction is unlawful. It is again a misconception that creditor
gives loan to a debtor he / she at the some time creates which is an asset. It means that creditor
has exchanged the form of his / her asset i.e. from cash to Account Receivable and debtor got
noting. Hence the basic claim is not right.

3.4 The Factor of Risk: Fifth Argument of Rent.

It is said that due to element of risk rent becomes lawful. It is not true, because Qur’an
has strictly prohibited gambling. Hence factor of risk cannot justify rent in any case.

4. Conclusion

On the basis of above discussion it can be concluded that prevailing concept of riba is quite
baseless and doesn’t have any logical base. The basic argument under which it is said that rent of
cash is unlawful and rent of other non-perishable assets is lawful don’t recognized by Qur’an and
all reasons which are given in this regard don’t fulfill any standard of reasoning.

Abstract

The present study was designed to determine the prevalence of Post traumatic stress disorder (PTSD) among flood affected school children in Pakistan. The sample of the study was comprised of 522 randomly selected students aged 10-16 years from five flood affected districts of Khyber Pukhtunkhwa. The instrument used in the study was The Impact of Event Scale-Revised (IES-R) to measure Post traumatic stress disorder (PTSD) among flood affected school children in Pakistan. The main findings of the study were; secondary school students were highly affected by Post traumatic stress disorder (PTSD); Female secondary school students were highly affected by Post traumatic stress disorder (PTSD); Displaced secondary school students were highly affected by Post traumatic stress disorder (PTSD); female students developed more PTSD as compared to male students; and displaced students developed more PTSD as compared to non-displaced students.

Key words: Post traumatic stress disorder (PTSD), Flood, The Impact of Event Scale-Revised (IES-R)

INTRODUCTION

Natural disaster affected the lives of many people all over the world. The affectess of such disasters faces different calamities in term of deaths, physical injuries, property lose and psychological injuries. Post traumatic stress disorder (PTSD) is one of the most common psychological injuries that the victims of natural disasters faced. Post traumatic stress disorder (PTSD) may be described as characteristic set of symptoms resulting from exposure to traumatic stressors. DSM-IV described Post traumatic stress disorder (PTSD) as exposure to a traumatic event in which person has responded with intense fear, helplessness or horror. (Clark, 1999)

Walsh (1994) observed that “Post traumatic stress disorder (PTSD) is usually provoked by a traumatic events that is outside the rang of usual human experiences such as bereavement, chronic illness, business losses or marital conflicts.”

The events that caused Post traumatic stress disorder (PTSD) are war, see or experience physical violence and natural disaster like earth quick, hurricane and flood. Smith (2003)
observed that Post traumatic stress disorder (PTSD) may develop immediately after the trauma or it may be brought on by a minor stress experience week, month or even year later.

Flood is one of the most severe natural disasters and it “can result in direct economic and property lose, physical injuries, death and psychological injuries” (Huang, 2010). Post traumatic stress disorder (PTSD) is one of the most common psychological injuries that the flood survivors faced. Green (1992) examined the survivors of Buffalo creek dam collapse in 1972 and found that 63% of the survivors were suffering from Post traumatic stress disorder (PTSD).

Natural disasters also caused Post traumatic stress disorder (PTSD) among school students as ziaddini (2009) observed that the prevalence of Post traumatic stress disorder (PTSD) was 66.7% among high school students after the earthquake disaster in the city of Bam, Iran.

The people of Pakistan faced a devastating flood in late July 2010 following by monsoon rain in Punjab, Sindh, Khyber Pukhtunkhwa and Balochistan regions. It destroyed the property and infrastructure and affected about 20 million people, with a death toll close to 2000. The people had horrifying experiences accompanying death of families and property loses resulted in severe traumatic responses in surviving people including school children.

The present study was designed to determine the prevalence of Post traumatic stress disorder (PTSD) among flood affected school children in Pakistan.

METHOD

The sample of the study was comprised of 522 randomly selected students aged 10-16 years from five flood affected districts of Khyber Pakhtunkhwa. These districts include Charassada, Lower Dir, Upper Dir, Noshehra and Swat. The instrument used in the study was The Impact of Event Scale-Revised (IES-R) to measure Post traumatic stress disorder (PTSD) among flood affected school children in Pakistan.

The Impact of Event Scale (IES) is a short set of 15 questions evaluating experiences of avoidance and intrusion which attempts to reflect the intensity of the post traumatic phenomena. Developed in 1979 by Mardi Horowitz, Nancy Wilner, and William Alvarez Daniel S. Weiss and Charles R. Marmar (1997) chose to revise the scale by adding seven additional questions to measure another dimension of intense stress events. Both versions have been found to be valid and reliable. The revised version of the Impact of Event Scale (IES-r) has seven additional questions and a scoring range of 0 to 88.

On this test, scores that exceed 24 can be quite meaningful. High scores have the following associations.

<table>
<thead>
<tr>
<th>Score</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>24 or more</td>
<td>Those with scores this high have partial PTSD or at least some of the symptoms.</td>
</tr>
<tr>
<td>33 and above</td>
<td>This represents a probable diagnosis of PTSD.</td>
</tr>
<tr>
<td>37 or more</td>
<td>This is high enough to suppress your immune system's functioning.</td>
</tr>
</tbody>
</table>
The data was collected four month after the event.

RESULTS
Table 1
Descriptive statistics

<table>
<thead>
<tr>
<th>Variables</th>
<th>N</th>
<th>Mean</th>
<th>S.D</th>
</tr>
</thead>
<tbody>
<tr>
<td>Age</td>
<td>522</td>

<tr>
<td>33 or more</td>
<td>46</td>
<td>8.81</td>
</tr>
<tr>
<td>37 or more</td>
<td>386</td>
<td>73.94</td>
</tr>
<tr>
<td>Total</td>
<td>522</td>
<td>100</td>
</tr>
</tbody>
</table>

Table 2 shows that the total no. of respondents is 522. Out of which (16) 3.06% did not have Post traumatic stress disorder (PTSD), (74) 14.17% had partial Post traumatic stress disorder (PTSD), (46) 8.81% had a probable diagnosis of PTSD and (386) 73% had high PTSD. This shows that secondary school students were highly affected by Post traumatic stress disorder (PTSD).

</tbody>
</table>

df=520

Table 8 reflects the numbers of displaced and non-displaced students are 326 and 196 respectively. The mean and standard deviation of displaced students on the measure of PTSD scale are 46.78 and 6.86. The mean and standard deviation of non-displaced students on the measure of PTSD scale are 35.32 and 8.53 respectively. The t and p value of both groups are 16.83 and .000.

This indicates that the difference between the means of the two groups is significant at .01 levels. Inspection of means suggests that displaced students developed more PTSD as compared to non-displaced students.

DISCUSSION
The present study was designed to determine the prevalence of Post traumatic stress disorder (PTSD) among flood affected school children in Pakistan. The main findings of the study were; secondary school students were highly affected by Post traumatic stress disorder (PTSD); Female secondary school students were highly affected by Post traumatic stress disorder (PTSD); Displaced secondary school students were highly affected by Post traumatic stress disorder (PTSD); Female students developed more PTSD as compared to male students; and displaced students developed more PTSD as compared to non-displaced students.

The main findings of the study that secondary school students were highly affected by Post traumatic stress disorder (PTSD) was supported by Piyasil et-al (2007) study on Post traumatic stress disorder (PTSD) in children after Tsunami disaster in Thailand: 2 years follow-up. They found that 57.3% students were suffered from Post traumatic stress disorder (PTSD) among affected children.

The finding of the study that female secondary school students were highly affected by Post traumatic stress disorder (PTSD) was supported by Stallard et-al (1998). They observed that there is 19% risk of Post traumatic stress disorder (PTSD) in boys and 55% in girls in children involved in road traffic accidents. This finding was also supported by Breslau (1997) on his study on Sex Differences in Posttraumatic Stress Disorder observed that Post traumatic stress disorder (PTSD) is more likely to develop in female than in male after exposure to traumatic events.

Abstract
Much of the literature on business development has focused on the role of community resources, especially financial and human capital, in organizational success and survival. Several studies also have examined the contributions of small and large businesses to the social and economic well-being of communities. There has been much less research on the relationships between social resources in communities and business development. This paper examines the importance of social capital in Iranian hospital. For this aims were selected 90 people from three hospitals. The results of this research indicated the level of structural and relational social capital is high, but the level of cognitive social capital is below of average.

Key words:
Social capital, relational capital, cognitive capital, structural capital

Introduction
Scholars such as Coleman (1990) and Putnam (1995) in an attempt to explain non-economic factors in explaining success of certain economic processes drew on the concept of social capital. That is why at present, besides human, financial, and economical capitals, a new reality as social capital is being extensively utilized in the literature of social and organization realms. Fukuyama (1999) believes that a number of definitions had been given with respect to social capital but they refer to its manifestation rather than to social capital itself. He says “social capital is an instantiated informal norm that promotes co-operation between two or more individuals” (Fukuyama, 1999). Putnam (1995) also defines social capital as “The characteristics of the social organization such as networks, norms and social trust that facilitate coordination and cooperation for mutual benefit”. Social capital as a theory view has been considered by behavioral science, economy, management and social science experts in recent two decades. Social capital is sometimes viewed as the peoples' property, so it is related to widespread social networks and accessible resources. Therefore social capital is considered as the group property. Social capital has been the subject of many surveys in recent years and its relation to political and economical development and personal effectiveness has been considered. Studies show that without social capital, it is hard to reach economical development by the means of other resources like financial, physical and natural resources.
Literature review

In recent years researchers concerned with understanding why some organizations perform better than others frequently have looked to the resource based view of the firm as a model for explaining the sustained competitive advantage some organizations possess (Barney, 1986, 1991). According to the resource-based perspective, successful organizations have unique capabilities or resources that give them an advantage over their competitors. Such resources are particularly valuable when they are rare, inimitable, and no substitutable (Barney 1986, 1991). Consistent with the resource-based view, Nahapiet and Ghoshal (1998) maintain that the development of social capital within an organization is likely to be a source of competitive advantage for a firm. In other words, they assert that networks of strong interpersonal relationships within an organization ultimately facilitate its success. As mentioned earlier, Nahapiet and Ghoshal's (1998) framework integrates previous research in the area and offers three specific aspects or dimensions of social capital: a structural dimension, a relational dimension, and a cognitive dimension.

Structural Social Capital

Nahapiet and Ghoshal (1998) conceptualize the structural dimension of social capital as encompassing network ties, network configuration, and network appropriability. Network ties are connections between members of an organization. Previous research using network analysis indicates that these connections can have a significant influence on information transfer (Krackhardt & Hanson, 1993), organizational learning (Fisher & White, 2000), and the execution of organizational activities (Shah, 2000).

Although formal and informal networks can both play a significant role in the overall configuration of interpersonal linkages (Ibarra, 1992), the important factors to consider in understanding a network configuration revolve around such characteristics as structural holes, centralization, and density. These characteristics are often a key determinant of the extent of movement of information, knowledge, and assistance within an organization, beyond what is attributable to simply the individual linkages (Krackhardt & Hanson, 1993; Seibert et al., 2001; Walker et al., 1997).

Finally, network appropriability can significantly affect the flow of information and assistance within a network (Nahapiet & Ghoshal, 1998). Network appropriability relates to the ease with which different types of relationships can be transferred within a network. Similarly, connections established between individuals in informal (e.g., social) contexts also may be relevant in more formal (e.g., work) contexts. Thus, networks created for one purpose may often be useful for other purposes (Fukuyama, 1995; Putnam, 1993).

Relational Social Capital

According to Nahapiet and Ghoshal (1998), the relational dimension of social capital is characterized by high levels of trust, shared norms and perceived obligations, and a sense of mutual identification. Their conceptualization of relational capital, then, is quite similar to Granovetter's (1973) notion of strong ties, which he describes as connections between individuals that are characterized by trust, reciprocity, and emotional intensity. Researchers have not been entirely consistent in their definition of the relational aspects of social capital, but it is clear that what are being described are interpersonal connections that are inherently affective in nature (Krackhardt, 1992).
Interpersonal trust arises from a belief in the good intentions, openness, competence, and reliability of another party (Mishira, 1996). In addition, high levels of trust result in a willingness to be vulnerable to the actions of the other party (Mayer, Davis, & Schoorman, 1995). Prior research suggests that trust facilitates social and resource exchange, increases communication, and enhances cooperation between individuals (Jones & George, 1998; Misztal, 1996; Putnam, 1993; Tsai & Ghoshal, 1998). Thus, high levels of trust ultimately may increase innovation, enhance teamwork, and improve organizational functioning (Bouty, 2000; Jones & George, 1998).

**Cognitive Social Capital**

According to Nahapiet and Ghoshal (1998), mutual understanding among employees is achieved through the existence of a shared language and from the exchange of shared narratives. Where shared language and shared narratives both exist, employees can more easily discuss problems, transfer ideas, share knowledge, and offer more effective assistance to one another (Klimoski & Mohammed, 1994; Nahapiet & Ghoshal, 1998). Shared language provides organizational members with the ability to communicate more effectively (Boisot, 1995). High levels of cognitive social capital give employees a common perspective that enables them to perceive and interpret events in similar ways (Boland & Tenkasi, 1995; Nohria, 1992). Shared narratives are the myths, stories, and metaphors that organizational members communicate to one another (Nahapiet & Ghoshal, 1998). These narratives also assist or generational members in interpreting and understanding their experiences in a common way (Morgan, 1986). Both shared language and shared narratives, therefore, serve to increase the level of understanding among organizational members. These assets also increase the ability of employees to anticipate and predict the actions of other coworkers, thereby facilitating the utilization of various members' inputs, successful coordination of activities, and adaptation to changing conditions (Klimoski & Mohammed, 1994; Krackhardt, 1992).

**Research hypothesis**

1. The level of Structural Social Capital in hospitals is high.
2. The level of Relational Social Capital in hospitals is high.
3. The level of Cognitive Social Capital in hospitals is high.

**Methodology**

The present research is an applied study in which the data have been gathered through a questionnaire and they have been analyzed by utilizing statistical methods. The society comprises first grade hospitals in Tehran among which three hospitals had been chosen as samples in which the possibility of gathering data through questionnaires have been achieved. Questionnaires have been administrated in hospitals’ three different working shifts (morning, afternoon, and night shifts). Due to the limited number of personnel in these hospitals, thereby all have been invited to complete the questionnaires. Related literature had been accumulated through a library research and for the compilation of questionnaire a throughout research in internet have been performed in which standards questionnaires have been considered and the viewpoints of professionals were taken into consideration, as well. The questionnaires covered questions which were capable in measuring social capitals in individuals. Twenty questionnaires in three hospitals have been preliminary administrated and then through Cronbach Alpha analysis the most valid questionnaire had been chosen. The reliability of the chosen questionnaire equaled 0.875 which guarantees the appropriateness of all questions. Statistical Package for the Social Science (SPSS) has been utilized for test of hypotheses and data analysis.
7. Results of research

Hypothesis 1
To evolution situation of structural social capital is used of Chi-Square Tests. The results of this test are showed in Table 1.

<table>
<thead>
<tr>

<td></td>
</tr>
</tbody>
</table>

1 cells (5.0%) have expected count less than 5. The minimum expected count is 91.

As seen in the above table and diagram the Chi-square distribution shows that there is a significance level less than \( \alpha = 5\% \) (\( p \)-value < \( \alpha = 5\% \)). Considering the result of the conducted test, it can be said with a 95% certainty that level of structural social capital in Iranian hospital is high.

Hypothesis 2
To evolution situation of relational social capital is used of Chi-Square Tests. The results of this test are showed in Table 2.

<table>
<thead>
<tr>
<th></th>
<th>Value</th>

<tr>
<td>N of Valid Cases</td>
<td>381</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

1 cells (5.0%) have expected count less than 5. The minimum expected count is 91.
As seen in the above table and diagram the Chi-square distribution shows that there is a significance level less than \( a=5\% \) (\( p-v<a=5\% \)). Considering the result of the conducted test, it can be said with a 95\% certainty level of relational social capital in Iranian hospital is high.

**Hypothesis 3.**
To evolution situation of cognitive social capital is used of Chi-Square Tests. The results of this test are showed in table 3.

<table>
<thead>
<tr>
<th></th>
<th>Value</th>
<th>df</th>
<th>Asymp. Sig. (2-sided)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Pearson Chi-Square</td>
<td>7,380(a)</td>
<td>4</td>
<td>0,090</td>
</tr>
<tr>
<td>Likelihood Ratio</td>
<td>9,110</td>
<td>4</td>
<td>0,052</td>
</tr>
<tr>
<td>Linear-by-Linear Association</td>
<td>0,827</td>
<td>1</td>
<td>0,437</td>
</tr>
<tr>
<td>N of Valid Cases</td>
<td>381</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

A 1 cells (5,0\%) have expected count less than 5. The minimum expected count is, 91.

As seen in the above table and diagram the Chi-square distribution shows that there is a significance level more than \( a=5\% \) (\( p-v>a=5\% \)). Considering the result of the conducted test, it can be said with a 95\% certainty level of cognitive social capital in Iranian hospital is not high.

**8. Conclusion**
The present research deals topically with the examining of level of social capital and its dimension in the Iranian hospital. Hence, three determinants entitled structural, relational and cognitive social capital. The result of research is shown that existence of social capital is very important for service organization such as hospitals. In this research results indicated that level of structural and relational capital in hospitals is high but the cognitive capital is low. So the manager of hospital should enhance this dimension of social capital in their hospital.

Abstract
The purpose of this study is study of relationship between personality and motivation as well as job satisfaction in Inspection Organization in Iran. For achievement of this aims were selected 150 people of inspection as sample. For measuring of personality was used of big five theory and for motivation, Herzberg theory as well as for job satisfaction Warr, Cook theory. The results of this research indicated that personality and demographic variables can be significantly related to both Job satisfaction and Motivation as defined by Herzberg et al’s (1959) two-factor theory. These results further validate the contention that work attitudes are not the product of situational factors alone, and that both literature and organisations should further investigate the variables that contribute to these values with the intention of increasing job satisfaction and performance, through effective selection methods and pervasive job interventions.

Key words: Personality, job satisfaction, motivation

Introduction and review of research literature
It has long been an aim of work psychology to uncover the reasons why individuals vary in their motivation to work, as well as how individual differences interact with organizational /situational factors to influence individual satisfaction and motivation (Furnham, 2002). Motivation can be defined as “an internal state…giving rise to a desire or pressure to act” (Westwood, 1992, p.288). Job satisfaction, on the other hand, is defined as “the extent to which people are satisfied with their work” (Warr, 2002, p.1). It is often the case that the two concepts are discussed side by side, as it is arguable that the extent to which an individual is satisfied at work is dictated by the presence of factors and circumstances that motivates him or her (Furnham, 1992). Indeed, early psychological approaches to motivation conceptualized the desire to act as an intention to “maximize positive results and minimize negative results” (Stress & Porter, 1991, p. 8). The rationale behind contemporary theories of motivation and job satisfaction is to provide a framework through which organizations can better influence their employees’ drive to work and increase their enthusiasm with their roles. Herzberg et al ‘s (1959) seminal two-factor theory of motivation postulated that satisfaction and dissatisfaction were not two opposite extremes of the same continuum, but two separate entities caused by quite different facets of work – these were labeled as ‘hygiene factors’ and ‘motivators’. Hygiene factors are characterized as extrinsic components of job design that contribute to employee dissatisfaction if they are not met. Examples include: supervision, working conditions, company policies, salary, and relations with co-workers. Motivators, however, are intrinsic to the job itself and include aspects such as achievement, development, responsibility and recognition. On the other hand intrinsic factors
have long been acknowledged as important determinants of motivation. There is a longstanding debate as to whether hygiene factors really contribute to job satisfaction (Furnham, Forde & Ferrari, 1999; Kerr, Harlan & Stogdill, 1974; Warr, 1987). Most job satisfaction and motivation research literature is concerned with organizational or situational predictors (such as pay and supervision) (Locke, 1976) while neglecting individual differences (Staw & Ross, 1985). O’Reilly, Parlette and Bloom (1980) discovered that individuals’ significantly differ in the way they perceive their jobs, even if the job description and the tasks they had to perform remained constant, thus suggesting that some individual differences must have an effect on work attitudes. It would be misleading to suggest a dichotomy between individual difference and situational factors in the determinants of job motivation and satisfaction. People select organizations that select and shape them. Some attitudes and behaviors are encouraged while others are suppressed. There is a rich theoretical tradition surrounding the concept of “psycho structure” that supports this fundamental point (Carr, 1999; La Bier, 1986; Maccoby, 2003). In this sense it is always advisable to do longitudinal research, however difficult and expensive, to see causal patterns in how people change work environments and they change those working in them. This paper however is a correlation study in the psychometric tradition seeking to explore the relationship between attitudes, traits and motivation.

Differential psychologists have long stressed individual difference predictor of work performance. Job redesign programs often have mixed success, despite changing extrinsic circumstances as recommended by motivational theories (Steers & Porter, 1991). Organizational interventions may be mediated both by dispositional factors and individual differences. This contention is supported by a longitudinal study by Staw and Ross’ (1985), in which employee attitudes (including job satisfaction and work values) were shown to be stable across a five-year period despite changes in both occupations and employers. Indeed, prior attitudes were a stronger predictor of job satisfaction than changes in pay and promotions. Similarly, research carried out on twins separated at birth have demonstrated that on average, 40% of variance in observed work values, was accounted for by genetic factors, whilst 60% was associated with environmental factors and error variance (Keller, Bouchard, Arvey, Segal & Dawis, 1992).

Researchers have given comparatively more attention to the dispositional traits that contribute to job satisfaction partly because on no clear theoretical account of how the process works (Kanfer, 1990). To illustrate, Arvey, Bouchard, Segal and Abraham (1989) showed that in addition to the well-documented contribution of environmental factors, genetic influences account for 30% of variance in job satisfaction. Taken with the fact that most studies regarding the heritability of personality report an average of .5 (Goldsmith, 1983; Loehlin & Nichols, 1976), it would therefore be reasonable to assume that personality accounts for at least a part of this contribution (Arvey et al, 1989; Davidson, 1983). Thus, in an often quoted meta-analysis by Judge, Heller and Mount (2002) utilised 334 correlations from over 100 independent samples. The Big Five personality traits showed a multiple correlation of .41 with job satisfaction. Particularly strong associations were found between job satisfaction and Neuroticism (-.29), Extraversion (.25), and Conscientiousness (.26). A meta-analysis carried out by Judge and Ilies (2002) investigated the relationship between the ‘Big Five’ and three models of motivation: Goal Setting Theory, Expectancy Theory and Self-Efficacy motivation based on 150 correlations. Results demonstrated that Conscientiousness and Neuroticism were the strongest and most consistent associates of performance motivation across the three theories, with correlations of .24 and -.31 respectively. Based upon an average multiple correlation of .49 with motivation
criteria, it was concluded that the Big Five are an important source of performance motivation. The authors also concluded that in light of the results presented in the meta-analysis, it would be beneficial to investigate the effects of the Big Five on other models of motivation such as the two-factor theory, which thus far has only received minimal attention from researchers. Staw, Bell and Clausen (1986) argued that individual disposition may have a profound influence over how the working world is perceived (i.e. what is important to the individual), and this is likely to affect the type of jobs that are sought. Furnham (1997) speculated that extraverts may be highly motivated by intrinsic factors such as recognition and positive feedback; as such rewards comply with their sociable nature. Theoretical support for the aforementioned speculation is provided by Gray’s (1975) theory, which also stipulated that extraverts would respond more readily to reward (motivator factors) than introverts, who he believed were motivated to avoid punishment. Additional speculative examples of how personality may affect work attitudes, include individuals’ high in Openness being more satisfied with jobs which allow them to learn new skills and be innovative (Furnham, Petrides, Tsaoasis, Pappas & Garrod, 2005). However, research has demonstrated that “attempts to empirically link personality characteristics to motivational variables have produced inconsistent results” (Gellatly, 1996, p. 474). An example of a recent study investigating the contribution of personality to Herzberg et al’s (1959) theory of work motivation is that of Furnham, Forde and Ferrari (1999). Results demonstrated that Extraverts (identified by the Eysenck Personality Profiler) regarded motivator factors as more important than Introverts, thus confirming the contentions made by Furnham (1997) and Gray (1975). These findings mirror those of Gupta (1976) who found that in a sample of individuals performing a linguistic task, Extraverts responded more to reinforcement and Introverts more to punishment. Results also showed that neurotics placed more importance upon hygiene factors than non-neurotics. Taken with the marginally significant relationship between Psychoticism and hygiene factors, it appeared that Personality factors had a sizeable impact on work motivation, accounting for 20-30% of variance, and provided the basis for future study. A part replication of Furnham et al (1999), by Furnham, Petrides, Jackson and Cotter (2002) not only attempted to illustrate the impact of personality on work values but also on job satisfaction. Findings were not replicated, with the personality super factors from the Eysenck Personality Profiler only accounting for 5% of the variance in the sample. However, when a Big Five measure was used, it was observed that between 8% and 13% of the variance in job satisfaction was explained by personality factors. The influence of Conscientiousness is mirrored in previous findings in job satisfaction literature (e.g. Salgado, 1997; Judge, Higgins, Thoresen & Barrick, 1999), and thus suggests that this trait is a relatively consistent predictor of job satisfaction (Furnham et al, 2002). A potential explanation for its influence is that conscientious individuals are likely to receive higher intrinsic and extrinsic rewards due to their efficient nature, thus consequently increasing job satisfaction. Additionally, the significant influence of age is supported by previous literature, which suggests that as individuals get older they tend to be more satisfied in their jobs, potentially because they are more capable of aligning their work values to their choice of vocation (Davies, Mathews & Wong, 1991). A more recent study by Furnham et al (2005) sought to find the associations between personality and work values for samples in Great Britain and Greece. Factor scores demonstrated that responses from both samples could be classified according to intrinsic/extrinsic categories, thus demonstrating a cross-cultural relevance for Herzberg’s et al’s (1959) theory. Regression analyses revealed that personality variables, age and gender accounted for between 5% and 13% of the variance for
each factor. In this instance, Motivator concerns were associated positively with Extraversion and negatively with Openness, whilst high scores in the hygiene-related factor were negatively associated with both Extraversion and Openness. Therefore, the purpose of this investigation is to further assess the extent to which individual differences have an effect upon motivation and job satisfaction. Following the statistical advice of Schmidt, Hunter and Urry (1976) this study will use a sample consisting of more than 170 individuals (N > 170). As suggested by Furnham et al (2005) a wider range of participant demographics will be investigated, these are: years in full time employment, job tenure, and job status.

Research hypothesis:
Based on previous research and speculative observations, the following predictions can be made:
Hypothesis 1: The factorial structure of the Work Values Questionnaire (Mantech, 1983) will reflect between 2 and 4 components that are grouped according to Herzberg et al’s (1959) two-factor theory.
Hypothesis 2: It is believed that when a measure of the Big Five is regressed on satisfaction/motivation factor scores, personality variables will account for a significant proportion of the variance (Staw & Ross, 1985; Furnham et al, 1999; Furnham et al, 2002; Furnham et al, 2005).
Hypothesis 3: Based on findings in the literature (e.g. Davies, Mathews & Wong, 1991; Furnham et al, 2002), there will be a significant relationship between age and job satisfaction. Due to the likely association between age and job tenure/overall years in full time employment it is believed that these variables will also have a positive association with job satisfaction.
Hypothesis 4: Based upon previous findings in the literature (Furnham et al, 2002; Salgado, 1997; Judge, Higgins) Conscientiousness will be positively, and Neuroticism negatively, associated with intrinsic motivation.
Hypothesis 5: An increased job status according to Herzberg et al (1959) provides individuals with both increased hygiene (e.g. pay, bonus, perks) and Motivator factors (e.g. power, recognition etc) it is believed that this variable will be positively associated with job satisfaction responses.

Methodology
Samples:
In this study 150 people of in Inspection Organization in Iran participant as samples.

Research tools
The Ten Item Personality Inventory (Gosling, Rentfrow & Swann, 2003): The ten items of this measure are scored using a seven-point scale, with two statements (one reversed) used to measure each personality variable. The authors report extensive data showing good reliability and validity of this instrument.
The Work Values Questionnaire (WVQ; Furnham et al, 2005): This inventory consists of 37 items and requires individuals to report the extent to which intrinsic (e.g. responsibility and personal growth) and extrinsic (e.g. pay and benefits) components are important to them on a 6-point scale. The WVQ is a revised version of Mantech’s (1983) questionnaire. Previous studies have indicated that between two and four factors tend to be extracted, and that these often correspond to Herzberg et al’s (1959) hygiene and motivator factors.
The Job Satisfaction Scale (Warr, Cook & Wall, 1979): This scale consists of 15 items, seven of which measure intrinsic satisfaction, whilst the remaining eight measure extrinsic job
satisfaction. Responses are given on a 7-point scale and can be summed to create and overall satisfaction score as well as an intrinsic and extrinsic value.

Results

1. Co relational Analyses

The below table illustrates the correlations between the personality and demographic variables and job satisfaction scores. Both overall and intrinsic job satisfaction were positively correlated with Job Status (all $p < .01$), whilst extrinsic job satisfaction was negatively correlated with Job Status ($p < .05$). All three job satisfaction scores were positively correlated with Conscientiousness (all $p < .05$). In addition, it was noted that Age, Years in Full Time Employment, Job Tenure and Job Status were positively associated with each other (all $p < .01$).

2. Factor analysis on the WVQ

The 37 items in the WVQ was treated to a Principal Components Analyses. An initial factor analysis was run to check for multi co linearity and revealed that no SMC was approaching 0.9. A varimax rotation was then run and the scree plot indicated that three clear factors emerged.

Items that did not sufficiently load onto the extracted factors were removed, and the three factors were given the following names; factor 1: Security and Conditions (accounting for 19.6% of the variance as revealed by the rotated sums of squares loadings), factor 2: Status and Rewards (accounting for 14.4% of the variance), and factor 3: Personal development and stimulation (accounting for 11.7% of the variance). Hygiene items largely defined the first factor and motivators predominantly defined the remaining two factors.

3. Regression analyses on WVQ factor Scores

In order to investigate the impact of individual differences upon motivation/work values, three regressions were performed, with the three factor scores regressed onto the Big Five, Age, Gender, Total Years Working Full-time, Job Tenure and Job Status. All three regressions were shown to be significant (all \( p < .05 \)), and the output is illustrated in Table 4 in compact form. Results demonstrated that the variables accounted for 15.2% of the variance for the security and conditions factor (\( F(10, 191) = 3.42, p < .01 \)). Both Job Status and Total Years Working Full-time were significant negative predictors in the equation (\( p < .05 \)), whilst Age and Agreeableness were positive significant predictors (\( p < .05 \)). In addition, it should be noted that Current Employment Length was approaching significance as positive predictors in the equation (both \( p = .054 \)).

The second regression revealed that, the predictor variables accounted for 11.1% of the variance in the Status and Rewards factor (\( F(10, 191) = 2.37, p < .05 \)). The variance accounted for by the five personality factors was not significant (all \( p > .05 \)). Both gender and years in Full Time Employment were revealed as negative predictors in the equation (with women more likely to
favour this factor). Additionally, Job Status appeared as a significant positive predictor of the factor \((p < .01)\).

</tbody>
</table>

Note. \(N = 150\); \(*p < .05\). **\(p < .01\)

The third regression demonstrated that the ten variables accounted for 9% of the variance in the Personal development and stimulation factor \((F(10, 191) = 2.21, p < .05)\). Of the personality variables, Conscientiousness was a statistically significant predictor of the factor \((both p < .05)\), whilst Openness was near significant \((p = .054)\). The output revealed that no demographic variable significantly contributed to the equation \((all p > .05)\).

4. Regression Analyses on job satisfaction scores

Regression analyses were also used to assess the extent to which the Big Five and demographic variables influenced job satisfaction scores (intrinsic, extrinsic and overall job satisfaction). Table 4 illustrates the results in compact form and reveals that all three regressions were statistically significant \((all p < .05)\). The regression carried out upon the overall job satisfaction scores revealed that the ten variables collectively accounted for 12.1% of the variance \((F(10, 191) = 2.639), p < .01\). Further examination of the coefficients table revealed that both Conscientiousness and Job Status were significant positive predictors of the variable \((both p < .01)\). Results of the regression with intrinsic job satisfaction scores revealed that 12.7% of the variance could be accounted for by the personality and demographic variables \((F(10, 191) = 2.774, p < .01)\). As with overall job satisfaction, both Conscientiousness and Job Status were positive predictors in the equation \((both p < .05)\).

Note. *$p < .05$. **$p < .01$. 

As Table 4 illustrates, the ten variables collectively account for 10.5% of the variance in the extrinsic job satisfaction scores ($F_{(10, 191)} = 2.240$, $p < .05$). As with the previous regressions Conscientiousness and Job Status were significant predictors of the variable ($p > .05$). Whilst the remaining variables were not significant contributors to the equation, (all $p > .05$), it should be noted that both Agreeableness and Age were both approaching statistical significance (both $p < .10$).

Conclusion:

This study set out to investigate the extent to which personality and demographic factors explain variance in motivation and job satisfaction as defined by Herzberg et al’s (1959) two-factor theory. In line with previous research (Furnham et al 2002; Furnham et al, 2005), three factors were extracted from the WVQ, and these essentially corresponded to the Motivator/Hygiene factor categorization. As predicted, personality and demographic variables were significant correlates of the extracted factors, accounting for between 9 and 15.2% of the variance. Similarly, personality and demographic variables were also significantly related to all three job satisfaction scores and accounted for between 10.5 and 12.7% of the variance. As expected, Conscientiousness was a significant correlate of job satisfaction scores in both correlational and regression analyses. Contrary to expectations, age, job tenure and years working full time were not significantly related to job satisfaction scores; however, in line with predictions and the two-factor theory, job status was significantly associated with these scores. The Security and conditions factor extracted from participants’ responses to the WVQ was largely characterized by Hygiene issues regarding physical conditions of the workplace and the extent to which work is stable and clearly defined. This factor was positively associated with Agreeableness which Furnham et al (2005) agreed is a robust correlate of Work Values. Negative relationships were observed between the Security and conditions factor and job status, as well as years in full-time employment. These results suggest that individuals with low job status (e.g. graduate positions...
and non-managerial roles) are more concerned with working conditions and clarity in their work than those of a higher status and individuals who have been working for longer periods. A potential reason for this is that those in high status positions may take the safety, quality of conditions and regularity of work for granted (Warr, 1987). Similarly, as individuals gain more experience in full-time work they may become accustomed to the regularity associated with work. While a positive relationship between scores in this factor and age was found, it is somewhat contradictory owing to the fact that age is strongly associated with both years in working full-time and job status. Items associated with the status and rewards factor were largely Motivator orientated in origin. This category was concerned with the extent to which work provides intrinsic rewards (such as promotion/development prospects and power) and to a lesser degree extrinsic rewards (such as pay, perks and bonuses). High scores were positively associated with job status and were negatively associated with the number of years participants had worked full time. A potential explanation for the former observation is that those who are lower in job status (as revealed by significant correlations) may be more orientated towards the hygiene aspects of a job as demonstrated in the results for the security and conditions regression. However, as individuals move up in the company hierarchy it may be the case that Hygiene factors are no longer as salient as they have been achieved/taken for granted, and are instead motivated by the prospect of more power and status (i.e. motivators). This is in line with Maslow’s (1954) seminal theory of motivation, which ascertained that once lower order needs have been achieved (e.g. physiological needs and security), individuals shift their focus to higher order needs, culminating in self-actualisation. Whilst Hygiene components are present in this factor (bonuses, perks and pay), they can be interpreted as associates of increased power, status and recognition. The negative association between this factor and years in full-time employment is somewhat contradictory given the latter’s positive correlation with job status. However, it is important to remember that job status is not always synonymous of experience, and should thus be further investigated before any firm evaluations can be made. Results also demonstrated that women rated this factor as more important than men, thus suggesting they are more motivated by the prospect of power and status than their male counterparts.

The Development and stimulation factor was concerned with the extent to which work allows for intellectual stimulation, recognition, personal growth and responsibility, and was positively associated with Conscientiousness. Conscientious individuals may place higher value on the opportunity to apply themselves and be responsible, as a consequence of their achievement-orientated nature. A near significant relationship was found between scores in this factor and individuals’ high in Openness to Experience. Because such individuals are flexible and creative, it may be the case that they place more importance on the prospect of increased stimulation and personal growth than others. With regards to job satisfaction, all three categories (overall, intrinsic and extrinsic) were significantly associated with Conscientiousness. This observation is in line with previous research investigating the personality correlates of job satisfaction, such as Judge et al’s (2002) meta-analysis, which demonstrated an average correlation of .26 between Conscientiousness and job satisfaction. This maybe because of their attention to detail, individuals’ high in Conscientiousness are likely to be rewarded both extrinsically (in the form of bonuses and other perks) and intrinsically (in the form of more responsibility and expanded job roles). In accordance to Herzberg et al’s (1959) this would fulfil both the Hygiene and Motivator pre-requisites for job satisfaction, thus accounting for its significance.
Scores for all three job satisfaction categories were also positively associated with Job Status, which is also logical when interpreted in relation to Herzberg’s two-factor theory. Individuals of a high job status are more likely to have both Hygiene and Motivator factors fulfilled by their positions as such roles are likely to involve more variety, recognition, and power as well as satisfactory pay/bonuses and better quality physical working conditions (e.g. a personal office). However, age, job tenure and years working full-time were not significantly related to job satisfaction. However, the near-significant contribution of age (as well as Agreeableness) for intrinsic job satisfaction suggests that a larger sample may have produced different results that would be more in line with previous literature (e.g. Davies, Matthews & Wong, 1991; Furnham et al, 2002). As a whole, the results of the current study are in line with previous findings and further validates the contentions proposed by Keller et al (1992) – i.e. work reorganization strategies focused on the alteration of extrinsic factors alone are unlikely to be successful in their intentions to increase job satisfaction/employee motivation without considering the impact of individual differences. There is theoretical support in Lawler’s (1973) Expectancy theory, which ascertains that different employees are likely to place different value on certain rewards, and therefore some incentives will motivate them more than others. In practice, this line of thought is adopted in cafeteria-style rewards systems introduced by large organisations (Furnham, 2002). For example, PriceWaterhouseCoopers runs a benefits scheme named ‘Choices’ (source: www.pwc.com), which offers incentives including discounts on flight tickets, childcare vouchers and sabbatical programmes. Such schemes seem to appreciate the role of individual differences in the value placed upon certain rewards (e.g. the priorities of parents’ are likely to differ from those of graduates), and illustrates that some organizations are acknowledging motivation research and applying aspects to the design of reward systems. The results of the current study have demonstrated that the influence of demographic variables should not be underestimated. Whilst age has not consistently shown to contribute to work attitudes (Furnham et al, 2002), the current study suggests that aspects such as job tenure and number of years working full-time can be influential. Future avenues of research could involve the further investigation of demographic variables and their impact upon motivation and satisfaction; these could include education level and socio-economic status. Through the exploration of such variables, organizations may be in a better position to understand what variables impact upon motivation and job satisfaction, which could in turn inform businesses’ how to be more successful in their attempts to influence work attitudes through selection processes and interventions. However it is important to note that this was a correlational study and that causality cannot be inferred. Though it is unlikely that jobs change people’s temperaments they may well change their attitudes and beliefs. Only longitudinal behavioural studies can really answer questions of causality. One obvious issue in this study and those related to it (Furnham et al. 1999, 2002, 2005) is how relatively little variance personality factors account for when examining both motivation and satisfaction. As tables 4 and 5 illustrate personality, demographic and work factors only accounted for 9 – 15% of the variance. This begs the obvious and important question as to what accounts for the remaining 80 – 90% of the variance in these two very important factors at work. This investigation may have benefited from a more representative sample of the workforce. While there was a wide range of ages, the majority of participants were below 40, and thus it would be of interest to see whether similar results would be gained from a quota sample consisting of a set number of participants for each age/job status/job tenure bracket. It should be noted that the use of an Internet survey allowed a large number of participants to be acquired.
with ease, however a lack of familiarity with the internet may have prevented some individuals’ from participating in the study – indeed, only individuals with email access were able to receive the request to take part. Another methodological concern of the current study is that of common method variance that arises from the use of self-report questionnaires. Future studies could tackle this issue by administering personality inventories at different time periods or perhaps use a behaviour rated scale.

To conclude, this study demonstrates that personality and demographic variables can be significantly related to both Job satisfaction and Motivation as defined by Herzberg et al’s (1959) two-factor theory. These results further validate the contention that work attitudes are not the product of situational factors alone, and that both literature and organisations should further investigate the variables that contribute to these values with the intention of increasing job satisfaction and performance, through effective selection methods and pervasive job interventions.

Abstract

The goal of this research is to test relationship between personality and organizational citizenship behavior (OCB) in public organizations in Iran. The research integrates the use of eight dimensions for OCB and five dimensions for identify personality. A survey is conducted by using questionnaires from the previous research. The questionnaires were sent to 90 people in public organizations in Iran. Validity and reliability tests were used to evaluate the questionnaire contents. The Structural Equation Modeling (SEM) was employed to test the relationship among the variables. The result of the research showed that all the five dimensions (i.e. Emotional Stability, Extraversion, Openness to Experience, conscientiousness and Agreeableness) and personality itself have a possible and significant effect on the organizational citizenship behavior.

Keywords: Organizational citizenship behavior, personality, Emotional Stability, Extraversion, Openness to Experience, conscientiousness and Agreeableness

1. Introduction

Organizational Citizenship Behaviors (OCB) are discretionary behaviors on the part of the worker, which are neither expected nor required, and therefore cannot be formally rewarded or punished for the presence of lack of, by the organization. In recent years, there has been increasing interest among the researchers to explore the contextual and dispositional factors responsible for eliciting “Organization Citizenship Behavior” (OCB). Researchers have started to pay more attention to understand the dynamics of and to develop normative theories of extra-role employee behavior that are thought to contribute positively to overall organizational performance (Erturk, Yilmaz & Ceylan, 2004). Organizations could not survive or prosper without their members behaving as good citizens by engaging in all sorts of positive organization-relevant behavior. OCBs are thought to have an important impact on the effectiveness and efficiency of work teams and organizations, therefore contributing to the overall productivity of the organization. Because of the importance of good citizenship for organizations, understanding the nature and sources of (OCB) has long been a high priority for organizational scholars (Bateman and Organ, 1983; Organ, 1988) and remains to be so. Paine and organ (2000), pointed out that OCB is an important construct in organization behavior and in current westernized business literature.

Although there has been augmented research in the field of OCB, but all these studies have been done in western countries and explored its relationship with other variables rather than personality constructs. As such, the application of the ‘Big Five’ model may provide much
needed integration in this literature. However, to date, we are not aware of any studies that have investigated the relationship between the ‘Big Five’ and OCB in Iranian context. Therefore, the Purpose of this study is to fill this research gap and assess the relationship between these constructs to better understand the dispositional basis of Organizational Citizenship Behaviors (OCB).

2. Literature review

2.1. Organizational citizenship behavior (OCB)

Organizational citizenship behavior (OCB) is a unique aspect of individual activity at work; that was first mentioned in the early 1980s. According to Organ (1988), it represents individual behavior that is discretionary, not directly or explicitly recognized by the formal reward system, and in the aggregate promotes the efficient and effective functioning of the organization. This special behavior has become a lively research field investigated by organizational researchers and industrial psychologists. However, whereas most of the studies appear to deal with the phenomenon from a behavioral/functional perspective, the natural orientation of organizational citizenship behavior to psychology is often overlooked.

The classical approach to thinking about a job is in terms of the tasks that make up the job. In fact, one purpose of job analysis is to establish or identify these tasks. In turn, performance appraisal is concerned with assessing how well employees perform the tasks that make up their jobs. However, organizational Researchers have discovered that some employees contributed to the welfare or effectiveness of their organization by going beyond the duties prescribed in their jobs. That is, they give extra discretionary contributions that are neither required nor expected. The most frequently used term for this phenomenon is organizational citizenship behavior. It is also referred to as pro-social organizational behavior and extra role behavior. The study of organizational citizenship behavior has emerged as an extremely popular topic in organizational psychology, human resource management, and organizational behavior. The roots of the construct could be traced back to Barnard (1938), and Katz (1964). Barnard (1938) underscored the theoretical and practical importance of the willingness of persons to contribute efforts to the cooperative system. He described this willingness as a posture tendency to produce various constructive gestures. Katz (1964) distinguished between dependable role performance (that is, in – role performance) and what he further described as spontaneous behavior, which includes cooperative gestures, actions protective of the system, and behavior all of which enhance the external image of the organization. Katz noted that much of the patterned activity that comprises organizations goes beyond formal role prescriptions in the extent to which it is intrinsically cooperative. Furthermore, the incentives (for example merit and pay) for excellence of in-role performance do not inhere in formal role obligations. The presumption is that many of these contributions aggregated over time and person enhances organizational effectiveness. Organ (1988) suggested that organizational citizenship behavior, in effect, places more resources at the disposal of the organization and obviates the need for costly formal mechanism to provide functions otherwise rendered informally by organizational citizenship behavior. The basic significance of organizational citizenship behavior lies in the observation that it cannot be accounted for by incentives that sustain in-role behaviors. Barnard (1938) further stated that the willingness of individuals to contribute cooperative efforts to the organization was indispensable to effective attainment of organizational goals. He elaborated that efforts must be exerted not only to perform the functions that contribute to the goals of the organization, but also to maintain the organization itself. Researchers have identified many different “types” of OCB, but in this
research eight type of OCB is used. Altruism, courtesy, conscientiousness, sportsmanship, civic virtue, interpersonal harmony, protecting company resources and organizational loyalty.

2.2 Personality
The ‘Big Five’ model implies that personality consists of five relatively independent dimensions that altogether provide a meaningful taxonomy for the study of individual differences. These five dimensions are Openness to Experience, Conscientiousness, Extraversion, Agreeableness and Neuroticism. Each of the Big Five dimensions is like a bucket that holds a set of traits that tend to occur together. Our interpretation of the Big Five directly corresponds to our measurement of the five-factor model of personality. **Openness to experience** refers to the number of interests to which one is attracted and the depth to which those interests are pursued. The behavioral tendencies typically associated with Openness to Experience include being imaginative, cultured, curious, original, broad-minded, intelligent (Digman, 1990), and having a need for variety, aesthetic sensitivity, and unconventional values (McCrae & John, 1992). **Conscientiousness** refers to the number of goals on which one is focused. It is related to dependability and volition and the typical behaviors associated with it include being hard working, achievement-oriented, persevering, careful, and responsible (Barrick & Mount, 1991). **Extraversion** refers to the level of sensory stimulation with which one is comfortable. The behavioral tendencies used to measure this factor include being sociable, gregarious, assertive, talkative, and active (Barrick & Mount, 1991). **Agreeableness** refers to the number of sources from which one takes one's norms for right behavior. The behavioral tendencies typically associated with this factor include being courteous, flexible, trusting, good-natured, cooperative, forgiving, soft-hearted, and tolerant (Barrick & Mount, 1991). **Neuroticism** refers to the number and strength of stimuli required to elicit negative emotions in a person. Typical behaviors associated with this factor include being anxious, depressed, angry, embarrassed, emotional, worried, and insecure (Barrick & Mount, 1991).

2.3 Personality traits and OCB
Personality plays a role in behaviors that are discretionary or performed in weak situations with limited external constraints. Given that personalities reflect enduring tendencies to think, feel, and behave in certain ways and that organizational citizenship behavior are discretionary, there is a strong relationship between organizational citizenship behavior and personality characteristics (Podsakoff, Mackenzie, Paine, and Bachrach, 2000). Also, personality can potentially yield organizational citizenship behaviors in the workplace through several simultaneous and interrelated processes. First, differences in personality may influence how individuals are motivated. Thus, motivation may be a mechanism by which personality yields organizational citizenship behavior. Also, personality characteristics may affect how individuals interpret situations that arise and the likelihood that they react in an interpersonally facilitative manner. Individuals low in emotional stability tend to view situations in a negative light (Costa & McCrae, 1992). Such individuals may interpret coworker’s organizational citizenship behaviors as or threatening to status hierarchies, and may withhold helpful responses. Commonly associated with efficiency, organizational, reliability, and thoroughness, personality is a dimension of human behavior that may both organize and direct behaviors. However, personality comes in different dimensions such as extraversion, and introversion. Individuals high in extraversion are described by adjectives such as active, assertive, energetic, enthusiastic, and
outgoing (McCrae & John, 1992). Though, there is some evidence that extraversion is characterized by urgency to a greater degree than sociability, individuals high in extraversion tend to be highly social, talkative, and affectionate and commonly have numerous friendships and good social skills. Extraversion has been found to relate positively to training proficiency (Costa & McCrae, 1992). Nevertheless; many other factors apart from personality characteristics also affect organizational citizenship behavior. Among these factors include gender. Work-related behaviors are often influenced by gender.

3. Conceptual framework

Based on mention in literature conceptual framework of this study is shown in below diagram

4. Research hypothesis

1. There are positive and significant relationship between personality and the organizational citizenship behavior
2. There are positive and significant relationship between emotional stability and the organizational citizenship behavior
3. There are positive and significant relationship between Extraversion and the organizational citizenship behavior
4. There are positive and significant relationship between Openness to Experience and the organizational citizenship behavior
5. There are positive and significant relationship between Agreeableness and the organizational citizenship behavior
6. There are positive and significant relationship between conscientiousness and the organizational citizenship behavior
5. The Methodology of the Research

5.1 The Method of the Research
In terms of the practical objective and the data collection method, the present research is
descriptive and in terms of the relation between the variables it is of the Casual type. The method
of conducting the research is "Survey research" and the foremost advantage of it is possibility of
generalizing the results. The variables of the research are: personality and its 5-way components
as the independent variable and the organizational citizenship behavior (OCB) as the dependent
variable.

5.2 Data Collection
In order to analyze the relationship between personality and the organizational citizenship
behavior, the required data and findings were collected through two types of 60-question NEO
questionnaires to test the personality traits and the 30-question Liva Markozi and Catharine Zane
questionnaire from the California University. The personality traits of people have been tested in
5 categories and the five-point Likert scale.

5.3 The validity and the reliability of the research
The validity of the personality questionnaire was determined and approved by the relevant
professors who specialize in related subjects and research and as it was mentioned before
construct validity was also measured in the factor analysis which indicated that all questions
have high correlation with their latent variable (the factor loading has been higher than 0.7 in all
cases). In relation to reliability of the questionnaire the Cronbach's alpha was calculated for the
30 early questions at 0.901 which shows that the questionnaire enjoyed sufficient and very good
reliability. The reliability for the whole statistical community is 0.904. Also, the Cronbach's
alpha of the dimensions of emotional stability, extraversion, openness to experience,
agreeableness and conscientiousness are 0.92, 0.85, 0.89, 0.93, 0.90 and 0.93 respectively. As it
is evident in the Cronbach's alpha all the dimensions have had high reliability.
The validity of the organizational citizenship behavior questionnaire was determined and
approved by the relevant professors who specialize in related subjects and research and as it was
mentioned before construct validity was also measured in the factor analysis which indicated that
all questions have high correlation with their latent variable (the factor loading has been higher
than 0.6 in all cases). In relation to reliability of the organizational citizenship behavior
questionnaire the Cronbach's alpha was calculated for the 30 early questions at 0.899 which
shows that the questionnaire enjoyed sufficient and very good reliability. The reliability for the
whole statistical community is 0.901. Also, the Cronbach's alpha of the dimensions of civic
virtues, altruism, conscientiousness, interpersonal harmony, protecting company resources,
sportsmanship, courtesy, organizational loyalty are 0.89, 0.92, 0.91, 0.88, 0.95, 0.96, 0.87 and
0.93 respectively. As it is evident in the Cronbach's alpha all the dimensions have had high
reliability.

5.4 The Statistical Community
The statistical community of the present research is comprised of the employees of one of the
Tehran's governmental organizations. Both measurements instruments were firstly distributed
amongst 30 employees and then among the whole statistical community. In the present research
and due to the easy access to all the community, all the members of the community were
analyzed (census data was used). Out of the 110 distributed questionnaires, 95 were returned to the researcher. Out of these 95 questionnaires, 90 were chosen and then analyzed.

5.5. The Data Collection Method
The structural equation modeling has been used in the research i.e. the causal personality relations and the organizational citizenship behavior were tested through standard Quotient and significant number with LISREL software according to which the hypotheses were either confirmed or rejected. All in all, the first and second factor analysis (measurement models) and also the path factor (structural model) have been used. First the first and second factor analysis for the concept of personality and the concept of organizational citizenship behavior were done for the validity of the questions and then through path analysis the causal relationship between personality and organizational citizenship behavior were tested. In general, LISREL has three basic functions: 1- Confirmatory factor analysis 2- path analysis 3- fit of the model. In the present research all three functions have been used.

6. The Findings of the Research
6.1 Description of statistical community
There were 90 participants in the research out of whom 65 were men and 23 women. 75 of them held bachelor's degree and 19 master’s degree and the remaining held PHD. Out of them, 23 were below 35 years of age, 45 were aged between 35 and 45 and 18 others were above 50.

6.2 Structural model
After making sure of the veracity of the measurement models (confirmatory factor analysis of the concepts of personality and organizational citizenship behavior), the secondary hypotheses of the research were put to the test. In other words the relationship between the dimensions of personality and citizenship behavior was tested. The model is discussed below in a diagram as standard estimation (standard coefficient) and coefficient of significance (significant numbers).

Diagram 2: The structural equation modeling (estimation of standard)

Diagram 3: The structural equation modeling (significant numbers)

Considering the results obtained and since the absolute value of all the significant numbers is bigger than 2, the model under consideration is hence a significant model. Regarding the main hypothesis, the structural models are as follows for coefficient standards and significant ones:
3.6. Analyzing the relationship between variables

In order to analyze the relationship between the variables of the model (personality and its dimensions; organizational citizenship behavior and its dimensions) multiple regression has been used. In this line, the structural equation modeling and specifically the structural models (path analysis) have been used. It needs to be mentioned that for confirming or refusing the hypotheses standard coefficient $^8$ and significant numbers $^9$ (refer to the footnotes where they have been

---

$^8$ - What is meant by standard coefficient is the amount of bi-correlations (between two variables). It is used for comparing the effect of the components of the model. The more the coefficient the more the independent variable influences the dependent one.
defined). Also the confidence coefficient for all paths is 95% and the rate of error is 5%. As shown in table 2, the effect of the dimensions of personality on the organizational citizenship behavior is significant and direct. In other words, in case any of the personality traits of the people in the organization is improved, the organizational citizenship behaviors will improve on the average.

</tr>
</tbody>
</table>

Table No.2: The independent variable numbers and its dimensions with the dependent variable of the model

Now considering the information gleaned, the hypotheses of the research are either confirmed or rejected as follows in table No. 3

---

9 In LISREL software, significant numbers have the same meaning as "Sig". The difference is that for a coefficient to be significant, its significant number must be bigger than 1.96 or smaller than -1.96. In general these numbers are used for the refusing or confirming the research hypotheses. If the significant number is bigger than 1.96, it shows that independent variable has a stronger effect on the dependent variable.
Table No.3: confirming or rejecting the research hypotheses using the results of the path analysis

<table>
<thead>
<tr>
<th>No.</th>
<th>Research Hypotheses</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>There is a positive and significant relation between personality and the organizational citizenship behavior confirmed</td>
</tr>
<tr>
<td>2</td>
<td>There is a positive and significant relation between emotional stability and the organizational citizenship behavior confirmed</td>
</tr>
<tr>
<td>3</td>
<td>There is a positive and significant relation between extraversion and the organizational citizenship behavior confirmed</td>
</tr>
<tr>
<td>4</td>
<td>There is a positive and significant relation between openness to experience and the organizational citizenship behavior confirmed</td>
</tr>
<tr>
<td>5</td>
<td>There is a positive and significant relation between agreeableness and the organizational citizenship behavior confirmed</td>
</tr>
<tr>
<td>6</td>
<td>There is a positive and significant relation between conscientiousness and the organizational citizenship behavior confirmed</td>
</tr>
</tbody>
</table>

4.6. Fitness of the model

The indicators of the good fitness of the model are $X^2$, df, P-value and RMSEA. The best indicator in the LISREL software $X^2$/df is chi-square to degree of freedom and the smaller it is than 3, the better will be the fitness of the model. The RMSEA is the same as average square root of the model errors. This indicator is made based on the errors of the model. The allowed limit is 0.08 i.e. it is acceptable if it is below 0.08 and if it is below 0.05 then it is very good.

<table>
<thead>
<tr>
<th>Indicators</th>
<th>RMSEA</th>
<th>Degree of freedom</th>
<th>$X^2$</th>
<th>$X^2$/df</th>
</tr>
</thead>
<tbody>
<tr>
<td>First Model</td>
<td>0.38</td>
<td>55</td>
<td>61.26</td>
<td>1.10</td>
</tr>
<tr>
<td>second Model</td>
<td>0.031</td>
<td>64</td>
<td>66.61</td>
<td>0.96</td>
</tr>
</tbody>
</table>

The numbers obtained in table 4 indicate that the conceptual model of the research enjoys good fitness and the hypotheses related to causal relations or the influence of personality and its dimensions over the organizational citizenship behavior is confirmed. Considering the fact that average square root of the model errors is less than 0.08 and the number resulting from dividing $X^2$ by degree of freedom is smaller than 3 in both models, the drawn models have high fitness which is indicative of the fact that the regulated relations of the variables have been based on a logical and theoretical research framework.

5- Conclusion and Recommendation

The main objective of the present research is to examine the effect of personality and its various dimensions on organizational citizenship behavior. The result of the research showed that all the five dimensions (i.e. Emotional Stability, Extraversion, Openness to Experience, conscientiousness and Agreeableness) and personality itself have a possible and significant effect on the organizational citizenship behavior based on the path analysis model. Moreover, according to the results of models No. 1 and 2 the different personality dimensions are related to
each other too. The hypotheses of the research will be discussed and analyzed at length and ultimately proposals will be presented below for the improvement of the situation.

**Recommendation:**
Taking into consideration the results obtained, it is proposed that the ground would be prepared for the emergence and the reinforcement of the personal characteristics amongst the governmental organization used in this study so that they will exhibit more organizational citizenship behavior. As was also mentioned in the literature review, organizational citizenship behavior is one of the concepts that will ultimately raise the productivity of human resources. Therefore it is important to pay attention to the needed infrastructures and the factors affecting it. In this line, the outcomes of the present research showed that by emphasizing and paying attention to personality traits, people will accept the organizational structure and respect organizational rules and regulations and may willingly make sacrifices for the interest of their organizations and become active in its activities and strive to defend the organization they work for and try their best to contribute to it. Therefore and considering the outcomes of the research it is recommended that the Organization try to know the personality traits of it employees and pay enough attention to this important matter that is the organizational citizenship behavior.

Survey relationship between organizational justice and the organizational health in public organizations in Iran

Freyedon Ahmadi

Public management Department, Payame Noor university, 19395-4697 Tehran, I.R. of IRAN

Zainab Habibitabar

Public management Department, Payame Noor university, 19395-4697 Tehran, I.R. of IRAN

Abstract

The aim of this Study is determining relationship between organizational justice and organizational health in Iranian public organizations. For achievement this aim 200 people from three of public organization in Iran were selected for sample. In this study were used of Nijhoff and Mormon scale for determining of organizational justice as well as Kottkamp for organizational health. The results indicted there are meaningful relationship between organizational justice and its dimensions with organizational health. In other hand organizational justice have effect on develop of organizational health.

Key words: Organizational health, organizational justice, procedure justice, distribute justice, transactional justice

Introduction

Organizational health is defined by an organization’s ability to accomplish its mission, specifically in terms of plans for artistic development and outreach, support for employment for artists and cultural workers, access to the arts and audience development through a solid and healthy administrative structure at the financial level. Organizations that are judged to be in good organizational health are generally those that have a coherent creative vision, artistic vitality, competent staff and an efficient board of directors. The evaluation of the organizational health of artistic organizations requires a professional framework offering guarantees of competence and discretion. The divulgation of strategic information by organizations, which is essential to the quality of the analysis, must be able to take place in a climate of trust. These modifications will also lead to the obligation for organizations to provide the Council, in operating competitions, with information on aspects of their management that had not been assessed until now, such as governance and human resources management. Organizations must be able to benefit from a reasonable period in which to improve their management and in the course of the process be able to count on technical support to help achieve their objectives.

Today health for organization in many filed is very important. So researches attempted to find solution for improvement health in organizations. In my idea organizational justice is main instrument for improvement of organizational health. Based of this idea, in this research attempted were determined relationship between organizational health and organizational justice.
**Literature review**

**Organizational Justice**
Moorman (1991) stated that "organizational justice is concerned with the ways in which employees determine if they have been treated fairly in their jobs and the ways in which those determinations influence other work-related variables" (p. 845). Perceptions of justice are formed as employees examine their work-related outcomes and the procedures which regulate the distribution of those outcomes (Cropanzano & Prehar, 2001). Additionally, justice perceptions are formed through the interpersonal treatment one receives, not only in the process and procedures which impact allocation, but also in everyday encounters on the job (Bies, 2001).

Over the past 45 years the concept of organizational justice has evolved. Originally the focus of the literature was on the fairness of outcomes, labeled distributive justice. In the 1970s, researchers began to examine perceptions of fairness as determined by the procedures within the system which regulate outcomes (Deutsch, 1985; Leventhal, 1980). This component of justice was identified as procedural justice. However, procedural justice did not fully address the impact of interpersonal treatment on fairness perceptions; by definition, it excluded the importance of interpersonal treatment outside the locative process. As such, a third component of justice was advanced: interactional justice addressed fairness perceptions regarding interpersonal treatment received in all organizational encounters.

In 1993, Greenberg further subdivided interactional justice into two separate components, informational justice and interpersonal justice. He suggested that informational justice refers to the social aspects of procedural justice, in that, thorough explanations of procedures and accounts demonstrate regard for the individual. Whereas, interpersonal justice refers to the concern and sensitivity that must be shown in the distribution of outcomes or the social aspects of distributive justice.

**Organizational health**
Organizational health is defined by an organization’s ability to accomplish its mission, specifically in terms of plans for artistic development and outreach, support for employment for artists and cultural workers, access to the arts and audience development through a solid and healthy administrative structure at the financial level. Parsons (1958) suggested that organizations exert three levels of control over activities—technical, managerial, and institutional. A healthy organization, therefore, is one in which all three levels of control work in harmony. Hoy and Feldman’s (1987) utilize Parsons’ concept of organizational health, as defined by three levels of control—the technical, managerial, and institutional—that combine to create a healthy organization. The technical level defines issues related to a organization’s academic emphasis and the affiliation of its personals, inclusive of job satisfaction and a commitment to colleagues and customers. At the managerial level issues of leadership, principal influence, and resource support are at work. The level of institutional integrity is described as “the degree to which the organization can cope with environment in a way that maintains the educational integrity of its programs” (Hoy & Hannum, 1997, p. 294).

Foe measurement of organizational health often is used of OHI-S instrument. In developing the OHI-S, Hoy and his colleagues utilized some aspects of Miles' framework, but relied more heavily on Parsons' three tiered conceptualization of organizations. Parsons (1967) suggested that formal organizations are comprised of three
Levels: technical, managerial, and institutional. With respect to educational organizations, he stated that the technical function includes the actual process of teaching.

He proposed that the purpose of the managerial component is to "mediate between the technical organization and those who use its 'products' - the 'customers,' pupils, or whoever" (p. 43). As such the managerial level is consumed by activities such as allocating resources for instruction, making staffing decisions, and organizing the instructional program. Finally, the third level of Parsons' framework is the institutional level, which intercedes between management and community interests. Using Parsons' framework, Hoy and his associates identified seven factors of a Healthy school climate. The technical level includes two factors, morale and academic emphasis, defined primarily by the effective schools correlates as high academic expectations, an orderly learning environment, teacher support and belief in students, and a strong student work ethic. The OHI-S consists of four factors at the managerial level -principal influence, principal consideration, initiating structures, and resource support. Influence addresses the principal's ability to effectively persuade superiors to meet the needs of the school. Consideration is demonstrated by the principal through interactions with the faculty that are friendly, supportive, and collegial. The principal shows evidence of initiating structure by setting clear expectations and standards for performance. Lastly, resource support is met by acquiring adequate supplies to meet program needs. At the institutional level only one factor was identified by Hoy and his colleagues, institutional integrity, which they characterized as the ability to buffer the school from environmental or community demands.

As illustrated above, the OHI-S not only aligns with Parsons' framework in terms of the technical, managerial, and institutional levels, but Hoy et al. (1991) proposed that it also meets the standards of adaptation, goal attainment, and integration articulated by Miles' conceptual framework of healthy organizations. The factors of institutional integrity and resource support correspond with the organizations need to adapt; academic emphasis and initiating structure are consistent with goal attainment; and, principal influence, consideration, and morale align with the need for integration and cohesion within the organization (Hoy et al.).

Hoy et al. (1991) proposed that a healthy school should be high in all seven factors. They characterized a healthy school as one where the principal sets high standards, supports teachers, and is able to procure resources and influence superiors to get what is needed; teachers are committed to teaching and learning and they support students, one another, and their school; students demonstrate a strong academic work ethic; and the school is reasonably protected from excessive, external pressures. Conversely, unhealthy schools demonstrate the opposite.
Conceptual framework
In this study for determining relationship between organizational justice and organizational health were used of the below paradigm.

Diagram 1: The Conceptual framework

Based of above diagram our Hypotheses are:
There is a positive and meaningful relationship between the organizational justice and the organizational health.
There is a positive and meaningful relationship between distributional justice and the organizational health.
There is a positive and meaningful relationship between the procedural justice and the organizational health.
There is a positive and meaningful relationship between the transactional justice and the organizational health.

Methodology
Kind of the Research
In terms of the practical objective and the data collection method, the present research is descriptive and in terms of the relation between the variables it is of the Casual type. The method of conducting the research is Survey research and the foremost advantage of it is possibility of generalizing the results. and the organizational health (OH) as the dependent variable.

Data Collection Tools
With the purpose of analyzing the relationship between the organizational justice and the organizational health, the present research assessed and measured the required information and findings collected by distribution of two types of questionnaires among the staff. Organizational justice perception was assessed by use of the Nijhoff and Mormon scale (1993) (comprising 30 indicators) and the three dimensions of the organizational justice including distributional justice, procedural justice and transactional justice were assessed by use of the five point Likert scale.
The second tool used in favor of the present research was the organizational health questionnaire (comprising 43 indicators) which was assessed by use of the five point Likert scale. The organizational health questionnaire used for the present research was arranged based on the Hoy, Tarter, Kottkamp organizational health questionnaire (1991) which is comprised of seven dimensions including institutional integrity, initiating structure, consideration, principal influence, resource support, morale and academic emphasis which, all, have been localized by the researcher of the questionnaire indicators.

**The validity and the reliability of the research**

The validity of the Organizational justice questionnaire was determined and approved by the relevant professors who specialize in related subjects and research and as it was mentioned before construct validity was also measured in the factor analysis which indicated that all questions have high correlation with their latent variable (the factor loading has been higher than 0.6 in all cases). In relation to reliability of the questionnaire the Cronbach's alpha was calculated for the 30 early questions at 0.899 which shows that the questionnaire enjoyed sufficient and very good reliability. The reliability for the whole statistical community is 0.901. Also, the Cronbach's alpha of the dimensions of distributional justice, procedural justice, transactional justice are 0.88, 0.93, 0.89. Respectively. As it is evident in the Cronbach's alpha all the dimensions have had high reliability.

The validity of the organizational Health questionnaire was determined and approved by the relevant professors who specialize in related subjects and research and as it was mentioned before construct validity was also measured in the factor analysis which indicated that all questions have high correlation with their latent variable (the factor loading has been higher than 0.6 in all cases). In relation to reliability of the organizational Health questionnaire the Cronbach's alpha was calculated for the 30 early questions at 0.902 which shows that the questionnaire enjoyed sufficient and very good reliability. The reliability for the whole statistical community is 0.903. Also, the Cronbach's alpha of the dimensions of Institutional integrity, Initiating structure, Consideration, Principal influence, Resource support, Morale, Academic emphasis are 0.95, 0.89, 0.92, 0.91, 0.90, 0.94, 0.89 respectively. As it is evident in the Cronbach's alpha all the dimensions have had high reliability.

**Statistical Community**

For the present research due to easy access to all members of the community responses of all of them were considered (census data was used) and out of 200 questionnaires distributed 185 were returned to the researcher. Out of the said 185 questionnaires, 180 were selected and analyzed accordingly.

**The Data Collection Method**

The structural equation modeling has been used in the research i.e. the causal organizational justice relations and the organizational Health were tested through standard Quotient and significant number with LISREL software according to which the hypotheses were either confirmed or rejected. All in all, the first and second factor analysis (measurement models) and also the path factor (structural model) have been used. First the first and second factor analysis for the concept of organizational justice and the concept of organizational Health were done for the validity of the questions and then through path analysis the causal relationship between organizational justice and organizational Health were tested. In general, LISREL has three basic functions: Confirmatory factor analysis, path analysis and fit of the model. In the present research all three functions have been used.
Research Findings
Description of statistical community
Out of 190 respondents, 130 were male and 58 were female. Also 140 respondents held bachelor’s degree, 35 held master’s degree and 6 held PhD degree. Out of total participants 46 were below 35 years of age, 90 between 35 and 45 and 36 were above 50 years of age.

Structural model
After making sure of the veracity of the measurement models (confirmatory factor analysis of the concepts of organizational justice and organizational Health), the secondary hypotheses of the research were put to the test. In other words the relationship between the dimensions of Organizational Justice and Organizational Health was tested. Significance (significant numbers). One and two below diagrams have been shown estimation of standard and significant numbers of model.

Diagram No. 2: The structural equation modeling (estimation of standard)
Diagram No. 3: The structural equation modeling (significant numbers) Considering the results obtained and since the absolute value of all the significant numbers is bigger than 2, the model under consideration is hence a significant model.
Regarding the main hypothesis, the structural models are as follows for coefficient standards and significant ones:

Diagram No. 4: The structural equation modeling (estimation of standard)

Diagram No. 5: The structural equation modeling  (significant numbers)

Analyzing the relationship between variables
In order to analyze the relation between the variables of the model (Organizational Justice and its dimensions; organizational Health and its dimensions) multiple regression has been used. In this line, the structural equation modeling  and specifically the structural models (path analysis) have been used. It needs to be mentioned that for confirming or refusing the hypotheses standard
coefficient\(^{10}\) and significant numbers\(^{11}\) (refer to the footnotes where they have been defined). Also the confidence coefficient for all paths is 95% and the rate of error is 5%. As shown in table 2, the effect of the dimensions of organizational justice on the organizational Health is significant and direct. In other words, in case any of the organizational justice in the organization is improved, the organizational Health will improve on the average.

Table No.1: the independent variable numbers and its dimensions with the dependent variable of the model

Now considering the information gleaned, the hypotheses of the research are either confirmed or rejected as follows in table No. 3:

\(^{10}\) What is meant by standard coefficient is the amount of bi-correlations (between two variables). It is used for comparing the effect of the components of the model. The more the coefficient the more the independent variable influences the dependent one.

\(^{11}\) In LISREL software, significant numbers have the same meaning as "Sig". The difference is that for a coefficient to be significant, its significant number must be bigger than 1.96 or smaller than -1.96. In general these numbers are used for the refusing or confirming the research hypotheses. If the significant number is bigger than 1.96, it shows that independent variable has a stronger effect on the dependent variable.
### Research Hypotheses

<table>

<td>There is a positive and significant relation between Transactional Justice and the organizational Health</td>
<td>4</td>
</tr>
</tbody>
</table>

Table No.3: confirming or rejecting the research hypotheses using the results of the path analysis

### Fitness of the model

The indicators of the good fitness of the model are $X^2$, df, Pvalue and RMSEA. The best indicator in the LISREL software $X^2$/df is chi-square to degree of freedom and the smaller it is than 3, the better will be the fitness of the model. The RMSEA is the same as average square root of the model errors. This indicator is made based on the errors of the model. The allowed limit is 0.08 i.e. it is acceptable if it is below 0.08 and if it is below 0.05 then it is very good.

<table>
<thead>
<tr>
<th>Indicators</th>
<th>RMSEA</th>
<th>Degree of freedom</th>
<th>$X^2$</th>
<th>$X^2$/df</th>
</tr>
</thead>
<tbody>
<tr>
<td>First Model</td>
<td>0.041</td>
<td>1976</td>
<td>1257</td>
<td>0.636</td>
</tr>
<tr>
<td>second Model</td>
<td>0.037</td>
<td>33</td>
<td>27</td>
<td>0.794</td>
</tr>
</tbody>
</table>

The numbers obtained in table 4 indicate that the conceptual model of the research enjoys good fitness and the hypotheses related to causal relations or the influence of Organizational Justice and its dimensions over the organizational Health is confirmed. Considering the fact that average square root of the model errors is less than 0.08 and the number resulting from dividing Chi-square by degree of freedom is smaller than 3 in both models, the drawn models have high fitness which is indicative of the fact that the regulated relations of the variables have been based on a logical and theoretical research framework.

### Conclusion and Recommendations

The prime target of the present research is to study impact or effect of the organizational justice and its dimensions on the organizational health. Outcome of the research was indicative of the fact that all the organizational justice dimensions (distributional, procedural and transactional) as well as the organizational justice itself, based on the path analysis modeling, did have a meaningful and positive impact upon the organizational health. In continuation all research hypotheses were discussed and analyzed and in the end a number of recommendations and suggestions were introduced for promoting the current status.

Main Hypothesis (relationship between the organizational justice and the organizational health):
Main hypothesis of the present research on existence of a positive and meaningful relationship between the organizational justice and organizational health amongst the government staff and employees was considered, discussed and confirmed accordingly. The results of the research also confirmed secondary hypotheses of the research notifying that the first secondary hypothesis is stronger than the other two secondary hypotheses.

All in all, the research reached the conclusion that all the staff and employees of those government organizations which considered and studied by the present research confirm impact and effect of the organizational justice and its dimensions on the organizational health (causative relationship).

First Secondary Hypothesis (relationship between the distributional justice and the organizational health):
After the hypothesis was put to test it was indicated that existence of distributional justice amongst the staff would lead to emergence of organizational health i.e. positive perception and judgment of individuals on the fairness of the distributed results, for instance, with regard to salary raise or opportunities for getting promoted in the job, would encourage the staff to make their utmost efforts in their jobs even beyond their responsibilities without expecting to be rewarded, being fully satisfied with their organization which by itself would bring about promotion of the organizational health. Generally speaking, if the distributional justice gets improved within any organization then the organizational health would automatically get improved as well. This dimension is of the most effect (0.79) on the organizational health.

Second Secondary Hypothesis (relationship between the procedural justice and the organizational health):
After the hypothesis was put to test it was indicated that the procedural justice within the organization would lead to emergence of the organizational health i.e. all the staff believed that administration of justice required adoption of just procedures; this means, in addition to the need that the foundation and concept of the law must be necessarily justice-based, the process which is supposed to produce justice shall also be a just and fair. In order to have a healthy organization we need to enjoy a just and fair procedure; the procedure which shall create equal opportunities in order for every one becomes a winner. In other words, if people get a justice-based perception based on the procedural justice then they would be ready to do over time work in their organizations generating further productivity as the consequence of which the organizational health would be promoted.

All in all, if the procedural justice gets improved within the organization the organizational health would get developed to an average extent as well. This dimension is of the least effect (0.60) upon the organizational health.

Third Secondary Hypothesis (relationship between the transactional justice and the organizational health):
Individual perception of politeness and mannerly conduct of managers and the staff is of decisive positive and meaningful effect towards emergence of the organizational health. This means that if employees of the organization consider behavior of managers towards any individual or by extent the whole staff of the organization as just and fair then they would be prepared to further devote themselves to the organization and stay in the organization and work more for the objectives of the organization even beyond the working hours which by itself would lead to promotion of the organizational health.
Generally speaking, if the procedural justice gets improved within the organization then the organizational health of the staff develops to an average extent as well. This dimension is of the second rank in terms of having effect (0.68) upon the organizational health.

**Recommendations**

Given the acquired results of the present research it is proposed that the ground for establishment and promotion of the organizational justice within the staff of government bodies shall be further considered and prepared in order for the staff cause more organizational health. As it was mentioned in the research literature the organizational health is a concept which finally gives rise to more productivity of the human force as a result of which the required infrastructures and effective elements for the organizational health are given further priority.

To this end outcome of the present research indicated the fact that further attention to and further emphasis on the organizational justice prepare the ground for the staff in order to accept the organizational structure, respect the organizational rules and regulations, make utmost efforts and support for the organizational interests, devote themselves to the organizational resources and actively participate in managing the organizational affairs. For example if the staff find distribution of results (rewards) fair and just they will consider the organizational procedures, i.e. the relevant process which lead to distribution of results, as just and fair as well.

Also just distribution of the results prepares the ground for the staff to consider mutual personal relations between managers as just and fair. Therefore given the obtained relations between the variables it is suggested that managers of the organization give further priority to the impact of the staff perception of the organizational justice and identify the relevant weak and strong points and accordingly based on the organizational prospects and future plans prepare a comprehensive plan for promotion of the human resources and further productivity of the human force. But if dissatisfaction is visible with the staff towards the organizational justice then serious reconsideration of the organizational results distribution, results distributional procedures and the communication between the managers with the staff are of utmost significance. As it was mentioned before perception of the organizational justice is considered as one of the new concepts which revolve around the human force and its privileges have already been discussed in many researches. Therefore it is also recommended that further attention shall be given to this important concept in order for the organization to use its privileges including improvement of the organizational health in favor of the organization.

Social Capital Influence on Production
Monireh Mohsenzadeh
Social Philosophy PH.D Student
Azerbaijan National Sciences Academy

Abstract
Social capital is one of the newest terms in studies relating economy, sociology and management which have occupied the attention of economists following natural, financial, physical and human resource. Studies have been done on interrelation between economical development and social capital recently in research centers amid the country. Especially good researches have been done on different capitals influence on production, but there are few researches on social capital role in production. As it is a must to raise production, we need to concentrate on the production growing factors, in a professional view. In this paper, special capital and its role in economy, especially on production will be discussed. Using social capital keywords and its correspondent definitions, production keywords have been mentioned as well and social capital effect on production economical policies, social capital influence to prevent market collapse, social capital role on owners' rights, and its effects on critical period's disturbance reduction have been analyzed. Finally, some proposals have been offered to enforce social capital.

Keywords: Social capital, transaction cost, market collapse, economical growth

Introduction
Social capital as a theory view has been considered by behavioral science, economy, management and social science experts in recent two decades.
Social capital is sometimes viewed as the peoples' property, so it is related to widespread social networks and accessible resources. Therefore social capital is considered as the group property. Social capital has been the subject of many surveys in recent years and its relation to political and economical development and personal effectiveness has been considered. Studies show that without social capital, it is hard to reach economical development by the means of other resources like financial, physical and natural resources.

Social Capital Meaning
Social capital is the characteristics of a society or group which includes: information, ideas, confidence and cooperation which raises the capacity of organizing to find solutions for public problems, in this way, unselfish behaviors is obvious and development is simplified.

One of the famous definitions for social capital has been presented by James Kelma. He has combined two important elements of social capital including: rules, commissions and the economical principle of personal wisdom response, he has come up with a model by which social operation for all the members of society is facilitated. (Kelman 1385)
This meaning affects the relation, confidence and cooperation among people and is active in the life of all (except those who live lonely). Social capital is necessary for capital and economical policies to give benefit and without capital, no society reaches any capital (Renan 1381).
The Social Capital History and its Definition
Social capital has been known as a key indicator in different forms and ways but its first definition refers to a young teacher named Hanifan. In rural schools gathering discussions he insisted on democracy and development and struttled the meaning of social capital. In spite of its creativity the meaning wasn’t considered widely. Then others like Seely, Loury and Jacob presented this plan. Social capital was defined seriously in 1980s. Spreading in theoretical and experimental sectors, it found an important place in sociology. This devotes first at Kelman (1998), An American sociologist and his research on school cooperation. Then Bourdieu in France clarified other parts of this meaning. Finally Pantham research (1993) on social capital relation with democratic institution in Italy was one of the effective factors on its expansion. Social capital in a public view is a kind of investing in social relations which is defined with its expected efficiency in the market. Of course market is a common term and its domain in analysis can refer to economy politics, society or labor market where people teach their benefits through social networks. The main idea of social network is that, family, friends, colleagues are important properties. Of course it involves a variety of groups. Groups, who have a variety of social networks and civil organization, face critical situations much better.

According to what mentioned above, some theorists believe that the social capital is not a new concept. This concept can be found in earlier sociologists like Dorkim and Marx. This idea that individual's contribution in social affairs, leads to positive consequences, was considered by sociologist from the very outset.

Social Capital Types
Social capital is divided to different kinds of bonding, bridging and linking social capital

Bonding Social Capital
Bonding social capital is created among people who have friendly relations with each other, like close friends and relatives and the family members since there is confidence among them and treatment is done easily between them and if a breaking occurs, it is resolved friendly without referring it to the court.

Bridging Social Capital
Bridging social capital exists when confidence and cooperation happens among people or groups that don’t have close friendship or irrelativeness among them but they are related in some manners like NGOs and political groups on the people of a village, city or country. Presence of numbers of versatile groups may make the society categorized, to prevent this, the bridging social capital is presented which its axis is healthy relations among people, people who belong to different groups, but live together in a society. Extended social capital is vital for every society to exist.

Some study results show that bridging social capital has positive effect and the bonding social capital has negative effect on economical development. Communicative social capital is made of the relation among people of different categories while it consists of their relation to ordinary people; leaders’ relation with other leaders and ordinary people is an example of this kind of relation. Religious leaders can organize their fans using their
social capital. In traditional environments, religious groups can enforce social confidence and contribution while in developed regions, institutes and organizations get this role.

**Social Capital as a Common Product**

Common products are products which can be divided but can be consumed by many people at once. These products are necessary for all and promote the convenience of the society; but no one can buy them as much as one needs. Many other social capital forms give their profits not only to those who do the best effort but give it to all the partners of the construction. For example, all the people of a region profit by the contribution of women who take part in local associations and this contribution has external positive effects. Social capital for inclusive people in the network is a source which is effective on quality and function, and while its profit involves all the people of a society, no one can be obligated to create it. Despite other capitals, voluntarily aspect is important for social capital and is created undoubtedly.

**Social Capital Theoretical Approach Comparison**

Social capital theories, consider social relations as the most important indicators. Despite structural differences, what gathers different approaches of social capital is it's relative aspects. Even with this common ideology and insistence on relative characteristics of social capital, different social capital theories can be derived from discussions of theorists as follows:

**A – Property Type**

The social capital to be a personal or cumulative (group, association, regional, national) property is considerable.

All the authorities affirm both personal and social aspects of social capital and see no difference between them but every one insists on one aspect.

Nanlin defines social capital as a relative personal property. Even thought while insists on social characteristics of the social capital he differs it from personal (human or material) property. Beardeu, Hekman, Patnam and Fokoyama are among those who define social capital as a group or social property.

**B – Relation types**

People's social network structure is another topic which has been considered. In Kelman and Bordeaux studies, insistence is on group compact networks to apply effective values and protecting its identity and its recreation

**C – Capital efficiency types**

Presented ideas on this sector can be divided into different groups based on its efficiency level (profit). Majority of social capital discussions are concentrated on personal properties and capital efficiency. From this point of view, the condition of the social capital usage by individual is important.

**D – Social Capital Custom Types**

Social capital in its private form is not necessarily useful for all the society or other groups or associations.
In this sector, we face a lot of positive and negative looks on social capital. Bordeau considers social capital as an instrument to regenerate upper circumstance for a group and then a person which leads in weakening the benefits of other groups, so usually negative view can be seen in Bordeau discussions, even though for Lin and Hekman, social capital has a private application, and consequently it's competitive. So the negative aspect of social capital is not always highlighted or at least it is ignored.

Nevertheless, social capital in Pantham and Fokoyama studies is evaluated on the basis of social capital advantage or disadvantage for the whole society. For example, immoral family direction and criminal bands are negative social capitals.

</table>

Negative Effects of Social Capital

Beside positive aspects of social capital, like other financial and physical properties, negative aspects of this capital and its effect on social and human goals should be considered. Criminal groups and bands and thieves have confidence and social capital among themselves but this trust and distrust toward the bigger society, helps antisocial activities, even in long lasting and widespread wars, there is social capital in both sides. Some forms of social capital may harm the liberty and identify of people. Some categories or parties efforts to hold power or some radical activities, results in disasters like genocide in Balkan and Africa in 1990s. They had a kind of social capital and performed risky crimes to kill masses of people.

So in social capital studies, motives, directions and goals should be considered and beside advantages and benefits, disadvantages and expenses should be noticed.

Unbalanced Income and Social Capital

Wilkinson, Linch and Kaplan have concluded through researches that there are unjustified incomes in some societies; these societies suffer from low firm relations in the society. Social
capital is in fact, an intermediate between unjustified income and good health. More injustice leads to less cooperation and lack of confidence, and both affect good health. There is a meaningful correlation between social communities and elections with the rate of death in healthy sectors (Winstra 1385)

It's obvious that collaboration among categories, facilitates cooperation between workers and supervisors and therefore helps the good health of all those who work in the labor market.

Some kinds of social capital provides taking more benefit from media, books, press and internet sites and helps to gain more information on good health which helps peoples health. Pantham has shown that social capital affects happiness which has effect on human's health. On the other hand, many studies show that there are relations between economical production and development and a healthy society.

The Most Important Researches

In paper "Social Capital and Economical Function (suri.1384)", internal impure production, share internal impure, internal impure production without oil, share internal impure production, general capital, private sector capitalization, private capitalization on machineries and business tools, working source and the existing capital, are economical indicators and returned checks per 1000 person of the country population have been categorized as indicators of social capital decrease in a typical economical model.

The results show that social capital reduction has a negative and meaningful relation with economical function. Specially, the proportion of private capitalization and social capital is negative and remarkable.

Also the correlation coefficient of the most of the economical variables and social capital reduction rate is negative and the relation between share productions without oil with social reduction is negative and noticeable positive relation between social capital and development is approved and external social capital in developed regions is more than in developing regions.

Developed regions use official tools for cumulative reactions while in less developed regions, cumulative reactions need unofficial social associations, unofficial religious cooperation is evidence in these regions.

In the article "Social Capital and its Effect on Economy" by Dr. Zahra elmi and Dr. mahmood sharepour and amir hasan hoseini(economic researches, No 71, winter 1384), after reviewing the topic, they have concluded that peoples' social activities is more coordinated with economical function and removing obstacles of peoples presence in social network will have positive effect on economy.

In Iran like other countries studied by rizo et al (2001), trusting common associations directed by the administration, will play a great role on confidence creation. It's better to let people cooperate in social activities, like south-eastern countries; this leads in the social capital increase.

When the government does what private sector and the society should do. Social capital is damaged severely. If the government interferes in all affairs; the society looses its confidence and abilities.

Hierarchical orders networks spread distrust in the society. Countries which have such vertical structures in them, face weak justice organization, deep sedition, back warded administration and weak people's presence in social fields. Social capital is one of the most important factors effective on economical function and promotion.
Bridging social capital reduces exchange costs and increases confidence through enhancing cooperation. But bonding social cooperation have negative effects on social cooperation and peoples relation to external environment. In a research with the title "Social, Physical and Human Capitals Analysis in Iranian Economy" (saadat, 1384), 28 states of the country have been considered. Results show that social capital has a relatively fixed procedure with some oscillations which are caused by historical, cultural and political problems.

Surveys show that Fars province has the most and baluchestan province has the least social capital. Also Yazd and Kerman provinces have high and kohkiloyeh has low social capital. This survey's indicators have been cooperation rate (proportion of members of cultural, artistics to the whole population) and crime rate justice files in elections, trustfulness, honesty and general knowledge.

After the Islamic revolution, physical capital has raised but social capital proportion to physical capital has decreased. Also the proportion of human resources in this period of time has been ascending and social capital motion to the physical capital has been ascending. The other conclusion is that human, physical and social capital procedure has been positive.

Theoretical Considerations

Studying economical production and promotion inside countries in the second half of 20th century, some conclusions have been achieved which could not been explained by economical theories. Pantham study in north and southern part of Italy was one of them that for a long time was a puzzle.

Twenty years research on local and state governments in different regions of Italy by Robert Pantham showed that participation customs like voting, reading newspapers, membership in associations and clubs are signs of an effective and efficient government.

So, interactive relation networks and social relations, is the condition of economical and social modernization not its conclusion (UN, 2001). Nort considers different economical applications among countries with the same production facilities and finds social capital a key factor, especially if social capital is proportional to economical development, as in happened it European countries, it will be effective on promotion and development.

In next discussion, social capital effects on the national and local elements of economical development will be studied.

Social Capital Effects of Elements and Factors of Economy and Production

Social capital is becoming one of the vital factors in economical development in all over the world. Tens of researches have shown that for rural development, local public associations are as important as physical and technological capitalization. Studies have been done to find why some activities to control common sources like water and pasture resources are successful. But others have failed. Social capital resources have a great role while government interference leads to undesired results.

Social capital is not only a tool to achieve development, but also a goal for social developments (Sen, 1380)

Economical transaction when done in social network is more efficient. Studies which have been done about efficient industrial sectors, insist on the importance of cooperation between workers and entrepreneurs.
Even, economical theories like "the new development theory" notice social structures more than new classic theories and Robert Lucas, one of the founders of intellectual expectance theories, considers human resources accumulation as an activity resulted by social capital (Pantham 1385).

What was noticeable in previous soviet unions and eastern European countries was lacking social capital and resulted in those systems corruption. Researches on education, urban poverty, unemployment, crime and public health show that successful outcome is much more in societies which have powerful social capital. By many studies it's concluded that social capital is directly related to education and health increasing, health status improvement, life expectancy, crime reduction, individuals economic performance succession, happiness feeling, trusting government, local and national development and economical promotion and national income (Pantham (2000), winter (2003), Krishna and colleagues (2002) and Firuzabadi and colleagues (1385).

Robert Pantham is one of those who have noticed the relation between regional development and social capital. He founded that social capital can describe regional differences in economical development and governed performance (Firozabadi and colleagues1385). Also, economical developments in recent decades were puzzles for economists. They found that in countries with the same resources and capitals, development is different, significantly. Denison (1961), studying on United States development, found that, labor and physical capital can't explain this countries development. This was human resources which resulted in development. Yet human resource is not the complete answer. In 1980s studies, the role of social capital was found and then, confidence was noticed as an important factor in development analysis.

Kormandi and Macwire studies (1985) were among the first studies, which considered social capital and economical performance and approved social capital effectively on development. Also Nek and Kifer in an article named "If Social Capital Has Economical Results" conducted a complete research on 29 market economy samples and found the firm relation between social capital and economic development. They concluded that in backward countries where financial development is low, Social capital is more important and confidence is correlated with capitalization. Laporta and colleagues' research is one of the most comprehensive studies which confirm relation between confidence and economical performance.

Studies done in our country shows that development and social capital relation has been positive but social capital trend in recent four decades up to 1380 has faced oscillations and a bit descending and in recent years, due to inflation and unemployment, life expectancy had decreased. Social capital can affect national production by different factors. Here, three groups of factors are discussed: A) the social capital effect on economic actors which directly affects production; B) social capital effect on one of the main production sources like human resources and its capacities as employment and C) social capital role on government efficiency and performance in economic domain. In all the above cases national production and economic development are affected.

A) The Social Capital Effect on Economical Factors

Social capital affects economic factors mainly by:

A -1) Investment

Studies conducted in Asian countries like Malaysia, Thailand, Hong Kong, South Korea, Singapore, Taiwan and china show that within last two decades they have experienced high
growth and have constructed a “Grid Capitalism” which is a new experience. It emphasizes on wide family rather than establishments as the capitalism bases. By mutual confidence in this network, Transaction costs are lower and innovation transmission in higher. This process can convert social capital to financial capital and investment. Also social capital helps productive investment and affects the final production and development by improving financial sector efficiency through people or families' savings to production investments (Rahmani et al.1386). In societies where social capital is high, crime rate is low and agencies are not obligated to use special security services to protect their benefits. Therefore financial resources increase by costs reduction. Investment security increases investment. Also, confidence causes the contractions to be confirmed, regarding the financial circumstance of establishments; it is a significant advantage and results in increasing transactions and investment. Providing security makes conservative families to deposit their cash in banks or buy bank shares and these supplies investing credits more and more. With high confidence, even if the payment time passes the problem can be solved friendly without court or prison sentence. If a debtor sentences to prison, a human resource is fallen into the prison and the creditor faces loss, consequently investment is damaged.

A-2) Property Rights Protection and Transactions Costs Reduction

Despite radical theories about individualism and personal benefits, Marx Weber investigates development in a leading country like Germany in people's relationship and cooperation. Principles of Confucius morad explain the south East Asia development after world war (Frankys, 1386). One of the results of Confucius ethics and peoples good manner is the costs reduction. Transaction costs are totally obvious and hidden economic and non-economic costs which are imposed to both sides of the transaction and increases production costs. Opportunity and transaction costs in absence of social capital are extremely high and in such a situation, many frauds occur. Within networks, exchange activities are protected against swindling, because there is guarantee that fraudulent will be punished. Punishment is applied by threatening that there will be no exchange with sinners in the future. The network benefit is achieved through pursuing such social norms. Besides those who exchange with fraudulent will be punished even if they have not fraud themselves. This can augment effectiveness of punishment. So worried for loosing their credit, they punish fraudulent (Frankvys 1386). In this way, relationships and network norms, in low level economy causes information flow, exchange acceleration and confidence and co working among economic agencies and consequently production costs is reduced (khanduzi 1384). Reducing costs, causes the establishment supply curves to go higher and production to increase. Also, ownership rights in institutional economy, if well protected in a region or country, by creating security and reducing production cost, attract capitals. More exchange and more capital increase benefits of sides and development.

Protecting ownership rights is so important that some economists consider it as a country's development indicator. Nevertheless it's obvious that using current technologies, no government can define and protect all rights in all fields in which exchange happens among people. Social capital is the factor that where government supervises and where there is no supervision, can make the behaviors
predictable. In other words social capital acts as governments complementary and even in some cases, it replaces the government. It's clear that where social capital acts in more fields, the government interference decreases; therefore costs resulted from the big government is omitted (Renan; 1387)

A-3) Productivity
One of the most important effects of social capital is productivity. Nowadays contract execution especially in developing countries faces a lot of problems, on the other hand a contract which contains all the aspects is complicated, and time consuming and expensive; in a way that many skills should be used for supervision that takes, a lot of expenses for exchanges. The more the mutual trust, the less the problems of contracts. In higher confidence situations, it is assumed that sides do not misuse opportunities, obstades and intransparencies are solved, the more simple the contracts execution, the more investment and development.

Investigating diamond market through intense family and social and religious interests, trade is facilitated by the guarantee needed in the market. If a member of this community steals or change precious diamonds he commits branch of trust, therefore he will lose all his familial, religious and social links and the society members will leave him. Strength of these links guarantee simplicity of trading in absence of such links; wide and expensive means and tools is required; otherwise, trading will not be possible (Kelman.1385)

A-4) Market Collapse Prevention
For market collapse, the most effective factor is unbalanced information. This means that service and goods suppliers have much more information and this result in customer's mistakes in recognizing merchandise advantages. If this situation continues, vendors who have weak correlations with customers will impose higher prices and omit equitable sellers who give information to the customers. If this repeats, leads to sources mal function and consequently market corruption.

B-Social Capital Influence on Human Resources and Employment Development

B-1) Entrepreneurship Development
Social capital is among factors which encourage people to start business and its absence has negative role on economic activities.
Social and cultural norms have complicated effects on entrepreneurship. Undoubtedly; his effects contain common beliefs, behavior norms, and patterns relating individual choice. While financial motives have effect on creditor's behavior, social and cultural norms or what is named social capital has sentimental effect (Sheikhan, 1386)

In a research conducted in 1989 by above pattern in 10 industrial countries and in 2000 in other 11 countries, it was proved that in countries where entrepreneurs are respected, and the society is not jealously against them, entrepreneurs are encouraged and motivated.

B-2) Career successes
Despite the literature of career success in individualistic systems, social mutual operations effect finding talents. What cause success are social relations. The more factors, the network gives to the society, the more the social capital. individuals power and influence in an organization network results from authority, expertise and one's circumstance in the network a successful
manager is a manager who has a better view of his organization are more successful (Sharepour, 1383).

B-3) Innovations and initiatives
Allocating credit and time for innovations and initiatives have the risk of not leading to the desired goal or not returning the capital, this is what economic agencies avoid it. Social capital in agencies and cooperation among them divides the costs and prevents bankruptcy. In such a condition initiatives spreads great economic revolutions (agriculture, industry, power, communication and information) and is consequence of innovations on the other sides, Nek and Kife (1997) have remind that if the employers consume time to investigative workers, employees or other partners will not be able to save time for innovations in their production process and new products. Social capital also helps research and development networks. The new view which came up in 1990s and in the new century, in developed countries, matters relations among organizations. Many agencies and factories have constructed good ties with laboratories, universities and national governments (Elmi et al. 1384) which results in applicable innovations by research and development.

B-4) Human Capitals
Bonding and bridging social capital have great effect on human capital construction and promotion. Inside and outside family social capital has shown a lot of evidence on reducing education drop (Coleman, 1385)
Outside social capital can be helpful to raise educations efficiency and human capital by social relations out of relative and friends links. This can be an actor to promote human capital can have a great role in economic development (Rahmani et al., 1386)
Human capital can complete social capital; it means that when social capital raises, human capital increases as well and in a society with high educated force, social capital promotion will be easy; because in a society in which people have highly educated, cooperation and coordination increases.
On the other side education system not only generates human capital, but it also transmits social capital in the form of values and norms, deprived provinces don’t have good condition in the education and social capital field compared with developed states.
Social capital is directly related to education and health, mortality reduction, expected life increase, crime reduction, people's economic productivity and success, feeling happiness, trusting the administration and national economic income and development.

B-5) Healths
Social capital can affect health. Social capital can affect health directly or cause policies which affect health. There is an irrefragable relationship between social capital, proverty and health. Societies, whose people have higher rate of social capital, have access to the media and press concerning health. This causes long life, higher life expectancy and disability reduction. Nowadays, the relationship between social capital and crime prevention has been proved (kawachi2000). The more social capital in a poor region, the more the health. Social environments which encourage social participation and confidence, cause better health inside
society. It should be known that positive spirit helps people to avoid illness. Also being under social protection, improves man's mental health (wynstra, 1385). This is even more probable that a social man refer to the doctor more than an isolated one. To meet job and generation duties, human resources health is very important. Especially total working days of healthy personnel are more than others and healthy personnel's total years of employment are more than others.

C) Social Capital Effect on Government Success and Productivity in Economy
Social capital effects governments work and efficiency through following points:

C-1) Social Capital Increase
Social capital increases confidence to establishments, and the government which has the main role, is trusted by people. This facilitates executing the policies. Studies show that there is a direct link between social capital and democracy (Sharepour, 1383). Policy consistence, following promises and fidelity to commitments causes the people trust the government. On the contrary, income unjustified distribution, and discrimination affects social capital, negatively. Pantham, in Italy region studies found the relation between social capital and government success, also in region in which special capital is more, state services is better, he discovered that where social capital is more, people present their requests in the front of authorities while in regions where social capital is less, people follow their private problems. In regions with higher level of social capital, people act more to solve public problems. Public confidence to the government is a key factor for social commitment and people's cooperation in political life. Social capital encourages all the people to consider positive values and social norms and isolates sinners, so social capital is an obstacle against crime, corruption and embezzlement.

C-2) Tax Gaining Facilitation and Budget Deficit Reduction
Many countries, including ours, have faced deficits for many years. As it is obvious, budget deficit is deficit of government revenues to costs. An important part of the government revenue is the taxes. Experience has shown that when confidence among government and citizens in more getting taxes will be easier and the total taxes income will increase.

C-3) Stagnation Period Damage Reductions
In Iranian economy, it is seen that when oil price increases and weather condition improves, agricultural and nonagricultural production increase, unemployment decreases and new agencies are established. Sometimes, oil price decreases and drought happens (like 1367) and therefore people's revenue decreases and workers loose their job. In macroeconomics, this oscillations in economic activities, is called business fluctuations (Mehrgan, 1386). If there is confidence and social capital, agencies and workers who loose their job and business, are supported by others (Mehrgan, 1386) and if social capital is higher and government and people trust each other, there will be more motivation for saving capital, especially it can compensate revenue and capital shortage and control economic production and advancement.

C-4) Mid Term and Long Term Programs
The purpose of preparing programs mid and long term plans such as a vision design is a movement considering challenges and opportunities and indicating strategies to utilize facilities and remove obstacles. This indicates determination and commitment of national governments
and causes people to trust their government. Increasing social capital facilitates achieving the objectives. For sure executing these policies, needs the government's confidence and relative social capital.

The aim of preparing the 20-years vision program is to avoid short-term and personal decisions to achieve and predict long-term goals; one of the main problems of the administration after the Islamic revolution victory is lack of commitment of them to the planned programs (Karimi1386). One of the problems which have affected economy is that long-term plans have not been considered. If there is not long-term plans, the government will be busy with daily problems and different, conflicting and temporary goals will be objected by the administration and the facilities will be devoted to the daily goals instead of planned ones.

C-5) Corruptions and Embezzlement Reduction

Social capital encourages all people to consider positive norms and values and isolates sinners so, social networks are considered as obstacles against crime, corruption and embezzlement. Other studies show that lower social capital causes more crime and theft. Also, the neighborhood intervention to protect their common benefits depends on their conditions of mutual confidence and social correlation among them (Sharepour, 1383). When theft decreases, cost saving increases and this can cause increasing production. Also there is negative relation between corruption indicator and human resources development and income index and there is positive relation between corruption and unequal income distribution (Dyna Torkman, 1385).

CONCLUSION

From this survey and other studies, some conclusions have been made. Some of the most important results are as follows:

1-Regarding social capital importance in economic increasing and development by factors reviewed in this paper, in current economical situation of our country which faces long-term unemployment and inflation and social capital is decreasing slowly, it is required to raise social capital. Lending money and fund distribution does not create jobs and employment. Especially new investments are necessary for young generation.

2-Adherence to 5-year development plan and vision goals is the product of social capital which promotes it and the commitment of the administration to the plan, causes public confidence to a better future. Building confidence between government and political sides is important in this field.

3-While, social capital facilitates contracts and accelerates their operation, and reduces the transaction coast; it protects ownership rights which are a key factor for production advancement.

4-Economic performance improvement of the government is effective on economical growth. This is very important in Iran with its large government. The government should also create and facilitate business for institutions.

5- In countries with high social capital, governments are trusted more and their promises and policies are more valid and economical laws and guarantees are not revised again and again. People find these countries a safer place for investment and choose production approach in them which is more effective and optimal in long – term period of time (Nek and Kifer, 1997). Serial changes in economic policies, causes instability in the market and makes the economic agencies distrust the market.

6-Every motion which causes people not to trust the administration, affects economy. Especially, confidence is a key factor for investment and production.
7- Public confidence to the government is a vital component to strengthen social commitment to flow social capital in political correlation and participation. Negative attitude of people toward discrimination is a considerable negative factor for public confidence (Ghabari & Sadeghi, 1387).

8- Workforce training for participation in team works is very important to transfer social capital to production. Education in this order is also important.

9- Deprived provinces of the country are in poor condition in accordance to social capital and should be considered more. Considering educational factors is very important and can help.

10- Also, as noted before; in poor countries, where financial capital is weak, social capital is very important and should be increased.

11- Also, in the country provinces, while outside social capital has positive effect on economic advancement and inside social interactions has negative effect on it, it is proposed that outside social capital and relations be encouraged to promote production.

12- To attract participation of citizens, tools should be considered. In modern areas, institutions and associations work while in traditional areas, religious foundations work more to develop public participation and confidence.

Abstract
Purpose- This paper aims at finding the relationships between social capital and job satisfaction in private service organizations (hospitals). Design/methodology/approach- An experimental method is performed to study the relationship between social capital variables and job satisfaction in three private hospitals to analyze their direct/indirect relationships with job satisfaction. Findings- The present paper indicates that there is a direct, positive, and significant relationship between trust and job satisfaction. Trust will lead to more satisfaction. There is also an indirect, positive, and significant relationship between formal networks and job satisfaction but through trust variable. There is no direct/indirect relationship between action norms and job satisfaction. It has also been found that there is a direct, significant, but negative relationship between educational level and job satisfaction. Research limitations/implications- This analysis had been performed in private organizations and further analysis shall be done in non-private organizations. Practical implications- Social capital is so tied to trust that in almost all organizations efforts have to be taken to promote trust among members and between members and organization. Originality/value- There is neither direct nor indirect relationship between action norms and job satisfaction, so social capital can either be supportive or not supportive.

Keywords- Social capital, Job satisfaction

Introduction
Scholars such as Coleman (1990) and Putnam (1993) in an attempt to explain non-economic factors in explaining success of certain economic processes drew on the concept of social capital. That is why at present, besides human, financial, and economical capitals, a new reality as social capital is being extensively utilized in the literature of social and organization realms. Fukuyama (1999) believes that a number of definitions had been given with respect to social capital but they refer to its manifestation rather than to social capital itself. He says “social capital is an instantiated informal norm that promotes co-operation between two or more individuals” (Fukuyama, 1999). Putnam (1995) also defines social capital as “The characteristics of the social organization such as networks, norms and social trust that facilitate coordination and cooperation for mutual benefit”. On the other hand, job satisfaction in organization, has long been an important issue and of great concern and has attracted the attention of many researchers. Many researches have targeted the assessment of job satisfaction in different group settings and the factors related to job satisfaction and their impacts on organizational productivity, job turnovers, absenteeism, and employee efficiencies (Brass, 1982, Helbert, 1991, Bulder et al. 1995, Hodson, 1997). Yet, less attention has been paid to social capital and its relation to job satisfaction. Taking into account the above issues, we intend to study the relationships between social capital and job satisfaction. The evidence is drawn from some private hospitals in Tehran, Iran.
Literature review

Social capital is less physically tangible in comparison with other resources such as physical, human and cultural. Physical capital is created through changes on materials to form tools which facilitate production. Human capital is generated by changing individuals through new skills and capabilities in them in a way that they are empowered to behave in a new way (Coleman, 1999). Cultural capital is a set of symbols, habits, characters, linguistic methods, training documents, zeal and tact, and life methods which are current among individuals. This capital is less tangible and objective in comparison to economical capital. Social capital is defined as the vast and complete panorama of social and communicative network qualities which one utilizes to promote his/her personal attitudes (Jaeger and Holm, 2007). Fukuyama defines social capital as an instantiated informal norm that promoted co-operation between two or more individuals (1999). He believes that all aspects of social capital such as trust, networks, civil society, and the like are all secondary, or as he himself call, epiphenomenal to social capital which arise as a result of social capital not constituting social capital itself (Fukuyama, 1999). According to Coleman (1990) and Putnam (1993) social capital is defined with regard to such peculiarities of social structure such as inter-individual trust, mutual norms, and bi-directional contributions that can lead to the persistence of resources which facilitate group or individual interplay to gain group activities. Trust, mutual action norms, and lateral (horizontal) networks which are self-reinforcing and self-generating are considered as social capital resources by Putnam (1993). He believes that regenerating peculiarities of social capital will lead to social interactions of highest cooperation, trust, mutual transaction, civil partnership, and social welfare. Putnam believes that the existence of these peculiarities in every society is an indication of its civic. He considers this trait as promoting good performance of democratic institutions.

1. Social Capital Resources. Coleman (1990) has classified the main resources of social capital as per following: (1) Governmental factors: An institution is said to be a law, a tradition, a custom, or an organization which is effective in human’s political or social lives and rules out an oriented system towards the needs of an organized society. Government is a tangible example of institution; institutional factors are either rational or irrational. Some laws are enacted rationally as an institutional factor to reinforce humans for participation. (2) Automatically factors: All norms which are formulated automatically through mutual actions of social members, rather than laws and other formal institutions, and are not due to purposeful options are called automatic factors. These factors are in turn classified as automatically rational and automatically irrational. Automatically norms are considered rational when individuals’ interactions in society are on the basis of intellectuality and thoughts, even if not purposeful. Automatically factors are considered irrational if mutual actions are random and not logical, such as honey bees’ cooperation in building hives which happens without intellectuality and thoughtfulness and is absolutely instinctive. (3) External factors: These factors refer to norms originated from the sources rather than the specific society in which it has been utilized. These comprise factors such as religion, ideology, culture, or common historical experiences. (4) Natural factors: Two factors are observable here as “family relations” and “ethnic or racial solidarity”. The importance of relatives in comparison to other social structures differs from one society to another, but in none of the societies it is completely vanished. There are considerable findings in natural science claiming that human socialization is somehow rooted in culture and is also related to fundamental approaches of socialization relatedness to genetic issues.
2. The two sides of social capital. One of the main and major advantages of social capital is providing ample information with a low cost and time involved. It facilitates trust, mutual relationships, strong social norms, and permanent solidarity of cooperation in social behaviors. Therefore, group social capital is achievable and there lays benefits not only for those who have created it but also for some more greater networks (Walter, Lechner, and Kellermanns, 2007). Inter-organizational networks resulted from social factor have several organizational advantages such as acquiring new skills and knowledge by network members. Power gaining and influence (pervasiveness) are other advantages of social capital. Creating solidarity among members is another merit. Strong norms and beliefs create a strong social network which encompasses certain customs, traditions, and regulations which substitute control methods. Fukuyama (2001) concludes that social capital will reduce the transaction costs associated with formal coordination mechanisms like contracts, hierarchies, bureaucratic rules, and the likes. He believes that formalities cannot replace social capital. “The fact of the matter is that co-ordination based on informal norms remains an important part of modern economies, and arguably becomes more important as the nature of economic activity becomes more complex and technologically sophisticated”, says Fukuyama (1999). Though social capital inherits myriad potentials but cannot be considered a “throughout remedy” for all situations. We will consider some of the disadvantages. First, there is no guarantee that considerable relationships will be established among humans in all cases. There is a possibility of setting up inappropriate or undesirable relations just for dissimulating or misuse. Second, establishing and maintaining social capital requires considerable financial capitals which in some cases are higher than the merits gained from social capital. Third, the strong links and relations established through social capital are less effective in comparison to weak linkages of groups in which the tasks are performed faster and in a better way. Fourth, the solidarity of social capital may adversely affect, due to the fact that this unification among members will involve individuals in their relationships at the expense of main targets and objectives and in some cases will lead to means-ends displacement. Social capital may also lead to the enhancement of malicious behaviors among members, resistance to new information, oppositions to their assessments, and the increase of organization vulnerability when facing amplified environmental changes. Fukuyama (1999) also makes an objection to Coleman’s comment that social capital is a public good (Coleman, 1988). “This is clearly wrong: since co-operation is necessarily to virtually all individuals as a means of achieving their selfish ends, it stands to reason that they will produce it as a private good” says Fukuyama (1999). Fukuyama (1999) believes that social capital can bring both negative and positive externalities, but still he believes that this notion does not “disqualify it as a form of capital”. Fukuyama (1999) does accept that “social capital seems less obviously a social good than physical or human capital is because it tends to produce more in the way of negative externalities than either of the other two forms”.

3. Social Capital Variables. Putnam’s social capital theory is utilized to identify social capital variables. He (1995) believes that social capital comprises those peculiarities of social organization that facilitate coordination and cooperation for mutual interests. The peculiarities are: networks, social trust, and norms act. Putnam explains that communications among individuals in social networks are resulted from mutual norms act and the trust which lay in them. In accordance with Eston’s typology (1998), social capital norms are classified into trust norms, mutual act norms, and non-reciprocal action norms.
Trust Norm. Two general views regarding trust have been proposed. On one hand, trust is an individual trait based on emotions, feelings, and individual values which have a close relation with the notions of cooperation, honesty, and sincerity, and on the other it is one characteristic of social systems or social relations based on social context. In this research a mixed concept of trust is taken into account and three forms of trust are considered as below: (1) Interpersonal trust. It is shaped as a result of face-to-face relationships and is applied in all networks where an individual participates. In this research Johnson’s measuring method is used for the measurement of interpersonal trust and the extent of measures such as honesty, explicitness, certainty, and individuals’ intention for cooperation had been taken into account, (2) Public trust. It can also be called organizational trust which relates to the extent of citizens’ trust to an organization especially public organizations (Mohseni and Lindstorm, 2007), and (3) Governmental trust. It means the extent of trust to formal and governmental institutions. In this paper, this trust is measured in connection with Tehran hospitals.

Norms Act. Norms act are of two categories: reciprocal and non-reciprocal. The former refers to acts which are considered as exchange process in social relations through which goods and services are exchanged from one place to another, and the latter refers to behaviors such as voluntary acts.

4. Job Satisfaction. There are many definitions for job satisfaction. Some of them are concentrated on job itself while others concentrate on both jobs and their dependant factors. Stephen Robins (1943) refers to job satisfaction as individual’s overall attitude towards his job. If job satisfaction is high then the attitude will be more positive and vice versa (A’rabi and Parsaeyan, 2004).

5. The Relationship between Social Capital and Job Satisfaction. Brass (1982), Harlebert (1991), Bulder, et al. (1995), and Hodson’s (1997) studies on this issue differ considerably with each other. For instance, Harlebert (1991) considers individual networks which do encompass working relations inside the network and concludes that network members have access to more resources such as training. Hodson (1997) found a positive impact of employees’ solidarity on job satisfaction. Brass did not succeed in finding an association between the core of a working network and job satisfaction. Bulder, et al. (1995) did not find any relationship between job satisfaction and the number of existing relationships in the network or the number of individuals in that network. On the contrary, they found that network diversity would have negative impacts (Flap and Volker, 2005). Douthit (1999) calls human and social capitals as individual investments which yield positive output in individual’s job in the form of objective and tangible capitals. He assumes that potential resources of human and social capitals manifest themselves in more tangible ways such as job satisfaction. Social capital facilitates and fosters recognition of opportunities and their increase for the purpose of more income on the side of the individuals. Social capital theory predicts that the efficiency of intelligence, training, and superiority in different sections are related to the individual’s status in his/her organizational social structure. As Douthit (1999) says, the social capital makes it possible to adapt individuals to their social scenes in a way that all their potentials can be utilized (Douthit, 1999). Social capital has three distinct impacts on job satisfaction. First, network structure and job satisfaction through job dependence and job-related strategic networks produce solidarities which promote satisfied employees through different job aspects such as income, safety, and job opportunities. Second, closed networks improve employee satisfaction in social aspects of job such as overall social condition of job, cooperation with management, and cooperation with colleagues. Third, a
network with integral arc structure (where a pivotal person adjoins mutually two or more exclusive members together) has intensive negative impacts on job satisfaction, in spite of the fact it encourages trust in satisfaction networks of social aspects of job.

6. Social Links and Job Satisfaction. Joukisari and Nurmi (2005) found that there is a relationship between social capital and those who are seeking for good social status by finding a long-term job which is also well-suited to their educations. The reason lies in the fact that social links would determine resources such as information and social impacts which formulate an individual network as more advantageous to personal profession than networks of lower social levels.

7. The Impact of Social Skills on Satisfaction. Social skills are capable in empowering individuals in their interactions with others and play a pivotal role in most models and also professional interplays. Experienced outcomes of individuals in different contexts such as job interviews, performance analysis, and even legal practices show that social skills have positive impacts on them. An increase of social capital would increase employees’ enthusiasm and commitments, promote effective communication with public, absorbs effectively the required personnel and partners, improve networks and commercial relations, establish trust, and legitimize trade with others. The higher the social skills in entrepreneurs, the more financial success they may have. Furthermore, they may contribute to entrepreneurs in mutual strategic benefits with other companies, more regular requests from customers, and etc. (Markman and Baron, 2003).

Methodology
The present research is an applied study in which the data have been gathered through a questionnaire and they have been analyzed by utilizing statistical methods. The society comprises first grade hospitals in Tehran among which three hospitals had been chosen as samples in which the possibility of gathering data through questionnaires have been achieved. Questionnaires have been administrated in hospitals’ three different working shifts (morning, afternoon, and night shifts). Due to the limited number of personnel in these hospitals, thereby all have been invited to complete the questionnaires. Related literature had been accumulated through a library research and for the compilation of questionnaire a throughout research in internet have been performed in which standards questionnaires have been considered and the viewpoints of professionals were taken into consideration, as well. The questionnaires covered questions which were capable in measuring job satisfaction and social capitals in individuals and can also assess the impact of social capital in job satisfaction. Twenty questionnaires in three hospitals have been preliminary administrated and then through Cronbach Alpha analysis the most valid questionnaire had been chosen. The reliability of the chosen questionnaire equaled 0.875 which guarantees the appropriateness of all questions. Statistical Package for the Social Science (SPSS) and LISREL software have been utilized for test of hypotheses and data analysis. The degree of social capital and job satisfaction and their relationships have been measured through the use of Rout Analysis model and Pearson Correlation Coefficient.

Results and discussion
1. Rout analysis of relationship between social capital and job satisfaction. In this section the relationship between social capital variables and job satisfaction variables is defined and assessed both directly and indirectly through LISREL software. Before the implementation of
route analysis we have analyzed and considered the test of Normality, Linearity, and Equality of variances and also pert values. At the beginning we have to identify and nominate all the variables in route analysis. The dependant variable is job satisfaction and the independent variables are: gender, marital statues, educational level, and place of education, experience, employment status, trust, formal networks, and action norms. First, direct relationship between all independent variables and dependant variable are considered in order to identify the independent variables which have a direct relationship with dependant variable. In diagram 1 and on the basis of “t” coefficient, the significance of relationship between independent variable (x) and dependant variable (y) can be examined. Due to the fact that t-value is less than two (measurement criteria), then it can be claimed that there is no meaningful significance between dependant and independent variables. Take in diagram 1

As it can be seen in diagram 1, there are only two independent variables in which “t” coefficient is grater than two ( in LISREL model “t” values grater than two are in black and smaller than two are in red). Trust variable (t=11.21) and educational level variable (t=2.6) have a direct relationship with job satisfaction with a 99 percent level of confidence. Other independent variables with “t” values less than two have no direct relationship with job satisfaction. It has to be noticed that educational level variable is an external variable. Now, the possibility of direct relationship between other independent variables and job satisfaction through trust variable which functions as a mediating variable is examined.

2. The Analysis of Direct Relationships of Independent Variables. One of the advantages of LISREL is its capability to identify both direct and indirect relationships between dependant and independent variables. In order to improve model’s criteria we will study indirect relationships of independent variables which do not have a direct relationship with dependant variable through the use of those independent variables which have direct relationships with independent variable. LISREL model has the potential to suggest routs of mutual relationships between those variables that if added to model can establish a meaningful significance between other independent variables. Diagram 2 shows the analysis. In this diagram we have studied indirect relationships of other independent variables (gender, marital statue, and educational level, place of graduation, experience, employment status, formal networks, and action norms) through the use of trust variable. Take in diagram 2

As it can be seen in diagram 2, internal dependant variable “trust” and external independent variable “educational level” have direct relationship with dependant variable “job satisfaction”. Other independent variables do not have a direct and significant relationship with job satisfaction. The independent variable “formal networks” through trust variable has an indirect relationship with job satisfaction.

3. Final Rout Analysis. At this stage all routs having values less than two and not being significant as per findings in the second stage of analysis are eliminated thereby the final values of parameters will be obvious and apparent. In diagram 3 standardized values are shown, all possible relationships between dependant and independent variables are also shown. Trust variable has a direct relationship with dependant variable while educational level and formal networks have relationships with job satisfaction through trust variable. Take in diagram 3

In diagram 3 the value of error variance in job satisfaction variable is 0.25 which means 25 percent of job satisfaction variable variance is not due to existing variables in model. It is quite clear that 75 percent of job satisfaction variable variance is under the effects of existing variables
which is a promising value for the description of the variables under consideration. In table 4 final root analysis model distribution is shown. This distribution is quite a desirable one.

Table 4. Distribution criteria of final rout analysis

All criteria show the appropriateness of model and even the LISREL software in an attempt to improve model criteria did not recommend any other routes except those discussed here.

### 4. Structural Equations

The following is the structural equation of final root analysis model:

\[
\text{Satisfaction} = 0.56 \times \text{trust} - 0.069 \times \text{education}, \quad \text{Error variance} = 0.25, \quad R^2 = 0.6
\]

(0.05) \quad (0.026) \quad (0.022)

11.21 \quad -2.6 \quad 11.25

As it is shown previously, independent variable “trust” has a direct relationship with “job satisfaction” and plays an important role in the indirect relationship of independent variables of educational level and formal networks with job satisfaction; thereby its structural equation is shown here to enable us in considering this indirect relationship.

\[
\text{Trust} = 0.89 \times \text{in formal network}, \quad \text{Error variance} = 0.16, \quad R^2 = 0.6
\]

(0.046) \quad (0.0114)

19.49 \quad 11.25

The values of direct relationship among variables are shown in table 5. In this table the direct and positive relationship between trust and job satisfaction is shown. It can then be claimed that the higher the trust, the higher the job satisfaction in employees.

### 5. Estimation Values

Estimation values are utilized to calculate the dependant variables values. “$\beta$” values are standardized values between -1 and +1. They are used to predict the intensity of relationship and their comparison with each other. Correlation between two variables are considered positive if the value ranges from 0 to +1 and considered negative if between -1 to 0.
6. t Values. t values are used to assess the significance of estimation values that is whether the significance of relationships are true or they are accidental or as a result of sampling errors or measuring errors. Acceptable t values shall be over 2. In table 6 the values of variables indirect relationships with job satisfaction are shown. As it has been stated before the formal network variable is the only variable which has significant relationship with job satisfaction through trust variable.

Table 6. Indirect relationships values in final rout analysis model

In table 7, we consider the total value of the sum of all direct and indirect relationships of external variables with job satisfaction in model. Besides, through the same method we can categorize all categories in job satisfaction in accordance with their priorities using standardized values of “β”. As it can be seen variables “trust”, “formal networks”, and “educational level” have the most impact on job satisfaction in these three hospitals.

Table 7. Direct/indirect relationships values (total impact) of variables on job satisfaction in final rout model

**Summery and discussions**

On the basis of research questions, the following hypotheses are formulated. The first research hypothesis: There is a relationship between individuals trust and job satisfaction in three selected hospitals. This is shown statistically as follows: H0: there is no significant relationship between individual's trust and job satisfaction, H1: there is significant relationship between individual's trust and job satisfaction. Taking into consideration the data drawn from rout analysis, with 99 percent confidence we can claim that there is a significant relationship between trust and job satisfaction (β =0.58, t=11.21, p < 0.01). It means that an increase in individuals trust would directly and positively increase job satisfaction and vice versa. The second research hypothesis: There is a relationship between formal networks and job satisfaction in three selected hospitals. This is shown statistically as follows: H0: there is no significant relationship between formal networks and job satisfaction, H1: there is significant relationship between formal networks and job satisfaction. Taking into consideration the data drawn from rout analysis, with 99 percent confidence we can claim that there is a significant indirect relationship between formal networks and job satisfaction (β =0.58, t=11.21, p < 0.01) through trust variable. It means that formal networks through increasing trust can lead to more job satisfaction. The third research hypothesis: There is a relationship between norms action and job satisfaction in three selected hospitals. This is shown statistically as follows: H0: there is no significant relationship between norms action and job satisfaction, H1: there is significant relationship between norms action and job satisfaction. Taking into consideration the data drawn from rout analysis, there is neither
direct nor indirect relationship between individual’s action norms and job satisfaction. In the first stage of route analysis “t” value was equal to 1.75 which weakly showed that there is no direct relationship between action norms and job satisfaction. In the second stage, the value of t=1.67 weakly shows that there is not even an indirect relationship between them, so, we can conclude that action norms neither directly nor indirectly affect job satisfaction. Pearson Correlation Coefficient shows a significant direct relationship between social capital and job satisfaction. Correlation Coefficient between social capital and scores of job satisfaction is 0.855. The mean values and the viewpoints of respondents with regard to the extent of job satisfaction and social capital have also been considered utilizing “t” test with a constant value. The range of job satisfaction is from 12 to 60 with the mean value of 36. This figure is 90 with regard to social capital. In table 8 the mean values are compared to the views of respondents. This table shows that with 95 percent confidence we can evaluate the viewpoints in the range of mean values.

</table>

Table 9: The comparison of job satisfaction scores and social capital at average

The present paper indicates that there is a direct, positive, and significant relationship between trust and job satisfaction. Trust will lead to more satisfaction. There is also an indirect, positive, and significant relationship between formal networks and job satisfaction but through trust variable. It means that formal networks can increase job satisfaction level. We have also concluded that there is no direct/indirect relationship between action norms and job satisfaction. In the analysis of the relationship between external variables and job satisfaction, it had been found that there is a direct, significant, but negative relationship between educational level and job satisfaction. Higher levels of educational background would lead to less job satisfaction. There is also a significant relationship between social capital and job satisfaction.

Abstract
The purpose of this paper study of effectiveness of work adjustment-based collective consultation on develops of job motivation about general inspection Organization staff. For achievement this aim was selected 150 people of sections in about general inspection Organization. This study based of objective is applied research and based method of gathering information is descriptive research. The results of this study indicated there are meaningful differences between average dimensions of typical motivation factors among the General Inspection Organization staff. In this respect the comparison made between the acquired average scores was indicative of the fact that the “recognition for achievement” stood at the lowest level and “responsibility for task” stood at the highest level. It is notified that there exist very meaningful differences in various dimensions of typical hygiene factors of the General Inspection Organization staff as well.

Key words: Work adjustment-based collective consultation, job motivation

Introduction
Research into why people vary both in their level of motivation for a task and in the reasons why they are motivated to undertake a task has a long history in the psychological literature. Theory distinguishes between different types of motivation in terms of the different underlying attitudes, reasons and goals that give rise to action. The clearest distinction is between intrinsic motivations (doing something because it is inherently interesting or pleasurable) and extrinsic motivation (doing something because one is externally forced to do so, or because action will lead to some sort of reward or outcome). These different types of motivation can produce different standards of subsequent task performance (Ryan & Deci 2000).

Historically, intrinsic motivation was viewed as the most favourable type. More recent approaches such as self-determination theory, however, propose that there are different types of extrinsic motivation. Some may be associated with disinterest and resentment, but others can lead to attitudes of willingness and facilitate self-endorsement of the task. Ryan and Deci (2000) explore the social and environmental conditions that foster active and volitional, rather than passive and controlling, forms of extrinsic motivation.

Ryan and Deci (2000) argue that although people have the capacity to be intrinsically motivated for an activity, this only occurs under certain conditions. The authors proposed self-determination theory to explain how different social and environmental factors can create
conditions that either promote or restrict the expression of intrinsic motivation. Within self-determination theory, Ryan and Deci (2000) postulate cognitive evaluation theory, to argue that intrinsic motivation will only be activated and maintained under conditions that satisfy people’s basic psychological needs for competence and autonomy. Specifically, they argue that external events interpersonal communications and rewards that induce feelings of competence, or efficacy during an action—will increase intrinsic motivation by fulfilling the need for competence. Competence-inducing events are those that present, for example, optimal challenges and non-demeaning evaluations.

However, feelings of competence alone will not necessarily increase intrinsic motivation for a task unless an individual also perceives autonomy, or an internal locus of control. In other words, they must perceive they have a degree of control over their behavior. Feelings of competence will also vary according to individual capacity to engage in particular tasks. Responding to the result that rewards made contingent on task performance can reduce intrinsic motivation, Ryan and Deci (2000) use cognitive evaluation theory to propose that external rewards diminish intrinsic motivation because they have the effect of shifting locus of control from an internal to an external location. Conditions that fulfill the need for autonomy—choice and opportunity for self-direction—enhance intrinsic motivation, while conditions perceived as controlling of behaviour will diminish it because they fail to fulfill this need. Autonomy and competence will only be related to intrinsic motivation, however, for activities that hold intrinsic interest for an individual.

**Review of research literature**

A series of empirical studies are reviewed in Deci, Koestner and Ryan (1999) that look at aspects of motivation theory and the circumstances in which performance-related rewards may reduce intrinsic motivation. We group our discussion around the five major conclusions drawn in Deci, Koestner and Ryan’s review. The evidence on which these conclusions are based is mostly drawn from laboratory-based experiments where individuals are randomized into treatment and control groups. Both groups are typically asked to undertake a series of common games, such as solving particular types of puzzles. The treatment group receives some reward for performing the tasks or is subject to some form of controlling behavior (for example, they face deadlines for task completion). The control group also undertakes the tasks (solves the puzzles) but is not subject to the same, or any other type of, reward or punishment. Unexpected rewards are not detrimental to intrinsic motivation because they are not experienced as informational or controlling. In addition, rewards that are not contingent on performing specific tasks are also not detrimental. This is because people who are not required to engage in the behavior to receive the reward do not perceive the activity as instrumental to receiving the reward; hence, there is no cognitive re-evaluation to the external locus of control (Deci 1972a). As already noted, in a series of laboratory experiments, Deci and others found that task-contingent rewards (rewards given for simply engaging in an activity) decrease intrinsic motivation (Amabile, De Jong & Lepper 1976;
Deci 1971, 1972a). Performance-contingent rewards (rewards dependent on the quality of performance of tasks) or punishments decrease intrinsic motivation (Harackiewicz 1979; Deci 1972b for monetary rewards), and also have a substantial effect on the intrinsic motivation of those not rewarded because of poor performance (Pritchard, Campbell and Campbell 1977). Harackiewicz (1979) found that performance-contingent rewards reduced intrinsic motivation more than task-contingent rewards. The effect of performance-contingent rewards may be mitigated or exacerbated depending on how the rewards are delivered (Deci et al. 1994; Deci, Nezleck & Sheinman 1981; Ryan, Mims & Koestner 1983)—Ryan, Mims and Koestner (1983) argued that performance -contingent rewards may be perceived as either ‘controlling’ or ‘informational’, depending upon how they are administered, and found that controlling rewards decreased intrinsic motivation more than informational rewards. The studies presented were designed to investigate whether various reward contingencies (task contingent or performance contingent) and different types of feedback affected intrinsic motivation. Overall, this experimental evidence strongly suggests that task-contingent and performance-contingent rewards decrease intrinsic motivation, while positive feedback enhances it. In many situations, however, use of external rewards or controls is necessary. The critical question, then, is: how may rewards and constraints is used to maintain, or even promote, intrinsic motivation? Studies that address various aspects of this problem conclude that the effect of incentives or sanctions on recipient behavior may crucially depend upon the nature of interactions with regulators, particularly those enforcing a sanction or giving a reward. Recipients’ perceptions of agency staff, and of the wider agency/department, are also likely to influence how they respond to an incentive or sanction. On the one hand, interactions perceived as informational, and procedures that give participants choice and encourage them to work out their own strategies and solutions, may create environments in which incentives will increase motivation. On the other hand, interactions perceived as threatening and highly controlling of behavior may mean that incentives work to undermine motivation.

Conceptual framework
The research was carried out based on the factors affecting the Herzberg's Motivation Theory (Two Factor Theory). This theory is a theory which has been given high significance by many experts and scholars in the field of job motivation in the last three decades. In the Hertzberg theory the typical motivation factors include: achievement, recognition for achievement, responsibility for task, growth, advancement to higher level tasks and interesting job. The typical hygiene factors also include: quality of supervision, interpersonal relations, salary, and safety, working conditions and company policies and conditions.
Research questions:
1. How is the current status of the General Inspection Organization staff job motivation?
2. Whether there is any difference between the job motivation of the General Inspection Organization female and male staff or not?
3. Whether work adjustment-based collective consultation affects promotion of job motivation or not?

Research method:
The statistical community for the present research includes all female and male staff of the General Inspection Organization working in Tehran in 2005. The statistical sample of the present research was taken based on random sampling method. At first 150 individuals from the General Inspection Organization staff were selected at random and the Hertzberg's job motivation questionnaire was used for them. Then out of those staff whose motivation was below the average (weak) 60 individuals were selected again at random. The 60 individuals were divided into two 30 strong group and, by chance, one group was titled as the probation group and another one as the control group.

Research tools:
In favor of the present research and with the purpose of measuring and estimating the job motivation a questionnaire comprising 36 questions in five categories of based on Likert scale was used and within the questions 11 factors were measured and considered in relation to the job motivation case. The questions on the job motivation arranged in questions from number 27 to 62.

Descriptive and reliability nature of the questionnaire
With the purpose of determining descriptive nature of the job motivation questionnaire, at first 12 relevant experts and scholars (3 in the field of management, 3 in the field of research methodology, 3 in the field of behavioral research and 3 in the field of psychology) were provided with objectives, theories as well as the contents of the questionnaire in order for them to judge about concepts lied in the questions and their relationship to the said objectives and research theories. Then all their views were collected and those questions which, according to the experts and scholars, were of higher values and weighs were identified and the rest of the questionnaire reconsidered, revised and used accordingly. Reliability coefficient of the job motivation questionnaire in the previous research On the final reliability coefficient of the job motivation questionnaire it is notified that in the previous research carried out by use of Cronbach’s Alpha methodology the figure of $\alpha=0.96$ gained for the reliability coefficient of the job motivation questionnaire. Table for reliability coefficient of the job motivation questionnaire in the previous research:
Reliability coefficient of the job motivation questionnaire in the present research

In favor of the present research, during a preliminary study carried out by the researcher of the present research on 50 individuals by use of the Cronbach’s Alpha methodology, the reliability coefficient acquired was the same as that of in the previous research.

Table for reliability coefficient of the job motivation questionnaire in the present research:

<table>
<thead>
<tr>
<th>Reliability coefficient</th>
<th>Job motivation questionnaire</th>
</tr>
</thead>
<tbody>
<tr>
<td>Cronbach’s Alpha</td>
<td>0.96</td>
</tr>
</tbody>
</table>

As it can be seen in the above table the questionnaire is implying an inner similarity and a high and satisfactory reliability coefficient (α=0.96) which is good for measuring variances of the job motivation.

The methods for analyzing the available data for the present research was used at two descriptive and inferential statistics levels:

1- At descriptive level, the statistical indexes used included abundance, percentage, average, variance, standard deviation, tables and charts.

2- At inferential level, for the research questions independent T-Test, dependent T-Test and Freidman Test were used with help of the SPSS software.

Discussion and conclusion

Based on the findings of the research on the first question of the questionnaire a meaningful difference between average dimensions of typical motivation factors among the General Inspection Organization staff was quite visible. In this respect the comparison made between the acquired average scores was indicative of the fact that the “recognition for achievement” stood at the lowest level and “responsibility for task” stood at the highest level. It is notified that there exist very meaningful differences in various dimensions of typical hygiene factors of the General Inspection Organization staff as well. Based on the comparison made in this respect the “salary” stood at the lowest level and “quality of supervision” stood at the highest. Outcome of the present research was quite consistent with the findings of Robins (1991), Katzel and Thompson (1990), Wilson L. and Thomas (1998), Stillwell (2001), Franco, Binet and Confer (2002), Kate (2001) and Martinez (2001) on the job motivation factors. Therefore the first question of the research confirmed that the typical motivation and hygiene factors are effective in promoting staff job motivation. Study of the motivation is considered as a drive for identifying human behavior and finding answer to this question that why they behave differently and why a director or an employee does his job keenly, eagerly, seriously and with forbearance but another director or employee shall necessarily be encouraged or intimidated to make the least effort in doing his or her job. This is one of the most important motivation related subjects. Cultures within
organizations, due to the values, beliefs, ideas and norms prevailed in these organizations, can play very decisive role in shaping behaviors of their staff, and managers and directors of these organizations can provide suitable and dynamic atmosphere towards promotion of their staff performance only if they themselves has already been properly encouraged by their superior official and authorities. Lary. K. Dimond (2005) believes that job motivation acts as a medium between emotional incompatibility and job performance and as the emotional incompatibility decreases job motivation is enhanced leading to promotion of job performance. On the other hand Thomas, S.Y& Trama, S & o’ Har, L.A. (2005) are of this opinion that positive emotional way of thinking by the staff will increase job motivation and consequently promote their efficiency. In the same respect Jentichi (2005) believes that low job motivation will lead to voluntary job change by the staff.

Based on the studies made and with respect to the second question of the questionnaire no meaningful difference was witnessed between job motivation of the General Inspection Organization female staff and the male ones. In this respect findings arising from this question were consistent with the findings of Alper (1973) implying that job motivation of men supersedes that of women, and findings of Monte Sinosu and Nelson (1997) suggesting that the job motivation of women supersedes that of men. Based on the comparison made between all these researches we reached to the conclusion that the job motivation of either of the two male and female categories is more than the other or meaningful differences is visible between their job motivations which by itself is not consistent with findings of the present research. It is notified that outcome of the research carried out by Franco, Binet, Confer and Stablin implying that there is no meaningful difference between job motivation of men and women are consistent with the outcome of the present research. Therefore outcome of the second question may not be confirmed accordingly. In another word the more individual job motivation, the more innovation and creativity and the more production would be. Growth and development in every organization depend on the optimum use of physical, mental and psychological capabilities of their staff. Those organizations which enjoy the staff with better job motivation and the staff who feels themselves responsible vis-à-vis their job commitments, are of high productivity and efficiency. Based on the findings and outcome the third question of the questionnaire on the typical motivation factors, job motivation of those staff of the General Inspection Organization who passed relevant training courses was remarkably much higher than those who have not yet passed the courses. This is the same with respect to the typical hygiene factors. The result of the present research in this regard is considered as consistent with researches carried out by Wodel (2003), Kelshrisda (2004), Watmore (1999), Fruid (1975) and Bagnara (1999) on work adjustment and it is inconsistent with those of Cohen (1983). Findings of the present research are also consistent with outcome of the researches conducted by Wilson L. & Thomas (1998) and Elihand & Sedohani (1998). Therefore outcome of the third question of the questionnaire was confirmed. This means that organization of collective consultations and work adjustment-based training courses may promote job motivation of the staff. Given the rapid change and development of the
existing industrial and economic establishments those organizations which may not adjust themselves to the new internal and external conditions would not be able to survive. One of the elements for survivability of the today complicated organizations is development of human resources and further promotion of human force productivity and provision of compatibility and adjustment requirements between the job and work environment and the physical and psychological capabilities of the human force is considered as one of the key elements in this respect. Work adjustment is considered as an important element for promoting productivity in every organization. Work adjustment is also a key factor for consistency of a successful job. Every individual expects to enjoy its desired job bringing him/her hygiene, self-complacency and credit and supplying his/her basic needs as well. Dawis and Lofquist theory on work adjustment (1987) is considered as a theory in the field of adjustment of individuals with the environment; unlike many of job related theories which are revolving around job decision making procedures, Davis and Lofquist theory is speaking of work adjustment. Based on this theory all individuals, innately, are in search of their adjustment to their environment. Job motivation is considered as one of the basic subjects of every organization and its management and efforts and activities of every individual depends upon his/her motivation. Hertzberg’s findings suggest that typical motivation factors will lead to job satisfaction and will substitute lack of interest with positive approach towards the work. Therefore dissatisfaction will be brought to its lowest level. On the other hand lack of typical hygiene factors in the work environment will aggravate negative approach to work leading to job dissatisfaction. Then given requirements of the staff and their commitment and their responsibilities towards their organization if the efforts within General Inspection Organization (in Tehran) are promoted in satisfying the environmental expectations then we may witness promotion of job motivation of the General Inspection Organization staff in Tehran. Therefore theoretical foundations presented by Dawis and Lofquist in relation to work adjustment and that of Hertzberg in relation to the job motivation are considered as consistent with the outcome of the present research.

Suggestions:
In view of the findings of the present research, with the purpose of improving the work adjustment situation and promoting job motivation accordingly a number of suggestions introduced to the scholars and researchers as follows:
1-Given the dependence and meaningful relationship between work adjustment-based collective consultations and promotion of the job motivation it is suggested that directors and managers of the General Inspection Organization, in addition to the organization of collective consultations training courses, within their general policies and strategies give high significance to the job motivation factors including typical motivation and typical hygiene factors, as stipulated in the Hertzberg's theory, training individuals who stand below the average level in order for them to promote their status in this respect. It goes without saying that this measure will lead to improvement of the work performance methods and ways, promotion of directors and managers awareness on their staff performance and recognition their achievements, proper appointment of
the staff and directors based on the relevant job rules and regulations, preparing the ground for
the staff to get promotion, promotion of authority and independence of directors and the staff in
the decision making process and public relations as well as in acquiring required expertise,
promotion of job security and necessary supports for the staff, further attention to the basic
requirements of the staff, observance of the principle of equality in paying salaries and bonuses
within the organization and with respect to other organizations, creation of further job motivation
in the policies and strategies of the organization leading to promotion of job motivation of the
staff.

2- Given the positive impact of work adjustment-based collective consultations it is suggested
that directors of the General Inspection Organization to include organization of collective
consultation training courses within policy and strategy of the organization. This, by recognition
of the achievements made by the staff and also recognition of their requirements, will promote
their sense of responsibility and commitment, their loyalty to the organization as well as their
efforts and performance within the organization which will be followed by meeting of the staff
expectations from their work environment leading to promotion of psychological and emotional
hygiene within the organization as well as further motivation and commitment of the staff.

3- Given the fact that findings of the previous studies carried out inside and outside the country
as well as the present research is indicative of the fact that between the work adjustment and the
job motivation there exists a typical relationship, the job satisfaction is considered as an
important index of the factor of the work adjustment. This implies that if adjustment is
established between capabilities and working conditions of every individual it will surely lead to
satisfaction and accordingly promotion of the individual in his/her job as well as his/her job
motivation. Therefore it is also suggested that planners and authorities of the General Inspection
Organization, while making their desired planning, bring the two above mentioned aspects to
their attention establishing a suitable work environment in which talents and abilities of the staff
manifested creating a safe work environment wherein the job safety will be revived accordingly.
To this end organization of collective consultation training courses, recognition of achievements
made by the staff and raise of their salary would be also effective in promoting their loyalty and
commitment to their organization preparing a suitable ground for giving rise to their productivity
and performance leading to creation of a dynamic and happy atmosphere in the work place and
creation of self complacency and joyfulness of the staff.

4- It is also suggested that instead of having these interventions in eight sessions during a month
they will be arranged in eight sessions per year and all the results be compared with the findings
of the present research. Based on the experiences of writer of the present research paper further
distance between the sessions and, instead, having them on a continuous basis would make them
more effective and useful. It goes without saying that the results of the research shall be tested
and measured as a hypothesis.
5- On the impacts of the intervention on two different male and female genders very limited number studies have already been carried out in Iran therefore it is suggested that in the future researches and studies this variance would be brought into attention and discussion.
6- Preparing and supplying CDs on training programs in favor of the staff and holding training courses for the managers and directors would be of great use as well.
7- It is also suggested that in the future studies work adjustment and job motivation within the General Inspection Organization branches in other provinces would be given significance.
8- It is suggested that in the future studies work adjustment and job motivation of other staff of the General Inspection Organization in Tehran would be given significance as well.
9- It is suggested that in the future studies work adjustment and job motivation within the operational sphere of the General Inspection Organization in the whole country would be given significance and further attention.
10- It is also suggested that in the future studies given low rate of job motivation vi-a-vis the existing work adjustment level in the General Inspection Organization in Tehran ways towards promotion of job motivation would be studied and considered accordingly.

Abstract
The basic purpose of this research is to identify the effects of diversity management on workgroup performance and job satisfaction of an employee working in Government organization. This research is primarily based on data which is collected from the Government employees through questionnaires and self administrated interviews from Govt. employees. After analyzing the data, finding shows that the diversity management is positively related to workgroup performance (group based performance) and job satisfaction of individual employee. This research is only conducted in twin cities with a small sample size so it cannot be generalized. A longitudinal study can be conducted with a larger sample size for generalizing the results. Through training, designing and implementing the diversity management program and strictly observing the EEO, a better workgroup performance as well as the employee job satisfaction can be achieved.

Keywords: Diversity Management, Job Satisfaction, Govt. Organization, Performance

Introduction
Workforce of a country plays a vital role in the overall performance of an organization as well as in the performance of a country as a whole in terms of growth in Gross Domestic Product (GDP). Since its independence, Pakistan’s workforce is highly diverse in terms of ethnicity, race, culture, language, religion, sense of belongingness, and demographics. A diverse workforce may be comprised a belief, understanding, values, ways of viewing the world and any information which is unique (Shen et al., 2009).

The population of Pakistan can be divided into different groups based on ethnicity. These groups are: Punjabis (44.15%), Pashtuns (15.42%), Sindhis (14.1%), Seraikis (10.53%), Muhajirs (7.57%), Balochs (3.57%), and other smaller ethnic groups (4.66%). Moreover, male are 51% and female are 49% of the total population of Pakistan (Livingston & O’Hanlon, 2010).
This workforce when work or interact with other group within an organization they exhibit the behaviour either positive or negative. Workforce diversity may affect the overall efficiency of an organization (Carrell et al., 2006). In this case, the responsibility of the Public Managers has been increased due to diverse workforce because they try to achieve desired goals through managing the diverse workforce. Pakistan’s society is a male dominant society and females facing problem in getting jobs and performance based award mainly in Public Sector Organizations.

Public managers are now putting their efforts on diversity and trying to find out ways to manage the diversity with the application of diversity management programs (Kellough & Naff, 2004; Pitts, 2009). When the diversity management programs are once implemented, the employees of an organization feel that they can get promotion and job opportunities on an equal base without any bias. Hence, the retention of the employees in the organization is based on the organization’s diversity management programs. When employees feel that the promotion and reward system is solely based on merit but not on biasness and resulted in employees’ job satisfaction and the employees feel fairness then it creates job satisfaction (Barak & Levin, 2002).

Diversity issues vary in different countries, whereas the most common diversity issue in the world is gender inequality. In both the United States of America (USA) and South Africa, racial equality is a strong issue although there is a systematic discrimination against black and ethnic minorities (Shen et al., 2009). A research shows that those companies where women are working have a positive effect on the profitability of the company (Gender Diversity, 2009).

The Government of Pakistan either Federal or any Provincial Government has introduced a quota system for jobs in the Government Sector Organizations on different bases like gender, geographical (Punjab, Sindh, Baluchistan, Khyber Pakhtunkhwa, and Northern Areas of Pakistan), disability and minorities (Christian, Sikh and others). Pakistan’s Government managing the diversity mainly through affirmative action and equal employment opportunity and in year 2002 a Labour Policy was introduced by the Federal Government to giving powers to labor courts, to built good employee-employer relationship, to give protection to contractual employees, ban on child labor and discrimination on the basis of geographical, ethnic, gender etc. (Ahmed, 2009).
The main objective of this research paper is to evaluate or identify the effect of diversity management on workgroup performance and the employee job satisfaction who are working in the Public Sector Organizations of Pakistan. This research will mainly focus on racial diversity and try to find out how diversity management can be effected to racial diversity. The Government of Pakistan either Federal or any Provincial Government has introduced a quota system for jobs in the Government Sector Organizations on different bases like gender, geographical (Punjab, Sindh, Baluchistan, Khyber Pakhtunkhwa, and Northern Areas of Pakistan), disability and minorities (Christian, Sikh and others).

**Conceptual model:**

![Fig.1 Proposed model](image)

**Literature Review and Hypothesis Development:**

**Diversity Management:**

Diversity is becoming more important for organizations because the workforce is shifting from one geographical to another area and organizations are expanding globally that lead to increase in global completion (Hite & McDonald, 2006). A diverse workforce may comprise a belief, understanding, values, ways of viewing the world and any information which is unique (Shen et al., 2009).

There are two types of approaches for defining the diversity in literature, one is based on affirmative action/equal employment opportunity and the other based on values, religion, demographic, culture etc. Most of the authors define the workforce diversity in a broader way i.e. culture, ethnicity, race, color, gender, age, national origin, religion, language etc. and workforce diversity may affect the overall efficiency of an organization (Carrell et al., 2006).

Most of the theories say that diversity is a universal concept that has more than one dimension and ethnicity is the main aspect of it (Pitts, 2009). A lot of work has been done to manage the diversity but only 46% of the companies in the year of 2004 have written diversity policy or programs although it is a smaller of percentage whereas it is an increase of 35% over the result of survey conducted in the year of 1992. Further, the workforce diversity policies and programs have a positive effect on organizations (Carrell et al., 2006). Researchers are proposing that women will be 47% of the total workforce and ethnic or racial minorities will be more than 30% of the workers in the year of 2020 (Barak & Levin, 2002).

Diversity is a component of Human Resource Management and diversity can be managed through training and friendly policies. The responsibility of the HR Managers will increase day by day to identify the ways of how to manage the diversity and achieve desirable goals by managing the diversity issues.
Workgroup Performance

Workgroup performance means the overall performance of the employees working in a group, unit, department or section. Employees divided into different categories either on the basis of demographics or on a gender base. When these employees work in a group or section, the issues of diversity will arise. If this diversity is fully managed through policies and programs, it will increase the overall performance of the group; otherwise, conflicts will arise in lack of performance. Employees feel comfortable if they made self-selected group either made on gender base or area and the performance will be better. Workgroup performance was evaluated through the productivity, quality of work that they performed and the satisfaction of the employees (Cragan & Wright, 1995).

Job Satisfaction:

Job satisfaction is a hot issue in this era and at the same time, retention of an employee is becoming a more challenging job for Human Resource Managers. Satisfaction with job is a degree to which how much an employee is satisfied with his job (Bettencourt & Brown, 1997). Employees, facing dissatisfaction with their jobs, have many reasons like lack of rewarding system, discrimination between employees, non-cooperative supervisors and colleagues, and uncomfortable work environment.

In youth dominant culture, it is evident that those employees who are older, they are much dissatisfied and de-motivated and resulted into they are terminated from their jobs and sometimes they are also discriminated (Barak and Levin, 2002). In Government Sector Organizations, employees are recruited through a quota system as well as on merit. The people of Pakistan prefer the Government service and they retain till retirement whether they are satisfied with their jobs or not.

Hypothesis Development

Much of the work on diversity management was in descriptive nature that could not help in evaluating the assumption about the links between job satisfaction and performance (Pitts, 2009). Little work has been done on indentifying the relationship between diversity management and work outcome which includes workgroup performance and job satisfaction.

Diversity Management effect on workgroup performance

H1 Diversity Management leads to higher workgroup performance.

This first hypothesis is based on the literature that diversity management will have a significant impact on workgroup performance because the workforce diversity in terms of ethnicity, race, and gender is increased day by day. Organizations that have a diverse workforce with well-adapted differences have a high retention rate and the performance as a whole of the group will be increased. Bureaucracy theory if true and organization provide the environment like the employees feels citizen of that organization so the retention rate and performance of the group will increase (Pitts, 2009).

Diversity Management’s effect on Job satisfaction:

H2 Diversity management leads to higher job satisfaction.

The second hypothesis is the relationship between diversity management and job satisfaction. In general, in the presence of diversity management there will be no job satisfaction for all employees. Literature shows that if the diversity management is strong then the people of different color, they show job satisfaction. It might be possible that the management is taking care of people of different color (Pitts, 2009). Therefore it is trying to identify that people of different geographical areas are satisfied with their jobs in the presence of diversity management.
Research method:

This research is based on survey and measures based on respondents’ perception which are full-time permanent employees of public sector organizations (Pitts, 2009). In this research, diversity management is an independent variable whereas workgroup performance and job satisfaction are dependent variables. For obtaining the responses from the respondent the study used questionnaire. The survey is primarily focused on permanent employees from different government sector organization which does not include Non Government Organizations (NGOs). It was conducted in Islamabad/Rawalpindi cities, this survey is self administrated and filled through a direct interview by using a structured questionnaire from the managers of the public sector organizations. The data is collected from almost 100 federal/provincial government employees in Federal Capital Territory (Islamabad) and Rawalpindi.

In this research, the responses of respondents is quantified through percentage that how much employees said yes or no about an argument and extent they think that impact of diversity management on performance of a group and individual employee job satisfaction.

Results and Discussion:

The questioners was distributed to 150 government sector employees working in Auditor General of Pakistan (AGP), Accountant General of Pakistan and Revenue (AGPR), Frequency Allocation Board (FAB), Islamabad and Excise and Taxation Office (ETO), Rawalpindi. However, only 84 officers/officials completed the instrument (questionnaire) resulting in a response rate of 56%.

After analyzing the data received in response of the questioners that out of 84 respondents’ males were 72 which was 85% of the total respondents and rest were the females which were 12. This shows that the government sector is a male dominant working group and the females compose very few in numbers. From the survey, it was revealed that only 46% of the male respondents redundant are satisfied with their job in relation to the training and payment that they have acquired. Further, they responded that the performance of a group as a whole is suffering due to lack of physical conditions e.g. room, infrastructure, computers etc. to perform their job well. Employees believe that the recruitment process in the organization is non-discriminatory, non-bias on the basis of gender or geographical locations, and unprejudiced behavior which proves transparency. Whereas, the rest of the 54% employees are not satisfied with their job because of training and pay.

The females which consist of 15% responded that they are satisfied with their job, pay, and training, and with their organization where they are working. They also replied that the workgroup/unit/section’s performance is good because they feel the physical conditions are good to perform their job and the overall quality of the work done by the unit/section is good as argued by David Pitts in 2009. Females also replied that the employees in the Government Sector recruited on the basis of skills not on other biased factors like gender, demographics etc. In general, employees’ survey revealed that the age group between 26-29 years which was 13% of the 84 respondents are not satisfied with there job because they feel that the working environment/physical conditions are not suitable due to which the performance of section/unit is not up to the mark. Nevertheless, they replied that although the Government Sector Organizations are recruiting employees through a quota system based on domicile and gender, favoritism/nepotism is still prevailing during the recruitment process.
Conclusion and Recommendation:

The main objective of this paper is to identify the effect of diversity management on performance outcomes which include workgroup performance and employee job satisfaction who are working in Public Sector Organizations of Pakistan. This research mainly focused on racial diversity and tried to find out how diversity management can be effected by racial diversity.

After examining the results, it is conclude that Diversity Management plays a significant role in maintaining job satisfaction and workgroup performance and from the above the discussion two results can be concluded, first is diversity management have a positive impact on job satisfaction and also positive impact on workgroup/unit/section performance.

However, this study has some limitation; first the sample size for obtaining the responses is not large, secondly, the area for selection of Government Department is limited only to Islamabad and Rawalpindi not whole or major cities of Pakistan, and thirdly, answers given by the respondents were primarily based on the perception and opinion of the employee. It might be possible when one replied; the person was very happy and replied everything positively.

Practical implications of the research are to manage the diversity by providing training, handsome salary; proper distribution of work/workload, and starting diversity management programs. Human Resource practices should design and implement programs so that employees of the government departments can perform better and performance and efficiency of the government may increase.

Abstract
The article uses a case study analysis of Amazon.com's strategy to develop an understanding of the e-commerce competitive environment and the importance of building a sustainable competitive environment to create value for the firm, its customers, and its shareholders. Business ethics are becoming more and more topical and important. Ethics are very important to all business people. Yet, many neglect ethics as an important concept that has a major impact upon a person's success as an entrepreneur and investor. In this paper we aimed to provide some evidences to support the idea that being ethical, transparency, and morality can make a firm much different from competitors. This paper is trying to present a model for relationships between ethics and SCA and connect it to amazon.com situation to show how this web site cares about ethics and transparency to keep customers satisfied. We conclude that the need for ethics in any kind of business like amazon.com has never been greater, precisely because the power of business was never so manifold and as extensive as it is today. In a global business environment, responsible marketers discover what consumers want and respond with marketing offers that create value for buyers in order to capture value in return. Some marketing companies use questionable practices and some marketing actions that seem innocent in them but strongly affect the larger society.

Keywords: Business ethics, SCA, Amazon, customer behavior

Introduction
Amazon.com began by selling books directly to customers over the Internet and by passing the traditional industry channels. Customers who valued the time saved by shopping from home rather than driving to physical retail outlets flocked to Amazon.com’s Web site to buy books. Industry competitors Barnes and Noble and Borders Books were forced to develop their own Web sites, thus driving up their cost of doing business. According to Efuturer center (2008) some types of goods are ideal for selling over the Internet; others are less suitable. For example, Amazon.com aims to make book buying fast and easy. Most people buy books based on the information contained on the jacket, or after reading a book review. Or, they may simply like the previous work of the author. Because all of this information can be displayed effectively on an e-business site, selling books over the web works well. To survive, it is critical that online retailers create a sustainable competitive advantage in their e-commerce strategy and plan for long-term strategic positioning. Ethical issues are becoming very important in today’s competitive market. Transparency and “honesty is the best policy” still have
their prominent roles not only in daily lives, but also in business. All people care about ethics in their business. Still there are many ignored ethics that have a major impact on a person’s success whether an entrepreneur or an investor. Here we are talking about business which is, in fact, dealing with money, either one’s own or borrowed. It also involves building successful money based relationships with clients and customers. Such relationships must be built on trust - and having ethical foundations are imperative to the building of trust. Therefore ethics constitute the core factor in a business.

An employee bribing somebody, even to further his employer's interests, is likely to be dismissed. Many multinationals refuse to conduct business in countries where bribes are commonly given and taken. These are examples of the applied side of ethics in business. In respect to the subject, we know that industries and some of the companies globalize because of changes in technology, innovation, customer needs, government policy, or country infrastructure make main differences in competition position among firms from different nations. These differences can give a competitive advantage to the company over its competitors. As porter (1998) point out that firms are engaged in an international competition. So they must compete in a global arena. Sustainable competitive advantage has proved elusive for companies in the 1990s. While making enormous investments in technology, research and state-of-the art marketing, Pfeiffer (1994) argue that most of the today’ managers have forgotten the single most important factor in achieving and maintaining competitive advantage: People.

In respect to ethical perspective we have seen sometimes philanthropic activities which have, in many cases, not been connected to the day-to-day business activity. As we mentioned earlier in the current international climate of interest in social issues, which can bridges business and wider societal concerns, most of the firms are trying to embed CSR in their activities. The underlying proposition of using term ethic in business is that the responsibility of a business is not just to focus on maximizing shareholder return.

Literature review
First of all we should say that businessmen need to consider ethical issues in their daily activities. As Mahoney mentioned (1997) the need for morality and ethics in business has never been greater and precisely because the power of business has never been as extensive as it is today. Ethics has been used very much referring mostly to the rules and empirical aspects of right and wrong operation. Aldag and Steams (1991) believe that it, ethics, deal to morality and or good and bad conduct. DiPiazza (2002) says “I see ethics as a mission-critical issue…. deeply embedded into who we are and what we do. It’s just as important as our product development cycle or our distribution system….it’s about creating a culture based on integrity and respect, not a culture based on dealing with the crisis of the day...We speak to ourselves every day, ‘Are we doing the right things?’” Sheth, Gardner and Garret (1988) opine that to make an ethical decision is so complicated, and sometimes some of the business practitioners who are guilty in some cases have mentioned that they did not think that their activities could create ethical problems. Arthaud-Day, 2005; Buller and McEvoy, 1999; Falkenberg, 2004; Windsor, 2004 demonstrate that Business organizations operating at international levels often find that many countries differ in what is considered as wrong or right in a business market. Therefore, here some certain fundamental questions will rise on the issues of international business ethics that are of concern in the current change of policy and in particular; the global business environment. For instance, which ethical norms should be applied and followed at global business environment?
Growing literature in international business ethics indicate that managing across borders involves dealing with ethical challenges that are complex and multifaceted. They range from varying legal, political, economic and cultural conditions that provide a challenge for business executives who want to satisfy moral expectations across different countries and aim to integrate an ethical dimension into their strategic decision-making processes.

Bowie (1996) says almost all of the countries in the world are different in different ways like, physical setting, economic development and literacy rates and he argues that even if we accept an universal ethical and moral principle, we should believe they must be related to different cultures and background. Hence ethical behavior would still differ among cultures even though they may agree on fundamental universal moral principles.

Following the economic growth does not necessarily lead us to social development. In many cases as Leonard and McAdam, (2003) opine it may actually leads to bad physical environment, unsafe workplace, discrimination, urban decay and other social problems. These environmental concerns have been expressed often than not. For instance, in one hand Beauchamp and Bowie (2004) report that there are other fundamental ethical issues associated with international business ethics, which include bribery, extortion, facilitation payments and human rights. On the other hand, Ferrell, Fraedrich and Ferrell (2002) describe global ethical issues as encompassing human rights, sexual and racial discrimination, price discrimination, bribery, harmful products, pollution and telecommunications issues. In this scenario, Hazarika, (1998) stated that it is no wonder that the attention of top management, governments and society are being directed towards corporate governance, corporate accountability and corporate social responsibility (CSR).

In a global business environment, responsible marketers discover that buyers want and respond to those offers which create value for sides, buyers and marketers. Sometimes people try to find a market for their products they think they are innocent but their products or their actions may affect a large part of the society. Consider the sale of cigarettes. Parker (1998) writes that the way corporations go about their business activities, with respect to business ethics performance, is increasingly important to their customers as well as all stakeholders of the corporation and the society in general. Customers in the marketplace are becoming increasing aware of and increasingly discriminating against corporations that fail to meet the customers’ criteria of acceptable versus unacceptable ethical business activities and management principles.

Norton Jouter, as cited by Hartman (2005), stated that, “From here that looks like a bucket of water, but from an ant’s point of view, it’s a vast ocean; from an elephant’s point of view, it’s just a cool drink; and to a fish, of course, it’s home.” Jouter’s statement is to imply, if we really are going to make a great change in the way that we handle our customers, we should consider different views of stakeholders and as we know the company itself is the most interested one in its success.

However, strict reporting, detailed codes of conduct rules and regulations are certainly necessary but not sufficient. Geoghegan & Azmi, (2005) argued that a company that has a well-known brand is like an individual who has a good name that enables him to make very good and strong relationships when he needs. Verhezen, (2005) says a corporate reputation shows and reflects the organization’s strategy, culture, and values.
As we mentioned earlier a good corporate reputation confirms the high level of trust in a company. It can make a strong relation with a number of stakeholders either emotional or intellectual and beside it can act as a source of authority and credibility for the company. Boatwright, 2005; White, (2006) have explained that business ethics as a competitive advantage includes making good and permanent relationships with stakeholders and try to keep this relation based on honesty and integrity. Ethical relations in business is like human relations together and as all we know it is nothing but a two ways traffic line not a one way and it is based on mutual respect and trust. Successful business must treat the parties affected by the corporation’s actions as constituents to be consulted rather than spectators to be ignored. Doing so was just smart business. This was a novel step that was among the first attempts to characterize the impact of ethical behavior on a company’s financial performance.

Burgelman and Meza, (2001) argued that from the customers” perception, the illusion was real enough to draw tens of thousands of visitors per day from all corners of the globe to browse Amazon’s virtual bookshelves. Today, Luftman et al., (1999) say Amazon’s state-of-the-art, highly-coupled supportive ICT infrastructure provides apparent seamless integration between internal and external databases of all kinds.

Also Gillenson et. Al, (1999) investigated that it’s sophisticated software that enable Amazon to predict customer interests in other products, based on the order profile of individual customers and of all others exhibiting similar product interests and purchasing patterns. Sing, (2002) believed while other online booksellers compete for a small piece of market share, Amazon uses its technological sophistication to promote continued expansion of the firm.

We should consider ethics in business as an important part regardless of the size of the business and or organization. Also it doesn’t matter whether your customers are many or few; the relevance of adhering to high ethical standards is the same. There are many organizations in the business world which have put compulsory ethical standards.

Wolfe, (1994; Hendriks, (2001); Senge, (2001; Meyronin, (2004) all pointed out that organizations like Amazon, Dell, EBay, Google, numerous banks (e.g. Chase.com and Citibank.com), retail chains (e.g. LLBean.com, WalMart.com, and BestBuy.com), the travel industry (e.g. JetBlue.com, Avis.com, Orbitz.com, and Expedia.com), and price search engines (e.g. PriceGrabber.com, NextTag.com) are led by senior management teams who not only recognize the greater efficiencies that can be gained by leveraging new ICT technologies, but they actually create entirely new ways of marketing services based on ethical standards. These firms distinguish themselves by mixing aspects of marketing with their strategic operational approach that consider ethical issues as a necessity for this era of business and, in sum, bring about causal responses from consumers that may be deterministic responses. They recognize that by using ICT in a focused and deliberate fashion, they can create and leverage opportunities to provide accompanying marketing services while sustaining operational efficiency.

**Gap in literature**

To explain the gap in literature we need to bring scientists ideas again and interpret what they have told in this area and express our own views regarding to that particular subject. Mahoney mentioned (1997) the need for morality and ethics in business has never been greater and precisely because the power of business has never been as extensive as it is today. We agree with
this statement but if we want to evaluate the importance of ethics role in business we must put it in its own dish on that time. For us as researches it is acceptable that today the role of ethics is much more important than ever. We can accept in today’s situation we talk about it more because of the lack of ethics in our daily business but it doesn’t mean that in the past time people didn’t care about it. Aldag and Steams (1991) believe that, ethics, deal to morality and or good and bad conduct. Yes it is about doing right or wrong things in business. We should also add sometimes businessmen are saying something and playing another thing and all the time they try to hide reality. Actually they miss use their reputation and they don’t walk the talk. Sheth, Gardner and Garret (1988) opine that to make an ethical decision is so complicated, and sometimes some of the business practitioners who are guilty in some cases have mentioned that they did not think that their activities could create ethical problems. It is natural to people feel guilty if they make wrong decisions which affect a large society’s life. But don’t forget here we are talking about ethics in business and make it as a competitive advantage. No one can accept our excuse to be just sorry. If we as managers want to make decisions ethically, then there must be some rules to prevent and protect us from making any mistake. Beside that as Arthaud-Day, 2005; Buller and McEvoy, 1999; Falkenberg, 2004; Windsor, 2004 demonstrated that Business organizations operating at international levels often find that many countries differ in what is considered wrong or right in a business market. So to act ethically we need to consider different approaches to right and wrong in different countries. Bowie (1996) says almost all of the countries in the world are different in different ways like, physical setting, economic development and literacy rates and he argues that even if we accept an universal ethical and moral principle, we should believe that they must be related to different cultures and background. Hence ethical behavior would still differ among cultures even though they may agree on fundamental universal moral principles. If we ignore these differences as Leonard and McAdam, (2003) say it may actually leads to bad physical environment, unsafe workplace, discrimination, urban decay and other social problems. Here again we need rules and regulation to prevent bad consequences. These environmental concerns have been expressed often than not. For instance, in one hand Beauchamp and Bowie (2004) report that there are other fundamental ethical issues associated with international business ethics, which include bribery, extortion, facilitation payments and human rights. On the other hand, Ferrell, Frederick and Ferrell (2002) describe global ethical issues as encompassing human rights, sexual and racial discrimination, price discrimination, bribery, harmful products, pollution and telecommunications issues. In this scenario, it is no wonder that the attention of top management, governments and society are being directed towards corporate governance, corporate accountability and corporate social responsibility (CSR) (Hazarika, 1998). So, different people in the world look at the issue from different angles. Geoghegan & Azmi, (2005) argued that a company that has a well-known brand is like an individual who has a good name that enables him to make very good and strong relationships when he needs. Making such a sense in the company is really hard. Sometimes we have a lot of problems to handle this issue with less educated people in the firm. Making a culture in respect to ethical issues is the main essence in this context. To support our idea we brought Verhezen view that says (2005) a corporate reputation shows and reflects the organization’s strategy, culture, and values. A leader has an important role in respect to playing ethical issues and norms in the company. People will and must follow their leaders so if top managers do care about it the employees will act so. From the other hand operating ethically is not about just inside the company.
It is also related to outside the company as Parker (1998) writes that the way corporations go about their business activities, with respect to business ethics performance, is increasingly important to their customers as well as all stakeholders of the corporation and the society in general. But here there is a missing part. We get the real partners which are share in acting based on ethical issue and who is really responsible to make ethics a sustainable competitive advantage? Norton Jouster, as cited by Hartman (2005), if we really are going to make a great change in the way that we handle our customers, we should consider different views of stakeholders and as we know the company itself is the most interested one in its success. For us it is not clear how to get stakeholders’ view because we are not talking about a simple subject rather we are talking about ethics that consists of several items how we can talk to all and understand all of them?. It is better to make a situation in which all partners can play their role ethically and of course we can receive feedback from them. We also agree that we as managers need to keep our connection to our stakeholders as Boatwright, 2005; White, (2006) have explained that business ethics as a competitive advantage includes making good and permanent relationships with stakeholders and try to keep this relation based on honesty and integrity. Ethical relations in business is like human relations together and as we know it is nothing but a two ways traffic line rather than a one way and it is based on mutual respect and trust. What we couldn’t find about amazon.com is that there is no a single research regarding to ethics issues at amazon.com. But there are a lot of scattered comments all around. We try to make our statements based on these comments.

What is business ethics?

Whichever way one looks at it, then, there appears to be good reason to suggest that business ethics as a phenomenon, and as a subject, is not an oxymoron. Whilst there will inevitably be disagreements about what exactly constitutes ‘ethical’ business activity, it is possible at least to offer a fairly uncontroversial definition of the subject itself. So in sum, here we provide some statements to show what we mean by business ethics:

- Business ethics is an area of study which deal with situations, activities and decisions where right and wrong are the issues to be addressed. We should stress by right and wrong we mean not only morally right and wrong but also strategically, financially or commercially right and wrong. Moreover, by ‘business’ ethics, we do not mean only commercial businesses, but also government organizations, pressure groups, NGO based businesses, charities, and other organizations. For example, questions about how to manage employees fairly, or what constitutes deception in advertising, are equally as important for organizations such as Greenpeace, the University of Stockholm, or the German Christian Democrat Party as they are for Shell, Volvo, or Deutsche Bank. However, given the high profile of ethical issues in relation to commercial businesses, it is on these types of businesses.

People still haven’t stopped to ask questions responding to statement about business ethics. Some people cannot even believe that it exists! Collins (1994) believes that business ethics is like a complicated term that has been used very much. By this we mean that we use this term to bring two apparently contradictory concepts, such as in “cruel kindness”. To say that business ethics is an oxymoron suggests that there are not, or cannot be, ethics in business: that business is in some way unethical (i.e. that business is inherently bad), or that it is, at best, amoral (i.e. outside of our normal moral considerations). For example, in the latter case, Albert Carr (1968) argued that the standards for business game are not the same moral standards as the rest of society, but should be considered as an equal to a poker game where deception and lying were perfectly permissible.
To some extent, it is not surprising that some people think this way. Various scandals concerning undesirable business activities, such as the despoiling of rivers with industrial pollutants, the exploitation of sweatshop workers, the payment of bribes to government officials, and the deception of unwary consumers, have highlighted the unethical way in which some firms have gone about their business. However, just because such malpractices take place, this does not mean that there are not some kinds of values or principles driving such decisions. After all, even what we might think of as ‘bad’ ethics is still ethics of a sort. And clearly it makes sense to try and understand why those decisions get made in the first place, and indeed to try and discover whether more acceptable business decisions and approaches can be developed.

Anything we get from corporate malpractice should not be interpreted to mean that even thinking about ethics in business can make trouble and is entirely redundant. Collins (1994) and Watson (1994) argued as various writers have shown, many everyday business activities require the maintenance of basic ethical standards, such as honesty, trustworthiness, and co-operation to make a situation in which people can work together get a SCA over competitors. Business activity would be impossible if corporate directors always lied; if buyers and sellers never trusted each other; or if employees refused to ever help each other.

Similarly, it would be wrong to infer that scandals involving corporate wrongdoing mean that the subject of business ethics is in some way naive or idealistic. Indeed, on the contrary, it can be argued that the subject of business ethics primarily exists in order to provide us with some answers as to why certain decisions should be evaluated as ethical or unethical, or right or wrong. Without systematic study, how are we able to offer anything more than vague opinions or hunches about whether particular business activities are acceptable?

**Why business ethics are important for Amazon.com?**

Nowadays business ethics is a very dominant business issue, and the debates, arguments, and dilemmas around business ethics topic have tended to gather a huge amount of attention from various sources. At the beginning stage buyers and pressure groups seem to be demanding that firms should seek out more ethical and ecologically ways in dealing with them and doing the business activities. From another angle we should care about media that is also constantly keeping spotlight on corporate abuses and malpractices. Even now firms themselves know that being ethical or at least being seen to be ethical actually is good for them. In recent years we have seen protesters in some of the big cities in the world for example in Seattle, London, Genoa, and elsewhere in fact challenging the nature of capitalism and the impact of global corporations on society. There are therefore many reasons why business ethics might be regarded as an increasingly important area of study, whether for students interested in evaluating business activities, or for managers seeking to improve their decision-making skills. Here there are the main reasons why we think that a strong understanding of business ethics is important:

1. Importance, power, and business affect in the community is greater than ever. Bernstein based on evidence suggests that many people in the public don’t feel like these kind of developments. By business ethics we can better understand why this is happening, what are the contributions, and how we should handle this situation?

2. Business abuse has a great potential to hurt individuals, communities, and environment. To helping us to get a clear understanding about the causes and consequences of these abuses, in fact as Michalos (1988) cited business ethics, as founding editor of the journal of business ethics has suggested, seeks “to improve the human condition”.
3. Business itself already has got the demand to be ethical. And it is becoming more complex and more challenging. Business ethics provides the means to appreciate and understand these challenges more clearly, in order to firms can meet these ethical expectations more effectively.

4. A few numbers of people in Europe and elsewhere have passed formal education on business ethics. Business ethics can help us in making ethical decisions by providing us suitable knowledge and some useful means that allow us to recognize, diagnose, analyze, and get solutions to those ethical issues correctly.

As we know in most European countries there is quite a dense network of regulation on most of the ethically important issues for business. Workers’ rights, social and medical care, and environmental issues are only a few examples where European companies could be said traditionally do not have to consider so very much moral values which should guide their decisions. All these regulations have been tackled, first time, by the government which tried to set up a tight organizational framework for businesses. Therefore we can claim in Europe all people who involve in business from, governments, trade unions, and corporate associations are the key actors in business ethics. In USA the situation is a bit different because in most of the areas, the organizational framework based in ethical issues in the business has been dramatically looser, so the key actor mostly tended to be corporations. Generally as we know even in USA when the law has not yet codified the ‘right’ or ‘wrong’ of a certain action, this would also seem to partially explain the longer legacy of the subject in the USA. However, Vogel (1992) says that the identification of the corporation as the key actor in the USA also means that corporate misconduct tends to face greater enforcement and harsher penalties. In sum we can say that all the people as stakeholders have an important role that sometimes those roles may make them key actors in the business so as we mentioned earlier firms must care about all partners. This is the situation in amazon.com as well where they put every action based on what their customers want. They think about what makes their customers satisfied. If we suppose that there are three important factors for every business: profit, planet and people, for amazon.com the role of people are dominant. Still it doesn’t mean that they ignore the other factors but the way that they do their activities show the key factor is the people.

**Amazon.com and SCA planning**

In their work Scott et al. (2000) opine that the development of the social perspective on sustainability has tended to trail behind that of the environmental and economic perspectives and remains a relatively new development. The explicit integration of social concerns into the business discourse around sustainability can be seen to have emerged during the 1990s, primarily; it would seem, in response to concerns regarding the impact of business activities on indigenous communities in less developed countries and regions. It would be wrong to assume though that this means that, until this time, local community claims on business (and other social issues) went entirely unheard by business, or unexamined by business ethics scholars. However, the inclusion of social considerations such as these within the specific domain of sustainability marked a significant shift in the way that notions of sustainability were conceptualized.

The key issue in the social perspective on sustainability is that of social justice. Despite the impressive advances in standards of living that many of us have enjoyed, the UN (2001) report on the World Social Situation identified growing disparities in income and wealth within many countries, including much of Latin America, Eastern Europe, and almost two-thirds of OECD countries. Similarly, the report identified a continued widening in the distance between richer and poorer countries. Business ethics of a firm has been defined as one of the invaluable
intangible assets for competing. In general, intangible assets are assuming increasingly competitive significance in rapidly changing domestic and global markets. As the speed of comparable tangible assets acquisition accelerates and the pace of imitation quickens, firms that want to sustain distinctive global competitive advantages need to protect, exploit and enhance their unique intangible assets, particularly integrity. Petrick & Quinn, (2001) claim that: Firms must understand stakeholders’ interdependence, explain ethical awareness, and give effective reaction to moral issue. Management they believe that must put themselves in a position of a competitive advantage in comparison to other companies by making a list of ethics capacities. International organizational leaders can and should be held accountable for enhancing the intangible strategic asset of integrity capacity in order to advance global organizational excellence. The situation makes us to do something different which makes us distinguishable from other companies like Svensson & Wood, (2004) expressed that the marketplace with globalization is becoming increasingly aware of, and increasingly discriminating against, corporations that fail to meet the criteria of ethical business operations and ethical management principles. Also SCA needs change, as porter (1998) argued it demands that a company invest to close off the way along which competitors could attack. Regardless of the size, nowadays, firms are very clear about ethical issues and their importance in the era of globalization thus they are developing their strategies to use their resources ethically to get their goals and objectives. In amazon.com planners believe that business ethics program helps owners and managers improve their business performance, make profits, and contribute to the economic progress of their communities ethically by meeting the reasonable expectations of their stakeholders. From their point of view program can help them to achieve specific expected program outcomes, such as increasing awareness of ethics issues, improving decision-making, and reducing misconduct. To be effective over time, amazon.com business ethics program aims to be a formal plan, because it touches on all aspects of the enterprise—operations, human resources, communications, and marketing to name but a few. Formally planning a business ethics program ensures that owners and managers give due consideration to the enterprise’s relevant context, organizational culture, and reasonable stakeholder expectations. Busy managers need not fear that formal planning for a business ethics program will overwhelm daily operations because, as discussed before, they already have many elements in place. The planning process requires targeted stakeholder participation more than a large staff. However, once an enterprise announces its intention to design and implement a business ethics program, it needs to plan well and to base its plan on its core beliefs. Hediger (1999) noted that the concept of sustainability is generally regarded as having emerged from the environmental perspective, most notably in forestry management and then later in other areas of resource management. Indeed, it would probably be true to say that, at the present moment, there is still a fairly widespread conception within business that sustainability is a purely environmental concept. But for amazon.com the issue is somehow different because they care either people or planet. The basic principles of sustainability in the environmental perspective concern the effective management of physical resources so that they are conserved for the future. Whereas in amazon.com managers are more concern about trust, delivery and security beside they vie to make a competitive advantage based on lower prices as well. It doesn’t mean they don’t care about environmental issues. Amazon.com has several sustainable competitive advantages (SCAs) that arise from strategic positioning that should contribute to sustained profitability if executed correctly. Amazon.com has patented one-click ordering, an SCA that cannot easily be
copied or duplicated as Amazon.com holds the patent. Amazon.com’s innovation to automatically suggest other items based upon previous purchases has become valuable both to customers and the company. Amazon.com also owns a patent on the Associates program, allowing consumers to have access to online stores from which it draws royalties. Amazon.com simply handles the transaction processes for these retailers. It can be argued that by allowing the sale of used books on its Web site, Amazon.com has created a SCA by creating a sense of community. Amazon.com mirrors EBay’s business model which aims to create a sense of community, a bond per se, that keeps people coming back to do business. Amazon.com makes it extremely easy for consumers to sell or buy books online. The company handles the payment transaction and then deposits the money, minus the fee, into the seller’s bank account. EBay, the Web’s most popular and profitable online auction, implemented a similar process. Theoretically, the strategy helps Amazon.com sell more items by allowing a customer with limited funds to purchase more items instantly. This generates repeat customers. Bezos describes Amazon.com’s marketing strategy as one that is designed as Qu, Zhonghua and Michael Brocklehurst (2003) find out to, “strengthen and broaden the Amazon.com brand name, increase customer traffic to our websites, encourage customers to shop in many product categories, promote repeat purchases, and develop incremental product and service revenue opportunities.” An emphasis is placed on improving the total customer experience through the delivery of personalized Web pages and services, ease of use, selection, availability, free on-time shipping and of course the lowest prices possible.

Quéau, Philippe (2002) expressed that Amazon.com uses a variety of online and traditional advertising, including sponsored links, e-mail, print media, direct marketing, television, and other offline advertising campaigns to reach customers. Bezos feels that the company’s direct marketing efforts are unique and effective: “I would claim that Amazon.com is one of the few companies that really have put a huge amount of effort into one-to-one marketing with the personalization features on our website.”

Senge, P. M., G. Carstedt, et al. (2001) cited that in 2001, Amazon.com’s CEO stated that, “People had higher expectations for the next couple of years than are likely to be realized …And people have much lower expectations for the next couple of years than are likely to be realized over the next 10 years.”

Industry analysts assert that the greatest challenge facing e-retailers is the ability for consumers to click from one site to another in search of the lowest price. Only 10 years ago, finding the best price for a book or movie meant driving from store to store. However, Zaheer, Srilata (1995) says now buyers can go online and compare prices for new and used books on at least 10 different Web sites. This one characteristic of the Internet retail industry exemplifies the challenge facing Amazon.com and demonstrates the threat of all five competitive forces identified by Porter:

1) The entry of new competitors
2) The threat of substitutes
3) The bargaining power of buyers
4) The bargaining power of suppliers
and 5) the rivalry among the existing competitors.

One is creating an SCA that will give a business enough time to build customer loyalty and profits. The second is positioning. If a company creates a competitive advantage, it must continue to improve upon that strategy. A competitive advantage is a living, breathing entity. To
maintain a sustainable competitive advantage requires constant nurturing and encouragement to grow and adapt to its environment.

There is actually quite a lot people can do at Amazon.com other than buy a book. We can create wish lists, write reviews, manage our one-click account, we can sell books, or music, or videos, and we can have our books printed on-demand. A non-store retailer such as Amazon.com is poised to be successful globally with the increasing spread and prevalence of the Internet and World Wide Web. The success of Amazon.com's global strategy would come from utilizing technological and global efficiencies of scale, lower costs of operations, enhanced customer service at lower costs due to better customer information and relationship management, and better adaptability to local tastes and preferences due to superior information collection and analysis. What competitive advantages does Amazon.com bring to each of these businesses? While Amazon.com may compete well on price on non-perishable food items in small size that can be shipped easily, as books can, they are less well prepared to compete on other types of grocery purchases. In terms of apparel retailing online, there are many players in this market and the prices may not be much lower on Amazon's site as compared to those offered by other players in these markets. Apparel shopping on Amazon.com is most likely to succeed with those consumers who want a one stop shop for clothing, books, entertainment, small appliances, etc.

A model that shows the importance of ethic in SCA regarding to amazon.com case
As we emphasized all above, firms must be clear about their interdependence to stakeholder. Because it is all about stakeholders and the way how firms handle them. Although we know conceptions of ethics and what is right and wrong in different countries are different but still we believe that there is a globally accepted understanding of what is ethical in the business. Therefore we make our model based on those factors that are very important in getting the CA over competitors. First of all, in our opinion, governments must set up rules and regulations to prevent any kind of self interpretation by firms in using the resources and providing services just for their own profit. When the rules are made firms must be as transparent as possible because they are seen by controlling systems, trade unions, pressure groups and mostly by community so they will fell that they need to be moral persons and moral leaders. They will understand that they need to compete in a market in which people know a lot more than before about business and products’ quality.

Even nowadays people really care about environment therefore, a firm that wants to get CA must try to enhance its own quality regarding to ethical issues and try to give useful information to its customers. Based on ethical theory every single firm must keep its relations to its internal and external environment because all of them are important.

Sometimes each one can play an important role for the company if a firm cares about its reputation and at the same time pays more attention to its stakeholders and try to satisfy them it can be hopeful to get a sustainable competitive advantage over competitors if it ignores the basic rules in business ethics it will not survive in mean time. So as we consider in our paper firms must understand stakeholders’ interdependence, explain ethical awareness, and give effective reaction to moral issue. Management they believe that must put themselves in a position of a competitive advantage in comparison to other companies by making a list of ethics capacities. International organizational leaders can and should be held accountable for enhancing the intangible strategic asset of integrity capacity in order to advance global organizational excellence. The situation makes us to do something different which makes us distinguishable from other companies like Svensson & Wood, (2004) expressed that the marketplace with
globalization is becoming increasingly aware of, and increasingly discriminating against, corporations that fail to meet the criteria of ethical business operations and ethical management principles.

There are myriad ways in which this phenomenon may be explained but most often, they usually differ because of the fundamental differences dominating the mentality that each firm maintains toward ICT as well as the perceived strategic direction these firms assume ICT will take them. For example, competitor firms Amazon.com, BarnesandNoble.com and BooksAMillion.com each have more or less the same user interfaces and overall processing capabilities, yet neither has a market share anywhere near that of the Amazon.com, the industry leader.

**Model of relations between ethics and SCA in Amazon.com**

- **Input**
  - Customers
  - Employees
  - Owners
  - Suppliers

  - **Service guarantee, lower price, update information, high quality,**
    - Transparency, honesty, payment, morality
  - **Controlling system, trust, profit,**
  - **Trust, information, payment**

  - **Job satisfaction, commitment, attract talented people**
  - **Dissatisfaction, quit, uncommitted**
  - **Trust, and finance growth**
  - **Reputation lost, bankruptcy**
  - **Trust, lower price, higher quality, and delivery**
  - **Opportunity to competitors and**
DISCUSSION AND CONCLUSION

Nowadays most of the firms are going to be sustainable organizations through building value for stakeholders in long term. At the same time they want to be responsible corporate citizen. It is globally believed that the only way to achieve that is to incorporate economic, social and environmental codes of conduct into business strategy. With this development, ethical considerations become more important. Thus, the importance of building a strong ethical culture is integral to the reputation, growth and finances of any organization. If firms work in this way their brands will be in positive situations that can attract the best talent and make long live trust among the stakeholders.

As Amazon.com’s CEO, Jeff Bezos, signed his seventh annual letter to shareholders in April 2003, he was firm in his conviction that his long-term approach to offering customers the lowest prices on virtually any product they wanted and providing a quality customer experience was the only strategy that would provide long-term value for Amazon.com’s customers and shareholders. Also, the company posted growing profits in the first two quarters of fiscal year 2004 (Amazon, 2004).

If Amazon.com offers an equal or lower price than a conventional bookstore and free or subsidized shipping, why not try it as an experiment? Sooner or later, though, some customers can be expected to return to more traditional modes of commerce, especially if subsidies end, making any assessment of customer loyalty based on conditions so far suspect. Finally, some “revenues” from on-line commerce have been received in the form of stock rather than cash. Much of the estimated $450 million in revenues that Amazon has recognized from its corporate partners, for example, has come as stock. The sustainability of such revenue is questionable, and its true value hinges on fluctuations in stock prices. When Amazon and other rivals entered the business, offering free auctions, eBay maintained its prices and pursued other ways to attract and retain customers. As a result, the destructive price competition characteristic of other on-line businesses has been avoided. It deterred the on-line store from capitalizing on the many advantages provided by the network of physical stores, thus playing into the hands of Amazon.

Abstract
This article is trying to provide a new definition of CSR and SCA regarding to Body Shop and their relation in current heavy globally competitive market at Body Shop as a well known brand. We examine some theories about CSR and SCA and connect them to Body Shop then the gap in literature makes it clear that what the differences between literatures are. The paper’s approach is to provide a model to show in what degree CSR and SCA can affect each other and Body Shop as well. And what are the advantages and coming opportunities for Body Shop in playing the responsibility role in the market. In this paper we provide a model to show the relations between SCA and CSR. Finally we conclude that we need to use both perspectives in regarding to CSR and SCA as Body Shop do in its everyday activities.

Keywords: CSR, SCA, marketing, consumer behavior, trust

Introduction
A strategic competitive advantage can be existed when a firm has a product which is considered by customers as better than of its competitors. For that to happen a firm must care about social responsibility. Unfortunately most of the entrepreneurs faced with tow myths in creation of a competitive advantage. One is that firms have lost most of their good opportunities. The other is that there is not a fair balance between small and big firms so that small firms cannot compete with big ones. Even if they try to invest in social activities they will fail to be as good as big firms so it is a big challenge for them to be more responsible to the society. But as we know most of the companies do not welcome competitors.

As one well-respected author, Karl H. Vesper, puts it:
Established companies do their best to maintain proprietary shields... to ward off prospective as well as existing competitors. Consequently, the entrepreneur who would create a new competitor to attack them needs some sort of “entry wedge,” or strategic competitive advantage for breaking into the established pattern of commercial activity.

In today’s business environment competition is going to be more intense. Although a firm may be a market pioneer today, the status quo might change overnight. Having competitive advantage alone is not sufficient. Important factor for being in growth is sustainability; it is the ability which enables the firms to maintain a competitive advantage. To more competitive regarding to CSR time is also of the essence. While others are merely finding their orientation to stay abreast with the latest innovations, the winning company is already moving up to the next level.
Organizations can seek consolation in the fact that most competitors are also struggling to survive in this turbulent business environment. Today the question is what do we expect from good CSR in business world? Actually we expect organizations, whether public or private, to be more coherent and transparent. Hopefully those standards will enable globalization process to go together with for human rights, to pay attention to social justice and to enhance the work. We really expect from CSR a practical reconciliation and a new balance especially between economic activities, labor relations and the environments in daily life.

**Literature Review**

CSR is more than an individual enterprise’s own perception of responsibility in relation to employees, shareholders, suppliers, customers, local, regional and national authorities, consumers, NGOs and the media. The people who are affected by firm’s actions are stakeholders. Thus they have right to ask how enterprise is running? The globalization of business and industry, politics and the media brings far more attention to bear on corporate social responsibility. The relationship between politics and economics is changing. Globalization has engendered new opportunities for enterprises; at the same time as complexity increases enterprises’ activities encompass many countries. Enterprises face entirely new challenges, especially in countries outside the affluent part of the world.

To be more effective in CSR and use it as a SCA we need rules and regulations that sometimes these rules must be accepted globally. According to Marianna Linnik and Professor Sune Skadegaard Thorsen, the need to have rules establishing corporate responsibility as real rather than optional can only be met if binding rules are introduced and if the law moves quickly to reoccupy an area previously held by communication and business. There is no doubt that the largest multinationals – particularly those that are the most “suspect” environmentally or in labor law terms (oil companies, fast-food chains, etc.) – know that they are already under the constant and sometimes highly critical eye of civil society. And people will blame them for mistakes that they have made in regarding to their rights.

Initial literature normally serves as a precursor to the development of SCA. In 1937, Alderson hinted at a basic tenet of SCA, that the most important aspect in competitive adaptation is the suppliers must meet buyer wants and needs. He (1965) again emphasized that firms must try to make a different view from themselves in the eyes of the customers. So they can be distinguished by buyers from their competitors and it is the essence of SCA. Later, Hamel and Prahalad (1989) and Dickson (1992) explained the necessity for the firms to be one step ahead from competitors in terms of creating new advantages that give them a better situation among the other firms. In respect to the suggestion that firms seek for ways to distinguish themselves from competitors, Alderson is considered “ahead of his time”.

Hall (1980) and Henderson (1983) demonstrated the necessity for organizations to present significant advantages in relation to peers if they are going to survive.

These arguments form the basis for achieving SCA. The foundations of competitive advantage for firms has been explored in two broad research streams, one looking for advantages in firm’s endowments of resources (e.g. Peteraf, 1993, Barney, 1986, 1991) and the configuration of activities (e.g. Porter, 1996), and another exploring the posture and positioning of firms vis-à-vis their competitors Porter, (1980&1991), and Ghemawat, (1991).
To have an understanding of why competitive strategies are better than others, we need to pay attention to resources’ distribution and allocation in competing firms. As we know resources in the firms are different.

It means that every firm may have more or less some of the resources, just those resources which are rare, valuable, and difficult to imitate can provide a SCA. (Amit & Schoemaker, 1993; Barney, 1991; Schoenecker & Cooper, 1998). Hitt, Nixon, Clifford, & Coyne, (1999) opine if we apply some of the strategies to leverage those rare and valuable resources successfully in the firm, that firm is likely to gain an advantage over its competitors in the marketplace and thus earn higher returns. Peteraf, (1993) says competitive advantages that are sustained over time lead to higher performance. Thus, if a firm could find better and cheaper ways in doing the production process, it could compete successfully and prosper. Among a firm’s intangible resources, human capital may be the most important and critical for competitive advantage because it is the most difficult to imitate. For example, Miller and Shamsie (1996) discussed the role of stars, or “talent,” in the success of the Hollywood studios in their heyday, the 1930s and 1940s. The stars were developed so that each had an unique reputation or image that was difficult for a rival studio to imitate. Yet as Miller and Shamsie note, rival studios often did try to develop their own versions of other studios’ stars by trying to imitate their “image”—for example, Warner Brothers developed Tyrone Power to compete with MGM’s Clark Gable. But this approach was generally unsuccessful because it focused on the star alone. Day and Wensley (1988) focused on two categorical sources involved in creating a CA: superior skills and superior resources. Other authors have elaborated on the specific skills and resources that can contribute to a SCA. For example, Barney (1991) states that not all firm resources hold the potential of SCAs; instead, they must possess four attributes: rareness, value, inability to be imitated, and inability to be substituted. Similarly, Hunt and Morgan (1995) propose that "potential resources can be most usefully categorized as financial, physical, legal, human, organizational, informational, and relational" (p. 6-7). Prahalad and Hamel (1990) suggest that firms combine their resources and skills into core competencies, loosely defined as that which a firm does distinctively well in relation to competitors. Therefore, firms may succeed in establishing a SCA by combining skills and resources in unique and enduring ways. By combining resources in this manner, firms can focus on collectively learning how to coordinate all employees’ efforts in order to facilitate growth of specific core competencies. As Body Shop has done to mix all skills and resources to compete with its rivals in caring of environment and today Body Shop is known with its core competency as a leader in protecting the planet. According to Warhurst (2001) the major elements of CSR are product usage that is concentrated on contribution of industrial products which can help in well being and quality society’s life, business practice which focuses on good corporate governance and gives high impetus for the environmental well being and equity which tries for distribution of profits equitably across different societies especially the host community. Chambers, Chapple, Moon and Sullivan (2003) evaluate the extent of CSR penetration in seven Asian countries (India, Indonesia, Malaysia, the Philippines, Singapore, South Korea and Thailand). The evolution of CSR in developing economies shows widely varying results. Many researchers have hypothesized that CSR in emerging economies is still in a very nascent stage and suitable mechanisms do not exist to ensure that companies practice CSR with anything other than a charitable outlook. Kemp(2001) states “There are numerous obstacles to achieving corporate responsibility, particularly in many developing countries where the institutions, standards and appeals system, which give life to CSR in North America and Europe, are
relatively weak.” It shows that it is important for a company where to locate, in a developed country or in a developed country. The rules, regulation and the government’s view of business are important factors to make a company succeed.

GAP IN LITERATURE
With increased visibility of corporate actions, customers’ perceptions of companies and their consequent purchasing behaviors are fundamentally changing. And because that means significant financial impact for businesses, CSR is no longer viewed as just a regulatory or discretionary cost, but an investment that brings financial returns.

From other hand many topics in strategy research have been linked to aiding in the process of creating and maintaining a SCA. Included in these topics are the concepts of market orientation and business networks. Day and Wensley (1988) suggest using perspectives of both customer and competitor to assess firm performance; this outward focus links the SCA construct to the concept of market orientation. Varadarajan and Jayachandran (1999) say that through a customer orientation, firms can gain knowledge and customer insights in order to generate superior innovations. But here there is no guarantee that by applying them we can get the customer satisfaction. From other hand caring about environment, Hunt and Morgan (1995) claimed, is not about just the customer, therefore these ideas just can help to improve one side of CSR in regarding to SCA. Because a market orientation employs intangible resources such as organizational and informational resources, it can serve as a source of SCA.

Although we can accept this view but still firms are not enough clear about their resources even in relation to CSR they don’t know that which resource should be allocated to which unit. Business networks consist of multiple relationships, with each participating firm gaining the resources needed to build core competencies and obtain a SCA. Porter (1985) discusses the formation of "coalitions" allow sharing of activities in order to support a firm’s CA. In another work Porter and Ghemawat try to show how firms can get CA over competitors by positioning. We believe that maybe in that time positioning could help so much but in current competitive market it can help as one of the factors not more. However, Porter’s "value chain" approach focuses on activities within a single firm. Marianna Linnik and Sune believe that if we introduce some rules for binding we can establish rules and regulations for SCA. As we know playing the SCA game in regarding to CSR is not about binding but it is about a series of factors that is included employees, suppliers, customers, and some other factors. In this context another researcher, Alderson, emphasizes just on suppliers. Paying more attention to suppliers and ignoring the other parts of the game will ruin the whole structure in mean time. Hamel, Prahalad, and Dickson argue that firms must be one step ahead from their competitors. The same idea comes from Hall and Henderson which explained the necessity for a significant advantage over the peers and competitors. We agree with these views but they didn’t tell us what kind of advantages. Could we consider the resource inside the firm or outside? We don’t know, based on these view, which factors are important, external or internal.

Body Shop background
The Roddicks set up their store at Brighton, UK in 1976. At the time the store sold some homemade cosmetics that were made of natural ingredients. Their store was close to some undertakers, the name of “Body Shop” made two funeral directors to threatened Roddick to not use this name, Body Shop. Even their made a report and compliment to the local council just because Roddick’s business was close to their businesses. From the time that Roddick opened
first store she faced with some problems and Anita tried to solve the problem and introduced the company as a social activism. The company featured bills of local charity and community events. Anita shot back a letter to the council saying that she was a housewife with kids trying to make a living. She even anonymously phoned the story to The Argus. The newspaper published the story as a Centre spread, which resulted in plenty of free publicity for Body Shop. From its very early days, Body Shop was associated with the social activism of Roddick. The windows of Body Shop stores featured bills of local charity and community events. Roddick was change in standard corporate practices.

The second store was opened six months after the opening of the first store. A former garage owner Ian McGlinn (McGlinn) helped them open this shop by lending the Roddicks £4,000. Roddick gave the company’s products brand names such as, Tea Tree Oil Facial Wash, Mango Dry Mist, etc. Urine sample bottles, the cheapest packaging available at the time, were used as containers. All labels were hand-written. Unlike other branded cosmetics, the packaging of its products contained detailed descriptions of the ingredients and their properties. The company never ‘sale’ priced their products but customers who returned product containers for refilling were offered a 15 percent discount. They used a number of leaflets and posters to provide information about product and give the customers some information about social causes that the company believed in, and encourage them to get involved.

In addition to providing product information, a number of leaflets and posters (on recycled paper) provided information about social causes that the company believed in and encouraged its customers to get involved. Customers were greeted with employees wearing T-Shirts bearing a social message. According to BBC news (2003) said Roddick, “The politics of the Body Shop has always been its DNA - the shops became our billboards. I don’t give a damn if we were made successful by Mrs Rosie Brown who loved her vitamin E cream. Behind us there was a tacit acceptance of what we were doing.”

Body Shop’s core brand identity was its “profits-with-a-principle” philosophy and the brand was closely associated with the social justice agenda. This was a revolutionary idea at the time, and Body Shop developed a loyal customer base. By the late 1970s, it had a number of franchisee stores throughout the UK. Body Shop was growing at a rate of 50 percent annually and was also getting a lot of media attention. Anita hired a PR firm to handle the media. In 1978, Body Shop’s first foreign franchisee opened in Brussels, Belgium.

In the 1980s, the Roddicks acquired the US rights to the “Body Shop” name from the two entrepreneurs of Berkeley, who continued to operate a small chain in the San Francisco Bay Area under the new name “Body Time”. Some analysts were critical of the Roddicks for having copied the whole business model of these entrepreneurs - from the idea and name, to even the product catalogs and image strategy.

In April 1984, the stock of Body Shop opened for the first time on London’s Unlisted Securities Market, at 95 pence. By the time it obtained a full listing on the London Stock Exchange in January 1986, the stock was selling at 820 pence. During this time, there were some concerns among the Body Shop franchisees that the outfit was becoming too political. But despite these concerns, in 1986, the Body Shop formed an alliance with Greenpeace for the “Save the Whales” campaign. Following some disagreements with Greenpeace, Roddick discontinued this
relationship and formed an alliance with Friends of the Earth (FOE) in 1990. It also teamed up with Amnesty International and from the 1990s onwards became very vocal in its support for international human rights. In 1991, Roddick was awarded the World Vision Award for Development Initiative. During the 1980s and 1990s, Body Shop had its share of critics who accused the company of hypocrisy as they felt that it was making profits under the guise of endorsing social equality. On the other hand, some shareholders complained that instead of maximizing profits, the company was diverting money into “social work” projects.

However, the company had shown strong growth through the 1980s and at its height, in 1991, the company was worth £700 million. But then the company faced many challenges. In the early 1990s, problems surfaced for Body Shop as many “me too” retailers mushroomed in the UK, running businesses on a similar green agenda. The Boots Group Plc launched the Botanics and Natural Collection ranges that directly competed with Body Shop’s product portfolio. Body Shop’s international expansion strategy had not achieved much success. In the US, it faced major reverses as Bath & Body Worksemerged as a tough competitor. Its new products too failed to take off. In 2002, both Anita and Gordon Roddick stepped down as co-chairmen and were replaced by Adrian Bellamy (Bellamy). Gournay also quit as the CEO and was replaced by Peter Saunders (Saunders), who was the CEO of the company’s North American operations. The new chairman shelved the idea of selling the company. Bellamy said “We would not enter into (further buy-out talks) unless we had very good reason to believe that it was in the best interests of shareholders.”

Based on Body Shop’s first report (2003) since 2002, Body Shop started working on repositioning itself to the ‘masstige’ sector of the consumer market. The re-positioning exercise began to bear fruit. For the fiscal year ended February 2003, Body Shop reported that its pre-tax profits were £20.4 million, when compared to £11.6 million in the previous year. The turnaround in its performance was followed by strong growth in the next two years.

For the year ended February 26, 2005, Body Shop announced a 21 percent rise in pre-tax profits to £34.5 million (US$ 65.6 million). As of March 2006, Body Shop had 2,085 branches around the world, including 304 in the UK. Its brand portfolio consisted of more than 600 products. On March 17, 2006, Body Shop announced that it had agreed to be taken over by L’Oréal in a £652 million (US$ 1.14 billion) deal. L’Oréal offered 300 pence a share, a premium of 34.2 percent to Body Shop’s closing share price of 223.5 pence on February 21, 2006. Bellamy said, “For the shareholders, L’Oréal’s offer is a significant premium to the share price and I believe provides an opportunity for them to now realize fully the prospects for the group on a standalone basis.” Body Shop was regarded as one among the first firms in the world to publish a proper report on its social responsibility initiatives. In addition to social activism, internal audit programs were conducted at Body Shop for environmental protection, health and safety at work, and the monitoring of ‘Against Animal Testing Policy’. In 1991, it drafted the EU Eco-Management and Audit Regulation (EMAS), and in 1992, Body Shop published its first environmental statement called ‘The Green Book’.

**The importance of CSR as a SCA for Body Shop**

CSR can appear as natural capital that refers to the way that nature and natural resources are an essential piece of capital creation. The comment here is that all resources must be used in the way that leads the organization to sustainable situation to help the leaders to make good decision in chaos situation to make more profit and to be caring about society. Here there is a question,
why is this relevant? The answer is that we are living in a very different world from 20 years ago. So if we compare current global business to past we will consider that what has changed fundamentally is the way in which, economies, societies, and individuals are tied to each other more closely than before. Hitt, Keats, & DeMarie (1998) expressed that in the twenty-first-century landscape, firms must compete in a complex and challenging context to challenge their capabilities in terms of CSR and SCA that is being transformed by many factors, from globalization, technological development, and increasingly rapid diffusion of new technology, new innovations whether radical or incremental, applying new methods in doing the activities, to the development and use of knowledge regardless of the kind of knowledge tacit or explicit.

To start our work on dealing with two interesting topics, Corporate Social Responsibility (CSR) and sustainable competitive advantage (SCA), we need to provide a clear and globally accepted definition of them, and then we can discuss how they can affect each other. Corporate Social Responsibility (CSR) means that Firms bring social and environmental issues in their business activities and in their cooperation with other groups on a desired basis. In general, CSR is characterized by the following issues:

- An entrepreneurship which is responsible
- Voluntary activities which go far away from normal requirements and obligations
- Focused on activities which are beneficial for the all parts of the business from employees to other relevant groups inside and outside the firms
- Positive contribution to all targets
- Periodic and regular activities rather than one-time events

CSR activities which are related to the society and community can get several aspects such as:

- Market integration with emphasis on society or labor
- Managing the changes and improvement in local infrastructures
- Helping NGOs by cash or other kind of donations
- Work as a supportive power in a variety of activities to help in developing the countries

According to Hollender & Fenichell, (2004), Mbare, (2004) and Thayer Robins, (2001) socially mature businesses lead the way for incorporating CSR principles in business conduct. Lindfeldt, (2006), Maignan & Ferrell, (2004) and Takala, (1996) opined that socially active companies, like the Body Shop and Ben & Jerry’s, have been pioneers in the work and communication of CSR. The question of how CSR is communicated is a research area still to be explored. Even Doane, (2004,) investigated that businesses with a clearly unsustainable business idea, such as the oil and petroleum industry, make efforts in communicating awareness of sustainability issues. When Body Shop employees volunteer to help the homeless, when Mattel donates money to the part of Los Angeles destroyed by riots—all of these actions imply that it is possible for a company to be driven by economics and ethics. No one is arguing that economics is unimportant, but the reduction of all human value creation/value-sustaining activity to economic measures misses the mark. In the market CSR activities can be at two sides on the one hand, at the customers and, on the other hand at business partners and or suppliers. The respective initiatives can be done to improve quality or safety of products and help in provision of voluntary services to the clients. These services must be presented at a fair price to give the firms a competitive advantage over competitors. In relation to the customers, their marketing and advertising must care about ethical issues.
L’Oreal is the Company that tested its cosmetics on animals, exploited the sexuality of women, and sold their products by making women feel insecure. Moreover, Nestlé owned 26 percent of L’Oreal. Nestlé was one of the most boycotted companies in the world for its alleged unethical business practices and aggressive promotion of baby milk in developing countries.

Body Shop’s critics said that they felt betrayed by the deal as Roddick had previously been quite vocal in her criticism of companies like L’Oréal. They called for a boycott of Body Shop’s products as they felt that the company had sold out its values and principles. Body Shop and Roddick defended the deal by saying that L’Oréal would not compromise Body Shop’s ethics and that the merger would give Body Shop a chance to spread its values to L’Oréal. L’Oréal also announced that Body Shop’s values would not be compromised and that it would continue to operate as an independent unit.

Chrisna du Plessis (2002) says that many analysts were concerned that Body Shop’s image would be affected by the acquisition. Some activists felt that Body Shop would not be able to function independently and that an important partner in CSR had been lost. However, they were a few who felt that Body Shop’s values would rub in on L’Oréal and believed that the deal had some positives. There were also questions raised about whether L’Oréal was trying to improve its image and buy CSR through this deal. But for Body Shop’s staunchest critics, the acquisition by L’Oréal was vindication of their view that Body Shop was nothing more than a green washer.

Till 1994, the company continued to publish its independently verified annual environmental statements. In January 1996, it published its first ‘Values Report’. Although we know that getting local partners has some kind of special problems, still they must care about it and try to be a fair partner because if they don’t care competitors will. If they want to get SCA in a period of time they must follow all of the standards, even in supply chain they need to think about social issues so they need to apply to find local/regional business alliances. To be more competitive among competitors we cannot only think about our own success, we as leaders must care about all aspects of the business. In this context Jack Welch, CEO, General Electric argued that we always believed that the biggest contribution that one business can make to society is its own success. He says I don’t believe that even generous financial philanthropy on the top of that prosperity is enough. So proofs show us that to be socially responsible and use our core competency as SCA is not as easy as it looks like and still it is not enough it is a persistently processf a social audit of Body Shop (arrived at through consultation with 5,000 stakeholders) as well as its environmental and animal protection performance.

Subsequently, in January 1998, Body Shop published its second ‘Values Report’. The report included results of Body Shop’s integrated internal management systems audit and accounting processes in the area of social, environmental, and animal protection. The United Nations Environment Programme (UNEP) and Sustainability ranked both the Values Reports highly in their international benchmarking surveys of corporate environmental reports. Chrisna du Plessis (2002) investigated that this firmly established Body Shop as a pioneer in social reporting. Its social reporting coupled with its social activism led many people to consider Body Shop as a pioneer in modern CSR. And Roddick reinforced this association with her statements such as, “My vision, my hope, is simply this: that many business leaders will come to see a primary role of business as incubators of the human spirit, rather than factories for the production of more material goods and services.” Body Shop did not test its cosmetic products on animals and did not commission others to do it on its behalf, as it considered this practice unethical. Along with customers and animal protection groups, Body Shop campaigned for a change in the law on the
testing of animals for cosmetics purposes in the UK, Europe, the Netherlands, Germany, and Japan. Its campaigns had some major successes. In 1996, Body Shop presented the EU with a petition signed by over 4,000,000 people, which at the time was the largest petition against animal testing. Body Shop was also instrumental in the UK government’s decision in 1998 to ban animal testing for cosmetic products and ingredients. In addition to this, the company’s campaigns also resulted in finished product test bans in Germany and the Netherlands. In Japan, Body Shop organized the first major campaign on this issue.

In 1995, Body Shop got its Against Animal Testing supplier monitoring systems independently audited and certified against the ISO 9002 quality assurance standard. It was also one of the few companies that complied with the Humane Cosmetic Standards (HCS). In fact; it was the first international cosmetics company to sign the HCS in 1996. It placed restrictions on its suppliers’ use of animal tests and fixed December 31, 1990 as the cut-off date for them to comply with these restrictions. Body Shop said that it would not buy any ingredients that had been tested on animals after the cut-off date. Body Shop also ensured that ingredients derived from animals were suitable for vegetarians and did not cause harm to the animal from which it was derived. In 2004, The Body Shop Foundation (BSF), awarded £20,000 to The Centre for Alternatives to Animal Testing at John Hopkins University to support research into alternatives that could substitute animal testing.

So Body Shop important priority was to use its knowledge and awareness about people and environment to get the best use of it as competitive advantage. In following this policy in 2005, the company was awarded the first place in the cosmetics category for ‘Achieving Higher Standards of Animal Welfare’ by the Royal Society for the Protection of Animals, in recognition of its efforts on this issue. The following year it was awarded Europe’s first annual Proggy Awards in the “Best Cruelty-Free Cosmetics” category, presented by People for the Ethical Treatment of Animals (PETA). Lauren Bowey of PETA said, “The Body Shop is a driving force in promoting a more humane lifestyle. By renouncing animal tests, The Body Shop has shown beauty doesn’t have to have an ugly side.” Roddick said: “I’m thrilled that we’ve won this award in recognition of our Against Animal Testing policy. It was always my vision to offer customers not just great products but an opportunity to demonstrate their ethical purchasing power as well. A recent survey conducted with our customers showed that 84 percent of them shopped with us because they shared our values – a million thanks to them for their support.” In the late 1980s, Body Shop purchased its first Community Trade product (CTP). Through CTP, Body Shop sourced products from marginalized communities for a fair price in a sustainable way. As we mentioned earlier, organizations must understand that customers are permanently dealing with them with their own ideals: so they are building a world of their own. Thus organizations must try to grasp that world and seek the sustainable way to be a part of that world.

For instance, it sourced marula oil from Namibia, bananas from Caribbean, beeswax and honey from traditional beekeepers in Zambia, shea butter from a women’s group in Ghana, etc. In Roddick’s words, “Our trade with these communities is not just about creating another product or market for The Body Shop. It is about exchange and value, trade and respect, friendship and trust.”

Through CTP, Body Shop guaranteed a living wage for its Community Trade suppliers and their workers through a predictable and long-term business relationship. It also supported initiatives in the supplier’s community that contributed to sustainable development. Due to its CTP program,
Body Shop was also considered a pioneer of fair trade in the cosmetics industry. According to the company, its vision was to present a model for other companies to follow.

To ensure that its CTP relationships would be successful in fulfilling a community’s goals, Body Shop developed a set of Fair Trade Guidelines in 1994. It benchmarked its CTP Supplier Guidelines to external standards such as Smallholder Guidelines of the Ethical Trade Initiative and the Fair trade Labeling Organization.

In addition to this, the company conducted participatory audits, and provided its CTP suppliers with information and feedback to assist them in maximizing long-term benefits. It helped suppliers to reduce their dependence on Body Shop by helping them gain access to wider markets and sharing best practices with them. Body Shop said that it marketed products honestly, did not make misleading claims and product promises. The marketing messages celebrated diversity and did not feature ultra-thin or very young models, as was the norm in beauty advertising. A statement in Body Shop’s website reads, “We will not promise eternal youth, or prey on people’s insecurities, but focus instead on products that provide wellbeing and comfort.” It promoted diversity, acceptance and empowerment in its workplace, and maintained equal opportunities standards. Employees were groomed through volunteering, training, and personal development programs. From its early years, Body Shop had promoted self esteem as one of its values. It challenged what it called “unrealistic beauty ideal presented by the beauty industry” and claimed that it used language and images that showed respect for women. Its campaigns on self-esteem took off in a big way in 1995, when it ran a “Women’s Rights Campaign” during the fourth UN World Conference on Women. As a part of the campaign, it collected more than a million signatures in support of the issue from people in 25 countries. In 1997, it launched a campaign based on ‘Ruby’, a realistic doll which represented real women as opposed to the dolls such as ‘Barbie’. In the same year it supported a debate on self-esteem by the Sophia Institute in Singapore. In addition to this, Body Shop UK sponsored an Oxford University research project that looked at the self-esteem of young women and worked with the UK Guide Association to produce a self-esteem activity pack called ‘The Can Do Girls’. In the following year, Body Shop published and distributed globally ‘The Body and Self Esteem’, to raise awareness of the issue of self-esteem and generate debate on the subject.

Therefore if we had to explain the scope of CSR and what is meant by “social”, the whole philosophy behind it could be summed up in the “triple bottom line” theory (“people, planet, profit”): a business regardless of its ways in carrying the activities, direct or indirect, must be judged according to two criteria: in what degree its activity affects the environment and people and how much profit does it make. Questions are clear, so answer to these questions make it clear whether a firm care about human rights and environment or not.

In 2003, Body Shop launched a global campaign against domestic violence called ‘Stop Violence in the Home’. From its stores in the UK, the company raised £90,000 for the charity organization Refuge in less than six months through the sale of badges and the recycling of 18,000 mobile phones. Each of these phones helped raise £2.75 for Refuge and its beneficiaries - women and children affected by domestic violence. In the US, 50,000 mobile phones were donated by customers, raising US$ 80,000 for The National Coalition Against Domestic Violence (NCADV) and The Wireless Foundation. In 2004, Body Shop’s customers helped raise over £500,000 through the ‘Stop Violence in the Home’ campaign. Throughout Europe and the Middle East, Body Shop stores recycled mobile phones and sold campaign key rings. In the UK, the campaign funded a pilot program to provide women with reconfigured mobile phones as emergency alarms.
that could be used in vulnerable situations. In 2005, Body Shop extended its ‘Stop Violence in the Home’ campaign to 40 countries. In that year, it raised over £500,000 for charities supporting victims of domestic violence. US customers donated over 100,000 old mobile phones to raise funds for the NCADV. In Canada, the campaign raised funds to support the Canadian Women’s Foundation. In Singapore, the company launched the campaign with public buses on six important routes carrying ‘Stop Violence in the Home’ advertisements on them. Throughout Europe, a special edition lip care stick was launched to promote the campaign. It became a best seller and customers also donated thousands of products and gifts, which the company distributed to local women’s shelters. In the UK, customers donated over 60,000 mobile phones, which were transformed into personal safety alarms for women or recycled to raise funds for “FonesForSafety” initiative. Based on what we review about Body Shop we got that one popular approach to understanding competitive dynamics is the resource-based view of the firm. According to this view, the explanation for why some firms ultimately succeed and others fail can be found in understanding their resources and capabilities. A firm’s resources and capabilities influence both the strategic choices that managers make and the implementation of those chosen strategies. It can be human capital such as knowledge skills that every employee has it can be experiences even it can be learning system of the firms. Another source is social capital that refers to Stakeholder relationships, inner trust building processes of the corporation, corporate governance, business ethics and standards of the business. Here the paper has tried to separate Body Shop’s activities regarding to human rights and planet protection in details.

**Human Rights and Body Shop**

Defending human rights is another core value of the company as it felt that it is the responsibility of every individual to actively support those whose human rights are denied. It ensured that its products were sourced and produced in regions where human and civil rights were respected and adhered to, as set out in the Universal Declaration of Human Rights. The Body Shop conducted and supported many Human Rights campaigns. For instance, in 1998, Body Shop Australia ran a “Thumbs Up for Reconciliation” campaign in support of reconciliation between black and white Australians. In 2000, Body Shop launched its Human Rights Awards. In addition to adhering to all relevant international Human Rights Standards in areas such as working conditions, protection of privacy, etc., Body Shop also benchmarked its employee management policies against international standards.

Body Shop was a founding member of the Ethical Trade Initiative (ETI) and strove to ensure that its suppliers complied with the ethical trade standards. Suppliers were screened by a buying team who were given ‘ethical targets’ on an annual basis. The team was also provided training in this area. Being a member of Supplier Ethical Data Exchange (SEDEX), Body Shop insisted on and ensured that its suppliers conducted regular ethical assessments. In addition to this, Body Shop worked with other stakeholders at various levels to share best practices and influence national and international policy on ethical trade issues.

**BODY SHOP’S ETHICAL TRADE STANDARDS**

- Employment is freely chosen
- Freedom of association and the right to collective bargaining are respected
- Working conditions are safe and hygienic
Child labor is not used
Living wages are paid
Working hours are not excessive
No discrimination is practiced
Regular employment is provided
No harsh or inhumane treatment is allowed

Environment and Body Shop

Body Shop said that it aimed to be a sustainable business and considered protection of the planet as a key responsibility. In 1986, the company began its campaign for protection of the planet. The company developed its first international environmental policy in 1992.

Body Shop supported materials and technologies that caused minimal harm to the environment and promoted the use of renewable resources and sustainable ingredients. It also strove to minimize wastage by using recycled materials and minimal packaging. In 1993, it stopped using PVC in its packaging, and in 2005, it announced that it would phase out all use of phthalates in its products by the end of 2006. It partnered with Friends of the Earth, Greenpeace, and WWF US and the US Campaign for Safe Cosmetics to ensure that its policies for chemicals use were environmentally responsible. The company had also set itself a target of becoming a carbon neutral retailer by 2010. Body Shop strove to ensure that its policies and practices regarding wood products were in line with the best sustainability practices. It was a supporter of the Forest Stewardship Council (FSC) certification scheme. It strove to ensure that all its wood products were derived from an FSC source. Body Shop was also a member of the World Wildlife UK Forest and Trade Network.

In 2004, Body Shop committed itself to address social and environmental impacts of palm oil production including deforestation, biodiversity and the rights of indigenous populations, poor labor conditions, etc. As an active member of the Roundtable on Sustainable Palm Oil, Body Shop partnered with NGOs and producers to ensure that customers would be able to choose sustainable palm oil. Other Initiatives the company made regular donations to charitable organizations including the Body Shop Foundation (BSF), its charitable trust that was set up in 1990. The trust supported charities working on environmental, animal welfare and human rights issues. As of April 2006, Body Shop had donated over £8 million to BSF.

In 2004, the company donated £1.3 million to charitable organizations, of which £0.7 million was donated to the Body Shop Foundation and £100,000 to the Disaster Emergency Committee for the Asian tsunami victims. The company pledged an additional £100,000 to Children on the Edge to help rebuild the lives of children in Aceh, the Indonesian province that was severely hit by the tsunami in December 2004. Body Shop raised £200,000 for tsunami victims through the contributions of its customers. The company also sold bracelets in the US and Canada to raise US$ 300,000 for HIV/AIDS victims. In 2005, the stores in the UK supported the ‘Make Poverty History’ campaign through the sale of over 200,000 white wristbands, raising in excess of £100,000 for the campaign. In addition to these campaigns, Body Shop was also engaged in causes such as violence against children. The year 2004 saw the return of Body Shop to social reporting as it published its independently verified Values Report in 2004 and 2005.
What is wrong with Body Shop?

Though the company had a distinguished record as a pioneer of corporate responsibility, it had its fair share of critics. From the 1990s, Body Shop faced increased scrutiny regarding its activities and claims. Business ethics expert Jon Entine (Entine) was one of Body Shop’s fiercest critics. Entine accused Body Shop and its founders of being hypocrites, as in his opinion, they were preying on the idealism of consumers, while not being any different from other companies in their pursuit of profit. According to Australian financial report, in 1994, Entine reported that Charity Commission for England and Wales records did not show any charitable contributions from the company in its first 11 years of operation. In the subsequent years, its contribution to charity was less than 1.5 percent of pretax profits (which was the average contribution made by US corporates). He also said that the company made false claims that its products were natural. He alleged that there was extensive use of petrochemicals in the preparation of Body Shop’s products. He quoted many ex-employees who had claimed that the stories put out to customers about various products were totally fabricated. He even cited the fact that Roddick herself had likened the operations at Body Shop to a “dysfunctional coffin”.

In 1998, McSpotlight and Greenpeace UK put forward similar criticisms that Body Shop exploited the public by championing various agendas while it was actually more similar to other synthesized and produced. Though the company claimed that it was against animal testing, its products contained ingredients that had been tested on animals by other companies. Critics also dismissed the company’s CTP as a mere marketing ploy as it accounted for less than one percent of sales of Body Shop products. Body Shop was also accused of paying exploitative wages and having an anti-trade union stance. Its CTP was also viewed as patronizing and was said to have created tensions and divisions within indigenous communities and undermined self-sufficiency and self-dependence. McSpotlight accused Body Shop of marketing products by making people feel insecure about their looks, in the same way that other firms used to sell their personal care products. McSpotlight cited the company’s “Love Your Body” campaign as an example. Some critics pointed out that the visual on the home page of Body Shop was no different from the idealized body images of beauty as projected by the cosmetics industry. The company was also accused of being very aggressive in its response to any form of criticism and allegedly tried to intimidate its critics through invective and/or lawsuits. Some analysts suggested that the image projected by the company and its “anti-city” attitude was hypocritical for a company that raised funds by listing on the London Stock Exchange. “It’s massively hypocritical. If making money from the City, you’ve got a nerve criticising the very people you’re taking money from,” said Ratner. Critics felt that there was a big gap between the image projected by the company and its actual practice.

Critics also argued that after its lackluster results in 2001 and 2002, the management was more focused on improving its financial position. It was only in 2004 that the company made a comeback to serious social reporting. But analysts felt that even after this gap, the 2005 report was unsatisfactory and failed to answer the criticisms leveled against it in a comprehensive way. The 2005 Values Report responded only indirectly to some of the criticisms that had been leveled against Body Shop. Some analysts said that the company’s report had not clarified its position on the allegations regarding its CTP. It did not provide any figures as to what proportion of Body Shop’s products were sourced through the CTP. Though the company had listed its participation in many stakeholder initiatives, the impact of these initiatives was not touched
upon. It was also said that the company’s position on workplace issues was not set out clearly and allegations of exploitative working conditions were not refuted properly. Criticisms of Body Shop intensified after the company announced that it had agreed to be taken over by L’Oréal. L’Oréal did not deny that it used animal testing for cosmetics, something Body Shop founder, Roddick, had opposed throughout the 30 years of her business life. Critics (including Roddick, in the past) had campaigned against L’Oréal’s alleged exploitation of the sexuality of women. Also, it was Roddick who had previously criticized L’Oréal for using only “sexy” saleswomen in their stores.

Heather Tyler (2006) cited that in a statement on its website, Nature watch said: “We feel that the Body Shop has ‘sold out’ and is not standing by its principles.” There were also several calls to boycott Body Shop’s products.

Sean Poulter (2006) quoted that John Ruane, director of Nature watch, said, “She appears to be taking the money and running. Clearly all the money that goes into the till at Body Shop in the future effectively amounts to supporting L’Oréal and, by association, disgusting animal testing. Consumers can make their feelings clear by not shopping at Body Shop.” Another reason why the sale of Body Shop to L’Oréal was criticized was that Nestlé was a large shareholder (26 percent) in L’Oréal. Nestlé had been strongly criticized by activists for several decades for allegedly promoting baby milk powder in the developing world. In January 2005, Nestlé was voted as the ‘least responsible company’ in an Internet poll. It was also one of the four most boycotted companies in the world and the most boycotted company in the UK. Anti-animal testing and anti-Nestlé campaigners called for a boycott of Body Shop too. Various protests were organized by animal rights activists and they also began digging deeper behind the marketing strategies and public image of Body Shop. They used a spoof of a 1990s leaflet of Body Shop and urged Body Shop loyalists to send back their Body Shop loyalty cards to register their protests.

In response to the protests, L’Oréal clarified that it had not done any animal testing since 1989. L’Oréal said in a statement, “We have not carried out or commissioned tests of products or ingredients on animals since 1989.” But it added that it could not guarantee that all ingredients bought from other firms had not been tested on animals. Its spokeswoman said that some ingredients still had to be tested under European health and safety rules. However, it did not stop the flow of criticism and demonstrations in front of various Body Shop stores.

On June 26, 2006, Nature watch organized a protest at the Body Shop headquarters in Little Hampton, West Sussex, UK. The protest included “Lilly Lapin”, a bunny mascot adopted for this campaign, while one supporter wore a dress made out of Body Shop’s loyalty cards that were sent to Nature watch by customers unhappy with the L’Oréal deal. Ruane said that the campaign was getting a lot of support. “It’s been very good with tremendous support from everybody passing, the horns are hooting all over the place and we think it’s been successful,” he said. Many Body Shop loyalists were taken aback by the deal. Some of them said that they felt betrayed and vowed never to shop at Body Shop again. A consumer said, “The Body Shop used to be my high street ‘safe-house,’ a place where I could walk into and know that what I bought was okay, that people were actually benefiting from my purchase. Now the people benefits are the overpaid, underworked ‘fat-cat’ CEOs of animal-testing L’Oréal and baby-milk-selling Nestlé. By buying from the Body Shop, you are now no longer supporting ethical consumerism.
If I want legitimate fair-trade, non-animal tested products, I can find them easily, at the same price, elsewhere.” Several anti-animal cruelty organizations struck Body Shop off from their ethical shopping lists.

Ethical Consumer downgraded its ethical rating of Body Shop from 11/20 (average), to 2.5/20 (very poor), on “ethiscore”. As per the BrandIndex, within three weeks of the announcement of the deal, Body Shop’s “satisfaction” rating had dropped by 11 points to 14, its “buzz” rating fell by 10 points to -4, and its “general impression” fell by three points to 19. Mike Brady (Brady), Campaigns and Networking Coordinator at Baby Milk Action commented: “The strength of feeling seems to have taken Body Shop and Dame Anita Roddick by surprise - they still do not have a statement on the Nestlé link.”

Body Shop reaction to critics

According to Robert Booth (2006) Body Shop clarified that the acquisition by L’Oréal would not dilute its ethical stance and that it would continue its position on anti-animal testing. Body Shop spokesman Bill Eyres said, “It has been agreed that all our values are ring-fenced and we will continue to apply our animal testing policy.” Roddick justified the deal by saying that L’Oréal wanted to learn from Body Shop’s commitment to the environment and human rights in business. She also denied that she had sold out and maintained that the company’s values would not change. She said, “I don’t see it as selling out. L’Oréal has displayed visionary leadership in wanting to be an authentic advocate and supporter of our values.” She added, “The campaigning, the being maverick, changing the rules of business – it’s all there, protected. And it’s not going to change. That’s part of our DNA. David Teather (2006) opined having L’Oréal come in and say we like you, we like your ethics, we want to be part of you, we want you to teach us things, and it’s a gift. I’m ecstatic about it. So I don’t see it as selling out.” Roddick argued that if at all she had sold out, it was by going to the stock market in 1984 and putting Body Shop in the hands of people who were contemptuous of the values of Body Shop.

Anita Roddick (2006) expressed that “We then became ‘owned’ by people who were happy to downgrade our stock at the merest whiff of community trade, who believed that pioneering an end to animal testing in cosmetics was a threat to our share price … That was, I now realize, selling out,” she said. She added that Body Shop would be better off in the hands of L’Oréal who had publicly committed itself to upholding the values of Body Shop. “They (L’Oréal) understand what a maverick The Body Shop was in the business world and how we helped change the language of business, incorporating the action of social change, especially in human rights, animal welfare, the environment and community trade,” said Dame Roddick.

Owen-Jones acknowledged that L’Oréal would not be able to stop animal testing overnight, but this issue was a part of its long-term plan. He said, “I can’t overnight use the Body Shop approach in all of the L’Oréal companies, but our long-term commitment is to join Body Shop on this issue. I cannot be clearer than that.” Roddick agreed that she had an issue with L’Oréal over animal testing earlier, but she was now convinced that L’Oréal was sincere in its commitment to this issue. She said, “So yes, I have criticized the cosmetics industry for their fantasies in the past. I’m not going to stop doing so now, but that does not mean I’m going to be satisfied with a splendid but pure isolation… I have not worked all these years to be satisfied to have pioneered a new way of doing business that nobody else ever tries.” With regard to the allegations that Body Shop marketed its products by making people feel insecure, Body Shop stated: “We do not promise eternal youth in our advertising, or prey on women’s insecurities, but
focus instead on products which provide well-being and comfort.” It also said that it was committed to not using ingredients in its cosmetics that had been tested on animals for cosmetic purposes after December 31, 1990. It further pointed out that most of the ingredients used in cosmetic and toiletry products had been animal tested for some purpose at some time in their history, and it would be almost impossible to sell products whose ingredients had never been tested on animals. Setting up own rule and at the same time doing business following own rules could lead to competitive advantage, but it is only possible, not certain.

Body shop is good example in this context. Body shop contracts suppliers who protect rules which are very severe and pay reasonable price for productions. Price standards are not set up by standards of product country, but by Body shop. Normally prices are higher than in other transactions, but these activities make customers trust Body shop and customers support these activities. This strategy that Body shop sets up own rule and does business following own rules is connected with core competence of Body shop and leads to competitive advantage. Though Body shop is not so big, but its presence is certain. This teaches us that a level of CSR is raised by some firms, namely management level or strategic level. So now the problem is that how firm manages CSR and take CSR in management.

On the other side, Body shop success is also one big step. Body shop is not so big in comparison with Toyota. Its activity is in so called niche market. But its strategy works so well and suggests us how to survive in niche market. Having sociality and environmental consciousness is accepted in such a small market, leads to competitive advantage and is connected with core competence. Environmental and social perspectives could be connected with core competence of a firm. Toyota has already suggested that and Body shop has also. These cases are landmark in markets and they play bottom line’s role. If such a big firm like Toyota suggests a new type of strategy, other firms in same industry imitate its strategy or think other strategies to compete with Toyota in new market like eco market which is found by Toyota.

A model for relationship between CSR and SCA at Body Shop

For presenting a model to show relation between SCA and CSR we need some factors. In our model we refer to market, employees, environment (customers, suppliers, investors and business partners), and society (communities, NGOs, business ethics and global issues). In this model we are trying to say that there is a strong link between different factors that can affect each other. Changing in one of them will cause change in another. As model shows we demonstrate if a firm like Body Shop wants to get CA over competitors it needs to apply both perspective and for that they must consider tangible and intangible resources to find their core competencies over competitors. The model shows that, as porter believes, firms must possess the best resources above-normal rates of return because of the comparative advantage of their resources. As we know, based on PBP, SCA, can be achieved from the ability to protect a suitable position within an industry so the model tell us to get that position a firm must consider its tangible and intangible resources and capital resources is the most important one among others. (See fig 1)

Resource based perspective gives us an open window to all resources that we have and guide us how to handle the external and internal environment. RBP is like a road map that illustrates all aspects of the resources from human capital to technological logistics. And presents a wide view in dealing with resources to get CA and be socially responsible. For that firms must care about whatever they claim. They must be as ethical as possible so they need to provide a chart of what they are believe in and act to them accordingly. If they do that they can be hopeful to get good
position in the market, make customers satisfied, have committed employees, keep good relations to the society, and being responsible to environment as Body Shop has done. So our model is a multi dimensions model that if be carried out well can help firms to handle their activities accurately.

Model for relation between CSR and CSA at Body Shop

![Diagram](image_url)

**PBP**: positioning based perspective

**RBP**: Resource based perspective

**DISCUSSION**

By providing a multi item measure of SCA and CSR, we empirically examined theoretical concepts in a model of both of them. As we mentioned earlier CA traditionally has been based on resources of a firm that enable it to take over others in the same industry. Sustainable competitive advantage is conservation-oriented as no organization has unlimited resources. Given such a limitation, conscious management of existing resources is necessary. Sustainable competitive advantage is future-oriented, placing itself beyond day-to-day management for the long-term development of resources to bring about strategic advantage. Strategic advantage is the standard for corporate renewal. It is highly dependent on, and influenced by, the development and timely introduction of strategic resources. The evolution of CSR in these developing economies shows widely varying results. As Warhurst (2001) points out, the major elements of CSR are product usage that is concentrated on contribution of industrial products which can help in well being and quality of life of the society, business practice which focuses on good corporate governance and gives high impetus for the environmental well being and equity which tries for distribution of profits equitably across different societies especially the host community. The paper provided a model based on PBP and RBP that is a multi dimensions model that if be carried out well can help firms to handle their activities accurately.

Resource based perspective gives us an open window to all resources that we have and guide us how to handle the external and internal environment. RBP is like a road map that illustrates all aspects of the resources from human capital to technological logistics. And presents a wide view in dealing with resources to get CA and be socially responsible. For that firms must care about whatever they claim. They must be as ethical as possible so they need to provide a chart of what
they are believe in and act to them accordingly. If they do that they can be hopeful to get good position in the market, make customers satisfied, have committed employees, keep good relations to the society, and being responsible to environment. For more research it could be great if someone start to look at the subject from different views and find out how we can make a model based of mathematic formula to prove the strong relations between CSR and SCA. Of course we concluded that there is a link between them but still we need to seek more to find other factors that may affect this relation. From the other hand doing a PESTEL analysis also can be another way to show the connection between them.

Having sociality and environmental consciousness is accepted in such a small market, leads to competitive advantage and is connected with core competence. Environmental and social perspectives could be connected with core competence of a firm.

Toyota has already suggested that and Body shop has also. These cases are landmark in markets and they play bottom line’s role.

**Conclusion:**

In this paper we are trying to find the significance of corporate social responsibility to achieve a desired condition for the companies that is sustainable competitive advantage (SCA). The case that have chosen as our sample for the study is body shop. Body Shop important priority was to use its knowledge and awareness about people and environment to get the best use of it as competitive advantage. Nowadays the contribution of CSR in SCA is more visible as it is directly related to society and people convenience that are the most important factor in competition. Actually we expect organizations, whether public or private, to be more coherent and transparent. Hopefully those standards will enable globalization process to go together with for human rights, to pay attention to social justice and to enhance the work. We really expect from CSR a practical reconciliation and a new balance especially between economic activities, labor relations and the environments in daily life. In this paper we are trying to say that there is a strong link between different factors that can affect each other. Changing in one of them will cause change in another. As model shows we demonstrate if a firm like Body Shop wants to get CA over competitors it needs to apply both perspective and for that they must consider tangible and intangible resources to find their core competencies over competitors. The model shows that, as porter believes, firms must possess the best resources above-normal rates of return because of the comparative advantage of their resources.

In this matter we analyzed that effectiveness of market and environment in CSR and in the other side employee and society. The nature of market is affecting the companies behavior to be socially responsible for their customers. Environment and society are the most important parts that are affected by CSR effectiveness and help companies to get CA if consider positively. The last factor that should be in consideration is the importance of members of the organization that the nature of their behavior and also their efficiency.

We concluded that despite the companies attempt to reach the advantages of SCA there are some external factors as society and market and environment that can affect the performance of organization as we call it CSR.

Abstract
In today’s office environment, employers have a relatively new issue to deal with; employees wasting time online and putting business at risk. A large proportion of corporate web traffic is non-work related: gambling, music downloads, personal webmail, social networking and even pornography sites. This misuse of internet nowadays can be reduced and control by the help of a DEEP PACKET INSPECTION system(DPI). DPI is a system for analyzing network traffic to discover the type of application that sent the data. In order to prioritize traffic or filter out unwanted data, deep packet inspection can differentiate data, such as video, audio, chat, voice over IP (VoIP), e-mail and Web. Here, I am going to analyze the effects of DPI system and it’s merits and demerits for the organization, when it can be useful, when can be harmful. Then I will evaluate the performance of various organizations in case of using internet connection during the work hours and non-using of internet connection.

Keywords: DPI ; Impacts ; Employee's productivity

Introduction:
The use of internet technology has become more and more a common practice (even part of real life) in the workplace. To stay competitive, companies try to increase availability and accessibility of internet technology to support and enhance the internal and external communications among employees. Internet-enabled communication media, such as e-mail, instant messaging and IP phones, are enabling companies to conduct business anytime from anywhere, also virtual teams are a natural product of the ubiquity of internet technology to smooth the communication process for all member’s of new teams and conducting day-to-day business of all types (Greenfield and Davis, 2002), in addition the web has been known to enhance personal productivity, communication and education (Anandarajan, 2002) , greater flexibility, and new applications for work (Greenfield and Davis, 2002).
Literature review:
The importance of this study is to find a solution to prevent the inefficiencies of workers during working hours which leads to lower productivity and it gets translated into lower performance. Because employees are spending time surfing on the net or communicating with friends, relatives and counterparts during working hours (Ferris, 1990). More employees are checking their stock prices, shopping for travel bargains and exchanging personal e-mail via the Internet while at work - even though their companies prohibit these activities (Marsan, 2000).

With historical point of view organisational misbehaviour has been a prominent feature of organisational studies throughout the twentieth century and continues to command similar attention in the first decade of the twenty-first century.

For instance, from systematic soldiering identified by Taylor (1917/1967) at the beginning of the twentieth century, to quota restriction in the 1940s (Roy, 1952), to workplace fiddles and theft in the 1970s (Mars, 1994; Ditton, 1977), to employees resisting new forms of human resource management (HRM) in the 1990s (McKinlay and Taylor, 1996a, b), and more recently, with a range of studies conducted in the first few years of the twenty-first century that focus on employee misappropriation of the organisation’s internet capabilities (Block, 2001; Lim, 2002; Griffiths, 2003; Lara et al., 2006).

According to The new ePolicy Institute many bosses who fire employees for web misuse (abuse) in 2007 claim that 84% of them viewing, downloading or uploading of pornography and otherwise offensive or inappropriate material as the reason.

Obstacles to adopting and using various security and filtering systems like DPI, that developing country organisations also face, is slow, unreliable, insufficient, and expensive telecommunications services (World Bank, 2006).

Background of DPI:

Deep Packet Inspection (DPI) combines the functionality of an Intrusion Detection System (IDS) and an Intrusion Prevention System (IPS) with a traditional stateful firewall. This combination makes it possible to detect certain attacks that neither the IDS/IPS nor the stateful firewall can catch on their own. Stateful firewalls, while able to see the beginning and end of a packet flow, cannot on their own catch events that would be out of bounds for a particular application. While IDSs are able to detect intrusions, they have very little capability in blocking such an attack. DPIs are used to prevent attacks from viruses and worms at wire speeds. More specifically, DPI can be effective against buffer overflow attacks, Denial of Service (DoS) attacks, sophisticated intrusions, and a small percentage of worms that fit within a single packet.

A packet is the unit of data that is routed between an origin and a destination on the Internet or any other packet-switched network

Deep Packet Inspection (DPI) is a form of computer network packet filtering that examines the data part of a packet as it passes an inspection point, searching for viruses, spam, intrusions or predefined criteria to decide if the packet can pass or if it needs to be routed to a different destination, or for the purpose of collecting statistical information.
Importance of DPI for productivity of organization:
There are some important benefits that help to understand its necessities for organization. Suppose you are manager of a big organization, and you are trying to use your campus network and found it was very slow, so, you can not reach your job as fast as is necessary, or you may fail to do. This is because your staff are using the network to download music or watch youtube. Bandwidth-consuming applications such as file-sharing programs, internet phone service, and online video are able to clog and slow down corporate networks, degrading performance.

Deep Packet Inspection (DPI) (also called complete packet inspection) is a form of computer network packet filtering that examines the data part and possibly also the header of a packet as it passes an inspection point, searching for protocol non-compliance, viruses, spam, intrusions or predefined criteria to decide if the packet can pass or if it needs to be routed to a different destination, or for the purpose of collecting statistical information. This is in contrast to shallow packet inspection (usually called Stateful Packet Inspection) which just checks the header portion of a packet.

One of the good examples can be Ball State University in Muncie, Indiana, found its network had slowed because a small minority of students were using peer-to-peer file sharing programs to download movies and music. After that using a DPI system from Allot communications, Ball State was able to cap the amount of file sharing traffic and assign it a much lower priority. Ball State’s preferred network traffic speeded up (White, 2007).

To solve these type of problems a good technology like DPI can help. DPI examines data files and sorts out low-priority online material while assigning higher priority to business-critical files. Based on the priorities established by network’s operator, it decides whether a specific data packet can continue to its destination or should be blocked or delayed while more important traffic proceed.

How Deep Packet Inspection can help?

The DPI device looks at the first 5-100 packets in a packet stream. These packets are then evaluated against a rule list, are the packets going somewhere that is impermissible? is an application being used that we are disallowing? and then allowed to continue to their destination or not depending on what the rule set dictates. In the case of images/movies/songs it is possible, in the case of some devices, to quickly look at the first packets of a .mov, .jpeg, etc file and correlate that particular file with a particular digital ‘fingerprint’.

The evolution of network and application-layer security threats has significantly altered the requirements for a modern network security architecture.

DPI is a system that is able to prioritize traffic or filter out unwanted data, also it can differentiate data, such as video, audio, chat, voice over IP, e-mail and web. Inspecting the packets all the way up to layer 7.

It can be used to analyze anything and everything within the packet that is not encrypted. For example, it can determine not only that the packets contain the contents of a Web page, but also which Web site the page is from.
DPI and its impact on productivity:
The internet has a world wide broadcasting capability, a mechanism for information dissemination and a medium for collaboration and interaction between individuals and their computers without regard for geographic location.
However, the internet being an open media is susceptible to misuse. There has been rapid rise in the number of unsuitable websites dedicated to harmful and undesirable content.
So, there is an urgent need therefore to prevent the misuse of internet in the early stages and promote its ethical use through awareness and educational programmes and also some prevention tools to force those who are not accepting the educational programmes and continue their misuse of internet.
The sub-field of internet misbehaviour may vary, yet it is reasonably clear to see how such actions are a form of micro-resistance or sabotage. The social study of the internet is in its infancy (Wellman and Haythornthwaite, 2002) and where it does exist some say it quickly becomes obsolete (Cavanagh, 2007), therefore internet misbehaviour represents a very new and ongoing challenge for the contemporary scholar or practitioner.
There is also another issue that influence internet abuse which named internet addiction, Although many companies have corporate policies to deter the internet abuse, many users are addicted to internet activities and have little control of not using internet activities in the workplace.
Obviously internet abuse behaviors in the workplace are the natural extension of internet addiction behaviors (Stanton, 2002), a user who is accustomed to use online chatting services at home will instantly respond to any request of online chatters even in the workplace.
DPI is a system that help in this matter. Filtration of unwanted data and prevention techniques can help to make the organization more productive.
Because nowadays with the development in the industries and applying the internet that is necessary for each organization to be competitive, misuse of internet will prevent the workplace to be productive.
There are some reasons that we can say DPI will help the organizations to be more productive:

- **Network security:**
  DPI's ability to inspect data streams at such a granular level may prevent viruses and spyware from either gaining entrance to a network or leaving it
- **Network access:**
  DPI creates conditions where network-access rules are easy to enforce due to the deep inspection of packets
- **Quality of service:**
  peer to peer traffic gives ISPs a great deal of trouble. DPI would allow the ISP to instigate traffic control and bandwidth allocation
- **DRM enforcement:**
  DPI has the ability to filter traffic to remove copyrighted material. There's immense pressure from the music and film industries to make ISPs responsible for curtailing illegal distribution of copyrighted material
Finding and analysis:

DPI system has some advantages and disadvantages as new technology that we will see.

http://www.developingsecurity.com/.a/6a011279135bcf28a4011571f75946970b-pi

A lot of attention and discussion has been paid to Deep Packet Inspection. DPI has developed a bad reputation for its role in censorship, data mining and eavesdropping. It is seen by many as a threat to Net neutrality and online privacy. This is giving some uncertainty and reduced the trust of users while using the internet.

The depiction of DPI as a detrimental technology was highlighted during the recent unrest in some organization when the Wall Street Journal claimed that DPI was used to spy on citizens and block traffic deemed undesirable by the state. Several media outlets jumped on the bandwagon calling DPI "a technology ripe for abuse".

Because of the negative media coverage around Deep Packet Inspection several parties have tried to affirm that, like most technologies, DPI is neutral. As a tool it can be leveraged for good or evil.

Even when DPI is used for positive purposes like information security, reducing the traffic of internet, there is debate. Recently, several industry experts caution that for security controls like intrusion detection/prevention, web application firewalls and data leakage prevention, the necessary protocol parsing is a duplication of effort that may be evadable, or worse yet present additional vulnerabilities. Vendors work extremely hard to mitigate these concerns.

Despite the negative image being used on DPI it's important to remember that as a technology it plays a vital role in information security, since no alternative options exist that are as capable.

As far as the advantages of DPI system are concerned we can see the Justin Foster’s five reasons that security and filtering controls rely on DPI:

1. **Prevention** - The majority of today's data enters and exits systems through the network. While there are plenty of ways to detect malicious code or behavior once a system has been compromised (and in some cases remediate), network filtration provides an interception point suitable for true prevention.

2. **Ubiquity** - Some applications like browsers and email programs expose APIs that can be used for inspection and prevention of the fully normalized data. Unfortunately such programs are few and far between, and only cover data entering the system. The only way to 'see' most of the data entering or leaving the system is through the network layer (DLP is also concerned with information leaving systems on other forms of media).

3. **Altitude** - If applications universally provide inspection points there are still risks below that layer of the stack. For instance, vulnerabilities in the TCP/IP stack could be be used
to compromise the operating system. Higher up for example, in the pre-render hooks browsers provide, significant amounts of code has already parsed the data in the document. The higher you are on the software stack the more abstraction exists and the more chance the layers under you may be compromised.

4. **Choice** - DPI can be deployed host-based, on physical appliances, or using new options like cloud-based security as a service, third-party vSwitches or Hypervisor introspection APIs. Because all of the traffic is based on standards (defacto or otherwise) consumers can mix and match vendors and control types without difficulty.

5. **Layers** - DPI can be applied cleanly as a serial chain of filters.Traditionally a network starts with a Firewall, behind which any number of components are deployed (IDS/IPS, Web Proxy, Network Anti-Virus, Anti-Spam). These layers form a funnel of traffic without having to be aware of each other.

As a technology DPI should not be condemned for how it may be used; DPI itself is not inherently good or evil. Until there are alternative means of policing information exchange with these positive attributes, DPI will continue to be a necessary and useful technology.

**Conclusion:**

Productivity is an important issue in today's competitive and complex environment. Internet misbehavior represents a very new and ongoing challenge for the contemporary scholar or practitioner. Many companies have corporate policies to deter the internet abuse, many users are addicted to internet activities and have little control of not using internet activities in the workplace.

DPI as a short definition is a way for networks and third parties to determine what information users are surfing for on the web. But according to Markey who is the chairman of house telecommunication and internet subcommittee, the internet is like a delivery service and when DPI is abused is like a post office inspecting mail and even altering it.

Despite of disadvantages of DPI when it is used to manage traffic, root out viruses and for some law-enforcement purposes and also controlling the staffs and end users for misuse of internet we can see its efficiency.

Deep Packet Inspection (and filtering) enables advanced security functions as well as internet data mining, eavesdropping, and censorship. Advocates of net neutrality fear that DPI technology will be used to reduce the openness of the Internet. DPI is currently being used by the enterprise, service providers and governments in a wide range of applications.
In this paper the focus is to understand the importance of a good security system for controlling of the misuse of internet by workers and help the organizations to be more productive. The best system in this case is Deep Packet Inspection (DPI), the reason for its usage is that research has shown the employees are to an extent using the Internet gainfully in their daily work but they are also misusing the Internet for personal uses during office hours. This has become a prevalent problem that needs to be tackled to reduce the negative impact on productivity. The company’s should embark on a campaign to promote a policy of acceptable use in their respective companies as of using DPI so as to minimize the abuse due to ignorance. The employees must be told what acceptable use is and what is not acceptable during the working hours so as not to stifle productivity of those who genuinely need to do so as part of their jobs.

Abstract
By emerging of worldwide web a great opportunity is provided for producers and customers to do their business in real time and directly without the role of a middleman. Business to business and business to customer are the results of such a technology that enables people to react very fast. Online shopping is a great opportunity for companies that want to have a competitive advantage over their competitors. In an online environment people make their decisions based on information provided on the site. From other hand traditional marketing relies on decisions in four basic controllable categories labeled the four “P’s”: Product, Price, Place and Promotion. This paper reviews the current approaches to Internet behavioral marketing and its shortcomings as well as biometrics and its potential for more effective Internet marketing. And found out that in current heavy competitive business market and in coming years the most important factors that can foster the growth of a firm is the level on mutual trust between consumers and suppliers and the degree in which suppliers can protect the information. Finally we review new technology based on biometric identification and found out that Biometric technology is still in the opening stages of commercial development.

Keywords: E-marketing, marketing, e-commerce, marketing principles

INTRODUCTION
“Internet Marketing is the process of promoting an organization using online media, typically with the goals of increasing sales and boosting profits. Everything you do to promote your business online is Internet marketing. For example, Internet marketing strategies include (but are not limited to) website design and content, search engine optimization, directory submissions, reciprocal linking strategies, online advertising, and email marketing. Internet marketing does not simply mean building or promoting a website nor does it mean simply putting a banner ad up on another Web site. Effective Internet Marketing requires a comprehensive strategy that synergizes a given company's business model and sales goes with their Web site function and appearance, focusing on their target market through proper choice of advertising type, media, and design”, reports Wikipedia, the digital space, the interactive place where consumers control interaction, connect with businesses, each other and their interest, the Internet platform is increasingly where marketing decisions are influenced and made.
This is confirmed by an Outsell Inc. survey: “spending on online advertising is encroaching on budgets allocated to traditional forms of advertising.” E-Marketer predicts that the share of total US media spending going to the Internet in 2008 will be 9.3% or $27.5 billion compared with 6% or $16.9 billion in 2006. In comparison, print spending is anticipated to grow just 3.3% and TV/radio 2.4% according to Outsell Inc. Currently, any amount of time an Internet user spends on the Internet will inevitably result in being prompted to create a username and password.

The purpose of this paper is to review the current Internet marketing approaches of gathering data, including their pros and cons. Secondly, examine biometrics in its potential for gathering information to help marketers determine their audience better at an individual user level. Then, review the current market for biometric technology and gain an understanding of where biometric technology for personal computers stands at the moment, and highlight some of the challenges that lie ahead. Finally we will consider the current and coming concerns regarding to the online marketing.

**Methodology**

As we earlier mentioned this study is a qualitative study so qualitative research is a method of inquiry appropriated in many different academic disciplines, traditionally in the social sciences, but also in market research and further contexts. Qualitative researchers aim to gather an in-depth understanding of human behavior and the reasons that govern such behavior. The qualitative method investigates the why and how of decision making, not just what, where, when. Hence, smaller but focused samples are more often needed, rather than large samples. It is not possible to accomplish the objectives of science or to acquire scientific knowledge without an appropriate methodology; in other words, the validity of a research is due to the method used in it, not the research topic.

Generally speaking, there are two perspectives with which researches may be classified:
- Research by purpose
- Research by method

Concerning its purpose, the present study is considered to be a conceptual one. On the other hand, by taking the methods into account, it is regarded as a survey aimed at rationalization. The conceptual studies are those which apply the theories, regulations, and compiled principles of basic researches in order to bring new ideas and knowledge. In researches as such, the most practical steps are stressed, while causes are less studied.

In the present research, the following method has been used to collect the data required: Review of literature and background of the study that benefit from library sources (i.e. the content of the books, papers, periodicals, dissertations, and the like) as well as the internet.

**Literature review**

For the third straight year, marketers are planning to spend significantly more on their content marketing efforts in 2010. For 2010, 59% of marketing professionals surveyed plan to increase their spending on content initiatives (as compared to 56% in 2009 and 42% in 2008). Only 7% are planning to decrease spending in this area. As a percentage of budgets, marketers are increasing their content marketing spending 11% from the 2008 study. That means that content marketing comprises 33% of the total marketing budget (29% in 2008).
From the marketing education standpoint, marketing professionals, almost across the board, “need to know” less about nearly every content product except for mobile content solutions, which rose 63% in 2010 from 2009.

Marketing is the collection of activities associated with identifying the particular wants and needs of a target market of customers, and then satisfying those customers better than one’s competitors. Good news for marketer is that the 1990s belong to the customer. But before that time we have been faces with emerging of marketing and especially online marketing. To provide an overview of the online marketing we must provide information about structure and function of a network. Arabie and Wind (1994) Iacobucci (1996) investigated that understanding the structure and function of networks whether in B to B or B to C for marketing is very important. And they expressed that it is not surprising that theories regarding to network are accepted very fast. And these theories are applied in wide range of issues in marketing. Duhan, Johnson Wilcox and Harrell (1997) Goldenberg, Libai and Muller (2001) argued that these areas include: word-of-mouth (WOM) communication, relationship marketing as Achrol (1997) says, and it is applied for information acquisition (Moorman and Matulich1993), and as Midgley, Morrison and Roberts (1992): Morrison, Roberts and Midgley (2000): Rogers (1995) found out it can be used for diffusion and adoption of new products and services. Regarding to this subject Porter (1985) investigated that marketing serves the purpose of developing competitive scope, which can have a powerful effect on competitive advantage because it forms the structure of the value chain. Therefore Wellman (1983) expressed as a marketer we need to analyze the network to understand how its structure can affect the behavior. According to the market research firm e-Marketer, by Holahan (2006) it is expected that $2.1 billion will be spent on behaviorally targeted advertising in 2008. Internet marketing in particular is evolving into more personalized advertisement approaches for strategic placements of advertisements to appeal to users’ preferences. However, as Internet marketing strategies move toward a more refined and personalized marketing approach, a better method of gathering user specific information is needed. Researchers have found the concept of ‘product life cycle’ for strategy development and implementation. There are normally a few numbers of firms which introduce product life cycle. In deed in some industries there are very few firms such as the pharmaceutical or biotechnology industries. The reason is because there is patent protection. Gotz (2002) in a survey pointed out that the numbers of entrants in each period of the product life cycle is limited and increases over time. Because new and improved products are introduced into the market, Chi and Liu (2001) investigated that due to technological obsolescence, an important trait of product life cycle is the decrease of the product’s market potential. Blattberg and Deighton [1991] laid out a good framework for Internet marketing where they argued consumers are addressable thus instead of treating them as homogeneous masses, managers need to indentify and communicate with each individual to improve their services on the web.

If a firm tries to interactive to the buyers properly, can use the technology advantages, as Wind and Rangaswamy (1999) pointed out that technological and manufactures improvements provide good opportunities for interactive marketing. They pointed to the customization by manufacturers that can be a power tool in hand of suppliers in e-shopping mall environment.
To implement a successful interactive marketing strategy, a firm must use information effectively. Many of the notions of interactive marketing have been refined in recent years by researchers studying direct marketing (Allenby, Leone, and Jen 1999; Bitran and Mondschein 1996; Bult and Wansbeek 1995; DeSarbo and Ramaswamy 1994; Gonul and Shi 1998).

Beside of this introduction about marketing in general, viral ideas, products, and media also make a new face of online marketing. For the first time Bill Wasik introduced ‘Flash mods’ as something between a social experiment and an art project, which this concept became popular in New York City in the summer of 2003, and then expanded to all around the world. At beginning of any new marketing approach there are some obstacles but nowadays, many of the barriers became lower in some industries because of e-commerce. Porter (2001) states that enhancements in technology and generally lowered entry barriers are believed to substantially increase the number of dot.com competitors. Bandyopadhyay (2001) says indeed, the low entry barriers have made the online market place easier to reach and of course it will increase the competition between businesses. For instance, in the past, Melewar and Navalekar (2002) investigated that, the most important barriers in the banking industry included the high infrastructure costs in order to establish geographical presence of the incumbents. However, now, the new Internet banks enjoy a low cost base because they do not have to have a physical infrastructure. In a study Hagel and Rayport (1997) pointed out that the internet banks are seen as a threat to the incumbent brick and mortar banks. Also another research by Pyun, Scruggs and Nam (2002) stated the same idea. Although there are barriers to get into the online marketing but firms need to use it. Connor (2000) mentioned that the purpose of marketing is to understand potential and promote the creativity required for product and service development. The term “biometric” and the concept of biometric identification, is originated before the digital era. But today, and presumably for the future, every form of biometric identification is based on the comparison of an image with information stored in a computer database. In 2001 VeriStar Corporation introduced the Smarttouch digital fingerprint system for use in fast food restaurants. According to a report in InformationWeek, “within the next few months, some McDonald’s customers will be able to charge BigMacs to their Visa cards simply by touching a finger to a screen”. Compared to a visual comparison of signatures or photo ID’s, biometric identification is less fallible and potentially much faster. This has prompted the use of biometrics for noncriminal governmental and commercial applications. James L. Wayman, Director of Biometrics Test Center at San Jose State University, mentions a number of such applications that were live as of May 1998, including immigration systems, airport security systems, employee time recording, social service benefits distribution, and driver’s licensing programs. “Disney World is using finger geometry with their season passes . . .”, he notes.
“Old” Internet Marketing

In the beginning, the Internet was cool. In a nod to modernization, many Global 2000 companies dabbled in the Web with experimental web sites, often nothing more than technology-little brochure sites. These experiments were purposely separated from day-to-day operations given all the unknowns relative to business impact, claiming dedicated people, business processes, technology, and information. The Web was commonly run by the jeans-wearing ponytail set as opposed to the blue suits carrying sales bags. Throw a pizza into the “conference-room-cum-web-lab” now and again and all was right with the world. Web marketing largely consisted of mass, outbound e-mail blasts and getting e-mail right became a huge focus of Internet marketing. E-mail technology jockeys found themselves acting as new-age marketers and it became more about crafting the perfect e-mail than about getting the right message to the right customer via the right channel. Thus the foundation was laid for the most critical mistake organizations have made with the Web to date: failing to integrate the Web into their overall channel structure.

Indeed we thought we were making things better by bifurcated marketing disciplines based on channel (e.g., online vs. offline) and formalizing the discipline of online or Internet marketing. We scoffed at the idea that a relationship or a brand could be enhanced through the Internet, and Internet marketing evolved separately from Relationship Marketing and Brand Marketing.

Traditional ‘word of mouth’ marketing (viral marketing)

Based on Bayus, (1985) definition, word of mouth implies that informal, ad hoc communication between individuals concerning products and services is taking place. Evans et al, (2006) believed this communication can be positive as well as negative, depending on the satisfaction levels of the individuals. In comparison to other forms of marketing communications, information dissemination and sharing among individuals is rapid when word-of-mouth occurs. Solomon, (2004) in a survey investigated that the behavior and views of individuals are significantly influenced by negative word of mouth communication, which tends to be weighted more heavily by consumers than positive communication. Based on a research he found that 90% of dissatisfied consumers do not purchase products or services of the company involved in the negative word-of-mouth communication. Equally importantly, these consumers will communicate their dissatisfaction to at least nine other people and 13% of these dissatisfied consumers will communicate their negative view to more than thirty people. Helm, (2000) argued that the Internet ‘word of mouth’ communication, i.e. viral marketing, is a far more effective, penetrating and faster medium compared to the traditional word-of-mouth communication. It is also a far more focused medium as consumers communicate their views in their social sphere (friends, colleagues etc) where their influence is more critical. Researchers such Helm, (2000), Porter & Golan, (2006) investigated that the short history of viral marketing is generally agreed to have been launched by Hotmail’s tagline “Get your private, free e-mail from Hotmail at http://www.hotmail.com” (and the resulting successful widespread diffusion of Hotmail. This tag line, added automatically to every email sent from a Hotmail account, was passed on from existing Hotmail users to the recipients of their email messages in the way that viruses spread, hence the term viral marketing. While for Welker (2002, p.7) viral marketing is nothing more than “a new
interpretation of the good old word-of-mouth-paradigm”, the use of the Internet for spreading the message clearly is a new concept that would not have been possible without the widespread diffusion of information and communication technologies. For the purposes of this study we will consider viral marketing as a technique which utilises the Internet to transmit and spread messages among individuals who will filter and forward the messages to their peers, who may be potentially interested in the message’s content. The communication style used for transmission is usually informal. Messages are spread through different channels such as email, chat rooms and discussion forums. They may contain various types of content ranging from text and images, to MS PowerPoint files, Adobe’s Flash animations and so on.

“New” Internet Marketing
We now know the Web experiment has succeeded, and the Internet as a commercial tool is here to stay. Consumers are purchasing goods and services more than ever via the Internet and marketing spend on media such as online classifieds, search marketing, and display advertising is fast following. Indeed spending on Internet marketing is projected to increase, depending on who you believe, between 7% (Winterberry Group) and 20%+ (e-Marketer) over the next 4 years. But just when we think we’ve got it figured out, consumers tell us otherwise. Customers understand that businesses operate through multiple channels, and they will leverage whichever channel is most appropriate to task. Studies show that Internet marketing is driving offline efforts; and there is a significant missed opportunity if all channels are not integrated. As such, organizations must begin to regard the Web (some call it the e-channel) as just another channel in its channel mix, as opposed to treating it as a separate business unit, operating company, or division. The integrated channel system itself must be economically optimized, versus optimizing the use of a single channel (e.g., the Web) within a channel system.

We also know that while the Web is a huge marketplace, 90%+ of the online purchasing and consideration process is occurring beyond the corporate website. Studies show that while customers may seek information from a corporate web site, the sale through this same channel rarely follows. So it would seem on the surface that the Web is an ineffective revenue-generating channel. If viewed in this way, an organization has the opportunity to influence purchase even if the Web isn’t the right channel for that consumer at that moment in time. In this model, the efficacy of the Web increases exponentially as it is causally linked to transactions in other channels. Indeed millions of these telling web interactions go unnoticed every week and harvesting this kind of information will lead to a more focused, productive marketing effort where coordinating online and offline marketing involvement drives mindshare and ultimately transactions across channels.

Therefore, today’s marketing executive needs to be continuously engaged in defining and refining the website’s objectives. Some of the performance questions include:
1. What is the first thing I want someone to do when they come to my website?
2. How am I directing that behavior?
3. Are the choices I am offering on my website – the buttons and navigation designed to lead to the behavior I want from the visitor?
4. What analytical data am I capturing that will help me analyze this behavior?
5. What tests am I conducting on the website to achieve the action I want the visitor to take?
6. Is my site text and keyword rich – persuasive and benefits-focused?
7. What are my “call to action” buttons?
8. Does the visitor understand how my site will solve their problem or deliver on their desire and need?
9. Is it clear why my website exists?
10. Is my website just an online brochure that is “us” focused instead of “you” focused?

Today, marketing executives must approach their website with an understanding of all aspects of Internet Marketing. A marketing plan designed to turn your website into a performance site not a static site requires measuring, testing and faith in metrics. Internet Marketing is here to stay as a part of the marketing mix. In short, the Internet platform requires a new kind of professional - one whose understanding of technology and marketing is integrated, creative and seamless.

**INTERNET MARKETING PROCESS**

There are four basic stages for internet marketing promotion research, plan, execute, and evaluate.

**Promotional research**
First of all, research is the first step to make internet marketing successful. Look at the online presence of your customers, competitors, and suppliers, made a first estimate of which methods might make sense. Check out the online services such as AOL, evaluate how companies advertise and how they place their ad, and ask some questions such as are they catching users when they first sigh on with a special offer? What types of ads appear on the news page? Then analyze sites that appear on the cool links or hot sites, determine which ads have the greatest pull. All these research can educate yourself about the variety of web sites, develop a sense for you find appealing.

**Writing plan**
Once a research has given you a lot of sense and information, the next step is evaluate your situation and make a plan. The plan should include goals and objectives, target audience, implementation methods, budgets for time and dollars, required personal, and schedule of activities. A written plan can communicate the objectives clearly to others, delegate responsibility for implementation and monitoring, and outline the results of different promotional methods. If there is a need, plan can use web marketing services. The web has spawned an industry of online promotion consultants, online agencies and specialized web marketing services, they can submit your site to multiple directories, search engines, and lists on a regular basis. Place your ads, coordinate web and other internet announcement with ad campaign, and plan and implement long-term strategic web marketing.

**Execute plan**
After the plan have been made, execute the plan step by step, and track all the details of the promotion plan. Be sure when launching a web site, announce special “opening day” or “inaugural week” site offer, through other internet venues or off-line, the will help drive web to traffic. If elect to use a web marketing provider, ask for references from
other clients. Evaluate these clients’ sites and contact the company to see if they are satisfied.

**Evaluating result**
Track the result of off-line and on-line advertising and promotional activities, then determine which ads have the greatest pull, track the result to see whether traffic builds and drops off, whether it increases steadily, or whether there is no difference, correlate web promotional activities with the traffic statistics, see whether sites carrying your ads can report click-through rates and impressions. From the evaluating result, you can get which links and ads are most successful. You can decide use the most effective methods and strategies within your budget.

**What’s Web 2.0 Got To Do With It?**
Web 2.0 is a buzzword referring to whatever is newly popular on the Web (e.g., blogs, podcasts); its meaning is still in flux. To be fair, Web 2.0 denotes an improved form of the Web, generally referring to a second generation of services that enable people to collaborate and share information online. It is important for marketers to understand the potential of this next-generation Web, as it provides the foundation for true (and seamless) cross-channel process and information integration. Web 2.0 enables marketers to predict and respond consistently to customer needs in every channel and across every stage of the commerce life cycle.

**Creating Pervasive Relationships**
The underlying features of Web 2.0 support the creation of pervasive, cross-channel customer relationships. A pervasive relationship is an “always on” conversation (“dialog”) which transcends individual transactions and interactions across all channels. The dialog is informed by the panoramic customer view and a customer’s strategic value, and is considered by the customer to be useful, unobtrusive, personal, and respectful. To get this right, marketing must become the “air traffic controller” of pervasive customer processes and interactions across every channel. In this way, all marketing disciplines work together to act on the panoramic customer view, providing the right information to the right channel at the right time.

The objective for multiple-channel programs is to make the sales, marketing, and service mix work together as a single, highly efficient execution system that delivers seamless service, rapid growth, and appropriate cost of sale/cost to serve. Facilitating multiple sales and service channels to work more closely requires new norms around channel compensation and tighter territory “rules of engagement.” Furthermore, the exponential growth in customer interaction points means that an understanding of customer interactions is as critical to a cross-channel strategy as are transactions for the following two reasons:
1) There is important behavioral information impounded in a customer interaction even if (or perhaps especially if) it does not result in a transaction; and
2) Organizations that do not tightly enforce consistency across every channel risk compromising their brand equity. Organizations must also assess channel efficiency economics as part of a cross-channel strategy.
The future of online marketing (Biometrics)

Koltzsch (2007) states the term biometrics derives its name from the Greek word “bios” (life) and “metron” (measure). As stated by Corcoran (1999), biometrics is used to measure something unique about individuals and later using those unique clues to identify them. More specifically, for this article, the term biometrics refers to the use of electronic hardware/software to verify the identity of a person by using human characteristics. Albrecht (2003) says that some of the common methods currently used include facial recognition, fingerprint pattern recognition, iris recognition, voice recognition and signature recognition. Currently, the main devices that are gaining attention in the market and becoming more available to businesses and individuals are fingerprint readers. Since this is the most common form found on the commercial market, the focus of this article is on fingerprint recognition.

For a consumer, the advantages of using biometric technology for identification are numerous. First, biometric technology is much more secure than common methods such as PIN numbers, passwords or security codes that are based on knowledge or possession. Koltzsch (2007) point out that while these can be lost or stolen, biometric recognition relies on unchangeable characteristics instead of knowledge and it cannot be lost or stolen. Secondly, biometric identification is more convenient and it is always accessible. After all, one does not have to remember to “carry” biometric identification. It is simply a part of the user. Finally, biometric characteristics are rather difficult to forge or replicate. Even though there are ways to duplicate these characteristics, they are not only very difficult but also very costly. Considering these advantages, it is obvious how using biometric technology can be more effective and efficient for Internet users as well as online service providers.

Sullivan (2006) found out that the growing number of identity theft and online fraud cases are forcing financial institutions, governments and other organizations to strengthen their Internet security. On October 12, 2005, the Federal Financial Institutions Examination Council (FFIEC) released updated guidance on the risks and risk management controls needed to authenticate customers accessing Internet-based financial services. Their guidance states that single-factor authentication (username/password) as the only control factor is inadequate for identification purposes for transactions involving access to customer information and the movement of funds. They state that “financial institutions should implement multifactor authentication, layered security, or other controls reasonably calculated to mitigate those risks” (Authentication in an Internet Banking Environment 2005). Biometric identification technology is stated in the guidance provided by the FFIEC as a control to strengthen online authentication. This indicates that there is already a potential demand for biometric technology for security purposes.

It is stated that most European Union nations include a biometric fingerprint on their national drivers’ licenses. As Europe and other countries move through the developments of biometric technology, this will inevitably result in the United States being more open to this technology. With the heightened security from the September 11th attacks, acceptance of biometrics in the US market has a great potential. With strong congressional interest, press coverage and public attention, biometrics has emerged as an
item of interest in public and private sectors of the market including financial services and health care (Concerns Spur Biometrics Growth 2001).

At the same time, the demand for personalized marketing is growing. As mentioned earlier, Tynan (2007) says according to e-Marketer, $1.5 billion will be spent in 2007 for behaviorally targeted advertisements and is expected to grow to more than $2 billion in 2008. Klaassen (2007) stated that the movement toward personalized advertisements gives marketers a new view of their audience rather than traditional marketing demographics.

Biometric technology is still in the opening stages of commercial development. Currently, the fingerprint readers (for e.g. Microsoft’s fingerprint reader) are marketed as convenience tools to identify a user logging into a personal computer or to store usernames/passwords for logging into a website. McMillan (2006) believes, they are used for convenience rather than security reasons. Alpert (2004) argued, several advances have been made to improve the effectiveness of the fingerprint reader devices such as matching fingerprints successfully even if a finger is placed in a different angle than the one when it was originally scanned, or if the fingerprint used is smudgy.

However, Alpert (2004) says advances in fingerprint readers are still needed. For example, the U.are.U 4000 sensor has a design goal of 1 in 50,000 chance of accepting the wrong fingerprint and a 1 in 100 chance of rejecting the correct fingerprint. While these are significant developments, continuous improvements are needed. After all, a password that consists of 6 letters or digits that contains numbers (10 different numbers) and letters (26 letters), means that the probability of someone guessing the right combination is 1 in 2,176,782,336. Obviously, there is a greater chance of the fingerprint reader accepting the wrong fingerprint than someone finding out the right password.

Also, with the emergence of new technologies, there are new crimes that develop and evolve to circumvent the controls that protect the consumer. Unfortunately, some crimes can become very violent and gruesome. For example, in March of 2005, a story from the United Kingdom’s BBC reported that some car thieves in Malaysia, armed with machetes, chopped off the finger of the owner of a Mercedes S-class that was protected with a fingerprint recognition system. They did this after they were unable to bypass the immobilizer that required the owner’s fingerprint. Although this case is extreme, this illustrates a challenge to owners of fingerprint recognition devices. As with all new technologies, companies will need to consider crimes such as this one when developing this new technology.

Additionally, in the US, the acceptance of biometric technology is growing, as is the demand. The stage is set for information technology experts to integrate biometrics into their websites to give marketers the edge to collect relevant data on Internet users and market to those users’ specific tastes and preferences.

A model that shows evolution of online marketing

In the beginning, the Internet was cool. In a nod to modernization, many Global 2000 companies dabbled in the Web with experimental web sites, often nothing more than technology-little brochure sites. These experiments were purposely separated from day-to-day operations given all the unknowns relative to business impact, claiming dedicated people, business processes, technology, and information. Based on Bayus, (1985) definition, word of mouth implies that informal, ad hoc communication between individuals concerning products and services is taking place. Evans et al, (2006) believed...
this communication can be positive as well as negative, depending on the satisfaction levels of the individuals. We now know the Web experiment has succeeded, and the Internet as a commercial tool is here to stay. Consumers are purchasing goods and services more than ever via the Internet and marketing spend on media such as online classifieds, search marketing, and display advertising is fast following. Indeed spending on Internet marketing is projected to increase, depending on who you believe, between 7% (Winterberry Group) and 20%+ (e-Marketer) over the next 4 years. But just when we think we’ve got it figured out, consumers tell us otherwise. Web 2.0 is a buzzword referring to whatever is newly popular on the Web (e.g., blogs, podcasts); its meaning is still in flux. To be fair, Web 2.0 denotes an improved form of the Web, generally referring to a second generation of services that enable people to collaborate and share information online. More specifically, for this article, the term biometrics refers to the use of electronic hardware/software to verify the identity of a person by using human characteristics. Albrecht (2003) says that some of the common methods currently used include facial recognition, fingerprint pattern recognition, iris recognition, voice recognition and signature recognition. Currently, the main devices that are gaining attention in the market and becoming more available to businesses and individuals are fingerprint readers. Since this is the most common form found on the commercial market, the focus of this article is on fingerprint recognition. As we mentioned above you can understand that online marketing began with web sites that were nothing but brochure sites. Then they became improved by technology enhancements. Viral marketing changed the face of web sites. Web 2.0 is another technology in which people are able to do new activities to introduce themselves and their products and services online. Now because of the importance of security biometrics characteristics are going to help us to make a new era of online marketing. Following is a model that shows how these components have evolved and how it can be used as a competitive advantage (see figure 1). The question is what is the role of managers regarding this evolution? And what can it do? Are these useful tools to be applied in business? The answers are positive what managers can take from these tools are more related to the present and the future of a business. If any firm has the new capabilities of the web can use them as a competitive advantage over its competitors. In mean time it will bring more power, profit and reputation to the firm, more trust and satisfaction for customers, more transparency to the owners, and of course it can help firms to communicate with their suppliers effectively (See figure 2). s

Conclusion

As we know, the internet can be used to varying degrees for an entire range of advertising, sale, and marketing activities that promise to extend a company’s relational with its prospects and customers. In this report, we studied an important stage of internet marketing— internet marketing promotion process, strategies and method, using these technologies effectively, you can get great number of hits, bring the target audiences to your site and ensure they get what they came for, and then the intent marketing will have the most successful solution. Viral marketing is a credible marketing tactic that can deliver positive ROI. When properly executed as a component of an overarching strategic plan. Marketers should utilize viral marketing when the messaging can coincide and support a measurable business goal. However, going online is not as easy as it sounds. Before starting out on this project, one needs to fully understand one’s own business, the web
and finally, how to use the web to their company’s advantage. It is important that every link in your value chain utilizes the Internet to increase the efficiency of your communications. For that, you need to figure out a strategy that is a unique mixture of both offline and online activities. The objective of using the web should be to gain a distinctive strategic positioning in the market.

Websites serve different purposes in different businesses depending on the market and the products they have on offer. For example, some companies use their websites just to get leads that will be followed up by their sales people whereas others sell directly on their websites. There is no one answer to strategy since all companies will have different markets, culture and objectives. But one thing that all companies have in common is the objective to make a profit. Simply stated, your strategy should be to combine all elements of your promotional mix to achieve the result you are looking for. As we reviewed in this paper, technology is improving in every day and companies are trying to be equipped with new innovations and technologies so they compete together to get new ways in business. In current market place internet is very important and most of the firms have a website to introduce themselves to customers so they need to be as creative as possible to get more customer. Using the internet marketing has changed already and its evolving every day. Using face book, flicker, blogs, email, wiki and other forms of web.2.0 tools can give every company one competitive advantage other the others. Even if companies employ a person who is experienced in IT can make them very professional in this area of internet. If people care about the market share, social responsibility, ethical issues and a lot of important issues in the business it’s the time to use internet in a variety of ways to introduce themselves and get new customer and make more profit in long term. The future is for the people who care about every tiny problem in handling the customers. So we believe that the game has started we need to get start right now so the way that we do our business is very important. We must use the internet to get the best use of it in business.

Even though this paper was specifically focused on one of the biometric recognition characteristics, the authors recognize the fact that the entire spectrum of the biometrics deserves an in-depth look in terms of its applications in various parts and aspects of online practices. It is hoped that the exploratory studies such as this one would provide the researchers with added incentives to conduct further investigations. After all, one needs to accept that fact that while the online marketing strategy is a popular one, it is still far from perfect.

More and more biometric technology is getting employed in order to detect and recognize individuals. Criminal investigation and intelligence are still the dominant areas of application, but it is becoming commonplace in the commercial sector and in the public. For example, scarce and/or valuable resources in everyday life are increasingly protected by video controls.

Governments enforce their immigration laws by taking fingerprints of certain people entering their countries. Companies, hospitals and organizations protect the entrances of their buildings, interior rooms, computers and safes by fingerprint readers. Some companies keep track of working hours by automatically recognizing incoming and outgoing employees. Banks monitor their tellers and ATMs in order to defeat theft and
credit card fraud. Car manufacturers are developing biometrically protected door locks and ignition locks in order to discourage theft and keep minors from driving. Drivers are getting video monitored when passing road tollbooths, bridges or tunnels. More sophisticated biometric technology will soon lead to non-transferable membership cards, passports, driver’s licenses, season tickets or election ballots.

Biometric technology tends to cost more than password or token-based systems, because the hardware required to sense and analyze biometric patterns is more complicated. However, biometrics provides a very high level of security because the authentication is directly related to a unique physiological or behavioral characteristic of the individual, which is more difficult to counterfeit. Recent technological advances have also helped to reduce the cost of biometrics. Moreover, biometric technology can be easier and more convenient to use than password or token-based systems. Biometric samples cannot be forgotten or lost, and they need not (and cannot) be changed on a regular basis.

In principle, biometric samples can be used more or less reliably to recognize individuals quickly, anywhere, and at any time throughout their entire life. So the technology opens the possibility to link all the political, economic and social roles and behaviors of an individual. How someone behaves as a customer, patient, car driver, member of the armed forces or as a tenant may have consequences on his treatment as an insurance policy holder, bank account owner, employee, or seeker of employment and vice versa.

If biometric technology gets deployed on a large scale basis and thus individuals cannot prevent the proliferation of their personal biometric data unless facing serious disadvantages in everyday life, then automatic biometric recognition becomes the default; avoiding it will require criminal activity. Another risk of biometric technology is that personal biometric data could be interpreted in medical terms and therefore may reveal certain medical diagnoses. Some methods of obtaining biometric data may even harm individuals. For example, taking blood samples may cause infection with debilitating diseases. The higher these risks are, the more invasive or intrusive the biometric method is called. Some governments and international organizations already acknowledge and address the risks of intrusive biometric methods by specific legislation.

Proven results, strong market growth, and demonstrable bottom line performance continue to drive mainstream adoption of biometric-based workforce management (WFM) solutions.

- Biometric time clocks provide accurate, reliable, and auditable real-time labor data.
- Biometric time clocks are the only effective means of directly linking an individual worker to their labor data while providing an irrefutable labor record.
- Biometric time clocks increase the integrity and security of labor records while reducing administrative costs of reviewing and updating payroll information.

No longer relegated to risky emerging technology or dismissed as high-tech gimmickry, are biometrically enabled time and attendance functionality essential to achieving maximum WFM effectiveness through the optimization and reduction of direct and indirect labor costs.

Biometrics is rapidly becoming mainstream technology that is routinely integrated into workforce management solutions. Biometrics is not only a viable method of controlling labor costs - with direct bottom line impact but the best available method of capturing accurate, reliable, and secure labor data.
Biometric time clock users consistently report significant reductions in overtime and payroll expense.

In the next ten years, the subjects that may be considered regarding biometric can be very different from shopping from big retailers without sales persons, tracking the goods by using biometrics technologies, biometric warehousing, to biometrics tags and so on. A lot of issues can be offered for further research. For example, we can handle some researches about using biometrics to improve shopping speed, save more money and get more profit. Even working on behavioral biometrics can be another area of research. Behavioral biometrics is used in an information security context to identify individuals by using unique features of activities they perform either consciously or unconsciously.

Abstract
The strict assumptions of Ricardian Equivalence Hypothesis hoist the debates on this issue among different school of thoughts. Its validity entails certain assumptions which raise the doubts on its validity especially in the context of developing countries like Pakistan. The aim of this study is to check the validity of Ricardian Equivalence Hypothesis and its sources of deviation in case of Pakistan. The study use annual data for the period of 1973-2009. Engle and Granger and Johansen cointegration approaches depicts the long run relationship among variables. Generalized Method of Moment results shows that the presence of liquidity constraints and infinite horizons are the sources of failure of Ricardian Equivalence Hypothesis. These findings illustrate concentration towards the importance of fiscal policies in raising private consumption and controlling budget deficits, which are the prime goals of stabilization policies.

Key words: Fiscal policy; Ricardian Equivalence; Pakistan

1. Introduction
External sector’s structural imbalances and fiscal slippages pushed the economy towards persistent budget and current account deficit. The sustainability and consequences of these deficits are great challenge for policy makers of developing and developed countries. Pakistan has a bad history regarding budget deficits as a result borrow money from national and international sources. Along with other borrowing sources, Pakistan borrows from international monetary fund (IMF). Since 1988, Pakistan signed eleven loans agreements with IMF, in which seven of them were signed in the regime of Peoples Party Parliamentarian, two were in Pakistan Muslim League (N) and two were in Mushraf regime.

We are sleeping like rabbit and seem to be unaware of that thing that we have to repay this loan plus its interest rate. In the future when the loan maturity ends the government definitely levied new taxes on people for the repayment of this loan. Hence, the burden of loan will transfer to our next generation. The question arise here that are we enjoying our present on the cost of our children or we keep in mind the welfare of our children. This thought receives fame after the work of Barro (1974) on Ricardian Equivalence Hypothesis (REH). A tax-cut will not increase consumer’s private consumption expenditure because he deals government debt in the context of future tax liabilities. Hence, aggregate demand will be unaffected and private savings will increase. Consumers are rational and think about the welfare of their children’s in mind. That’s why they
purchase bonds and does not consider them as a net wealth. They behave like this because they don’t want to transfer the burden of debt on their children. They purchase bonds because after the loan maturity their children sell bonds and give the tax. This theory works in the presence of certain assumption like, infinite life horizons, lump-sum taxes, perfect capital markets, perfect substitutability among taxes & bonds, and consumers are rational & farsighted.

The other school of thought is of view that consumer’s prefer present on future and neglect the welfare of their children. So, in response to tax-cut they will increase consumption expenditures while, private savings will remain unaffected.

These two approaches actually enlighten about the effectiveness of fiscal policy. If consumers are Ricardian fiscal policy is ineffective and if they behave like Keynesian, fiscal policy is effective, but all this influence depends how consumer treat government debt in the context of net wealth. Therefore in order to design stabilization program a comprehensive research on the issue of REH is very essential. This study investigates the validity of REH and its main sources of failure12 in case of Pakistan.

The rest balance of study is planned as: part two explains the model specification, part three discuss about data and empirical methodology, part four investigates and interprets the empirical results. Finally, part five presents the conclusions of the study and also provides some policy implications.

2. Various Specifications of the REH

Ricardian equivalence hypothesis, by estimating structural consumption function has been criticized because of the use of current income rather than permanent income. Permanent income is used in some studies but they used one lag of current income as a proxy for permanent income. Secondly, this approach is failed to coexist with utility maximization problem and rational expectations. Flavin (1987) argues that first order condition from consumer optimization problem is compulsory condition to hold REH. Euler equation approach has a plus point because it is based on intertemporal optimization problem. From this approach REH is tested under two conditions, finiteness of planning horizon and excess sensitivity of consumption to current income. After criticizing Feldstein methodology Aschauer (1985) use first order condition and derived consumption function which is based on microeconomic model. Life time wealth is not measured in Aschauer’s model, which is actually a hard task. Moreover, Hall’s (1978) idea is adapted by Aschauer to measure permanent income, which states that one lag period deals as a permanent income. Aschauer’s consumption function is as follow;

\[ C_t = \alpha + \beta C_{t-1} - \theta E_{t-1} G_t + u_t \]

with

\[ G_t = \gamma + \varepsilon G_{t-1} + \ldots + \varepsilon G_{t-n} + \omega D_1 + \ldots + \omega D_m + v_t \]

C, G and D are per capita consumer expenditure, government expenditure and government deficit, respectively. Whereas, v and u are unexpected shocks and measures the substitution between per capita consumption expenditure and per capita government deficit, respectively.

12 Diamond (1965) said that this will be only possible if consumer lives forever, if consumer realizes that government will collect the tax after his death his consumption pattern definitely will changed. Bernheim (1987), King’s (1983) and Con and Jappeli (1990) results showed that consumer’s behavior is changed due to liquidity constraints. Feldstein (1988) said that uncertainty in parent’s future income fails REH.
expenditure. By using this consumption function Aschauer indicate that there is a substitution between government expenditure and private consumption expenditure. Moreover, REH and rational expectation holds. Graham (1993) criticizes Aschauer and argues that government spending is not used as aggregate measure because private consumption can be influence by government spending. Moreover, disposable income must be used in the model. Graham then introduce following model, in which in case of $\lambda = 0$ REH is accepted. The $\Delta$ shows first difference lag and error term is shown by $e$.

\[ \Delta C_t = \alpha - \theta \Delta G_t + \lambda \Delta Y_t + e_t \]

By using above equation Graham shows that Aschauer findings are only valid during certain time period. He found that REH does not hold because there is a significant relationship between disposable income and private consumption. The coefficient of $\theta$ has a wide range during test period. The wide range of $\theta$ may be due to different types of government purchases.

Aschauer replied in response to Graham comments that his emphasizes is to determine whether there is substitutability between government spending and private consumption or not. He also refuse the Graham’s assertion that change in disposable income will change private consumption is enough for supporting Keynesian view.

Aschauer developed another model in which he tried to highlight that whether change in taxes will change private consumption or not.

\[ \Delta C_t = \alpha - \theta \Delta G_t + \lambda \Delta Y_t - \phi \Delta T_t + e_t \]

Where $C$ shows private consumption, $G$ shows government spending, $Y$ is gross income and $T$ is level of taxes. By using same instruments used by Graham he concluded that their is narrow range of $\theta$ and variable tax is less statistically significant then aggregate government spending variable hence, REH is accepted.

In 1985 Blanchard includes both Ricardian and non-Ricardian case through parameter $\rho$ . Different values of $\rho$ shows different behaviors of the family. If $\rho$ equal to zero then successive generations of the family behaves in a continuous manner hence, exhibits REH. If $\rho$ is positive the expected life of an agent is finite and considers debt as a net wealth. He use total wealth ($A$), marginal propensity to consume with respect to total wealth ($\alpha$), constant real rate of interest ($r$) and real labor income after tax ($Y_t^l$) to check REH. His function is as follow

\[ CP_t = \alpha \left[ (1 + r)A_{t-1} + \sum_{j=0}^{\infty} \left( \frac{1-p}{1+r} \right)^j E_t Y_{t+j} \right] \]

With budget constraint

\[ A_t = (1 + r)A_{t-1} + Y_t^l - CP_t \]

Evans (1988) eliminates human wealth and introduces following consumption function, deduced from Blanchard’s (1985) model.

\[ CP_t = \left( \frac{1+r}{1-p} \right) \left( 1 - \alpha \right) CP_{t-1} - \alpha p \left( \frac{1+r}{1-p} \right) A_{t-1} + \alpha U_t \]
Where, key parameter is $\rho$ and $\rho > 0$ this shows finite horizons. Himarious (1995) argue that not only the finite horizons but also the existence of liquidity constraints is necessary for existence of REH. He modified Evan’s model and incorporate the possibilities of there being a percentage of family are the subject to liquidity constraints. In case of imperfect markets, the equation is as follow.

$$CP_t = \left(\frac{1+r}{1-\rho}\right)\left(1-\alpha\right)CP_{t-1} - \alpha p \left(\frac{1+r}{1-\rho}\right)A_{t-1} + \lambda Y_t - \lambda \left(\frac{1+r}{1-\rho}\right)(1-r)Y_{t-1} + U_t$$

The $\rho > 0$ and $1 > \lambda > 0$ shows the finite horizon and liquidity constraints respectively. Haug (1996) included government and family budget constraints in Blanchard’s (1985) model and derive new consumption function to check REH. Again parameter $\rho$ is the tool to check REH. If $\rho \neq 0$ then RE holds. Haug estimates following consumption function.

$$\log \left(\frac{CP_t}{Y_t - GP_t}\right) = 9 + \rho D_t + \frac{\alpha}{1-\alpha} \left(\frac{W_t - (Y_t - GP_t)}{CP_t}\right) + u_t$$

By using different specifications some studies favored REH$^{13}$, while some rejected$^{14}$ REH. The study firstly estimate Graham model (1993) in order to estimate the degree of substitutability between government expenditure and private consumption. Secondly, in order to investigate the validity of REH and its sources of deviation the Evans (1988) and Himirious (1995) models are used. These models investigate the two sources of deviation from Ricardian equivalence; finite horizons and liquidity constraints.

3. Data and Methodology

The study used time series data of Pakistan for the time period of 1973-2009, collected from international financial statistics (IFS) and different Economic Surveys of Pakistan. Government expenditure, private consumption expenditure, tax revenue, government debt, disposable income$^{15}$, government budget deficit and wealth$^{16}$ are the variables used in this analysis. All the variables are transformed into real per capita.

Before the estimation of time series analysis it is necessary to check the stationarity, long run and short run dynamics of the variables. To check the stationarity of data the study utilized Augmented Dickey Fuller (ADF), The Phillips-Perron (PP), and The Kwiatkowski, Phillips, Schmidt, and Shin test (KPSS) Unit Root Test. In econometric literature there are

---

$^{15}$ A proxy variable of Gross National Income.

$^{16}$ By following Garcia and Ramajo (2003) this is a proxy variable computed by adding Government debt and M2.
lots of uni-variate\textsuperscript{17} and multi-variate\textsuperscript{18} cointegration techniques. The study used Engle and Granger and Johansen cointegration approaches to identify the log run and short run dynamics among variables.

To check the goodness of fit, diagnostic test like Serial correlation, functional form, normality and heteroskedasticity tests and stability test like Cumulative Sum of Recursive Residuals (CUSUM) and Cumulative Sum of Squares of Recursive Residuals (CUSUMsq.) are performed. The study used generalized method of moment (GMM) technique for estimation, introduced by Hansen (1982). This technique is based on assumption that there is no correlation among equation disturbances and instrumental variables. This method picks that parameters in which the correlation among equation disturbances and instrumental variables are as close to zero as possible. It does not require the exact information about the disturbances distribution.

\section{Empirical Findings}

\subsection{Unit root results}

To hold off the specious findings the study test the variables for unit root. Three methods of unit root are adopted, ADF, PP, and KPSS. The study test the stationarity of the variables under two models, with intercept and trend and secondly with intercept and no trend. All the variables are $I(1)$ under ADF test, except government expenditure. PP test result indicates that all the variables are $I(1)$. This time government expenditure is stationary at first difference. In the next model, which considers no trend in data, all the variables are $I(1)$ under ADF and PP tests. Under KPSS in the first model, with intercept and trend, all the variables are stationary $I(1)$. In the second model, with intercept but no trend, government expenditures, debt, budget deficit and wealth are stationary at $I(1)$. Keeping in view the results of three unit roots tests the study deals the variable at $I(1)$. (See table 4.1)

After checking the stationarity of data we come to know that all the variables are $I(1)$, so Johansen and Juselius (1990) cointegration technique is applied. In JJ approach the first step is to identify the order of VAR. On the basis of AIC and SBC lag length of VAR is selected.

Notes: PC is real per capita private consumption; GE is real per capita Government expenditure; YD is real per capita disposable income; TR is real per capita tax revenue; DEF is real per capita budget deficit; DEBT is real per capita debt; WEALTH is real per capita wealth. P* shows the maximum lag length, as determined by using AIC. Under PP test Q* and K* in KPSS test shows Newey-West Bandwith, as determined by Bartlett-Kernel. *** shows 1% significance level; ** shows 5% significance level and * represents 10% significance level.
4.2 Euler equation

4.2.1: Graham Model

In order to check whether government expenditure and private consumption are substitutes or complements, Graham introduced following function.

\[ C_t = \alpha - \theta G_t + \lambda Y_t + \varepsilon_t \]

To hold REH the restriction \((\lambda = 0)\) must be fulfill. The sign of \(\theta\) indicate whether government expenditures and private consumption are compliments or substitutes.

Variables used in the Graham model are \(I(1)\), so we apply Johansen and Juselius (1990) cointegration technique. Based on the AIC lag length of VAR are four but under SBC lag length of VAR are three. The study preferred SBC and set the lag length of VAR three.

Pantula Principal is used to identify the model of cointegration. The model with unrestricted intercept and no trend is selected, among the five cointegration models. Both Eigen value and Trace statistic reject the null hypothesis of no cointegration. Eigen values and Trace statistics showed that there is one cointegrating vector.

Error correction model is estimated to dig out the short run dynamics among variables. Error correction term shows the slow speed of convergence towards equilibrium. Moreover, disposable income and government expenditures are positively significantly related with private consumption.

Following graphs of CUSUM CUSUMSQ shows the stability of model for whole sample because the residuals are within 5% critical bonds.
The study used a constant and the variables PC, GE and YD lagged by first periods, as instruments. The null hypothesis that model is over identified is not rejected by the J-test. The restriction of the model is rejected by the data, hence REH does not hold in Pakistan’s economy. The variable of government expenditure is negatively significantly related with private consumption which means that government spending and private spending are the substitutes to each other. Moreover, disposable income is positively significantly related with private consumption, which states that when the disposable income of the consumer increases he will increase his consumption expenditures and behave as opponents of REH.

4.2.2: Evans Model

In order to find the sources of deviation from the study utilize following Evans model.

\[
CP_t = \left( \frac{1+r}{1-\rho} \right)(1-\alpha)CP_{t-1} - \alpha p \left( \frac{1+r}{1-\rho} \right) A_{t-1} + \alpha U_t
\]

Where, key parameter is \( \rho \). To test REH \( \rho > 0 \) this shows finite horizons.

In Evans model all the variables are \( I(1) \). Engle-Granger (1987) cointegration approach is adopted to check the cointegration among variables. This approach is divided into three steps. In first step cointegration equation is estimated by using OLS and residuals of regression are used to find out the cointegration. In second step stationarity test is applied in the residuals. The study use ADF test and rejected the null of no cointegration which concludes that there is cointegration among variables.

### Table 4.6: Engle-Granger cointegration result

Null Hypothesis: RES has a unit root

The third step of EG approach is to find out the short run dynamics of variables. Results show that private wealth is positively significantly related with private consumption.

</tbody>
</table>

Dependent variable is DPC.
The study used a constant and variables PC, W, and DEF as instruments\(^{19}\). The null hypothesis that model is over-identified is not rejected by the J-test. Durbin-h statistic rejects the null hypothesis of autocorrelation. The results imply the presence of finite planning horizons because the null hypothesis of finite horizon is not rejected. These results are in line with the literature on developing countries (Ghatak and Ghatak, 1996; Khalid, 1996). Wealth is negatively significantly related with private consumption. Permanent income is positively related private consumption which depicts that as permanent income of consumer increases his consumption expenditures also will increase. Hence in case of Pakistan finite horizon is one of the sources of deviation of REH.

### 4.2.3: Himarios Model

The beauty of Himarios model is that it indicates the two sources of deviations of REH, finite horizons and liquidity constraints. By using GMM technique the study estimates following model.

\[
CP_t = \left(\frac{1+r}{1-p}\right)(1-\alpha)CP_{t-1} - \alpha p \left(\frac{1+r}{1-p}\right)A_{t-1} + \lambda Y^l_t - \lambda \left(\frac{1+r}{1-p}\right)(1-r)Y^l_{t-1} + U_t
\]

In Himarios model all the variables are \(I(1)\), so Johansen and Juselius (1990) cointegration technique is applied. AIC shows that the lag length of VAR should be four but SBC shows that it should be two. By using SBC lag length of VAR is selected.

### Table 4.9: Lag length selection criterion

Following table shows the results of Himarios model, with instruments a constant and variables PC, W, YD, and DEF by first lag. The null hypothesis that model is over identified is not rejected by the J-test. All the variables are significant and Durbin-$h$ statistic reject the null hypothesis of autocorrelation. Wald test results shows that the null hypotheses of finite horizon and liquidity constraints are not rejected. These results validates the result of Evans model that finite horizon is one of reasons of deviation from REH. Himarios model investigate that not only the finite horizons but the imperfect capital markets distress the Pakistani consumer to not being a Ricardian. With the existing text on developing countries these results are in line with Haque, 1988; Ghatak and Ghatak, 1996; and Khalid, 1996.

5. Conclusion and Policy Options
The aim of this study is to inspect the REH and its sources of failure by using the annual data of Pakistan from 1973-2009. Graham (1993), Evans (1988) and Himarios (1995) models are used to investigate the sources of deviation from REH. ADF, PP and KPSS unit root results shows that all the variables are $I(1)$. JJ and EG approaches of cointegration
investigates the long run relationship among the variables. Evans (1988) and Himarios (1995) model results show that the finite planning horizons and the imperfect capital markets distress the Pakistani consumer to not being a Ricardian.

The findings of the study confirm the effectiveness of fiscal policy because consumers treat government debt as a net wealth. Thus fiscal policies should be used as major policy instruments in order to boost private consumption and control trade deficits, which are the prime goal of stabilization policies in Pakistan. Moreover, the issuance of bonds for Public Works Programs is fruitful because consumers treat government bonds as a net wealth. The findings, about the crowding out consequence or substitutability among public and private expenditure show that the public spending either has no crowding out effect or is a poor substitute for private consumption. This advocates the possibility of expansionary effects of government spending on aggregate demand even if the Ricardian Equivalence holds.

Abstract
The study was conducted to check the safety and soundness of banking sector of Pakistan. This study focused on six commercial banks; two from each area i.e. Domestic, International and Islamic. CAMEL Framework was applied on the financial data for the last three years of selected banks to analyze them. The final result shows that despite economic problems worldwide, Pakistan has a healthy and sound financial system to support its economy.

1. Introduction
Financial Sector all over the world has evolved into one of the biggest service industry of the world. From the last one decade the banking sector in Pakistan has also shown a huge growth and impact on the Pakistan’s Economy. The study assessed the safety and soundness of the banking sector of Pakistan.

2. Objective
The objective of the study was to check the soundness of Domestic, International, and Islamic Banks in Pakistan. The study checked whether the banks are following regulations defined by the Central Bank of Pakistan and are safe for the investors and customers for investment and deposit purposes respectively.

3. Significance of Analysis
The analysis will benefit the following:

The Central Bank: The study will help the State Bank in finding whether the Banks are following its regulations. It is related to the first pillar of BASEL II which is compulsory now for all banks in Pakistan to follow. It can be used as a tool to foster a sound and dynamic financial system in Pakistan.

The Banks: The study will help the banks in better following the regulations and standards. It will help them in making their position better and compete with other banks.

Individuals (Customers, Investors): The study can be used by individuals to find which banks are better to invest and deposit.
4. Data

There are total forty five Scheduled Banks in Pakistan. For this study 2 banks were chosen from each area i.e. Domestic, International and Islamic. For evaluation, three years data was taken from each bank. The source of each data was the banks website and their annual reports respectively. The Banks selected were as follows:

☑ Habib Bank Limited-HBL (Domestic)
☑ National Bank of Pakistan-NBP (Domestic)
☑ Bank Alfalah-BAL (International)
☑ Standard Chartered-SCB (International)
☑ Meezan Bank Limited-MBL (Islamic)
☑ Bank Islamic Pakistan Limited-BIPL (Islamic)

In the domestic side National Bank of Pakistan was chosen because it's the biggest Government owned Bank now existing in the country. Habib Bank Limited was taken as it is one of the largest privatized Banks of Pakistan. In the International side Bank Alfalah and Standard Chartered Bank were chosen because they have the largest Banking Network in Pakistan. In Islamic side Meezan Bank and Bank Islami were taken as in the Islamic side data was available for these two Banks only. All other Islamic Banks have started their operation in late 2006 and 2007 so they don’t have sufficient data available for analysis.

5. Methodology

CAMEL Framework was applied to check the safety and soundness of banking sector of Pakistan. It covers all the objectives as the factors capital adequacy, asset quality, management, earnings and liquidity meets the requirements of all the regulators, investors and depositors criteria. The main reason for applying the CAMEL Framework was that CAMEL Rating System has become very much important nowadays, as BASEL-II guidelines are being implemented worldwide including Pakistan. CAMEL Framework is strongly correlated with BASEL-II. BASEL-II is a supervision accord which is being implemented by the central banks all over the world including Pakistan. There is a very strong relationship between BASEL-II and CAMEL. There is strong relationship between every factor of CAMEL and pillar of BASEL-II. There are three pillars of BASEL-II: Minimum Regulatory Capital, Supervisory Review, and Market Disclosure.

- (C) Capital adequacy (Capital / Risk-Weighted Assets),
- (A) Asset quality (Non-Performing Loans / Total Advances),
- (M) Management (Qualitative),
- (E) Earnings (Net Income / Average Assets),
- (L) Liquidity (Advances / Deposits).

*Under management following sections of the banks are analyzed i.e. Banks Financial Performance, Banks internal controls such as its audit program, segregation of duties, succession planning etc. and Bank’s management conduct.
CAMEL Framework is used to measure soundness of a bank on a scale of 1 to 5. Banks with a rating of 1 are considered most stable; banks with a rating of 2 or 3 are considered average, and those with rating of 4 or 5 are considered below average, and are closely monitored to ensure their viability.

Different standard defined by central banks and credit unions worldwide under CAMEL rating are shown below in Table 1.1:

Table 2.1

The CAMEL Ratings for Habib Bank Limited are given below in table 2.2:
The domestic banks are excellent with their capital adequacy ratio, their earnings and management but they have serious problems with their asset quality. So they should make their procedures and policies regarding lending of loans and advances more clear and make lending policies more stringent.

6.2 International Banks:

The CAMEL Ratings for Bank Alfalah Limited are given below in table 2.3:

<table>
<thead>
<tr>
<th>BAFL</th>

</tr>
</tbody>
</table>

Table 2.4

The internationally held banks are very good with their capital adequacy ratio, asset quality, liquidity, and management but they have a little bit problems with their earnings. The main reason behind that is that their lending policies are very stringent and lending criteria is very strict. Standard chartered Bank in later is having problem with asset quality as it took over a domestic bank (Union Bank Limited) in late 2006.
6.3 Islamic Banks:
The CAMEL Ratings for Meezan Bank Limited are given below in table 2.5:

<table>
<thead>
<tr>
<th>MBL</th>

</tbody>
</table>

Table 2.6

The banks that run their operations on the principles of Shariah are having a mix trend. Meezan Bank as first Islamic Bank in Pakistan is very good with all aspects except the liquidity which is also been now improved. Bank Islami and other new Islamic Banks are finding it very difficult in earn their part of earnings in a huge conventional environment and main reason behind that is lack of proper management.

7 Overall Conclusion
The study shows that the banking industry of Pakistan is running safely and soundly. None of the analyzed banks had a CAMEL rating of 4 or 5 in any of its operating year. The rating results are shown in fig 1.1.

The Pakistani Banks were indicating very good performance and were consistently providing safe and sound operations. Their historical trends were mostly positive. They were resistant to external financial and economic change that is the main reason the internal recession did not impacted the Pakistani Banks so badly. They were of least supervisory concern. Only few new banks and some with new takeovers were having problems and were giving flawed performance to some degree, they were just at marginal level and need supervisory concern to some extent.

Personality influences Advertisement Likeness

DR KAMRAN SIDDIQUI

MBA(IBA, Karachi)
MA Marketing (University of Bradford, UK)
PhD Marketing (Manchester Business School, Manchester, UK)
Assistant Professor
Institute of Business Administration
University Road, 75270
Karachi, PAKISTAN

Abstract
The aim of this paper is to explore the influence of consumer personality on likeness of humorous advertising themes. Research data were collected through a survey from undergraduate and postgraduate students of different universities. The research instrument includes the Goldberg’s Big-Five personality construct. Two more constructs were used to measure the respondent’s attitude towards advertising likeness and it’s by showing them five different humorous advertisements. Factor analyses were used to validate the constructs while regression analyses were conducted to describe the respondent’s attitude towards likeness of humorous advertising themes. The final outcome shows that the extraversion dimension of consumer personality explains a significant variance in advertising likeness for humorous advertising themes. Two standard practices of psychological studies i.e. involving students as subjects and self reporting questionnaire using paper and pen are subject to criticisms from different quarters. Study adds a significant and valuable information in this research area as this was not done before.

Keywords: Personality, Five-Factor Model, Advertising, Advertisement Likeness

I. INTRODUCTION
With the growth of in world’s markets and adoption of sophisticated marketing techniques, the customers have more choices for where they get their products and services. This implies more challenges to marketers who now need more information about their customers their behaviors. This paper discusses the influence of consumer’s personality factors in predicting the advertisement likeness of humorous advertising themes.

II. LITERATURE REVIEW
Much has been written on personality factors/facets and their predictability for social and behavioural intercourse (Larsen & Buss, 2005; Cheng & Furnham, 2003; Steel & Ones, 2003; Yik & Russell, 2001; Silverthome, 2001; Judge & Bono, 2000; Bono & Judge, 2004; Chamorro-Premuzic & Furnham, 2003; Watson, 2001; Trobst, Herbst, Masters, & Costa, 2002; Paunonen, 2003; Egan & Stelmack, 2003; Clower & Bothwell, 2001). There are numerous reasons for its predictive capability. First, the personality factors/facets remain
stable in adulthood (Costa & McCrae, 1992a); second, these are dimensions, not types, so people vary continuously on them (Costa & McCrae, 1992a); third, the factors and their specific facets are heritable (Loehlin, McCrae, Costa, & John, 1998); fourth, the factors probably had adaptive value in a prehistoric environment (Buss, 1996); fifth, the factors are considered universal, having been recovered throughout the world (McCrae & Costa, 1997); finally, and most importantly knowing one's placement on the factors/facets is useful for insight and diagnosis (Costa & McCrae, 1992b).

The contemporary advertising uses various themes to communicate the advertising message to its respective target audience and one of these themes is humor. On the other hand modern society cannot live without humor, as a realistic approach humor is a significant source of receiving attention, increasing its, aiding in learning names and situations and method will be required for human-machine contact in upcoming years to handle it (Stock & Strapparava, 2005). Apparently humor may enhance the likeness of advertisements, but the effectiveness of this relationship is determined by likeness of advertisement by target audiences in which the humor is perceived (Gelb & Pickett, 1983). Presence of humor in an advertisement doesn’t guarantee a successful advertisement but the effectiveness can be enhanced by carefully choosing the target audience, situation and type of humor to be used (Weinberger & Gulas, 1992). When humor is linked to the message and it’s also strong, the ads are unforgettable and this contact is interceded by attention and mood. Strong humor appeals also influence higher recall among persons with a high "need for humor" (Cline & Kellaris, 2007). Humor in advertising was considered risky, partially due to its possibility for failure of advertisements in getting proper likeness from target audience or causing offense (Beard, 2008).

Research on humorous advertising themes has different approaches and different authors have given different point of views regarding humorous advertising themes. But research failed to explain variance within same target audiences for likeness of similar humorous advertisements. Most research in advertising has ignored the extent to which the psychographic variables like a consumer’s personality, or demographic variables such as age or education, contribute as predicting advertisement likeness. A careful examination of the previous literature suggests that systematic research on the predicting role of consumer personality on likeness of humorous advertising themes is largely absent.

III. RESEARCH METHODOLOGY

For this research the students of graduate and post graduate were selected through a simple random sampling method from different institutions out of which 251 were males and 105 were females aged between 20 and 24 years (N=356). The criteria of choosing the respondents from institutions was, randomly selecting two classes from each institution as every students studying there had an equal chance to be the part of this research. It was ensured that classes chosen for this study at least have 10 students and they have completed their one year of study in respective discipline.

The questionnaire was divided into three parts. Part – I uses Goldberg’s 120 item IPIP scale to measure the respondent’s personality The second part of the questionnaire was the most interesting part of the research exercise. Five different humorous advertisements were shown to respondents four question were used for measuring the likeness of each humorous advertisement themes. Humorous ads tend to be more productive for the electronic media as compared to print media (Madden & Weinberger, 1982) therefore electronic advertisements were shown of this research.

Five hundred questionnaire were distributed out of which one forty four questionnaire were rejected during screening process, because of having high percentage of missing values and having less or no variation in them as it was affecting the reliability of the results. The rejected questionnaires were discarded before entering the data. SPSS software was used for entering the data and analyzing the results.
IV. ANALYSES

The data was analysed in three steps. First, exploratory factor analysis, using the Principal Component Analysis Extraction Method and Varimax Rotation Method with Kaiser Normalization, was used to determine the factor structure of 25 items related to advertisement likeness for humorous advertising themes. Second confirmatory factor analysis using 120 items of Goldberg’s IPIP-NEO using the Principal Component Analysis Extraction Method and Varimax Rotation Method, was used to confirm that the items loaded on the respective factors as prescribed by previous studies (Goldberg, 1993). Finally, using the resulting factors from Goldberg’s personality inventory and advertisement likeness factors, multiple regression was used to investigate the effects of consumer’s personality on the likeness of advertisement for humorous advertising themes.

At first step the analyses resulted in a five factor solution, consists of a total of 25 items. All items related to one advertisement were loaded on one factor (Table 1). These items were analysed using double qualifying criteria. First, a priori knowledge was used which is critical for any factor analysis (Byrne, 1998) and based on theoretical underpinning and empirical research, relations between the observed variables and the underlying factors were postulated a priori. This a priori knowledge was also supported by the use of the Kaiser criterion (eigenvalues ≥1) and scree test to determine the number of factors. Secondly, the factor loading criteria were applied which required that (a) a factor must have at least 2 salient item loadings greater than 0.3, (b) individual items must have at least one factor loading greater than 0.3 and (c) any item loading on more than one factor when the final solution is obtained will be placed only in the factor on which it loads most highly. Items were factor analysed using the principal component analysis method of extraction and varimax rotation. Overall scores were created by summing item scores creating one-dimensional factors scores, one for each factor. The resulting value was then divided by the number of items in that factor, making overall scores relative and comparable. Participant’s potential overall scores on each factor ranged from 1 to 5. The second order factor analysis was performed and all five factors were loaded on a single factor which shows that underlying structure of all five factors was measuring a single concept i.e., likeness of humor.

Using a priori knowledge about Goldberg’s IP-IP inventory, five high order factors i.e., Neuroticism, Extraversion, Openness to experience, Agreeableness and Conscientiousness were factor analysed separately. These factor analyses were performed using 24 items related to each factor and hence making the five separate analyses for all 120 items in the IP-IP inventory (Table-2). The second order confirmatory factor analyses were performed and all 30 facets were loaded on Big Five factors as expected (Table 2).

The multiple regression analyses were performed to explore the relationships between personality factors (as predictor variables) and advertisement likeness for humorous advertisements variables (as criterion variables). The likeness of humorous advertising themes as criterion variables were regressed on the Big Five personality dimensions as predictor variables in stepwise regression analyses. Stepwise multiple regressions was undertaken in order to obtain the best possible prediction of criterion variable (Table 3).

It shows that personality factor Extraversion predicted likeness for humorous advertising themes with a β of 0.13 and an adjusted R^2 of 0.56. Thus the proportion of variance in likeness for humorous advertising themes predicted by the personality factor Extraversion was 0.56 (56%). Positive Beta values reflect that these two variables are directly correlated with each other. Multi-colinearity diagnostics were examined and it was revealed that condition indices in all three analyses were less than 30 and none of the factors have a variance proportion of .50 or higher on a factor with a high condition index.

V. FINDINGS
This research finding explains variance within same target audiences for likeness of similar humorous advertisements. As personality factor Extraversion explained a significant variance in likeness for humorous advertisement theme, illustrates that persons watching same advertisement or similar advertisement theme may behave differently based on their personality factors. It also support that Extraverts have relatively higher tendency to experience positive emotions such as joy, happiness, love and excitement (Costa & McCrae, 1992) and tend to be happier, and are most at ease in the company of other extraverts (Fleeson, Malanos, & Achille, 2002).

VI. LIMITATIONS
The results obtained from this empirical work must be interpreted in the light of the study’s limitations. A few strengths of personality research; the universal use of self-reporting questionnaires, and use of students in the research process, which make the process robust and economically feasible, are actually highly criticised in different non-academic quarters.

VII. IMPLICATIONS
The availability of more and better information will enable a more productive analysis of customer profiles which, in turn, will affect behavioural and evaluation outcomes. The implication is obvious for segmentation strategies. Demographic variables such as age, sex, marital status, only identify ‘who’ is in the segment. Behavioural consequences and attitudinal information indicate ‘why’ the customer is in a particular segment and ‘why’ that customer demonstrates a particular behaviour towards a particular advertisement. The ‘why’ information constitutes a more powerful marketing tool, since it provides insight into the reasons behind customer decisions and evaluations. Therefore, by having access to both types of information, managers would be able to use their existing resources in a more efficient manner to access their target customers and deliver appropriate messages.

Abstract

Purpose – The purpose of this study is to measure the awareness and perception of halal food in Pakistan which is predominantly a Muslim country. Design/methodology/approach – The study is exploratory in nature and cross sectional data has been obtained from 528 respondents belonging to two major clusters-university students and corporate sector. Empirical data was collected through survey methodology. Three statistical tools have been used for data analysis; (a) Cronbach’s alpha; (b) Confirmatory Factor Analysis and; (c) Pearson product correlation matrix. Findings – The author purports that; (a) religion is the omnipotent source of religious beliefs for Muslims Consumers; (b) Beliefs are closely knitted with religious commitment; (c) People who are highly religious may not necessarily have high level of awareness about halal food; (d) Attitude towards halal food is closely akin to the notion of beliefs; (e) The dogma of identity is more linked with intrinsic rather than extrinsic forces. Research limitations/implications – The study focuses on two major clusters and the data is obtained through cluster sampling. The researcher measures general awareness and perceptions of consumers regarding halal food. However further research is suggested to nudge deeply in the concept of halal logo and dimension of halal brand amongst the Muslim consumers. Practical implications- Although Pakistani is a by and large a Muslim country but there is very little awareness regarding Halal food unlike other Muslim states such as Indonesia and Malaysia. The country has no formal Halal certification issuing body. The findings of this research will be of great significance to the marketers and food manufactures in Pakistan who will find new avenues to delve into halal food certification business, and endeavor into Muslim markets as the producers of certified halal food. Originality/value – Although Islamic marketing is the new buzz word but religion and consumer behavior largely remains untapped by academic researchers. There is lack of empirically tested knowledge about the awareness and perceptions towards Halal foods among Pakistani consumers. The research will be a valuable addition in propagation of knowledge on the subject area.

Keywords: Consumer behavior, perceptions, awareness, halal, religion, Muslim consumer, Islamic Market
1.0 Introduction

There is a growing concern amongst the Muslims about the “Halal” food and ingredients which has led to a stimulus in demand for “Halal” food (Sungkar, 2010). The global “Halal” food market potential could rise to USD 500 billion by 2010 (Dagha, 2011). Such lucrative figures points towards growing awareness about “Halal” food amongst Muslim consumers. This awareness regarding “Halal” food is not only restricted to Muslim minority countries but also is getting momentum in Muslim dominant countries. However so far no significant literature is available that reflects upon the awareness and perceptions of halal food amongst the Muslims.

1.1 Study Objective

The basic objective of the study is to measure the awareness and perception of Muslim consumers in Pakistan towards halal food. Pakistan is an Islamic country where more than 95% population is Muslim. It is therefore imperative to explore the impact of religiosity on consumer behaviour with regards to Islamic dietary laws.

1.2 Significance of the Study

The primary motivation for this study is the desire to fill the gap in knowledge about the Awareness and perception of the Halal food in Pakistan. Traditional research reflects on the global concerns about Halal food amongst the Muslim consumers; however there is paucity of data that is specifically targeted towards measuring the consumer behavior towards consuming Halal food. Some of the aspects of these researches are; (a) Most of the studies conducted globally are confined to the concept of Halal food with respect to the usage of meat products only; (b) Much of the available studies are confined to general Islamic marketing practices; (c) One commonality between most of the researches is need and “importance of Halal labeling”. Most importantly, major work has been done in non-Muslim countries and was then assumed to be universal. At present, there is a little meaningful research in Pakistan that empirically measures the consumer perceptions and behaviors towards Halal food. A major motivation is the curiosity about how Pakistani consumers perceive the element of “Halal-ness” in the food they purchase.

This study will also be great significance to the Marketers and food manufacturers in Pakistan. Although Pakistan is predominantly a Muslim country but there is very little awareness regarding Halal food certification unlike other Muslim states such as Indonesia and Malaysia. The country has no formal Halal certificate issuing body. Halal Development Council (HDC) is the only registered NGO in Pakistan dedicated to the development of Halal Economy thereby increasing trade and business within the country and exports from Pakistan. This study can be a starting point for the marketers to understand the need of halal food certification through an accredited body because many local and imported food products available in Pakistan have halal logo but it has no traceability.

2.0 Literature Review

Food items that are “Halal” not only abide with Islamic law but also are healthy for human consumption because the way they are prepared and processed. However all “Halal” food may not be perceived as “Halal” until they are not endorsed by “Halal food certifications” or “Halal food clerics” because of the probability of adulteration in food. Muslims consider it as a religious obligation to consume food that is permitted by Allah and falls under the jurisdiction of Islamic law and is considered “Halal”. In Islam “Halal” generally refers to all such deeds and acts that are in accordance with the sayings of Almighty Allah and Prophet Mohammad (may peace be upon him). Islamic law commonly known as “Shariya” designates the term “Halal” specifically to the
food items and products that are permissible, lawful and are unobjectionable to consume. The opposite of “Halal” is “Haram” which in context of food items refer to the products that are forbidden, prohibited and their consumption is liable to punishment in an Islamic country. Almighty Allah clearly states:

“He has forbidden you only the Maitah (dead animal), and blood and the flesh of swine, and that which is slaughtered as a sacrifice for others than Allah (or has been slaughtered for idols, on which Allah’s Name has not been mentioned while slaughtering). But if one is forced by necessity without willful disobedience, nor transgressing due limits,- then is no sin on him. Truly, Allah is Oft-forgiving Most Merciful. (Qur'an 2:173, pp, 34 Hilali & Khan).

Food that is considered Haram (forbidden) for Muslims are Pork and all its products, animals that have been immolated in name of anyone other than Almighty Allah, alcoholic drinks including all forms of intoxicants, carnivorous animals, birds of prey and any food contaminated with any of these products (FIANCÉ, 2010).

2.1 Halal food perceptions in non-Muslim countries

Considerable literature reflects the work of different academic scholars who suggest that Muslim consumer’s behavior shows a visible inclination towards consuming halal meat in non-Muslim countries. One such research is conducted by Ahmed (2008) in which he claims that Muslims in UK prefer to buy meat sold in their local shops rather than the supermarkets. Similar work is contributed by Bonne, Blacker and Verbeke (2007). They have used the theory of planned behavior to explain Muslim consumer’s behavior towards meat consumption in the light of their religious obligations (Bonne, Blacker & Verbeke, 2007).

2.2 Halal Food Perceptions in Muslim countries

There is growing literature on Halal Food consumption in Muslim countries. Malaysia is moving towards becoming the hub of “Halal” food industry and a significant portion of research on halal food consumption. Academicians in other Muslim countries have also done some meaningful researches in the same demeanor (Lada & Tanakinjal and Amin, 2009; Wilson & Liu, 2010; Shaharudin, Pani, Mansor, Elias and Sadek, 2010; Musaiger, H1993); such as the concept of halal food are opening new vistas and avenues for the marketers and is emerging as a new brand concept (Lada, et al., 2009); using the theory of reasoned action (Fishbein & Icek Ajzen, 1975 & 1980) they provided the insight into the halal products selection among Malaysian consumers; another interesting yet thin literature is also available on halal branding. Pioneering work extended the concept of brand to halal food (Wilson & Liu, 2010); religion, beliefs, food preferences gender discrimination, education and women employment are found to have affect food consumption patterns in Arab region (Musaiger, 1993); choice of sensitive products were also in compliance with religious values (Khraim, 2010); Islamic ideology mirrors the food consumption habits of Malay Muslims (John Fischer, 2008). As per our religious obligation Muslims are required to strictly adhere to Islamic dietary laws and consume only those food and ingredients considered permissible by Islamic law.

2.3 Factors affecting halal food perceptions

2.3.1 Religious commitment

Literature suggests that religion is ascribed as having a paramount importance in consumption patterns of Muslims in non-Muslims countries. Religion provides guidelines for not only Muslim consumers but also channel the behavior of non-Muslims consumers (Delener, 1994); religious impact is greater on the Asian consumer as compared their British counterparts (Lindridge, 2005); the impact of religion has an internal influence on the lives of individuals and guides
different rituals and behaviors (Loser, Klein and Dollahite, 2008); religious affiliation and religious commitment has been identified as two important aspects of religiosity and are found to impact consumer behavior (Mokhlis, 2009); there is a positive relation between religious commitment, store loyalty and consumer complaints (Swimberghe, Sharma, & Flurry, 2009); religion is observed to be an inspiring factor in choosing food amongst the Norwegian consumers (Honkenan, Oslen & Verplanken, 2005); inclination towards religion also affects alcohol consumption among adolescents in Iceland specially females (Bjarnason & Thorlindsson & Sigfusdotti and Welch, 2005); and similarly mothers religiousness leads to their children asceticism in drinking alcohol in rural regions of Finland (Winter, Karvonen, & Rose, 2002).

2.3.2 “Self-Identity”

Literature also suggests that consumer’s behavior towards certain products tend to be predisposed by the notion of “self concept” (Biddle, Bank & Slavings, 1987; Govers & Schoormans, 2005; Granzin & Bahn, 1982; Lindridge, 2002; Lindridge & Dibb, 2003; Bonne, Blecker, Verbeke, 2007). The literal meaning of “Self identity” is awareness about oneself and can be depicted as perception and portrayal of One-self (Biddle, et al., 1987). Self identity as a “Muslim” means individual has a pressure to act in a manner that is acceptable in Muslim society. Previous studies enumerate upon the fact that in collectivistic societies where individuals are influenced by other members of a reference group, behavioral traits attribute to the religious spiritual origins (Lindridge, 2002; Lindridge & Dibb, 2003). Self identity issue also affects Muslim consumers’ awareness to consume halal meat in Belgium (Bonne, Verbeke & Vermeir, 2009). Bonne, Blacker and Verbeke (2007) have identified that Muslims with strong Islamic identity tends to be more religious and influenced by the members of their association. Factors such as self image can also impact on consumers buying behavior; people like to connect their self-worth with the product they purchase (Govers & Schoormans, 2005). Muslims are entangled in a web of relationship that constantly guides and influence their social behavior. Consuming “non-Halal” food can lead to isolation from a Muslim community or else can also affect their relations with friends, peers and family that may treat them as a social “outcast”.

Figure 1. Based on previous studies, awareness & perception of halal food is found to be correlated to religious beliefs, religious commitment, attitude towards halal food and the concept of self-identity.
2.4 Islamic marketing dynamics in Muslim countries

The above text has roped in the works of various academicians on the subject of “Halal” food its consumption, awareness and factors that shapes the consumer behavior. A lean amount of text is available that focuses specifically on halal food. Researchers from various schools of thought contemplate on the Islamic marketing practices among Muslim consumers and a general observation is that religion is the driving force behind Muslim consumers’ behavior; (Hashim & Mizerski, Khraim, Moschis & Ong, Muhamad & Mizerski, Rehman & Shabbir and Safiek); Muslim consumers in Malaysia realize the importance of business being conducted in Islamic way but they were uncertain whether the businessmen in Malaysia were adhering to Islamic laws and regulations in running their affairs (Abdullah, 2010); Fatwa (Islamic religious ruling by religious scholar and not mandatory to follow) verdicts are coupled with Malaysian Muslim consumers choice of selection for certain product category, gender of respondent and religious bearing (Hashim & Mizerski, 2010); age factor and religious inclination are to some extent positively correlated but nevertheless there exist little evidence to support the fact that consumer’s brand preference and store loyalty are effected by religious proclivity (Moschis & Ong, 2011); number of factors such as commitment, motivation, affiliation, knowledge about a religion and awareness of the social consequence of following a religion mediate on the consumers’ market place behavior (Muhamad & Mizerski, 2010); religious stanchness also impacts upon the shopping itinerary of Muslim consumers (Mokhlis, 2009) and on the same note religious beliefs also maneuver the New product adoption behavior for Muslim consumers (Rehman & Shabbir, 2010).

3.0 Research Methodology

3.1 Research design

The study is primarily exploratory in nature and following tools have been used for data collection; (a) desk research; (b) In-depth interviews; (c) Focus group; (d) Surveys through questionnaire and (e) Hypothesis developing and testing.

3.2 Sample selection

Sample of respondents were chosen from two major clusters; (a) corporate world associates: they are a suitable candidate for the research because they are the opinion leaders of the society and their insights can be generalized; (b) university students; evidence from past researches shows that university students have been used for data collection in many psychological researches.

3.3 Sample size

Sample size was 600 respondents. We assume that larger the sample size more generalized will be the findings. 95% population of Pakistan is Muslims; therefore the target population for this study is presupposed to be homogenous (CIA - The World FactBook, 2011). Out of 600 questionnaires distributed around 550 were returned. Response rate was thus 91%. Of these 550 questionnaires 22 were incomplete and rejected. To sum up 96 % (528) questionnaires were accepted and analysed.

3.4 Research instrument

The research instrument was systematically designed having structured and unstructured questions. The questionnaire was framed to measure five important constructs which were derived through literature review; (a) Religious Believes, an example of this construct is “I believe in Allah, Muhammad (PBUH) as his last prophet, Quran & Sunnah; (b) Religious Commitment, some of the items to measure Religious commitment have been developed through using “Religious Commitment Inventory” (Worthington & Wade & Ripley & McCullough & Berry and Schmitt, 2003). An example for this concept is “I often read books and magazines about my religion”; (c) Awareness about Halal Food, sample items is “I am aware that there might be some non-halal food items also available in local market”; (d) Attitude towards Halal Food is measured through questions like “I read all the ingredients before buying the food products” and (e) Identity. Example item for this construct is “I purchase halal food just because
of social pressures”. All responses are measured on a five point Likert scale with “1” as strongly disagree and “5” as strongly agree. The survey also included respondent’s profile which includes data pertaining to their education, age, marital status, cast and sex. Respondent’s perception towards halal foods was measured through open ended question at the end.

3.5 Data collection
The questionnaires were not personally administered and student volunteers were hired to assist in the whole process. The whole procedure of data collection was done meticulously and a pack of 30 questionnaires were dispatched for each chosen sample from representative clusters.

3.6 Hypothesis
With the help of secondary data and insights from the in-depth interviews and focus group hypothesis were generated to test the correlation amongst five constructs;(a) religious beliefs;(b) religious commitment;(c) awareness towards halal food;(d) attitude towards halal food;(e) identity.

4.0 Data analysis
4.1 Reliability Analysis
Data has been analyzed using SPSS version 19. The internal consistency was measured through Cronbach’s Alpha or Coefficient alpha ranges from 0-1. Researchers generally consider an alpha of 0.7 as minimum however lower values are also acceptable depending upon the situation (Hair & Babin & Money and Samouel, 2005). In one of the previous researches whereby linking religiosity with consumer behavior Moschis & Ong (2011) have measured religious commitment, beliefs and behavior using a four item scale that measures various dimensions of religiosity. Based on the findings of reliability scores from past researches we can safely infer that items measuring religious beliefs, religious commitment and attitude towards halal food have high internal consistencies. Awareness of halal food and identity indicates lower reliability but a Cronbach’s alpha coefficient of 0.5 or higher is also acceptable in some social science studies (Kerlinger & Lee 2000).

Table 1: Instrument’s Reliability

</tbody>
</table>

4.2 Instrument Validity
The five constructs that have been used to measure religiosity are based on significant findings from earlier studies, in-depth interviews and focus group discussions. Religious beliefs are based on the five basic pillars of Islam; Oneness of Allah and Mohammad (saw) as his last prophet, Salah (prayers), Fasting in the holy month of Ramadan, Zakat (giving alms to the poor) and pilgrimage to Holy Mecca. According to sayings of holy prophet (peace be upon him): Narrated Ibn ‘Umar: Allah's Apostle said: Islam is based on (the following) five (principles):

- To testify that none has the right to be worshipped but Allah and Muhammad is Allah's Apostle.
- To offer the (compulsory congregational) prayers dutifully and perfectly.
- To observe fast during the month of Ramadan.
- To pay Zakat (i.e. obligatory charity).
- To perform Hajj. (i.e. Pilgrimage to Mecca)

(Abed al Latif-al-Zabidi, 2006)
Face validity was achieved as a result of agreement between the professionals that this scale accurately measures what it purports to measure. The questionnaires were also pretested before actual data collection procedure.

4.3 Confirmatory Factor Analysis

Confirmatory factor analysis is multivariate statistical technique used to parsimony i.e. reduce large number of variables into a manageable number of factors (Zikmund, 2002). Separate factor analyses were performed for religious beliefs, religious commitment, awareness towards halal food, attitude towards halal food and identity. The decision to retain the number of factors depended on two most widely used methods: latent root or Eigen values and percentage of variance explained criteria. Factors with Eigen values greater than one were retained and factors having explained variance less than 50% were reckoned insignificant. Kaiser-Meyer-Olkin (KMO) measure of sampling adequacy was computed to assess the sufficiency of the correlation matrices for factor analysis. A KMO greater than 0.5 is considered good for sample size (Hutcheson & Sofroniou, 1999). Descriptive stats were used through the computation of mean and standard deviations. The matrices of the final solutions were than drafted, based on the following criteria: (a) each factor must have at least three item loadings greater than 0.3; (b) individual items must have at least one factor loading greater than 0.3; (c) any item loading on more than one factor when the final solution is obtained will be placed only in the factor on which it loads most highly. Table below depicts the Confirmatory Factor Analysis of the five constructs: Religious beliefs; Religious commitment; Awareness of halal food; Attitude towards halal food; and Identity.

Table 2: CFA For Religious Beliefs

<table>
<thead>
<tr>
<th>Items</th>
<th>Factor Loading</th>
</tr>
</thead>
<tbody>
<tr>
<td>I read my namaz five times a day.</td>
<td>0.81</td>
</tr>
<tr>
<td>I believe in Allah, Muhammad (PBUH) as his last prophet, Quran &amp; Sunnah.</td>
<td>0.76</td>
</tr>
<tr>
<td>I will perform (have performed ) my Hajj whenever I will have sustainability</td>
<td>0.75</td>
</tr>
<tr>
<td>I happily and willingly pay my zakat on time.</td>
<td>0.73</td>
</tr>
<tr>
<td>I read my namaz five times a day.</td>
<td>0.64</td>
</tr>
</tbody>
</table>

The variable religious belief was measured through five items. All the statements were loaded thus determining religious beliefs, with variance explained of 55.51% and Eigen Value 2.77. Alpha is 0.77 and measures the reliability of instrument. The mean score was 4.49 with a standards deviation of 0.59 and KMO was 0.80.

Table 3: CFA For Religious Commitment

<table>
<thead>
<tr>
<th>Items</th>
<th>Factor Loading</th>
</tr>
</thead>
<tbody>
<tr>
<td>I often read books and magazines about my religion.</td>
<td>0.80</td>
</tr>
<tr>
<td>I make financial contribution to my place of worship /religious organizations</td>
<td>0.78</td>
</tr>
<tr>
<td>I enjoy spending time with others of my religious affiliation.</td>
<td>0.78</td>
</tr>
<tr>
<td>I have my religious beliefs lie behind my whole approach to life.</td>
<td>0.71</td>
</tr>
</tbody>
</table>
For the concept religious commitment four items were loaded on factor analysis. The Eigen value is 2.45 with variance explained of 50%. Cronbach’s alpha for reliability is 0.71. Mean score was 3.81 with standard deviation and KMO of 0.75 and 0.76 respectively.

Table 4: CFA For Awareness Of Halal Food

<table>
<thead>
<tr>
<th>Items</th>
<th>Factor Loading</th>
</tr>
</thead>
<tbody>
<tr>
<td>Food items coming from Muslim countries are necessarily halal.</td>
<td>0.86</td>
</tr>
<tr>
<td>Food items with Islamic names are necessarily halal.</td>
<td>0.78</td>
</tr>
<tr>
<td>Halal logo on food item means it is necessarily halal.</td>
<td>0.73</td>
</tr>
<tr>
<td>I think that whatever food is available in Pakistan is halal.</td>
<td>0.68</td>
</tr>
</tbody>
</table>

Awareness regarding halal food is measured through four statements. All these items were loaded on factor analysis with explained variance of 58.88% and Eigenvalue was 2.35. The reliability alpha was 0.58. Mean score was 3.32. Standards deviation was 0.85 with KMO as 0.72.

Table 5: CFA For Attitude Towards Halal Food

<table>
<thead>
<tr>
<th>Items</th>
<th>Factor Loading</th>
</tr>
</thead>
<tbody>
<tr>
<td>I don’t eat pork or haram meat.</td>
<td>0.86</td>
</tr>
<tr>
<td>I don’t buy any food with haram ingredients.</td>
<td>0.80</td>
</tr>
<tr>
<td>I don’t drink alcohol.</td>
<td>0.75</td>
</tr>
<tr>
<td>I may drive extra miles to buy halal food, if I am in a non-Muslim country.</td>
<td>0.70</td>
</tr>
<tr>
<td>I will not buy a food product, if doubts are raised about it by my peers and family.</td>
<td>0.55</td>
</tr>
<tr>
<td>I am willing to pay more for food that has halal logo on it.</td>
<td>0.45</td>
</tr>
</tbody>
</table>

Table 5 shows the attitude towards halal food items. Six factors were loaded with Eigenvalue of 3.0 and 50.86% explained variance. Reliability alpha was 0.81. Mean score for this variable was 4.31 with a 0.68 standard deviation. KMO was 0.76.

Table 6: CFA For Identity

<table>
<thead>
<tr>
<th>Items</th>
<th>Factor Loading</th>
</tr>
</thead>
<tbody>
<tr>
<td>My family and friends always use halal foods.</td>
<td>0.82</td>
</tr>
<tr>
<td>My parents/siblings will stop visiting my house, if they will find non-halal items in my house.</td>
<td>0.72</td>
</tr>
<tr>
<td>Muslims have to follow a set of dietary laws as ascribed by their religion.</td>
<td>0.70</td>
</tr>
</tbody>
</table>
The above table depicts CFA for the identity construct. Three items were loaded measuring the variable. Eigenvalue was computed as 1.69 giving an explained variance of 56.5%. Coefficient alpha was 0.54; mean score was 4.29 with standard deviation of 0.69. The KMO was 0.58.

4.5 Pearson Product Correlation Matrix

A correlation matrix is used to report correlations results among the five constructs used in the instrument to collect data for this study. This matrix assumes interval data, a linear relationship and normal distribution.

<table>
<thead>
<tr>

</tbody>
</table>

**Correlation is significant at .01 level

4.6 Decision Rule

Based on the scores of above matrix we can infer correlation coefficient between religious beliefs and religious commitment is 0.56 and at .01 significant levels it is statistically significant. Hence forth, religious beliefs and religious commitment are significantly correlated. The calculated correlation coefficient between religious beliefs and awareness towards halal food is 0.046 and at .01 significant levels it is not statistically significant. It represents a very weak correlation. There is not much evidence to prove that the two variables share some association in the population. Therefore, religious beliefs and religious commitment are not significantly correlated.

The correlation coefficient between religious beliefs and attitude towards halal food is 0.394 and at .01 significant levels it is statistically significant indicating that religious beliefs and attitude towards halal food are significantly correlated. The computed coefficient scores between religious beliefs and identity as Muslims is 0.329 and at .01 significant levels it is statistically significant. It is therefore inferred that religious beliefs and identity as Muslims are significantly correlated. The calculated correlation coefficient between religious commitment and awareness towards halal food is 0.076 and at .01 significant levels it is not statistically significant. It indicates a very weak correlation between the two constructs. Religious commitments and attitude towards halal indicates a correlation of 0.357 and at .01 significant levels it is statistically significant. The correlation coefficient between religious commitments and identity as Muslims is 0.333 and at .01 significant levels it is statistically significant. Therefore religious commitment and identity as Muslims are significantly correlated. The correlation coefficient between awareness towards halal food and attitude towards halal food is not statistically significant reporting a score of 0.168. We conclude that there is not much evidence to prove that the two variables share some association in the population. Hence forth, awareness towards halal food and attitude towards halal food are not significantly correlated. Awareness towards halal food and identity as Muslims is representing a very weak correlation with scores of 0.133. Lastly the calculated correlation coefficient between attitude towards halal food and identity as Muslims
is 0.52 and at .01 significant levels it is statistically significant. We therefore conclude with some degree of confidence that the two variables share some association in the population.

5.0 Discussion & Findings

The basic contention for this study was to measure the perception and awareness of halal food among the Pakistani consumers. In addition to this a preliminary investigation was made to unveil the conundrum of religiosity and consumer behavior and trace how former influences the latter. Considering the empirical findings of data analysis we infer that:

(a) Religion is the omnipotent source of religious beliefs for Muslims Consumers.
(b) Beliefs are closely knitted with religious commitments.
(c) People who are highly religious may not necessarily have high level of awareness about halal food.
(d) Attitude towards halal food is closely akin to the notion of beliefs.

The dogma of identity is more linked with intrinsic rather than extrinsic forces. Findings of this study generally suggest that Muslims consumer behavior is largely predisposed by their Islamic ideology. However, data supports the fact that a staunch believer and a highly committed Muslim may not necessarily be aware about the fact that whatever food is available in Pakistan is halal or not. Respondents are more concerned towards food as being halal rather than looking for negative connotation of haram element in the food item. In other words as long as the food does not overtly contain a haram item people will not mind consuming it. This may be due to the fact that Pakistan is named as “The Islamic Republic of Pakistan” based on Islamic ideology. Another important finding of this study is the notion of Self identity and its relationship with awareness and attitude towards halal food. Previous studies have suggested meaningful relationship between the self worth and consumer behavior (Biddle,1987; Govers & Schoormans, 2005; Granzin & Bahn,1982; Lindridge, 2002; Lindridge & Dibb 2003; Bonne et al., 2007) and have enumerated on the fact that social influences, pressures and strong Islamic identity have a bearing on our behavior. Our data does not support the fact and indicates a weak correlation amongst the notion of self-identity and awareness towards halal food. Although belonging to a collectivistic society (Hofstede,1984) where we are bound to act in a socially desirable manner, religion is deemed as a private affair and the decision to consume halal/non-halal food is solely based on intrinsic values rather than extrinsic.

Findings of the study also suggest that consumers generally perceive two things to be haram (forbidden) ; (a) pork and related products ; (b) alcohol and alcoholic beverages. Mixed responses were reported for other non-halal food items which again strengthen our claim for frugality regarding the awareness of halal food in Pakistan.

5.1 Need for further research

On academic level some general attempts are being made by researchers to delineate the importance and role of various religions such as Christianity, Islam, Hinduism, Judaism and other faiths in consumer behavior. Nevertheless, individual preferences and product choices based on religious inclinations have been rarely a focal point for marketers. It is only very recently that the potential of this lucrative yet untapped consumer segment has captured attention of the business world. However this segment has many behavioral intricacies enveloped by religious creed. There is a need to deeply probe into the normal perceptions of consumers towards halal logo and halal as a brand. It is also desirable to investigate into how the elements of branding concept can be incorporated with the notion of halal. Lastly, what would be the degree of acceptability and penetration of halal brands in Pakistani market as compared to normal brands?

5.2 Implications for marketers

Religion has been traditionally considered as one’s private affair with no linkage to commercial activities. However with evolving facets of consumers there is an impetus in demand for
products and services that adhere to the physical and spiritual need of individuals. Religious conviction is no more a private affair restricted to mode of worship but has provided a playing field to the marketers. It is gaining momentum as a dominant force behind consumer buying behavior and decision making processes. This study can be a starting point for the marketers in Pakistan to understand the need of halal food certification through an accredited body because many local and imported food products available in Pakistan have halal logo but it has no traceability.

Abstract
Purpose: To explore the effect of internal and external mandate on the new product development process in fast food industry of Pakistan. Design/Methodology: The total sample of 40 fast food outlets was selected to conduct study. All the owners of selected fast food outlets were given questionnaires for the concern study and results were analyzed through SPSS 17.0. Regression Analysis, F-Statistics, Correlation Matrix, ANOVA and Cronbach Alpha were run to compute the values of results. Findings: The results show that there exist positive correlation between the internal mandate and external mandate with the performance of NP process of fast food industry in Pakistan. The proposed model explores 57.4% variance in performance of NP process. Future Study: Future study is needed to be done in cultural aspects, communication gap between the top management and their employees, by improving society combined needs for NP Process, and by focusing on long term achievements for their successful product. Originality/ Value: The results of this study may help the fast food new entrants. It provides the internal and external fit between

Key Words: NP Process, Internal Mandate, External Mandate, Fast Food Industry.

1: Introduction:
According to Prince (2002) the concept of a food worldwide is changing significantly due to healthy eating habits, weight concerns and time constraints.
Busy schedules and eating pattern change is one of the major causes of transformation in the overall perception of food (Prince 2002). The only way to make the customer loyal is to respond to change the preferences of customers by a new product (Jeffery 1998). New Product development Process is a way to transform the customer preferences into a product (Meybodi, 2003). Henry et al. (1989) and Ramaseshan, Caruana, and Loo (2002) reported that NPD process provide a reason to an organization to be alive. According to the recommendation of Jeffery (1998) adoption of NPD process should be in accordance with the changes in market condition. Several studies have explored different aspects of NPD in different framework. Some studies show varying aspect of NPD practices and NPD factor consideration from country to country. Besides there are many research which has considered importance of different factors for NPD success such as Adis and Razli (2009) explored the impact of environment on NPD in relation with some other factors like strategic orientation, marketing strategy, market research activities
in the context of Malaysia. Factors recommended by Ramaseshan, et al., (2002) are customer orientation, cross functional integration, and proficiency of the new product team

Whether it is developed or developing country, NPD is a critical factor for success for any competitive industry like food industry (Suwannaporn, 2002). No other study has taken into consideration the NPD Process in the country of Pakistan which can analyze the practices of NPD in the fast food industry of Pakistan. This paper provides a theoretical framework with regard to NPD process by which the course of NPD can be estimated in the developing nation. This paper plays a role of pioneering study which has the contribution in practical framework as well. By this research NPD performance and consideration can be compared in developed and developing countries. This study assists strategically not only in the perspective of Pakistani environment but also guides to entrepreneurs whom are interested to invest in fast food industry of Pakistan so this paper has significant at international level.

The objective of this study is to observe the NPD practices in the fast food industry of Pakistan. To what extend NPD process has been accepted by this industry when it is required to bring a new product in the market? Furthermore this study also considers the factors, which have significant contribution in NPD process and can affect the success or failure of this process in the fast food industry of Pakistan. This research is going to address the following questions:

1. To what extend NPD process is being practicing in the fast food industry of Pakistan?
2. What are the key components in the internal environment which can affect NPD Process?
3. What is the influence of the external factors such as suppliers, customers, competitors and technology on NPD process in fast food industry of Pakistan?

2: Literature Review:

The history of product innovation as Charles M. Mayo states can be divided into three stages, first the product-oriented or technology-pushed stage, second stage market as the driver of innovation and final stage as skills required for making new products more complex. As earlier it is stated by the Henry et al. (1989) and Ramaseshan, Caruana, and Loo (2002) that NPD process leads to the healthy life of a organization because in this dynamic world of success old ideas get obsolete at their earlier stages whenever new idea takes a birth. So for this there is a complete process for the organization to keep their customer with them whether they are in a same industry meting same needs but with some new ideas. There are different steps of NPD process defined by different authors and scholars but the theme and stream of NPD process remains the same. As Koen et al. (2001, pp. 47–51) defined five different elements of NPD process.

1. Opportunity Identification
2. Opportunity Analysis
3. Idea Genesis
4. Idea Selection
5. Concept and Technology Development
Later on Cooper and Edgett (2008) asserts the following pattern of NPD process:

1. Preliminary market assessment.
2. Technical assessment.
3. Source-of-supply-assessment: suppliers and partners or alliances.
4. Market research: Product concept testing
5. Value-to-the customer assessment
6. Product definition
7. Business and financial analysis.

In a paper by Husig, Kohn and Huskela (2005) proposed a conceptual model for NPD which comprises of few phases of Innovation and three phases and three gates for NPD model:

- Phase 1: Environmental screening or opportunity identification stage in which external changes will be analyzed and translated into potential business opportunities.
- Phase 2: Preliminary definition of an idea or concept.
- Phase 3: Detailed product, project or concept definition, and Business planning.
The gates are:

- Opportunity screening;
- Idea evaluation;
- Go/No-Go for development

McGinnis and Vallopra (1998) have explored the way by which NPD process can be improved by the contribution of supplier, NPD success rate can be increased by three significant factors that are direction given by managers, policy of business and taking initiative in the purchase decision. NPD process must take from the perspective of consumer as new product is for consumer so consumer can guide in the better way the orientation of new product and new product that is consumer-oriented have more chances to be successful in the market (Bogue, Hofler & Sorenson 2005).

Moskowitz, Beckley, Mascuch and McKenna explore that segmentation enhance the understanding of consumer preferences by which product development process can be improved. Moreover they assume consumer’s knowledge about the product is more important than all other factors. High rate of failure in the new products is a common phenomenon that’s why new product decision must consider the alteration in cultural preferences and careful strategy development by management (Winger & Wall, 2006).

Winger & Wall, (2006) also said that market size is one of the most important determinants that lead to new product, by creating an opportunity for supplier, in an industry. New product development is a way by which an organization can create a competitive edge within an industry but hazard of failure is involved along with, which can be minimized by proper control by management and the tools of control can be careful screening and monitoring the whole program (Francis & Bessant, 1997). Bigliardi et al. (2010) suggests that involvement of R&D in every step of NPD can give you the idea about failure or success of new product before launch as R&D assists you to cope up customers as well as competitor response. Adis and Razli (2009) has enhanced the literary understanding of NPD process by assessing the nature of relationship between strategic orientation and NPD process that is significant which shows that new product performance can be moved up by exploiting technological enhancement, execution with the voice of customers, and understanding the competitive surroundings. Armstrong and Kotler (2005) reported that responsibility of a marketer is to be aware of the needs of customers and fulfill their requirement, by offering the product that can create superior value along with taking
into account the effective pricing and distribution strategy. Hung and Sung (2011) has considered
the applicability of six sigma in fast food industry by studying the practices of one of the fast
food industries of Taiwan and concluded that concept of six sigma is not practicable in fast food
industry, as this industry is very slow to respond to customers’ requirements. Soldatos and Hardy
(2007) has studied the impact of size of organization on NPD in the context of Australia in which
he explored that influence of management is greater in large size companies that pressurize to
reduce the expenses on the other hand in case of medium companies NPD process is not
implemented thoroughly due to insufficient resources. On the basis of the above literature the
hypothesis statements for testing are as follows

**H1:** Internal mandate is significantly and positively related to the performance of NP process of
fast food industry in Pakistan.

**H2:** External mandate is significantly and positively related to the performance of NP process of
fast food industry in Pakistan

3: Theoretical Framework:

![Theoretical Framework Diagram]

4: Methodology:

This study is a quantitative study. Questionnaire was adapted from past researches authored by
Lord (2000) and Suwannaporn & Speece, (2002) scales were used for NP process and for
Internal and external mandates. A total of 100 questionnaires were filled by the fast food
managers, sales persons and head of outlets.
4.1 Population:
The sample was derived from the population of fast food restaurants and outlets in Pakistan, because they experience the day by day progress of their existing products and need of new innovative products.

4.2 Scale Used:
The responses of participants were measured by 5-point likert scale in which 1 represent strongly disagree and 5 represent strongly agree.

5: Statistical Measurement (Data Analysis):
From the data entry to the Mean, Descriptive analysis, Regression analysis, correlation Matrix, ANOVAs, coefficients matrix SPSS 17.0 software was used and following results were deducted which shows the relationship of Internal and external mandate with the NP process of fast food industry in Pakistan.

5.1 Descriptive Statistics:
The table reveals the mean values of all the three variables which show the positive response of respondents towards the questions asked.

<table>
<thead>
<tr>
<th></th>
<th>Mean</th>

\(^a\) Predictors: (Constant), INTERNAL, EXTERNAL

The value shown in last column of the table given indicates that there are one or more significant predictors. As the significance value of regression is .000 that is less then F value of regression which is 27.223 thus I can say that the Internal and External Mandate are the significant predictors of dependent variable Performance of the NP Process. The df (degree of freedom) column shows the first value which is 2 which shows that there are two independent variables, second value of 37 shows total number of complete responses for all the variables in the equation minus number of independent variables. The F statistics produced at (F=27.223) is significant at .000 level.

\(^a\) Dependent Variable: NP

6: Results Discussion:

External mandate was found to have positive and significant relationship with performance of NP process (r=.723(**), **.p<0.01). It shows that in context of Pakistan external mandate is also a very elegant factor in the performance of NP Process. There was also found positive and significant relationship between internal mandate and performance of NP process (r=.620(**), **.p<0.01), because the internal mandate is considered as valuable asset of any firm. This shows that it is an important factor which contributes to the success of NP Process.
Also the internal mandate was found to have positive and significant relationship with the external mandate ($r=.544(**)$, **$p<0.01$) which shows that strong combine relationship of both the internal and external mandate contribute in increasing the performance of the NP Process. So, all the three variables confirm the theoretical hypothesis.

The above discussion shows that this study will be helpful for the new entrants. As in Pakistan the fast food trend is growing day by day so the owners of fast food should recognize the internal and external facilitators to grow better and best.

6: Recommendations and Future Implications:

After the deep study of fast food industry, this study has analyzed some problems faced by this industry.

- One of the area in which this industry lacks is the similar core competency of different restaurants this industry of Pakistan. Due to the similar foundations, players in this industry don’t come up with unique ideas. There are almost similar products in which all the restaurants deal with. The future area of research reveal by this limitation which is associated to the identification of the way that how the troupe of this industry alter the pattern of imitation which they have been adopting since the growth of this industry.

- Secondly, there exists communication gap between the top management and employees working here. Literature is the evident that employees can be a great source of many of good ideas for new product. Particularly the employees who serve customers, if encouraged, can be a considerable asset of the organizations because most of the time they are the first knower of the complaints of customers. This gap calls for the attention of researcher to identify bring this issue under the concern of this industry.

- Thirdly, Another substantial phenomenon is concerned with the acceptance of the NPD process which is dependent upon the factor that how much their potential customers are influenced by the society in which they are living because society influence a lot in selection of whether to buy any product or not so the future implication for this limitation is that the NPD team must be able this industry to improve their new product success by improving their product on the basis of the society combined needs so to increase the adoption level of their product.

- Fourthly, most of the fast food companies rely on the achievement of their current objectives of fulfilling their customer need and does not focus on the long term achievement of their successful product. Future area of this deficiency is the study that can increase the awareness of Pakistan fast food industry to the importance of future insight.

- Finally, another important aspect is the culture of the different people living in a country that affect the success of the new fast food product. Future based research is the recipe to cook cultural food in a different manner.

Abstract
This Study focused on employee empowerment and how empowerment is related to job satisfaction and employee’s commitment with the organization in the banking sector of Pakistan. It also evaluates the empowerment given to employees in banking sector of Pakistan, their satisfaction, and commitment level. Hypothesis statements contend that employee empowerment positively affects the job satisfaction and employee’s commitment. Data was collected from 334 employees from the different branches of banks in Lahore. Findings of the study support the hypothesis. In addition, it is also found that job satisfaction has a positive impact on employee’s commitment with the organization. Employee empowerment offers organizations an invaluable tool in their quest for organizational competitiveness.

Keywords: Employee Empowerment, Job Satisfaction, Employee Commitment

1. INTRODUCTION

Effective management is the foundation for creating high morale, high productivity, a sense of meaning and belonging for the employees and also for the organization. The success of an organization depends on the ability of the organization to continuously nourish the satisfaction of its employees so that they can perform their best for the organization. There are a number of job characteristics which are considered crucial to the employee satisfaction and all these variables (characteristics) are linked with each other as all of them influence the way employees feel about their job and organization.

A workplace phenomenon, employee empowerment, continues to cultivate the attention of business administrators, organizational socialists, Human Resource professionals, and psychologists. It is one of those terms that everyone thinks that they understand it but in reality only a few of them knows what actually it is. If different people are asked about the question “What is employee empowerment?” then everyone will be having a different answer to this question. In fact, if we research a dozen of organizational theories then there will be as many answers to the same question. In other words, the organizations, which have empowerment policies in their management, define empowerment according to their own usefulness and scope in practice.

Over the centuries, our working lives are explained by the concepts of hierarchy, power, and bureaucracy. But now due to the concept of empowerment, the vertical hierarchy, authority, and power are delegated up to some extend to untie the employees from many of the limitations of organized power relationships in the organization.

“Empowerment is a human resources term that involves a power transfer from higher levels of employees to lower levels of employees within an organization.” (Cunningghham, 1996). When
most people refer to employee empowerment they do not only mean delegation but it is more than that and that is the reason that there are a numerous studies which has defined empowerment in different aspects.

Some of these definitions are vague and meant to be so. (Block, 1987) describes empowerment as "a state of mind as well as a result of position, policies, and practices”.

2. OBJECTIVES
The objective of this study was to answer the following questions.

How does empowerment relate to the job satisfaction of the employees?
How does empowerment relate to the commitment of the employees with the organization?
How does satisfaction of employees regarding to their jobs relate to the commitment of employees with the organization?

The purpose of this study was to highlight the relationship between Employee Empowerment, Job satisfaction, and Employee’s Commitment with the organization. The findings will provide the management of the organizations the direction to understand the balance of performance elements with employees and trust their employees by empowering them to make them satisfied and committed and to help the organization as well.

3. LITERATURE REVIEW
In this section, literature review on Employee Empowerment and Job Satisfaction is discussed. The researches done by different researchers and models are described.

3.1 Employee Empowerment:
Creating a working environment where employees are allowed to make decisions on their own regarding specific work related situations is employee empowerment. The decisions taken by employees could be small or large and the effects of those decisions is depend upon the employer that how much authority he has given to the employee.

Every organization has its own way to describe and implement empowerment according to its usefulness and scope in practice. Even though it is very difficult to assign an exact definition to empowerment but a few more definitions are:

Empowerment means giving people their head. It means that the management is delegating the authority to the employees while commanding less (Rock, 1994). In management point of view, empowerment is “giving up some control to the employees and sharing information regarding company goals and achievements of the employees, its acceptance of risk by taking more responsibility” (Lorette, 1991). “When employees are encouraged to take decisions and initiate actions with less control and direction from their manager then that means they are empowered by their manager” (Handy, 1993). Empowerment is a process in which the feelings of self efficacy are enhanced in the employees of the organization by identifying the conditions which promotes powerlessness and by removing those conditions by formal organizational practices and informal techniques of providing effective information throughout the organization (Conger & Kanungo, 1988). For the purpose of this thesis study, the definition of empowerment which was given by Conger and Kanungo will be taken as the basic definition.

The concept of employee empowerment is not fairly used when it is compared with the size of employee population and it can also be easily misconstrued by the organization as every
A straightforward model has laid out for organizational empowerment by Blanchard. In this model, he contends that “empowerment is not a magic but it consists of some simple steps to be followed and a lot of persistence by the management” (Blanchard, 1996).

Communication, creating autonomy and self-directed work teams are the keys on which Blanchard’s model is based. (i) Communication is the first key to empower the employees and to make them feel like the owner of the organization, it is important to share information with them. Sharing information encourages them to act in the best way (Blanchard, 1996, p. 27). (ii) Autonomy is the second key to empower employees in the organization. “Employee autonomy is the degree to which employee has substantial autonomy to perform the job and he has freedom, independence and discretion in scheduling the work and in determining the procedures to carry out the job” (Hackman J. & Oldham, 1998, p. 162).

According to (De Jonge, 1995, p. 13), “employee autonomy is the independence, self determination, and freedom of the worker to determine different factors of the task”. Bary claimed that “employee autonomy is important for the employees as well as they want to have freedom and independence in determining the factors related to their work in their own way” (Brey, 1999, p. 15). (iii) Self Directed work teams is the third key to empower the employees is to replace the hierarchy of layers (Blanchard, 1996, p. 57). In the concept of self directed work teams, the employees from the lower level can form teams to perform the task and in this way they will be able to perform in a better way. These teams have the responsibility of an entire process from start to end stage. A number of employees make a team and they select a leader among themselves so they all feel equally powered and share responsibility. They do not need a manager to supervise as they make one by themselves. Thus, the employees feel less dependent on the manager or supervisor and feel themselves empowered teams. These empowered teams can perform better than the empowered individuals but it is necessary that they should know how to work in self-directed teams. All these three keys must interact with each other in order to implement a successful empowerment in the organization. Empowering all employees means they all should work together in a way by which the organization can become the best.

Two aspects have been developed from Conger and Kanungo’s work (1988) with an addition to Thomas and Velthouse’s work (1990). First aspect is organizational empowerment which is also named as multi-dimensional perspective. This aspect is basically about the supervisor’s behavior regarding empowerment and also related to the policies which includes top-down level in the organization. Organizational empowerment is regarding the responsibility of organization and managers to help their employees delegate the responsibility to them and share the information with them (Bryman, Dainty, Greasley, Price, Soetanto, & King, 2005); (Cole & Diaz, 2003); (Koh, 2001); (Spreitzer, 1995). The other aspect is regarding employee empowerment or intrinsic motivational dimensions. This aspect of empowerment is regarding, how an individual perceives empowerment. It has also been related to bottom-up polities of organization (Bryman,
As this aspect deals with the employee’s perception and experience about empowerment and this study is also related to employee empowerment and the satisfaction so the focus will be now on this aspect.

Employees can be empowered in two different ways either by supporting an environment which build competencies, motivation and knowledge sharing or by giving them authority and autonomy. (i) Psychological empowerment relates to the internal beliefs of the employee. It is the feeling of being in control of one’s future, of being able to make choices about how when and where the skills can be get advanced and where one can use those new skills. When employees get their skills advanced, they become confident about their work and they will get opportunities to apply those skills and new knowledge. Psychological empowerment has been described as a vehicle for instilling motivated behavior throughout organizations (Conger & Kanungo, 1988). (ii) Discretionary empowerment means that employees have the decision making power and they have the power to make changes in their work environment and also they can access the ones who have decision making authority. Primary discretionary empowerment is a broader concept as compared to the structural empowerment as there is an indication that authority which is beyond current role boundaries is given to the employees where as “structural empowerment involves transfer of power from the higher authorities to those who are below in hierarchy and it is also term as delegation of power” (Ozaralli, 2003). So, employees can be empowered by giving them authority to undertake assigned roles.

3.2 Job Satisfaction:

When an employee is empowered by the management then he or she may change their attitudes regarding their job which may affect their job satisfaction level. There are numerous articles which are published on job satisfaction. This section will look at some definitions given by different researchers about job satisfaction and also look at some of those articles.

Job satisfaction is the pleasurable emotional state of an employee regarding his or her job duties, supervisor, working situations and the organization. Additional research was done on satisfaction and dissatisfaction of employees and it was find out that “those employees who are dissatisfied with their job are more likely to leave the organization for some better opportunity or place as compared to the satisfied employees” (Mobley, 1979). Dubinsky and Skinner (1984) argue that “if an employee is satisfied with the job then he or she will show commitment to the organization, the higher the job satisfaction the more the commitment” (Dubinsky, 1984).

A research involving non-supervisory hospitality employees was done by LaLopa (1997) which indicated that “employee’s job satisfaction is the most important factor in the study of turnover intentions because it plays a very important role in turnover process. It shows the intentions of an employee, to quit or stay with the organization” (LaLopa, 1997).

For a service industry employee, job satisfaction is a very important factor because it is usually assumed that if an employee is satisfied with his job in service industry then he or she will have satisfied customers. And job satisfaction also contributes in decreasing the turnover rate and increasing the commitment level of the employee.

An organization can increase the employee performance and satisfaction and decrease then turnover and absenteeism by evaluating the job satisfaction. If the management evaluates the value perception of employees then it can create a work environment which will lead to satisfied employees.
According to an employee loyalty specialist, Marc Drizin, “employees are the assets with feel. They are the only resources which a company has to make a conscious decision to return the next day” (Modic). A survey regarding Power and Associates concluded that “there are not only the obvious customers who are needed to be satisfied but the employees of the organization are also needed to satisfied in order to get customer satisfaction” (Kash, 2003).

There are a number of effects which job satisfaction has on an organization. The most relevant and profitable effects are described below:

According to the results of different studies, “the businesses which are doing extremely well in achieving the job satisfaction of their employees reduce their turnover by 50% from norm, increase customer satisfaction to an average of 95%, lower labor cost by 12% and increase the profit margins by an average of 4%” (Carpitella, 2003).

Employee turnover, customer satisfaction, labor costs, and pretax margins are not only the factors which improve by job satisfaction. But it also affects the products, customers, and company in a positive way.

“If the company has productive, loyal, and satisfied employees, employees who are committed to the organization and who have a sense of team work then they will give the best service to the customers. In this way the customer perception of the value of service will be influenced heavily in a positive way and that will cause customer satisfaction. Customer satisfaction has direct affect on customer loyalty and when an organization has loyal customers then it will have profits and growth as well” (surveys.(n.d.)).

A theory was developed by Herzberg (1959) which is known as “motivator hygiene theory”. The main purpose of the theory was to convey the idea that job satisfaction and dissatisfaction are not the reverse of each other but these two are entirely different concepts. According to Herzberg (1959), the opposite of job satisfaction is no satisfaction and opposite of dissatisfaction is no dissatisfaction. The main difference between job satisfaction and dissatisfaction is that job satisfaction is the feeling of an individual about the content of the job where as dissatisfaction is due to the feelings of an employee regarding the context or environment in which his or her work is accomplished. “In this theory, the motivator is the variables that relate to actual content of the job such as recognition or achievement. Motivators are basically more related to the satisfaction side of the job. Hygiene aspect is basically regarding the context of the job. It includes the aspects such as employee benefits. Hygiene factors are more towards the dissatisfaction side of the job” (Herzberg, 1965).

Job satisfaction is also described in traditional theory which was given by Hazer (1976). The theory was given in contrast to Herzberg (1959) “Motivator hygiene theory”. This theory represents job satisfaction and dissatisfaction at the same platform. Traditional theory looks at the feeling of an individual as a whole, including the job related factors and the environment related factors. “Traditional theory gives a spectrum of neutrality according to which an individual is neither satisfied nor dissatisfied with his or her job or position. But satisfaction and dissatisfaction are polar opposite. This theory is not given by a single person but it is evolved as a traditional view” (Hazer, 1976).

To choose the definition of job satisfaction, the search field was divided. There are a number of people who believe and support motivator hygiene theory but there are also many who feel the evidence support the traditional theory. But there is another group of people and according to them neither motivator hygiene theory nor the traditional theory is correct regarding the feelings...
of an employee towards his or her job. They believe that one simple attitude cannot measure the job satisfaction.

There are a number of factors which affect the job satisfaction. (i) Employee turnover and absenteeism is the first factor which affects the job satisfaction. Different studies have been done on it and it has been revealed through them that usually if “people like what they do but do not like where they do it then this will cause the turnover of the employee” (surveys.(n.d.).) . (ii) Voice employee participation is the second factor that affects the job satisfaction. It is the responsibility of the management that they find out whether the employees are happy and if they are not then what are the reasons behind that.

Management needs to find out them and then solve them in order to make their employees happy with the working environment. Foy (2004) gave different ideas to help the management how to give voice to the employees to tell what is going in the organization. He suggests that “if the employees want to remain anonymous so that there would be no offense to the boss then for such employees there is a suggestion box. And they can put their problem or suggestion in that” (Foy, 2004). (iii) Valued employees are the third factor which effects the job satisfaction.

A study was conducted by “Big Builder” in 2003 on “employee satisfaction” reported that “according to the responses, there is a clear need to give employees a greater role in the decision making” (Leibowitz, 2003). “Employees feel themselves valuable when they participate and when they see that the results stemming from their actions” (Calder, 1999). (iv) The fourth factor is to give opportunities of training and to increase the knowledge. According to Clark (2001), there are two ways for the companies “either to invest and provide training and growth opportunities or to pay the costs of the turnover later” (Clark, 2001). (v) Leaders/ Supervisors/ Management are the fifth factor which affects the job satisfaction.

A national workforce retention survey was done by the Daniels Group, an executive search firm. According to the results of that survey, the management of an organization plays a very important role in increasing the satisfaction of the employees. Supervisors are a determining factor in employee satisfaction and to support this finding, 64% of committed employees were surveyed by the Hay Group. According to that survey, it was reported that the employees found satisfaction with coaching and feedback. So, coaching and feedback are one of the top factors that lead to the employee satisfaction.

NBRI surveyed 15,000, largely white collar, employees nationwide from all levels of participating organizations... There were 20% managers/supervisors, 91% worked full time, the average age was 33 and even proportion of males and females.

NBRI (National Business Research Institute, Inc.) (2005) identified six factors that influence job satisfaction, as a part of a large project whose goal was to create employee driven survey improvement process. When there is positive increase in these factors then job satisfaction also increases and when these six factors are low then job satisfaction also decreases. These six factors are (i) Opportunity: Employee survey studies show that when employees get challenging opportunities at work then they possess more job satisfaction. (ii) Stress: The most important factor that affects the job satisfaction of employees is stress level. When stress level is high that means employees have low job satisfaction. (iii) Leadership: Data from employee satisfaction survey shows when employees have good leaders then they show more job satisfaction. (iv) Work Standards: NBRI survey data concluded when the employees take pride of the quality of work performed by the work group, then they possess more job satisfaction. (v) Reward:
Employees have more job satisfaction when they feel that they are rewarded fairly for the tasks they have performed. (vi) Adequate Authority: When the employees have freedom to take decisions on their own up to some extent then they feel satisfied. Management should give adequate authority to their employees in order to make them satisfied and committed.

3.3 Employee Commitment:

Defining and creating employee commitment is an evolving topic currently receiving considerable attention. It had been identified as a multi-dimensional concept which had important impacts on an organization through its effects on employee performance, turnover, and absence, and via its influence on customer attitudes to the bottom line.

“Commitment was divided into five components, each of which was created by different factors which were Affiliative, Associative, Moral, Affective, Structural.” (Allen N, 1990).

Affective commitment is the form that has most potential benefit for an organization, as it directly influences how employees perform their jobs. This form of commitment is increasingly referred to as ‘engagement’ among HR professionals and is the form most usually measured by organizations. Organizations that take positive steps to create commitment appreciate that it is a vital component of business success. They recognize that it can take various forms and are able to concentrate on the ones that are relevant to themselves. Commitment is a two way process which the organization itself has to initiate. This can be done by creating a clear employer brand and group identity so that the right people are recruited. The organization then needs to ensure that the values of its brand image are delivered, by treating employees fairly and maintaining trust.

Job satisfaction is an important component of commitment, but should not be perceived as equivalent to it. Commitment has more positive outcomes for the organization in terms of employee performance. Job satisfaction can be promoted by making work as enjoyable as possible, providing growth and development opportunities and making provisions for staff to assist them in balancing their work and personal lives. Once established, commitment has to be maintained by ensuring staff has clear roles and responsibilities, and an understanding of what is required of them in their jobs. Good communication and openness throughout the organization is vital, especially in times of change. The role of line managers should be recognized and positively supported, as it is a vital component in the creation and maintenance of employee commitment.

3.3.1 Benefits of Employee Commitment:

The performance benefits accrued from increased employee commitment have been widely demonstrated in the literature. To list but a few, these include:

- increased job satisfaction (Lance, 1992)
- increased job performance (Mathieu J, 1990)
- increased total return to shareholders (Walker Information Inc., 2000)
- increased sales (Barber et al., 1999)
- decreased employee turnover (A, 1991)
- decreased intention to leave (Balfour & Wechsler, 1996)
- decreased intention to search for alternative employers (A, 1992)
With this in mind, employee commitment should be viewed as a business necessity. Organizations who have difficulty in retaining and replacing competent employees will find it hard to optimize performance. There are not only the immediate expenses of the recruitment process, but other hidden costs such as management time and lost productivity as new employees take time to become effective in their roles.

4. METHODOLOGY

4.1 Questionnaire Designing

Study conducted was explanatory and cross sectional, basically its purpose was to find the relationship among three variables that were Employee Empowerment, Job Satisfaction, and Employee’s Commitment. Questionnaire was used for the process of data collection.

The questionnaire was consisted on four parts including (1) Personnel Information; (2) Job Satisfaction of the Employee, (3) Employee Empowerment, the employee was having on the workplace and (4) Employee Commitment with the Organization. The responses were measured by using five point Likert Scale. Collection of data was done by handing over the questionnaires to the employees personally and some of them were mailed also. After receiving all the questionnaires, the scored data was entered into the SPSS 15.0 for data analysis.

Pre-testing of this questionnaire was done by distributing the questionnaire among employees of a randomly selected bank branches, so that the reliability and validity of the questionnaire could be measured. SPSS version 14 was used for the analysis of the data.

From the Service sector, banking sector was selected being one of the biggest and fastest growing sectors in Pakistan. Sample size was limited to 334 working employees, both male & females, considering the time and financial constraints. Twelve Commercial banks selected for the study include MCB, Allied Bank Limited, Meezan Bank Limited, Bank of Punjab, Standard Chartered Bank, United Bank Limited, Silk Bank Limited, Askari Bank Limited, Bank Alfalah, Habib Bank Limited, Faysal Bank Limited and Bank-Al Habib Limited.

4.2 Sampling Technique

Multi stage random sampling was used for the study. To start with from service sectors, banking sector was selected based on the objective of the study. At first stage 12 banks were selected randomly from the list of more than 35 local and international banks working in Pakistan. At Second stage, Lahore based 18 branches of the randomly selected 12 banks were selected randomly based on the list of branches. At third and last stage, Lists of employees of the selected branches were obtained and 334 bank employees were selected randomly for data collection.

5. HYPOTHESIS

The hypothesis statements made for the study were:

1. Employee Empowerment has a positive impact on employee Job Satisfaction.

According to this Hypothesis, if the employees are empowered then they will be more satisfied with their jobs as compared to those employees who are not empowered. To find out this relationship between Employee Empowerment and Job Satisfaction, this hypothesis was made.
2. Employee Empowerment has a positive impact on Employee Commitment.

The second Hypothesis explains that if employees are empowered then they will possess high commitment level with their organization and if the employees do not have empowerment then they will have a low commitment level with the organization they are working for. To find out this relationship this hypothesis was made.

3. Job Satisfaction has a positive impact on Employee Commitment.

If the employees are satisfied with their jobs then they will be committed to the organization and will less likely to shift to another organization. To find out whether there is positive relationship between Employee Commitment and Job Satisfaction, this hypothesis was made by the researcher.

As the aim was to find out the relationship between these three variables, these hypothesis statements were made. For each hypothesis statement the dependent and independent variable was different.

In the first hypothesis statement, where the objective was to find out the relation between Employee Empowerment and Job Satisfaction, the dependent variable was Job Satisfaction where as Independent variable was Employee Empowerment.

For the second hypothesis statement where the objective was to find out relation between Employee Empowerment and Employee Commitment with the organization, the dependent variable was Employee Commitment and the independent variable was Employee Empowerment.

The third hypothesis was about the relationship between Job Satisfaction and Employee Commitment with the organization and for that the dependent variable was Employee Commitment and the independent variable was Job Satisfaction.

As the literature review suggested different other factors other than Employee Empowerment which could had an impact on Job Satisfaction and Employee Commitment, to find out the only impact of employee Empowerment on the other two factors, all the other factors which had impact on Job Satisfaction and Employee Commitment were held constant for the study.

6. STATISTICAL TOOLS

Regression analysis was used in order to test the hypothesis statements and to find out whether there is any linear relationship exists and that is positive or negative. Linear equation was sued to represent the relationship.

\[ Y = a + bx + e \]

Where \( Y \) is the dependent variable, \( x \) is the independent variable, ‘a’ is a constant, ‘b’ is the slope of the line, and it tells the intercept and coefficient for each independent variable.

Coefficient of Determination \((R^2)\) was also used which tells how well the model is explained by the data. The value of \( R^2 \) tells what percentage of variances occurred in dependent variable is due to the independent variable.

7. DATA ANALYSIS

After collecting the data, it was analyzed. SPSS was used for the analysis of the data. The analysis of demographic data represents the analysis of different characteristics of the respondents participated in the study.

| Range of Salary | Less than 25000 | 76 | 22.8% | 26000 – 40000 | 173 | 51.8% | 40000 – 60000 | 63 | 18.9% | More than 60000 | 22 | 6.6% | Total | 334 | 100 |

Majority of the respondents, 263 out of total sample of 334, 78.7%, had shifted their jobs due to different reasons. Different reasons which included Work environment, Salary, No career advancement opportunities, Lack of job clarity, Better opportunity, were asked in order to find
out the major reason behind shift in the job. Frequency distribution was used in order to find out the main reason. Different respondents mentioned different reasons and for a few of them there were multiple reasons behind shifting their previous jobs. Frequency distribution was used in order to find out the main reason. Different respondents mentioned different reasons and for a few of them there were multiple reasons behind shifting their previous jobs.

After analysis the major reasons found behind shifting the jobs were working environment and to find out better opportunity. After these two reasons salary was one the third number as a reason for shift in the job. No career advancement opportunity and lack of job clarity were found at the lowest level to be a major reason for shift in the job.

To determine the factors which are most important for the employees while working for an organization, respondents were also asked to give their preference level regarding different work related factors which included working environment, Level of authority, Pay package and bonuses, Job clarity and Designation.

<table>

</tbody>
</table>

By comparing the means of all the factors according to the scale mentioned in scoring criteria, it was found that working environment, pay package and bonuses and job clarity having means 2.36, 2.47 and 2.47 respectively are the factors which were preferred by most of the respondents whereas level of authority, superior subordinate relationship (respect) and designation having means 2.92, 2.75 and 3.12 respectively are the factors which were more towards does not matter or neutral opinion by the respondents.

For the statistical analysis Regression analysis and correlation was used to find out the relationship between the variables.

7.1 HYPOTHESIS 1:

Employee Empowerment has a positive impact on employee Job Satisfaction.

The independent variable was Employee Empowerment and dependent variable was Job Satisfaction.

* Significant at .001 level of significance

For all categories the independent variable was Employee Empowerment and the dependent variable was Job Satisfaction.

The relationship was found positive and significant between Employee Empowerment and Employee’s Job Satisfaction. The first hypothesis was also analyzed for different categories separately which were Gender, Type of Organization and Level of Management, to find out in which category the relationship was strongest between Employee Empowerment and Job Satisfaction and to see the variations in the need of Empowerment and Job Satisfaction through different categories.

7.11 Research findings for Hypothesis 1:

H1 was not rejected at 0.000 significance level (P value < 0.001). The value of correlation was found 0.817 and 66.8% of variation in Job Satisfaction was due to Employee Empowerment. There was a positive relationship between Employee Empowerment and Job Satisfaction and with every one unit increase in Employee Empowerment there was 0.736 unit increase in Job Satisfaction. It was found that the respondents under the study were more towards neutral and disagree opinion regarding having Empowerment and Job Satisfaction.

A strong and positive relation between Employee Empowerment and Job Satisfaction was observed under the above mentioned categories also. The empirical finding for the gender wise analysis showed that Empowerment had stronger impact on Job satisfaction for females as compared to males. Female employees were found to get more satisfied in the presence of Empowerment as compared to male employees and also in the absence of Employee empowerment, female employees were found dissatisfied with their jobs which meant female
employees were more interested in Employee Empowerment. In the comparison of types of the organizations, it was found that the employees in Gov. and Semi Gov. Organizations were found more interested in having empowerment to be satisfied with the jobs as compared to the employees working in Private and Public organization. Similarly the Top level management was found more towards having empowerment so that they can be satisfied with their jobs as compared to the middle level management and the officers.

7.2 HYPOTHESIS 2
Employee Empowerment has a positive impact on employee’s Commitment with the organization.

The independent variable was Employee Empowerment and dependent variable was employee’s Commitment with the organization.

Model Summary

* Significant at .001 level of significance
For all categories the independent variable was Job Satisfaction and the dependent variable was Employee’s commitment with the organization.

7.31 Research findings for hypothesis 3:

H3 was accepted at significance level of 0.000 (p value < 0.001). 53.2% of the variations in the Employee Commitment with the organization were due to the Job Satisfaction of the employees. There was a strong positive relationship between Job Satisfaction and Employee Commitment as with an increase of one unit in the Job Satisfaction there was 0.966 unit increase in the Employee Commitment to the organization where as in the absence of Job Satisfaction, the Employee Commitment was very low.

A strong and positive relation between Job Satisfaction and employee’s Commitment with the organization was observed under the above mentioned categories also. The empirical finding for the gender wise analysis showed that Job Satisfaction of female employees had stronger impact on Employees Commitment with the Organization. Female employees were found more committed if they had Job Satisfaction as compared to male employees. In the comparison of types of the organizations, it was found that the employees in Gov. and Semi Gov. Organizations were found more interested to be satisfied with the jobs so that they remain committed with their organizations as compared to the employees working in Private and Public organization. Similarly the Top level management was found more towards having Job Satisfaction so that they can be committed with their organizations as compared to the middle level management and the officers and also when they had no job satisfaction then they were more towards changing their jobs (no commitment).

8. CONCLUSIONS

The study leads to the following conclusions:

1. This study was drawn on the survey data collected by 334 respondents who were employees in different Banks to primarily investigate the impact of Employee Empowerment on Job Satisfaction of employees and also Employee Commitment. The study revealed informative and practical results which clearly showed that Employee Empowerment had a strong impact on Job Satisfaction and Employee Commitment with the Organization.

2. The survey procedures, sampling, and data analysis supported the study’s key hypothesis that Employee Empowerment had a positive impact on Job Satisfaction and Employee Commitment.

3. Empowerment will lead to an employee to get satisfied with his or her job and also to be committed with the organization. And employee who does not have empowerment, which means that he or she has no authority to make decisions for his/ her work related activities and also does not has sufficient autonomy to perform the job, will not be satisfied with his/ her job and will try to find out better opportunities for work and that is why they will be less committed with their organization.
4. Low Empowerment leads to low Job Satisfaction. This study clearly showed that the employees, who were not empowered by their management, were also not satisfied with their jobs. Similarly, the employees who were empowered by their management were satisfied with their jobs also. So, Employee Empowerment and Job Satisfaction have direct positive relationship.

5. Empowerment leads to Commitment with the organization. Employees, in the study, who were empowered by their management, were intended to stay with the organization and those who were not empowered, were less committed with their organizations.

6. Furthermore, the relationship between Job Satisfaction and Employee Commitment with the organization was also found. Job Satisfaction, an employee have, will lead him to be committed with the organization. The employees, who were satisfied with their jobs, were also intended to stay with the organization where as those, who were not satisfied with their jobs, were intended to shift to another organization and showed less commitment with their organizations.

7. So Hypothesis-1 and Hypothesis-2 showed very significant relations and they also supported to the basic purpose of this thesis study that Employee empowerment and Job Satisfaction, both are positively related and also that employee Empowerment and Employee Commitment with the Organization are positively related. Hypothesis 3 showed that Job Satisfaction and Employee Commitment are also positively related, more the Job Satisfaction more the Commitment with the organization.

9. LIMITATIONS
1. All employees working in an organization do not rank their personnel level of satisfaction and empowerment using the same scale.
2. Only banks were taken from the service sector. The result could vary in other sectors.
3. Despite Employee Empowerment, there are other factors also e.g. age, tenure of total professional period, marital status, personnel preferences, tenure spent with the current organization etc which can have an effect on Employee Job Satisfaction and commitment but they were held constant for the study.
4. Selection of branches was random. Not all the banks and branches were covered for the study.

10. RECOMMENDATIONS
1. Employees should be empowered in organization because it’s through empowerment that an organization will be able to survive, grow competed, and face challenges posed by globalization with confidence.
2. Managers, in various organizations must accept that empowering individual employees is empowering the entire organization. Therefore, managers should empower employees from time to time to increase job satisfaction, commitment and reduces employee turnover.
3. Leaders who empower employees must be at all levels of the organization. Empowering leaders must not just delegate and disappear. They must mentor their employees so that they have good chance of being successful in decisions they make. This mentoring process involves training and providing them with the necessary resources especially the information resource.
4. This research should be conducted in other cities of the country to get comprehensive data about Employee Empowerment and its effect on Employee’s Job Satisfaction and Commitment with the organization.

5. The research can be done in other sectors and industries also to get information whether there are empowerment policies in other organizations and if yes then are they implemented properly and have an effect on the Job satisfaction and commitment of the employees.

Dr. Mayhoub Abdul Azim Mayhoub is Egyptian citizen. Started teaching English (as second language) in Egypt from 1994. Promoted to lecturer in 2001 and then to Assistant Professor in 2005. Teaching ESL in the Gulf since 2003. Coordinator of GRC 111 & GRC 122 at KAU. Participated in international training courses and conferences in Egypt, Saudi Arabia, USA, and UK. Obtained Ph.D in 2005. Certified team member at the COE (accreditation body in USA). Academic interests include methodology, adult education, and educational policies.

Abstract
This research paper focuses on the Accreditation of Jeddah Community College. Faculty perspective is also kept in view for Accreditation of Jeddah Community College. Study focus on identifying strengths and weaknesses in the accreditation process of Jeddah Community College and to recommend guidelines that will facilitate future international partnerships; and to generate some theory inherent in the dynamics of accreditation.

Keywords: Accreditation; Jeddah Community College; Faculty perspective

1. Introduction
Much of the literature on accreditation of higher education institutions reveals foci on in-depth context specific processes and outcomes. There has been a general dearth of writing on the philosophy of accreditation, the power- and group dynamics operating within this phenomenon, strengths and weaknesses of the accreditation process itself, tensions and dilemmas within institutions seeking accreditation, etc. Does accreditation imply some sort of equal partnership or a top-down relationship based on compliance and unequal power relations? Is it a “paper qualification” which has very little practical value to the ultimate client, in this case, the student? The Council for Higher Education Accreditation (2006) states that: “Accreditation is a process of external quality review used by higher education to scrutinize colleges, universities, and educational programs for quality assurance and quality improvement”. The term “scrutinize” suggests a detailed review to ensure adherence to prescribed norms and criteria. It also conjures up images of diligent and voluminous record keeping, and includes feelings of success or failure. This paper, as with much of the literature, will attempt a critical reflection of the accreditation of a college in Saudi Arabia by an accrediting agency in the United States. In examining this
process, the authors will go beyond the institutional context and extract salient features of the study and use them to formulate some theory around the whole notion of accreditation. It must be stressed at the beginning that this investigation was conducted from the standpoint of faculty involved in the various standards that formed the pivot on which the entire process revolved. It also includes those faculty involved in various roles as coordinators or key teaching personnel who were responsible for the day-to-day mechanics of document preparation, compilation and collation; liaison with different entities within and outside the college for information gathering; conducting of regular progress check meetings; active participation in workshops; translation of certain texts into English; attention to students and the classroom environment; etc. The study therefore does not incorporate a student, management or societal perspective.

2. Aims of the study
The aims of the study are threefold:

➢ To identify strengths and weaknesses in the accreditation process of Jeddah Community College;
➢ To recommend guidelines that will facilitate future international partnerships; and
➢ To generate some theory inherent in the dynamics of accreditation.

3. Institutional Background
Before discussing the accreditation of Jeddah Community College further, a background sketch of the institution is necessary. Jeddah Community College (hereafter referred to as JCC), is a division of King Abdul Aziz University (KAU). Established in 2002, it is a relatively young institution. At the time of accreditation it was just 7 years old. JCC has a student population of about 1100 male students. Prior to registration, students have the option of enrolling for and completing a 3-year associate degree in either Business -, Computer -, or Health Information Technology. Since all programs are taught through the medium of English, all students have to undertake an Intensive English Course in their first year of study. This course supplements whatever English they learned at secondary school or elsewhere. In addition, students have to study mathematics and some information technology in their preparatory year.

4. The Process
The idea of entering into international partnerships was, and remains, part of the strategic plan of JCC. In 2008 the senior management of JCC held preliminary discussions with the leadership of the Louisiana Community and Technical College System (LCTCS), a state-funded public postsecondary education network of nine community colleges and eight technical colleges located in the state of Louisiana in the USA. The President of LCTCS nominated JCC to be accredited by the Council on Occupational Education (COE). The COE was chosen as the accrediting agency because it is the agency that has accredited the Louisiana Technical Colleges for over 25 years. Following senior management’s communication with COE, a letter of intent was submitted to the Council. The Council reciprocated by providing JCC with a Handbook of Accreditation and details of their website. Time frames for the completion of the online Application for Candidacy and subsequent Candidate Visit were negotiated between COE and JCC.

A two-person team was appointed early in 2009 by COE in preparation for the Candidate Visit. JCC was provided with the team visit check sheets in advance. The Candidate Visit Agenda included: introduction of the team to institution personnel; a tour of the institution; review of
check sheet exhibits; summary of findings; and candidate consultation and orientation to self-study and Accreditation Visit.

The team submitted a report to the COE after the Candidate Visit. The Commission reviewed JCC’s application and the team report, and on 05 November 2008 the COE notified JCC that its application for candidacy was approved. JCC was now an official candidate for accreditation by COE. As an officially approved candidate, part of JCC’s responsibility was to attend the candidate academy. The candidate academy involved a series of workshops focusing on, inter alia, preparing the self-study report; organizing committees and plans; preparing for the Accreditation Visit; and reporting institutional program completion, job placement, and professional licensure rates.

The self-study reports involved the participation of all institutional personnel. They were prepared according to the template outlined in COE Self-Study Manual. The following subheadings had to be used for each section of the report: introduction, analysis, opportunities and challenges, and summary. The purpose of these self-study reports was to orient the accreditation team and the COE Commission to the institution’s programs and services. It described how the institution complied with the standards and criteria of the COE. The COE Self-Study Manual had to be consulted on a regular basis in order to compile the self-study reports. Most self-study reports included a separate Program Supplement that showed how each occupational program is in COE compliance. In addition, each self-study report contained a checklist of Exhibits for each standard.

Based on the Candidate Visit the COE team conducted an orientation program focusing on preparation of the self-study reports. After submission of the self-study reports, a Preliminary Visit occurred 4 to 6 weeks prior to the Team Visit. During this Preliminary Visit the team leader confirmed that the Institution’s preparations were timely and in order. Key areas subject to verification included: Candidate Academy attendance; Exhibit preparation; and Self-Study Reports.

The Preliminary Visit was followed by the Accreditation Visit (see Addendum 1 for the Accreditation Process Flow Chart). A 4-member team was assigned by the COE to conduct the final review, none of whom participated in any of the previous site visits. The date of the Accreditation Visit was decided by JCC in consultation with the COE. The foci of the visit were the check sheets of the 10 Standards. The 11th Standard i.e. Distance Learning does not currently apply to JCC. Once the final team review was over, the 4-member team issued an oral report at the exit meeting. The oral report may include Finding(s) which can lead to a Recommendation or Suggestion. The report can also contain a Commendation. These key terms are defined below:

Finding(s): “A statement by the team explaining a situation that leads to a recommendation or suggestion.”

Recommendation: “A statement by the team that the institution is in violation of a standard or criterion. Recommendations require that the institution remove the violation and submit documentation assuring the Commission that the violation has been corrected.”

Suggestion: “A statement written by the team identifying improvements that could be made in an educational program or in the operation of some part of the institution. It may also be a statement setting forth a questionable activity of the institution which is not a clear violation of a standard or condition, but which is a concern to the team. The institution may respond to suggestions, but is not required to do so.”
Commendation: “A statement by the team that the institution exceeds the expectation of the team on a standard or condition.”

The team submitted a formal report to the COE. The Council in turn sent a copy of the team report to JCC. JCC submitted its response to the formal report to the COE. After reviewing the Self-Study Report, team report, and JCC’s response, the Commission of the COE voted to accredit JCC. The Commission is the 20-member Board of Directors of the Council on Occupational Education; the Commission meets in full session twice a year and collectively makes all the accreditation decisions involving COE-accredited institutions.

An official letter was sent to JCC informing the institution of the Commission’s decision. There were no findings, recommendations, or suggestions. The College received two commendations (English and Insurance).

The current accreditation is valid for one year. Accreditation is renewed annually by means of the COE Annual Report in which the institution attests to continue compliance with the Standards and Conditions of accreditation. In granting initial accreditation to JCC, the Commission determined that the next self-study report and accreditation team visit will occur in six years—the maximum period allowed by the Commission. Now that accreditation has been granted, JCC may make substantive changes e.g. introduce new educational programs.

5. Methodology

The primary instrument used for this study was a questionnaire (see Addendum 2). The questionnaire was distributed to the chairpersons of all ten standards as well as coordinators and other key faculty. Fourteen questionnaires were handed out and eleven were returned. Respondents were not required to reveal their identities to safeguard confidentiality, and encourage openness/honesty of feedback. Standard chairpersons were at liberty to consult members of their standard committee when filling in the questionnaire. Follow up unstructured interviews were held in a few cases where remarks made in the questionnaire were either unclear or required further elaboration (see Addendum 3). The distribution of respondents as per their official role is given in the table below.

6. Findings

Questions 1, 10, and 11 in the questionnaire were designed to elicit information. Questions 2-9 required either a “YES/NO” response with qualifying comments if necessary. A summary of the quantifiable “YES/NO” responses is provided in table 2 below. A more detailed exposition of findings follows after table 2.

**Item 2:** Did you find the Candidate Academy workshop sessions regarding self-study reports, collation and preparation of exhibits, program supplements, etc. adequate?

The majority of subjects found the Candidate Academy workshop sessions adequate. Respondents felt that the workshops were generally systematic, well-designed and structured which helped participants to prepare drafts, plans, reports, exhibits, etc. Procedures were clearly outlined. The purpose and process of accreditation were fully explained to workshop audiences. Workshop presenters were well organized always providing participants with clear directives. One respondent did mention a shortcoming of the sessions i.e. participants were not told how to prepare for the workshops. Only one respondent found the workshop sessions to be inadequate. No reasons were given but after an interview the member indicated that workshops were too short and didn’t cover all salient aspects of the accreditation process. He was of the opinion that there should have been more sessions spread out over a longer period of time. This would have given facilitators and participants the chance to delve into issues more deeply. It must be pointed out that facilitators did arrange private meetings with chairpersons of standards where matters and materials related to that particular standard were thoroughly examined and clarified. Members of standards were free to attend these meetings and pose questions to the consultants.

**Item 3:** Did you receive satisfactory support from senior management and administration staff?

Most respondents indicated that they received satisfactory support from senior management and administration. However, some faculty members felt pressured by senior management. All
members of the standards committees were not equally active in fulfilling the requirements of the relevant standard. This was true especially of administration staff who worked on most standards. The authors suspect that because most members of the administration have limited proficiency in the English language, they were “excused” from many tasks. This resulted in other faculty being burdened with extra work which in turn caused a lot of resentment amongst staff. The fact that members of administration did not take a very active role in standard work could have meant that the importance of accomplishing the feat was somehow not fully appreciated by them. Senior management was asked to intervene at times to force some administration workers to cooperate. One respondent drew attention to the lack of coordination among members of senior management (example/s). Senior management may have inadvertently made conflicting demands on faculty. A major concern expressed by most subjects was the adverse effect of accreditation work on class teaching. Many teachers had to either postpone or cancel classes altogether to attend meetings or honor deadlines. Faculty had to go to extraordinary lengths to procure vital information or obtain access to key documentation. For example, one interviewee had to request a senior administration member to be an intermediary to obtain key information on financial matters. The intermediary would contact his seniors at the university to gain access to the necessary documentation. There was much reluctance initially on the part of the intermediary because he felt that much of the information sought was sensitive/personal especially with regard to staff payrolls. The following graph captures the perception of support received from management and administration.

**Item 4:** Were you invited by the final review team to provide any feedback on your role in the process?

The final review team did have discussions with some chairs and members of standards as well as key faculty. These interviews were either to thank the individuals for their work or to clarify common shared exhibits among the different standards. Four respondents indicated that they were not engaged by the final review team. The common assumption at the time of review was
that standard chairs would only be interviewed by the final review team if clarity was required or shortcomings in the relevant standard were identifed. As one member of faculty put it:

*Evaluation doesn’t necessarily entail only fault finding. If people have done a good job, they should know about it. It’s not about being patted on the shoulder, either. Feedback from the review team has implications for your modus operandi in accreditation or international partnership work for the future. So even though my standard was judged satisfactory, I would have appreciated it if I was told so. But I was not interviewed by the final review team.*

**Item 5:** Has the accreditation of JCC had a significant impact on students and/or their learning?

Perhaps the almost equal number of “Yes/No” responses to this item is an indication of just how much debate this question is likely to stir up. Those that chose “Yes” spoke of the assurance of quality global education. Long-term benefits could include student placement and teacher exchange programs. However the more skeptical among respondents felt it was too early to assess any significant impact on students or their learning. In terms of phrasing, the word “significant” in Item 5 was regarded as being “too generous”. Most students were not actually involved in the process. Most students were not aware of what was going on at the college in the run up to the final review visit. Only a few students participated in social activities with members from the visiting accreditation team. The COE team did have group meetings with some students. The extent of doubt and skepticism surrounding this issue is captured in the following quote: “I think the greatest and biggest value of this accreditation is to improve the quality of students’ learning, and as long as this is not felt by the students themselves, I think the whole thing will be in vain.” Another respondent stated that: “Students are aware of the affiliation with COE (but) to what extent this has impacted them remains questionable.”

The resolution to this issue could lie in institutions seeking program accreditation. Perhaps the impact on student learning may be more real and concrete in program accreditation. It was the opinion of one faculty member that institutional accreditation did not focus in detail on the teaching/learning process. It was just concerned with meeting general guidelines e.g. job placement, external representation on curriculum advisory committees, etc.

**Item 6:** Do you foresee tangible instances of collaboration between JCC and other partner institutions within the COE ‘family’, e.g. student/staff exchange programs, curriculum adaptations, etc.?

The majority of colleagues involved in the study were of the opinion that JCC would enter into some sort of tangible co-operation with other partner institutions within the COE “family”. There were some qualifications though. One member felt that this kind of co-operation isn’t possible in the near future due to logistical factors. Distance could imply heavy financial commitments. Another reply intimated that JCC would have to take the initiative and make the first overtures.

**Item 7:** Are you optimistic about future prospects of JCC being accredited by other international accrediting bodies other than COE?
Seeking accreditation from other agencies other than CEO elicited a variety of opinions. Those advocating accreditation from other bodies spoke of JCC’s growth and improvement in all fields. The institution was becoming more organized and efficient in terms of output and delivery. Accreditation from other organizations would only strengthen the institution further. More value would be added to courses e.g. CISCO, Microsoft ABET, etc. Other respondents felt there was more need for program accreditation rather than institutional accreditation. Program accreditation would perhaps be more beneficial to students. One participant proposed that since accreditation focuses on the same issues, the internal Accrediting Agency within Saudi Arabia (NCAAA) should be sufficient for national purposes.

Institutions needed to be more circumspect in deciding whether to pursue accreditation or not. The issue was whether accreditation should be a means to an end or an end in itself. As one responded aptly put it: “Accreditation has become a fashion (or we can say a virus) and all institutions are copying each other regardless (of) the real need for accreditation.”

**Item 8:** Were you satisfied with the procedure used to define your role in the accreditation process?

The procedure adopted by senior management was to list the names of all standards on the whiteboard and faculty were asked to indicate their choice. The chairpersons of standards were appointed by management. One person who was dissatisfied with the procedure for assigning roles stated that he had no choice but to complete the tasks given to him. He felt that the process was “rushed” and was unhappy with the administration work involved, e.g., filling in application forms. Another commented that the choice of people for specific roles was based on management’s perception of people’s abilities. Some members of faculty were not sure about their exact roles in the process at the time of choosing standards. It was felt that a brainstorming workshop at this time might have helped to provide more information and clarity. Almost half the number of participant feedback suggested that choices were made on the basis of insufficient information or guidelines. Even one respondent who was satisfied with role allocation conceded that the procedure should have been more systematic.

**Item 9:** Were you satisfied with the level of teamwork within the entire process?

Although there were different levels of involvement amongst staff, there was general satisfaction with the level of teamwork during the entire process. Standards shared key information with other standards e.g., budgets, contracts, structural layout plans, etc. At this point a distinction between teamwork **within** and **between** standards needs to be made. While the latter seems to have been good the former was fraught with problems. A major complaint was that the workload was not evenly distributed. In one case, the teamwork in a 4- member standard involved just the chairperson and one member. The other 2 incumbents were not active at all, prompting the rather cryptic remark in the questionnaire: “(In terms of teamwork in my standard, it would have been more appropriate to say we had) pair-work rather than teamwork.” Management was informed about this imbalance in workload but no action was taken. Other comments on intra-standard teamwork referred to standards with more members. The teamwork in these larger standards could have been better. A final observation regarding teamwork was that the process shouldn’t have been so “rushed”. The frenetic pace could have had a negative impact on teamwork.
7. Discussion of Findings

Items 10 and 11 in the questionnaire were designed to elicit information from participants in the study. Item 10 required respondents to identify problem areas encountered during the accreditation cycle. Item 11 asked subjects to reflect on the entire process and, with the benefit of hindsight, suggest possible improvements for the future. Since these latter items are of a more discursive nature, the authors have decided to include them in this section rather than enumerate them under the “Findings” sub-heading.

The disruption to the normal teaching timetable was a major concern for many respondents. The institution’s preparations for accreditation meant myriad meetings, search and collation of documents, compilation of manuals, staff/standard meetings, translation of documents, proofreading, editing and correction of different texts, preparation of exhibits, together with a host of other duties all of which impinged on contact teaching time. Classes had to be either postponed or cancelled altogether. Students did miss out on a significant portion of their syllabus. The authors are of the opinion that management and all other roleplayers in the accreditation initiative could have been operating under the following premise: “Sacrifice some teaching time now for the greater long-term good” (i.e. accreditation and all its spin-offs). Although efforts were made to “catch up” on lost lessons and to complete syllabi, the old adage: ”Time lost is never regained” may very well have applied to the accreditation process of JCC.

Faculty did have many meetings/information sessions with COE consultants as part of guiding the institution through the various stages of accreditation. Despite these contacts confusion and misinterpretations did sometimes occur. An example may help to illustrate. Faculty members were told that the VISION and MISSION statements of the institution should appear on all publications of the College. This ruling was duly implemented in all official JCC publications with the exception of the program brochures. The various programs were allowed to have their own vision/mission statements included in their brochures without mentioning the official vision and mission of the College. This was not made clear to faculty. The fact that omitting the official vision/mission statements in all program brochures was acceptable was only discovered later. The point is that the Accreditation Handbook should make clear where exceptions are allowed to prevent future misunderstanding and avoid unnecessary stress!

A common grievance was the uneven distribution of workload. This complaint can be divided into two streams, one involving the administrative staff, the other related to the academic staff. In the case of the former, the language barrier seems to have resulted in minimum participation of the administrative staff. Because of their limited proficiency in the English language, administrative staff couldn’t contribute much to standard or staff meetings. Whatever official documentation was required was already available on disc or as a hard copy. Administration couldn’t formulate or compile new documentation because these records had to be in English. In fact, many of the Arabic speaking faculty members were burdened with the task of translating official texts from Arabic to English.

The other aspect of the imbalance in workload referred to the academic staff. Some members were guilty of not doing their share in the standards they had chosen. This resulted in chairpersons becoming overtaxed. Standard chairs were actually placed in an awkward dilemma: “Do I report the offending member of my standard (and appear to be a weak chairman, not to mention wasting precious time), or ignore the problem and take on the extra work?” The whole scenario of non-contributing staff may have impacted negatively on group dynamics and human relations amongst College personnel.
The whole accreditation exercise was not entirely unnoticed by the local media and reports of the final outcome were published in no less than 5 newspapers. The publicity generated by the press may have had the positive effect of arousing public curiosity and interest in Jeddah Community College. JCC may have become more marketable and recruitment of students and staff could be greatly facilitated in the future. This observation, coupled with the fact that the College profile was possibly raised amongst educational institutions in KSA in general, may have made the teaching staff more acutely aware of the need for quality educational delivery. But herein lies the rub! How could quality education be effected when many classes had to be either postponed or cancelled during the pre-accreditation period due to the enormous work pressure imposed on faculty? Accreditation, it seems, is not without its own tensions, strains and contradictions!

It must be remembered that publicity creates expectations and if these expectations do not crystallize over time into some form of concrete, viable achievements, then they remain just that - empty, unproductive, rhetoric! The “Arab News” (24 March 2008) quoted a senior member of JCC management as saying:

“(The JCC-LCTCS accord) will help our college make use of LCTCS’ educational programs and establish an electronic library. Staff members at American colleges will come to lecture at our college. Our students will also learn new subjects that are taught at American colleges.”

These outcomes are still pending. This idea of unfulfilled expectations becomes all the more poignant when considered against this comment by one respondent: “It is ironic that even though we have been accredited, we still feel disempowered as teaching faculty.” When asked to elaborate he pointed out that English teachers are unable to change the credit hours for English.

The fact that the various steps leading to accreditation were taken at a rapid pace meant stress and anxiety at least for some faculty. Many respondents commented on the “rushed” nature of the process. Faculty members were told by the COE consultants that they had completed all the requirements for accreditation within six months, an undertaking which normally takes two years for most institutions to conclude. While some academic staff may feel a sense of having accomplished an extraordinary feat within a relatively short space of time, others may not be so sanguine feeling rather that they were put through a lot of unnecessary anxiety and trouble. An interesting range of questions which emerge from this rapid movement of the accreditation cycle is: If the sheer volume of work involved was concluded within six months instead of two years, then why the rush? What was the agenda behind the stepped up momentum of activities? More importantly, whose interests are served by the accelerated series of events, the students, faculty, senior management, or KAU? And are these interests personal, professional or altruistic?

The pressures of meeting deadlines coupled with poor compensation were cited as having a negative impact on professionalism and job satisfaction. Standard chairs were asked to indicate verbally the percentage of work completed by members of their respective teams. Faculty members were remunerated according to this arbitrary estimate.

The entire tenure of the accreditation initiative was management driven. The approach adopted was “top-down” with directives emanating from senior management and handed down to staff. Democratic input and consultation was either non-existent, or reduced to a minimum involving questions around the logistics and basic details of administrative record keeping. The nature of accreditation is such that it demands compliance rather than a constant questioning mind set intent on accommodating as many divergent, dissenting viewpoints as possible. The COE may consider building in some measure of flexibility in its working manuals especially in terms of
compilation, collation and presentation of documents (i.e. exhibits, program complements, etc.). The fact that all documents in Arabic text were not required to be translated was appreciated by faculty.

8. Recommendations
One of the major grievances was the increased accreditation workload imposed on faculty and the resultant stress and anxiety. This also had implications for loss of teaching time. It would in future be more appropriate to “second” certain members from faculty to attend solely to accreditation work. The secondment period would of course be of limited duration (perhaps 4-6 months) during which time these selected members would concentrate on all matters related to accreditation. Criteria for selection could be decided by management in consultation with faculty. The teaching load of these seconded individuals could be shared amongst other members of the relevant department. The remainder of faculty could play a more supportive role to the core members in charge of accreditation. This support could range from suggestions at stipulated report-back meetings, preparation of documentation, networking with sources outside the college, etc. In this way, stress is relieved and teaching/learning, which is the essence of the college, proceeds as normal with any possible disruption being reduced to an absolute minimum. This arrangement would also obviate the charge that some faculty members are overburdened while others are not under any pressure. It would be up to management and the seconded faculty to work out a schedule whereby the accreditation workload is more or less evenly distributed. The principles which ought to guide deployment of staff could be the following: fairness, strategic considerations vis-à-vis individual strengths, transparency, and a spirit of give and take. Allied to the above point is the issue of an incentives program for accreditation work. Faculty members were aggrieved at the financial remuneration/compensation received at the end of the process. If the institution is unable to make monetary rewards available, other benefits could include:

- Likelihood of being part of a staff exchange program
- Inclusion in other professional development programs
- Modest subsidization of travel/transport
- Extension of leave benefits
- Assistance with technology (laptops, cellular phones, etc.).

One very obvious shortcoming was the lack of student involvement in the whole accreditation process. Members from the COE team did have informal discussions/interviews with a few selected students, and even chats on a social level. However, the larger student population was completely uninvolved with the whole accreditation exercise. What are students’ needs and to what extent can these needs be fulfilled as a result of accreditation? What do students see as the tangible benefits of accreditation for themselves, individually and on a collective level? Although students were informed about the whole notion of accreditation, and what is involved therein, they need to be included in a much more formal way by the institution and COE. In addition to student exchange programs, learners need to see in concrete terms what has been added on or amended in the institution as a result of accreditation. Student involvement can be much more intense if the institution embarks on a leadership training campaign where students
are encouraged to become more involved in the institution via recognized structures such as student representative councils, subject committees, sporting and recreational clubs. Students have to be taught how to make their representations and voices heard though these structures. The emphasis in all these representations should be a clear focus on how to enhance the quality and outcome of students’ learning and the resultant implications for their future vocations.

A crucial issue which the institution will have to grapple with is whether to pursue institutional or programmatic accreditation. This has implications for choosing the appropriate organization/s to effect the accreditation for the future. The institution will need to involve and liaise with independent/external/impartial consultants or ‘experts’ who can advise the institution on the way forward. While institutional accreditation has the advantage of raising the status of the whole college, programmatic accreditation can have the benefit of refining, sharpening, and honing in on students’ learning and its outcomes. This is a recurrent debate which the institution will have to wrestle with in the years to come. One respondent suggested that the College should start locally with The National Commission for Academic Accreditation & Assessment (NCAA) in Saudi Arabia and then proceed to a more international level. He was of the opinion that: “… an academic institution should improve its fundamental assets and perfect its mission to a high level first then seek accreditation and not the other way around.”

The fact that JCC was accredited by the COE means that the institution has to some extent entered the international arena. To actualize the global nature of our accreditation, a large world map should be installed as a permanent fixture at a strategic location on the college campus, e.g., the college foyer. This feature should serve to highlight the institutions accredited by the COE with their names and respective locations clearly delineated. This step will help bring out the international ‘nuance’ of our institution, and this in turn can have a significant impact on staff professionalism and quality of educational delivery, not to mention recruitment of staff/students. The College’s in-house TVs could also be used to transmit various clips on all aspects of accreditation, for example, special features on other COE-accredited institutions, the COE itself, case studies of institutions/programs accredited in the past, instances of student/staff exchanges, the history of accreditation, etc.

The COE needs to review and help the networking process among the various institutions that it has thus far accredited in different countries. Having annual conferences/meetings may not be enough to share the great amount of wealth (i.e. quality, experience and expertise) latent in all these establishments that form part of the COE family. In addition to peer review and exchange programs, examination papers could be moderated by externally by other institutions falling within the COE domain. Academics from partner institutions can travel to other partner institutions to deliver quality professional development programs/training. These endeavors will demand sacrifices in terms of time and money, but these resources will have to be made available by the COE and its various protégés if accreditation is to be taken seriously by all parties. One possible option is for the COE to compile a comprehensive directory/manual wherein all partner institutions are listed together with all relevant information pertaining to these institutions. Information could be given in relation to programs offered by these institutions, resources that they possess, academicians and their level of expertise, affiliations to other professional organizations, etc. The COE could in this directory suggest through a series of combinations or permutations the possibilities of networking and collaboration between and among partner institutions. Areas of cooperation could be identified with the initiative being left to individual institutions to follow up. Although co-operation and working agreement across
partner institutions could be an optional endeavor at this stage, it could count favorably for those institutions who have engaged in this exercise and who are seeking re-accreditation. Another way of facilitating networking and collaboration between and among partner institutions is to rotate the venue of the annual COE conventions/conferences. Each partner institution should be given an opportunity to host the annual COE convention/conference. If, for example, JCC hosts a convention, partner institutions wishing to draw up a working agreement in certain programs with JCC can send their delegate/s to follow up, finalize and implement the agreement. Now that accreditation has been achieved, mechanisms to monitor post-accreditation need to be put in place. The incumbent standard chairpersons could meet once a quarter to review developments within the institution and how these developments impact on the various standards. Continuous follow-up sessions to evaluate programs, materials, resources and student learning, staff development, interaction with business/industry, etc. have to be undertaken in a bid to ensure that quality and professionalism are not compromised in any way. The other advantage of these post accreditation follow up activities is that it paves the way for a smoother “run-up” to re-accreditation or accreditation by another agency, be it programmatic or institutional.

The visit by the final review team was reminiscent of some kind of formal examination or assessment procedure. While we do concede that this was an evaluation of JCC, there should have been some kind of immediate feedback. An oral report was given to senior management but standard chairs weren’t given any indication of the result of the review. We are not asking for the final verdict, only a brief overview of the review team’s impressions.

Faculty members were allowed to choose their standards. However, the chairpersons of standards were appointed by management. In retrospect this was not conducive to effective teamwork. Personality clashes, professional jealousies, and a range of other interpersonal dynamics can have a detrimental effect on group work. It would have been advisable to allow standard members to choose their own chairpersons. This would have been a clear indication that people were comfortable working with a particular person as standard head, and thus cooperation and teamwork would have been facilitated. By management appointing standard chairpersons, faculty were to work with someone they couldn’t get along with thus resulting in negative human relations, wastage of time, and possible compromise in the quality of work achieved within that particular standard. An additional concession could have been that faculty would be given a chance (within a reasonable time period of e.g. one week) to change standards providing they had compelling grounds to do so. In this regard general factors such as individual skills, interests, personality, etc. could be used as broad guidelines to determine which standards a person could choose.

The issues of teacher overload, balancing teaching and accreditation work, uneven distribution of workload in some cases, lack of professionalism and job satisfaction, and the marginalization of students in the process makes it necessary to refocus on the roles of the various players in accreditation. According to Wilds (2008:2), an educational consultant, role theory defines a role as “a set of expectations applied to the incumbent of a particular position.” These role expectations can apply to an individual, a group, an institution or an organization. Wilds (ibid: 2) goes on to differentiate two dimensions to roles: the functional dimension and the symbolic interactional dimension. The functional dimension is composed of those skills/knowledge required to function successfully in a role. These skills/knowledge are quite often obtained through formal studies and they are instrumental in securing a job or position for the individual. The characteristics of the functional dimension of a role are concrete, visible, external, and in
in accordance with society’s expectations. Colleges and universities generally focus more on the functional role at the expense of the second dimension i.e. the symbolic interactional dimension. The symbolic interactional dimension of a role is identified by values such as caring, engagement, concern for others, compassion, communication skills, integrity, and adherence to principles. The hallmarks of the symbolic interactional dimension constitutes features that are more abstract, less visible, internalized, and based more on principles. Wilds (2008:2) says that:

Performing well in this dimension demonstrates an educational institution’s true and real endeavors in the process of accomplishing its mission in educating students, and improving the quality of its programs and services... The success and livelihood of a college or university and its learning environment are based on how it attends to and performs in this dimension.

Unfortunately many individuals, organizations, colleges, and universities place little emphasis upon the symbolic interactional dimension of their role. This could be a valuable lesson for JCC since it may in the future be contemplating re-accreditation or programmatic accreditation by another agency.

The final recommendation encompasses the broad field of domestic versus international accreditation. This area requires more extensive exploration and analysis. Compliance criteria and other stipulations used in national accreditation might not be sufficient when applied to accreditation across geographical boundaries. Differences based on religion, culture, language, infrastructure, macro- and micro educational structures / policy, public support, management style, etc. need to be taken into account when an accrediting agency in one country prepares to accredit an institution in another. In this regard Chandler, a member of the COE, asks the following pertinent questions:

1. Are our criteria, check sheets, reporting structures, and compliance documents adequate for international accreditation?
2. Should there be an international committee for compliance criteria?
3. Should visiting teams have additional training in international affairs and cultural differences?...These and other questions need to be discussed in more detail as we move forward with this important global experiment in accreditation.

The authors are aware that the COE has entered into a partnership with a recently formed accreditation agency called “Accreditation International” (AI). The idea is to cater for institutions in other countries that desire American-style accreditation. International accreditation may require a body that could be empowered / authorized and operationalized by the United Nations via UNESCO.

9. Theoretical Perspectives
As mentioned at the beginning of this paper literature on the subject of accreditation lacks theoretical constructs, an observation which this paper will try to address. The main aim of any accreditation effort is to improve the quality/output of the institution or program being accredited. This presupposes that the accrediting agency itself is qualitatively ‘superior’ to the institution being accredited. Hence, the unequal power relations. This in turn begs the question: “Who accredits the accreditor?” Put another way: How do accrediting bodies derive their
power? Since the COE is American-based we need to review briefly the history of accreditation in the USA. This may help to shed some light on the question.

According to Weissburg (2008:195) accreditation was first used by the federal government in 1952 and this federal reliance on accreditors increased with the passing of the 1958 National Defense Education Act (NDEA). According to this legislation a school could only receive federal funds if it was accredited by a nationally recognized accrediting body. Until that point in time, accreditation had been a purely optional initiative. The NDEA changed everything. In the short term the delegation of government authority to the regional accrediting associations had little impact on them. In other words, they were simply being asked to continue what they had been doing all along. The federal government did not try to exercise any influence over the higher education sector until the creation of the Accreditation and Institutional Eligibility Staff (AIES) in 1968. Trivett (1976:3) explains that the aim of the AIES was “to administer criteria and procedures for approving accrediting organizations, list them, and determine preliminary eligibility of institutions.” This was regarded as the turning point in the relationship between the federal government and accreditation agencies.

From the above review of accreditation history in the USA, it can be said that accrediting bodies formally derive their power from the government. Of course, some of this power can also be traced to the specialized expertise that accrediting bodies possess and which they derive from the industry/profession itself. This was true especially in the period prior to 1968.

Governments have in the past found it useful in many cases to adopt the standards, rules, licensing requirements, procedures, etc. of privately run, self-regulatory bodies for their own purposes. These self-regulatory bodies are established by members of a given industry or profession, and the governance of such bodies usually reflects the power dynamics operating within that self-regulating sector. In his doctoral dissertation, Weissburg (2008:2) identifies the American Bar Association as an example of a self-regulatory body which regulates the legal profession and which is composed of representatives from that same profession.

The principle of self-regulation itself will be discussed later, but it must be remembered that the delegation of government authority to a public agent is not quite the same as delegation to a private, self-regulatory one. Mattli and Buthe (2005:399) make this distinction by saying that:

“....[T]he key difference between delegation to a public agent and delegation to a private one is that in the latter case a multiple-principal problem emerges that is qualitatively different from the one usually considered in the literature. An agent’s action will be determined by the relative tightness of competing principal-agent relationships. This tightness is a function of the relative importance of each principal for the agent’s financial and operational viability as well as its effectiveness in rule making.”

In the above quotation, the term ‘agent’ refers to the accrediting body/association while the term ‘principal’ refers to the institution itself. The history of accreditation in the USA reveals the existence of another principal i.e. the federal government. In other words, the accrediting bodies have two clients to serve.

Mattli and Buthe hypothesized that the decision of the private agent to elevate one principal over another will be based on the relative ‘tightness’ of the relationship between the agent and each of its principals. The word ‘tightness’ implies the degree to which the agent is dependent upon the
principal for its financial well-being. They further state that there are three factors that determine this tightness, financial viability, operational viability, and the macro-political climate. Financial viability means that the agent will be highly receptive to the demands of the principal from which it derives its funding. Operational viability signifies the agent’s need for specialized expertise. As stated previously, in most cases the private agent’s authority stems from its high level of specialized expertise which it brings to the accreditation process. The source of this expertise is often the industry itself. In fact, accrediting bodies perform periodic quality reviews of themselves to ensure that they are competent enough to be able to handle the requirements of their job. The third variable, the ‘macro-political’ climate, refers to the “cycles of broad public attitudes towards regulatory matters” (Mattli and Buthe, 2005:406). If we relate this to the accreditation of Jeddah Community College, financial viability does have applicability in the sense that JCC had to pay the COE an accreditation fee. In terms of operational viability the COE has its own specialized expertise in which to carry out the tasks of accreditation. In the case of the ‘macro-political climate’, it can be safely assumed that most of the broader public in Saudi Arabia would be favorable to accreditation of a Saudi institution by an accrediting association from the USA.

The Mattli and Buthe model outlined above suggests that the relationship between the agent (accrediting body) and the principals (the institutions and federal government) is often filled with a complex interplay of power dynamics. This power differential is all the more profound since the history of accreditation in the USA is punctuated with conflictual relations between and among the various roleplayers/stakeholders (Weissburg, 2008:89-155). This complex interplay of power dynamics is captured in the following statement by Trivett (1976:8):

“The study of accreditation and institutional eligibility is only to a small degree an educational issue; it is more a political issue, a study of how the power to distribute benefits is generated, channeled, and regulated.”

This point is underscored when we realize that accreditation in the US takes place at different levels. At the highest level, governmental and other agencies govern and recognize the accrediting bodies. For example, the US Department of Education, the Council for Higher Education Association (CHEA) and the Association of Specialized and Professional Accreditors (ASPA) confer power to associations that oversee accreditation at the regional, institutional or program level.

The authors have already alluded to the concept of accrediting bodies being private and self-regulatory. The literature reveals ample debate as to whether government regulation or self-regulation is more effective. Up to this point there are no easy answers to this question. Governments around the world generally find it more expedient to rely on privately run self-regulatory bodies. However, self-regulation is not without its problems. Gunningham and Rees (1997:366-370) are of the view that standards set by self-regulatory industries, or professions, may be weak and/or poorly monitored. They also argue that self-regulation can lead to a lack of transparency and accountability.

It is the authors’ view that if the Mattli and Buthe hypothesis is applied to accreditation, then accreditation itself becomes a sort of business enterprise, an adaptation of a business franchise model characteristic of the private sector. In other words, the accrediting body becomes the “franchisor” while the institution/program becomes the “franchisee”. The three variables mentioned by Mattli and Buthe i.e. financial viability, operational viability, and the macro-political climate all support this business analogy. The COE is currently embarking on a project to accredit many other colleges in Saudi Arabia.
10. Concluding remarks
This paper has considered the whole issue of accreditation from a macro (power political) and a micro (institutional/program) perspective. While an institution may be accredited, this does not necessarily mean that its clients will immediately receive better service or that the quality of the institution will be dramatically elevated. As one member of faculty put it: “While it is understood that accreditation should correlate positively with quality assurance … it should be also understood that the first (accreditation) doesn’t guarantee the last (quality assurance).” Accrediting agencies cannot exercise any legal control over institutions or programs. A host of variables can intervene from the point at which the institution was accredited, e.g., change in staff, new management, reduced funding, change in government policy, etc. All these factors can impact negatively on planned improvements, quality assurance, service delivery, and student learning outcomes. In fact, Wilds (2008:3) goes further and asserts that:

*Colleges and universities (seeking accreditation/re-accreditation) rarely describe the process as having improved the quality of education in their institution. Instead, the process is looked upon with much anxiety; is described as time consuming, often bringing the college to a halt for a period of years or so in accomplishing its goals; and the institution may have produced a compliant certification report that is of little value to it.*

One interviewee used the analogy of a person obtaining his/her driving license. In order to successfully pass the driving test, an individual will do all that is required according to prescribed norms/regulations. However, once the individual has his/her driving license, there is no guarantee that the person will always obey the rules of the road, especially if he/she had a history of poor driving skills. The respondent also made the point that although bodies/committees within the accredited institution maintain set procedures, i.e., regular meetings, the level of commitment and input into these meetings may be considerably weaker post accreditation. In other words the various roleplayers within the institution can simply go through the motions once accreditation has been granted. Although the institution has to submit an annual report, this document can conceal or omit many elements of this ‘laissez-faire’ attitude, if these in fact do exist.

The above comments are not designed to condemn accreditation. They serve rather to highlight the plea that accreditation should be accompanied by a great deal of introspection and circumspection especially with regard to the symbolic interactional dimension as elaborated on earlier. It is approximately one and a half years since JCC was accredited. The short-term benefits include a noticeable change in the physical infrastructure of the campus, the introduction of e-learning, and the induction /training of JCC personnel to facilitate accreditation of other colleges in the Kingdom of Saudi Arabia. The long-term benefits, that is, the maintenance of quality education, financial aid opportunities, credit transfer, and continued success in the workplace remain to be seen. The last words must go to a member of faculty who worked tirelessly throughout the whole process: “Getting accreditation is not the end of the journey; however, it is the beginning of a long (process of) self-commitment.”

**Research questionnaire on Accreditation**

Dear Colleagues  
Accreditation is an important milestone in the growth and development of any educational institution. The questionnaire below is part of an academic study reflecting on the recent accreditation of Jeddah Community College by the Council on Occupational Education (COE). The study is aimed at identifying strengths and weaknesses of the entire exercise from the point of view of key faculty participants so that future international partnerships can be easily facilitated. The researchers would like to appeal to you to kindly respond to the items in the questionnaire. Please try to furnish as much information as possible, remembering to be specific in your comments.

**WE WOULD LIKE TO ASSURE YOU THAT ALL INFORMATION WILL BE TREATED WITH THE STRICTEST OF CONFIDENCE. YOU ARE NOT REQUIRED TO WRITE YOUR NAME.**

All items (with the exception of items 1, 10 and 11) require a “YES” or “NO” response. Read each item carefully and then circle either “YES” OR “NO”. Below each item is space for you to explain your “YES”/”NO” response, add any detail you feel is necessary, identify problem areas, quote specific examples, etc. ELABORATE AS AND WHEN YOU FEEL NECESSARY. Use a separate sheet if space for a particular item is insufficient.

Thank you for your participation.
Dr. M. Mayhoub and Dr. A. Maharaj

Abstract
This study investigated the relative and combined influences of job satisfaction and powers on administrative effectiveness of higher secondary schools principals in Punjab. Seventy two higher secondary schools were selected from thirty six districts of the Punjab. A sample of 360 teachers participated in the study who rated the administrative effectiveness of their respective principals. It is guided by the consideration that evidences collected through this study would be some help in developing an insight into the factors that contribute to the administrative effectiveness of the principals. A self developed, validated and reliable questionnaire was used for data collection. Findings from the study revealed that principals’ job satisfaction and powers are related to his administrative effectiveness. The combined influence of job satisfaction and powers on administrative effectiveness was also noted. It was recommended that a high school principal must be satisfied with his job including working conditions and school climate. For a principal to be more effective, he must have financial and administrative powers in school affairs.

Key words: Principal, administrative effectiveness, powers, job satisfaction

Introduction
A high school principal is a group leader, an administrator, a supervisor and a coordinator (Fafunwa, 1980). He has to perform all such functions at different occasions. He can demonstrate administrative effectiveness if he is satisfied with his job and enjoys financial and administrative powers in school affairs.

Administrative effectiveness is neither an absolute concept nor does it exist in vacuum. It is influenced by certain situational/environmental factors (Lyons, 1979). Sharma (1979) found that principals’ effectiveness is significantly and positively related to school climate. For a principal to be more effective, he must be satisfied with working conditions, school climate (Albright, 1998) and his salary as principal must be compatible with his needs and esteem (Holscclaw, 2005).

Parallel to job satisfaction, he must have financial and administrative powers for controlling and coordination (Umar Ali, 1991). Using these powers, he defends his position strongly and is not swayed by pressure group (Gossett, 1997).
A principal’s administrative effectiveness is the quality of his behavior perceived by school population in general and faculty members in particular. Administrative effectiveness/leadership effectiveness was described by Bennett (2003) as the acknowledged ability of a leader to guide, manage or coordinate a group of people to achieve pre-determined goals of an organization.

Ronald (1971) and David (1987) found in their studies that several situational factors were positively related to administrative effectiveness of the principals. Hulin quoted Cornell studies stressing that job satisfaction must be considered as feeling which has arisen in the worker as a response to the total job satisfaction. In addition to being related to the present job satisfaction, this feeling is associated with perceived differences between what the worker expects for his services and what he actually experiences in relation to the alternative available to him (Hulin, 1996). Major findings of the study conducted by Safar (1997) on job satisfaction of secondary school principals in Kuwait, show that the highest level of satisfaction was associated with prestige, colleagues’ relationships and recognition. Autem (1989) found that directors and administrators were found to be the most satisfied educators in terms of esteem needs. Hilgert (1997) found pleasant working conditions as high on the list of factors important to workers’ job satisfaction.

Research Questions

1. To what extent will principals’ job satisfaction and powers in school affairs predict administrative effectiveness?

2. What is the relative influence of job satisfaction on administrative effectiveness?

3. What is the relative influence of principals’ administrative powers on their administrative effectiveness?

4. What are the relationships among job satisfaction, powers and perceived administrative effectiveness?

Research Methodology

Research design
This study adopted an ex-post-facto research design.

Population and Sample
The target population for this study was all the senior most teachers working in higher secondary schools in Punjab. Seventy two higher secondary schools were selected from thirty six districts of the Punjab. A sample of 360 teachers participated in the study who rated the administrative effectiveness of their respective principals.

Instrumentation
A self developed, validated and reliable questionnaire was used data analysis

Data Analysis
Data were analyzed using regression analysis for research questions 1 to 3, and Pearson product-moment correlation for research question 4.
Results and Discussions

Research Question 1
To what extent will principals’ job satisfaction and powers in school affairs predict administrative effectiveness?

Table 1: Combined influence of job satisfaction and powers on administrative effectiveness

<table>
<thead>

<td>0.00</td>
</tr>
<tr>
<td>Residual</td>
<td>15718.35</td>
<td>357</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Total</td>
<td>16950.78</td>
<td>359</td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

*Significant (p<0.05)

Table 1 shows that job satisfaction and powers, when taken together, accounted for 7.3% of the total variance in administrative effectiveness (R²=0.073, P<0.05). This percentage, though low, is statistically significant. The low percentage only shows that there are other factors that can also explain administrative effectiveness. Thus, these two independent variables are important predictors of administrative effectiveness.

Research question 2

What is the relative influence of job satisfaction on administrative effectiveness?

Table 2: Job satisfaction as predictor of administrative effectiveness

<table>
<thead>
<tr>
<th></th>
<th>Sum of squares</th>
<th>Df</th>
<th>mean square</th>
<th>F</th>
<th>p</th>
</tr>
</thead>
<tbody>
<tr>
<td>Regression</td>
<td>693.33</td>
<td>1</td>

</tr>
<tr>
<td>Residual</td>
<td>16257.45</td>
<td>358</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Total</td>
<td>16950.78</td>
<td>359</td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

*Significant (p<0.05)

Table 2 shows that principals’ job satisfaction singularly accounted for 4.1% of total variance in administrative effectiveness (R²=0.041, P<0.05). Thus, job satisfaction is an important factor in predicting administrative effectiveness.
Research question 3

What is the relative influence of powers on administrative effectiveness?

Table 3: Powers as predictor of administrative effectiveness

<table>
<thead>
<tr>
<th>Remarks</th>
<th>Sum of squares</th>
<th>Df</th>
<th>mean square</th>
<th>F</th>
<th>p</th>
</tr>
</thead>
<tbody>
<tr>
<td>Regression *</td>
<td>1081.5</td>
<td>1</td>
<td>1081.55</td>
<td>24.4</td>
<td>0.00</td>
</tr>
<tr>
<td>Residual</td>
<td>15869.2</td>
<td>358</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Total</td>
<td>16950.7</td>
<td>359</td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

*significant (p<0.05)

Table 3 shows Principals’ powers in school affairs singularly accounted for 6.1% of the total variance in administrative effectiveness ($R^2=0.061$, $p<0.05$). Thus, powers of the principal in school affairs is an important factor in predicting his administrative effectiveness.

Research question 4

what are the relationships among job satisfaction, powers and perceived administrative effectiveness?

Table 4: Correlation matrix of job satisfaction, powers and administrative Effectiveness.

<table>
<thead>
<tr>
<th></th>
<th>Job satisfaction</th>
<th>powers</th>
<th>admin Effectiveness</th>
</tr>
</thead>
<tbody>
<tr>
<td>Job</td>
<td>1.000</td>
<td></td>
<td>1.000</td>
</tr>
<tr>
<td>Satisfaction</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Powers</td>
<td>0.855*</td>
<td>1.000</td>
<td></td>
</tr>
<tr>
<td>Admin effectiveness</td>
<td>0.166*</td>
<td>0.255*</td>
<td></td>
</tr>
</tbody>
</table>

*significant (p<0.05)

Table 4 shows that there are significant positive relationships between job satisfaction and administrative effectiveness and between powers and administrative effectiveness. However, the highest positive relationship is between job satisfaction and powers.

Job satisfaction and powers were combined to significantly predict administrative effectiveness. These two independent variables also have significant relative influence on administrative effectiveness, which implies that job satisfaction and powers are important predictors of administrative effectiveness. When a school principal is satisfied with his job and has desired financial and administrative powers in school affairs, he is more effective and strong.
Conclusion and Recommendations

A high school principal can work effectively if has job satisfaction as well as enjoys powers to exercise accordingly. From the findings of the study, the followings conclusions/recommendations are made:

The higher secondary school principal must be provided job security, good working conditions and full cooperation of teaching staff.

His salary as principal must be compatible with his needs and esteem.

A principal cannot work effectively when he feels a threat about his unwanted transfer.

He should be provided opportunities to utilize his skills and potential.

He may work with due interest when he feels that his work is being appreciated by his high ups and society.

The principal is more effective when he enjoys financial and administrative powers to exercise when needed and desired.

No teacher should be transferred from his school without consulting him.

He must have powers to transfer or suspend any of his subordinates for poor performance.

Abstract
Impression management has gained significant attention of researchers and practitioners all over the world. Different impression management tactics are used by the employees in the organizational setting to get a better performance rating. The impact of these impression management tactics has been analyzed in the current study. Researchers developed a hypothetical model on the basis of literature review. Banking and telecom sectors of Pakistan were chosen for this study. The data was gathered from 153 dyads of supervisor and subordinates. The frequency of different impression management techniques was measured with the help of an instrument and afterwards these employees were rated by their respective supervisors. The responses of supervisors and subordinates were matched and analysis was made. Different impression management techniques are viewed differently by the supervisors. Some of them are viewed positively like ingratiation and exemplification while intimidation, self-promotion and supplication have a negative impact on performance rating.

Keywords: Impression management, performance rating, intimidation, ingratiation, exemplification, self-promotion, supplication

1. Introduction
The area of impression management has gained considerable concentration during the past five decades. The concept of impression management was firstly presented by Goffman (1959), who provided a model in which actors perform differently according to the settings and audiences. The impression management tactics can be useful in controlling their images in others’ mind (Goffman, 1959; Jones & Pittman, 1982) better influence the situation (Goffman, 1959) and group dynamics (Kacmar & Carlson, 1999).

According to Kacmar and Carlson (1999) the attempts carried out by the individuals to portray the desired images in their social networks can be referred to impression management (IM). The two parties in this definition are actor and target. Actor is the individual who control the flow of information and present it in a desirable way while the target is the individual or group received
the information (Goffman, 1959). Although both of the parties are involved in this process but most of the researchers has only studied the role of actor (Doherty & Schlenker, 1991; Kowalski & Leary, 1990). The past researchers have given attention to the use of different IM strategies by the actor and the motive behind the use of these tactics. However, it is strongly required to investigate that how these strategies are perceived by the target. The researchers have attempted to address this issue in the current study.

1.1. Rationale of the study

The current study has been conducted with a twofold purpose. Firstly, all the employees engage themselves in impression management tactics consciously or unconsciously in one or another way. These impression management tactics can benefit them at one end but can be harmful for them as well in shape of negative rating by the management. The researcher will try to analyze the impact of all the impression management tactics on performance rating and then identify the tactics effecting performance rating negatively or positively.

Secondly, many researchers has examined the impact of impression management on performance rating but the results of all the studies reveal a lack of consistent findings. For example, whereas Orpen (1996) found ingratiation affect performance rating positively but a negative relationship was found by Thacker and Wayne (1995). Moreover, the study conducted by Stevens and Kristof (1995) revealed that there is a positive relationship between self-promotion and performance assessments, but the contrary results were founds by Ferris, Judge, Rowland, and Fitzgibbons (1994). These conflicting findings make it difficult to determine the true nature of the relationship between impression management and performance rating. Therefore in this research the researchers have tried to analyze the impact of impression management on performance rating and try to provide a consistent finding. The study of impression management is significant as very little study has been done in context of Pakistani work environment. The study will lead to further exploration of this important area, which is directly linked with the employee motivational level and their career advancement.

2. Literature Review

Laura (2006) has stated, “Professional image is defined as the aggregate of key constituents’ (i.e., clients, bosses, superiors, subordinates and colleagues) perceptions of one’s competence and character”. This definition refers to an externally tilted, public guise based upon reflected appraisals rather than one’s self-image or others’ “actual” perceptions (Ibarra, 1999; Mead, 1934; Tice & Wallace, 2003).

Impression management is a common phenomenon in the organizations (Wayne & Liden, 1995), and employees are often found engaged in such behaviours for the developed of a positive image in mind of others (Bolino & Turnley, 1999). Individuals distinguish that they can be considered as assets for the organization by delivering the high level performance. They will be viewed as efficient workers of the organization. This will bring them in a position where they can impress other and build a positive image of themselves. However, this option has not been significantly addressed in the past studies conducted on impression management.

Men and women have different tendency in the use of different impression management tactics. Some of the IM tactics are masculine-typed tactics leading to better performance evaluations and salary, whereas other are feminine-typed impressions management tactics yielding less favourable results. The IM literature reveals that, when women are involved in masculine IM
tactics, they often get punished for contravening the norms instead they are rewarded for adopting the successful tactics for men (Guadagno & Cialdini, 2007).

2.1. Intimidation

Intimidation is an IM tactic in which individuals try to make an impression that they can make the things difficult for them if they are tried to be pushed too far. They deal toughly with the individuals who interfere in their matters, or use forceful behaviour to get colleagues to behave properly (Jones, 1990; Jones & Pittman, 1982). Jones (1990) pointed out that individual using intimidation try to look stubborn and obstinate. However, these strategies have risk of being seen unfavourable. The people involved in intimidation are likely to be viewed tenacious and forceful persons. They are prone to the risk of getting an adverse reaction of their tough behaviour. Women using intimidation are more likely to receive this adverse reaction. Employees depending on intimidation strategies may get higher performance rating; they may also have less favourable responses for doing so (Allen & Rush, 1998; Wayne & Ferris, 1990).

The inference of research studies of Jones & Pittman (1982); Wayne & Liden (1995) is that there are both positive and negative repercussions of intimidation strategies of impression management on performance evaluations. In their study Yukl and Tracey (1992) were of the view that pressure tactics as part of Intimidation may result favourable outcomes for the actor (person using the intimidation strategies). There are cases, where use of intimidation has enhanced the ability of an employee to get his or her job done. This shows that being aggressive may actually makes the employee more effective in his or her position for achievement of the desired personal gains. It is added here that in general, employees who are practicing intimidation strategies are using threat and hard tactics on their subordinates to get the assigned jobs done are viewed highly by their respective superiors as they consider them job doer, commanding and capable of dealing with the situation. This favourable perception on part of superiors resulted to good performance rating.

2.2. Ingratiation

In this strategy the actors tries to adopt all the traits and behaviours which are likable by his performance rater. The aim of Ingratiator is to be likeable. This strategy covers use of complimenting another person or involvement in flattery with certain amount of credibility and honesty. It also involves agreeing to another person’s view point. It is the human instinct and nature that he likes people who think or acts like him. Thus presenting ourselves in the same way can generate favourable response from others (Jones, 1964).

Many authors (Fandt & Ferris, 1985; Tedeschi & Melburg, 1984) have identified Ingratiation as one of the effective impression management strategies. Tedeschi and Melburg (1984) conceptualized four impression management techniques, and they defined Ingratiation as "a collection of forceful tactics with the aim of gaining the admiration of an audience, who has the authority to offer significant rewards for the actor".

In case of Ingratiation, the social interaction also plays an important role in respect of gaining and maintaining persona power. It is a fact that in our social life especially in the cases of interpersonal relationship, there is interdependence meaning to say that parties involved in interpersonal relationship are either intentionally or un-intentionally using influence on each other. One of the important aspect of ingratiataion is that the same situational factors which increase one person's desire to be found attractive by another alert the other (the "target" person) to the likelihood of tactical behaviour. Thus, the dependent person will be strongly motivated to
be ingratiating, but the fact that his dependence stands revealed reduces the likelihood that his overtures will be effective (Edward, 1965).

2.3.  Exemplification

In this strategy, the person shadows the impression of overly dedicated and committed to his/her job on the supervisors, while creating a feeling of guilt among others. When a person says,” I will finish this work at any cost, even for that I have to suffer personal loss, you please go and enjoy.” he is using this strategy (http://www.citehr.com/1027-impression-management.html).

In this strategy, actors portrays such behaviours to make them appear like Ideals employees, working or showing to work beyond the call of the duty when using this tactic (Kacmar, Harris & Nagy, 2007). People self-sacrifice or go above and beyond the call of duty in order to have the appreciation of dedication from observers (Jones & Pittman, 1982). Exemplification suggest that individuals are engaging in behaviours such as working for extended hours, giving phone calls to the boss from the office telephone late at night to update the assignment status, coming to office early in the morning even before the office hours and staying late at work or arriving at work early in order to be seen as dedicated (Bolino & Turnley, 1999).

2.4.  Self-Promotion

This is a kind of self projection and image building strategy in which the self-promoter desires to be acknowledged as competent in certain areas. He may recognize minor flaws in his personality but with that he over projects and over emphasize the stronger points of his personality in front of his Superiors However, if his claims do not match his abilities, then he may create a very bad impression (http://www.citehr.com/1027-impression-management.html).

Self-promotion is a type of behaviour in which individual is involved in conveying his expertise and competence (Sosik & Jung, 2003). Self-promotion is generally considered an aggressive strategy. Self-promotion is more in line with a masculine orientation; the use of such a strategy may result to more penalty than benefits in case of female workers (Lim, Chidambaram, Carte. 2008).

Higgins, Judge and Ferris (2003), in their meta-analysis, found that self-promotion strategies yield positive results in the scenario of selection interviews as compare to that of performance appraisals as compared to selection interviews. In a work environment, where the supervisors have ample opportunities to gauge the performance of their subordinates in comparison to their competency claims, the self-promotion strategies proves not effective (Higgins et al., 2003).

2.5 Supplication

In this strategy the person advertises his weak areas in order to get sympathy. The person portrays himself as helpless to get the help from others (http://www.citehr.com/1027-impression-management.html). Supplication is a strategy through which individuals publicize their shortcomings in an effort to be viewed as disadvantaged (Turnley & Bolino, 2001). Supplication entails actions that persons employ in order to portray a personality of humble and helpful (Sosik & Jung, 2003). Supplication is considered as a passive strategy (Lim, et al., 2008). Employees may engage in supplication to seek the help and support from others (Wayne & Ferris, 1990). Supplication is usually considered as a part of feminine gender roles and has contributed the previous studies establishing images of humility and modesty (Sosik & Jung, 2003; Guadagno & Cialdini, 2007) or helplessness (Turnley & Bolino, 2001).
Supplication is a powerful practice. It is observed that in case of supplication, the person supplicated has more power than the person performing the supplication. The Supplicator usually has an essential and crucial interest in its success. Supplication often entails physical actions, (Clark, 1998). Supplication is considered as the most negative of the impression management tactics (Bolino & Turnley, 1999). Employees sometimes try to look down at work by using supplication strategies of impression management (Becker & Martin, 1995). Supplication strategies were found negatively related to the leadership traits (Chidambaram et al., 2008). According to Turnley & Bolino (2001), the use of supplication was positively related to the image of "lazy" for both high and low self-monitors. These findings suggest that individuals, who use supplication, tend to be perceived negatively by their colleagues—regardless of their self-monitoring abilities. The supplication, therefore have negative connotations.

Other studies of supplication have found that use of Supplication strategies often result to negative consequences such as decreased self-esteem for the individuals using them (Christopher, Morgan, Marek, Keller, & Drummond, 2005). There is not research undertaken on how the individuals using supplication or intimidation are viewed by others - either positively or negatively.

2.6 Relationship between Impression Management and Performance Ratings

The primary motive to manage the impression that we create is that through the desired social identity, we try to bring our public selves closer to our ideal selves. We try to influence how we people perceive us, and therefore, the way in which we will be treated by others. The impact of this type of behaviour may impact material outcomes directly viz giving the impression of competent and ambitious can results in benefits such as better performance rating and career advancement opportunities. (Wayne and Liden, 1995).

Singh and Vinicombe (2001) identified that successful British and Swedish managers in engineering firms try to manage vigilantly the impression of commitment which they give to their supervisors. There was a clear viewpoint that in order to gain promotion, individuals needed to have a good understanding of the "rules of the game" in the early stage of their careers. For men, this involved gaining early understanding of the prevalent success model within their organization and following the same. Two approaches were there: (1) hard work, and (2) fitting the mould (Singh, Kumara and Vinicombe, 2002).

3. Conceptual Framework

According to the impression management theory, in the process of impression management there are always two parties; one is the actor and other is the perceiver. The actor performs all the tactics to attain the attention of the perceiver. Now this impression management can be used for both negative and positive consequences.

Impression management theory suggests that a person's behaviour is a function of the behaviour and values of an audience. An individual in an aggressive encounter has two relevant (external) audiences: the antagonist(s) and third- party onlookers. The audience may alter- cast ego into a situational identity or, by enlightening its values, may indicate how a favourable situational identity might be attained (Felson, 1978). Felson further explained; according to impression management theory, public behaviour and information exposed to audiences tend to reflect more favourably on self as compared to private behaviour and concealed information.

According to Bolino (1999), Impression Management theorists have identified many strategies that can be employed in an organization setting. Jones and Pitman (1982) indicated that these
tactics fall into following five categories, which have been taken as independent variables in this study:
- Intimidation
- Ingratiation
- Exemplification
- Self-promotion
- Supplication

The Supervisor’s rating of employee performance has been taken as a single dependent variable. The study is made on assessing the impact of these five independent variables.

3.1. **Research hypotheses**

The researcher has developed the following hypotheses after study of the available literature.

*Hypothesis 1:* A subordinate’s use of intimidation will have a negative effect on supervisor’s performance rating of employee.

*Hypothesis 2:* Ingratiation has a positive effect on the performance rating of the subordinate.

*Hypothesis 3:* Employees engaged in exemplification will be rated positively by the supervisor.

*Hypothesis 4:* A supervisor’s ratings of the subordinates performance is negatively related to self-promotion tactics.

*Hypothesis 5:* Supplication tactic used by subordinates is negatively related to the performance rating.

3.2. **Hypothesized Model**

In the light of Literature Review, the Researcher has developed the following hypothesized model:

Insert Fig. 1 here

4. **Research Methodology**

The research methodology employed in this research is being illustrated as follows:

4.1. **Sources of data**

Preliminary secondary data has been gathered through digital library and other libraries. A number of journals, thesis, and research paper have been studied in order to prepare the literature review.

Primary data has been collected from the employees of banking and telecom sector through survey questionnaires. The banking and telecom sectors were chosen on account of their similarity in corporate culture and work environment.

4.2. **Sample characteristics**

The sample selected for the present study is 250 Supervisor- Subordinate dyads belonging to different companies from the banking and telecom sectors located in the twin cities. In case of banking sector, mostly private sector banks were selected in order to have a common basis for the study as the telecom sector is dominated by the private sector/multi nationals except the PTCL. The Researcher targeted the middle level hierarchy for getting the feedback on the
grounds that they dominate the working of the organization and it is comparatively easy to get feedback and response from them due to their availability and high education level. It was observed that most of the respondents were in the youth category.

A total of 153 pairs have been incorporated in these results. 51.6% of the subordinates are male and 48.4 are female while 83% of supervisors are male and 17% are female which shows that most of the higher positions are occupied by men. Most of the subordinates are from the age category of 21-30 and supervisors are from 31-40. The average education level of subordinates is Graduate Level while of supervisors is Post Graduate Level. 41.2% respondents are from the banking sector and 58.8% respondents are from telecom sector.

4.3. Sample selection procedure
A sample of 250 Supervisor-Subordinate dyads belonging to banking and telecom sector organizations, located in the twin cities were selected as part of the intended study. Convenient sampling is used for choosing the sample due to the shortage of time and swift response. The data is obtained from subordinate-supervisor dyads. A total of 250 sets of questionnaires were distributed divided equally among the two selected sectors. Out of total distributed 250 sets of questionnaires, the response in shape of correctly and completely filled out 153 sets of questionnaires was received. The response rate was 61.2%, which is satisfactory keeping in view the level of awareness about such studies and respondent’s behaviours. The previous studies that of Wayne and Liden (1995) and Singh & Krishnan (1999) had used sample size of 111 and 52 dyads and termed them as appropriate representation for analysis of data.

4.4. Research instrument
Two scales are adapted by the researchers to form a questionnaire in order to collect the primary data (Bolino and Turnley, (1999) scale of impression management, and Wayne and Liden (1995) scale of performance rating of employees). This research made a few changes in the scales of above cited authors in order to make it fit in local context. Subordinate’s questionnaire is about impression management tactics used by the subordinate. All subordinates reported their impression management behaviours with the frequency of the behaviour at the developed scale. This questionnaire comprised of 5 sections and 22 items. All items were rated on 5 point likert scale (5=Very Frequently to 1 = Very Infrequently). Supervisor scale was for the rating of subordinate. This scale was also rated on five point likert scale (5 = Outstanding to 1 = Poor). This was initially a six item scale. The Likert Scale was used in the present study to keep the consistency within the questionnaires and for ease in receiving the feedback.

4.5. Scale reliability
The Researcher carried out a pilot test for checking the reliability of the scale by getting 30 questionnaires filled in personal presence at one organization. In order to measure the reliability of the scales used in this study, the overall Cronbach alpha coefficient for both the scales lie at about 0.75, which shows that scales used are reliable and they can be used in the Pakistani context. The high value of cronbach alpha coefficient is consistent with the studies of Yang, Watkins and Marsick (2004).

4.6. Procedure
Important variables have been identified with the help of literature review. The data is collected on all the identified variables with the help of questionnaires, designed separately for Supervisors and Subordinates. In order to have reliable feedback, the respondents were briefed about the
purpose, importance of the study and definitions of the key terms used in the questionnaires both personally and through a covering letter. The questionnaires were given identification numbers (same number on both Supervisor and Subordinate’s questionnaire) to facilitate the feedback. After this Multiple Regression test was applied on the gathered data with the help of SPSS. The results obtained by the means of SPSS are interpreted. The type and nature of the relationship among the variables has been explained and then an analysis about the effects of the different impression management tactics on performance rating has been made.

5. Results and Discussion

The data in this study has been obtained from the subordinate-supervisor dyads. The researcher has applied multiple regressions in order to test the model. But before model testing, researchers have conducted analysis of the taken scale. Researchers measured anti-image correlations of all the items of scale. One item from exemplification section and one from the rating section is deleted as a result of this scale analysis. The anti image co-relations for exemplification item and rating item are 0.392 and 0.341 respectively. So these items are deleted from the final scales. Moreover these items have different responses as compared to other items mentioned under the same variable.

The results of analysis of scale are given in table 1:

Insert Table I Here

KMO value is greater than 0.6 for all variables which shows the adequacy of sampling and Bartlett’s test is also showing the fitness of all variables as $p < .05$.

Independent sample t-test has been computed in order to make a comparison between male and female employees regarding the use of different impression management strategies and their respective rating. The results of independent sample t-test are shown in table II.

Insert Table II Here

The above table shows the mean values for all IM strategies and rating, both for male and female. Female employees have more intimidatory behaviour as compared to male. But male employees are more ingratiator, exemplifier and self-promoter as compared to females. So these strategies are more in line with masculine orientation (Chidambaram et al., 2008). But female are adopting supplication more than male and it is more feminine oriented strategy (Sosik & Jung, 2003; Guadagno & Cialdini, 2007). They seek guidance in every matter more than male, whereas rating mean for both male and female is approx. same. The above discussed differences are not very significant as shown in the below table. The $p > 0.05$ for all strategies except exemplification, so males try to look more dedicated as compared to females.

Insert Table III Here

Overall we can see the male are more inclined towards impression management tactic as compared to females. This is in accordance with Laura (2006).

One way ANOVA is computed in order to analyze the use of IM by different age groups. The results of one way ANOVA are given in Table IV.

Insert Table IV Here
The ANOVA table shows that there are significant differences in use of Impression Management tactics by different age groups. Post Hoc Tuckey Test was applied in order to analyze the nature of the differences.

The results of Post Hoc Tuckey Test revealed that with increase in age people use more intimidation. Their behaviour becomes stricter with their co-workers. They deal aggressively with other people.

The results were very interesting for ingratiation and exemplification. In the beginning of their careers people tend to be more hardworking individuals. They try to look dedicated and loyal to the organization. They try to show a positive attitude. But with the passage of time, they learn the rules of game and stop relying on the impression management tactics.

People in early ages try to promote them. They talk very proudly about their accomplishments and try to show that they are very valuable to the organization. But when they succeed to make their place in the organization their tendency for self-promotion diminishes. But wheel is reinvented and during their old ages people again try to promote themselves.

In order to test the model and interpret the relationship of variables, the researchers have run multiple regressions. The results of multiple regressions are as follows:

*Insert Table V Here*

Table V is the model summary table. This table includes the multiple correlation coefficients, $R$, its square, $R^2$, and an adjusted version of this coefficient. The multiple correlation coefficient, $R = 0.532$, indicates that there is a moderate correlation between the impression management techniques and performance rating of employees. This also means that there are other variables contributing 46.8% to the model fit. In terms of variability in observed performance rating accounted for by our fitted model, this amounts to a proportion of $R^2 = 0.284$, or 28.4%. The *adjusted* $R^2$ is an improved estimation of $R^2$ in the population. Use of this adjusted measure leads to a revised estimate that 25.9% of the variability in performance rating of employees in the population can be explained by the five impression management techniques variables. The error term is measuring the difference between an individual’s performance rating and the mean performance rating of subjects of the same class using same strategies. According to the regression model, the mean deviation is zero (positive and negative deviations cancel each other out). In the above table error value = 0.69144 that is not very high. So the different in the observed and expected rating would not be very high. Durbin Watson = 1.682, is measuring the auto correlation between independent variables. It is in the acceptable range i.e. 1.5-2.5.

*Insert Table VI Here*

The “ANOVA” table i.e. Table VI is providing an $F$-test for the null hypothesis that none of the impression management strategy is related to performance rating, or in other words, that $R^2$ is zero. Here the null hypothesis is rejected ($F (5) = 11.634, p < 0.051$), and so it is concluded that at least one of impression management strategies is related to performance rating of employees. As $p < 0.05$ so the model is fit so it is assumed that there is a strong regression between impression management strategies and performance rating.

*Insert Table VII Here*

Table VII is the coefficient table that is providing estimates of the regression coefficients, standard errors of the estimates, $t$-tests and tolerance and VIF values. The estimated regression coefficients are given under the heading “Un-standardized Coefficients, B”; these give, for each
of the independent variables, the predicted change in the dependent variable when the independent variable is increased by one unit conditional on all the other variables in the model remaining constant. For example, here we estimate that the performance rating of an employee is decreased by 27.9% with a one unit increase on intimidation scale assuming that there is no change in the rest of variables. Similarly, there would be 7.6% increase in the performance rating of employee by a unit increase on the ingratiation scale. One unit increase in exemplification will bring a 28.2% increase in performance rating. Self-promotion is negatively related with performance rating. It has a 5.3% negative impact on performance rating. Supplication will also decrease one performance rating by 8.6%. In this coefficient table t value is also mentioned. It is showing the influencibility of impression management strategies on performance rating. All the strategies can be ranked with the help of this t value. Strategies with a high t value are more influencive as compared to those having lower t value. Tolerance values for all IVs are in acceptable range i.e. none of them is approaching to zero. VIF value is also in acceptable range i.e. all values are below 2. The researchers have developed the following regression equation with the help of above coefficient table.

\[ R = \beta_0 + \beta_1 T + \beta_2 G + \beta_3 E + \beta_4 P + \beta_5 S \]

(Where, R = Performance Rating, T = Intimidation, G = Ingratiation, E = Exemplification, P = Self-Promotion and S = Supplication).

\[ R = 3.662 - 0.279T + 0.76G + 0.282E - 0.053P - 0.086S \]

Impression management strategies can be ranked as follows:
1. Exemplification
2. Ingratiation
3. Self-Promotion
4. Supplication
5. Intimidation

Examining the residual plot, it appears that the homogeneity of variance assumption is not violated since the residuals scatter randomly around the zero line and the degree of scatter appears approx. constant across the range of predicted values. The histogram of the residuals is also approx. consistent with the assumption of normality

The above results indicate that most of the impression management strategies are male oriented (Chidambaram et al., 2008) and women are not inclined towards adopting impression management tactics (Laura, 2006).

Young people try to portray a positive image of them by adopting the strategies like ingratiation and exemplification. But with the increase in age people left the use of positive strategies and move towards negative ones like intimidation and supplication.

In this study it has been proved that intimidation and supplication are the most negative strategies of impression management (Bolino & Turnley, 2003). People using intimidation were rated lower so first null hypothesis is proved.

The study results have shown that the performance rating of an employee is decreased by 27.9% with a one unit increase on intimidation scale assuming that there is no change in the rest of variables. The value of t-statistics is -2.882, which is significant thus our first hypothesis is accepted. The acceptance of this hypothesis is supported by the study of Wayne & Ferris (1990) and Allen & Rush, (1998).
H1: A subordinate’s use of intimidation will have a negative effect on supervisor’s performance rating of employee. (Accepted)

Similarly, there would be 7.6% increase in the performance rating of employee by a unit increase on the ingratiation scale. In this case the value of t-statistics is 0.688, which is insignificant, resulting to rejection of second hypothesis. The rejection of this hypothesis is not generally support by the empirical study but as the major of the research has been done in a western environment the difference in result is contributed by the peculiar work environment, culture and demographic characteristics of Pakistan in which an Ingratiator is often considered as a YES BOSS employee.

H2: Ingratiation has a positive effect on the performance rating of the subordinate. (Rejected)

In case of Exemplification, its one unit increase will bring a 28.2% increase in performance rating and value of its t-stats is 3.739 which is very significant, causing acceptance of our third hypothesis. The acceptance of this hypothesis is endorsed by the research work by Kacmar, Harris & Nagy (2007). With the help of exemplification people try to portray themselves as dedicated and loyal to the organization.

H3: Employees engaged in exemplification will be rated positively by the supervisor. (Accepted)

Self-promotion is negatively related with performance rating. It has a 5.3% negative impact on performance rating, but its value of t statistics is -.727 giving rejection of our fourth hypothesis. So the relationship of self-promotion with performance rating is insignificant. The result is supported by the study of Jones and Pittman (1982), wherein they were of the view that self promotion works well, when it is difficult to measure and verify the competency claims. In Pakistani culture, the persons practicing self promotion are not viewed high.

H4: A supervisor’s ratings of the subordinates performance is negatively related to self-promotion tactics. (Rejected)

Supplication will also decrease one performance rating by 8.6%. The table shows that value of t-statistics is -1.018, which is low resulting to rejection of our hypothesis that Supplication has a negative impact on the employee performance rating. The result received is quite contrary to what empirical study has shown about the impact of supplication strategy on performance rating but if we see it from our generic cultural point of view wherein people are generally sympathetic and tend to help others and extend support, the supplication strategy may strike a positive feedback from the Supervisor.

H5: Supplication tactic used by subordinates is negatively related to the performance rating. (Rejected)

The strength of different impression management strategies with the performance rating is represented by the following model:

Insert Fig. II Here

5. Conclusion

Impression management is a phenomena exhibited by all employees, whether in a conscious or an unconscious manner in an organizational context. The study shows that Impression management plays an important role in the performance rating of employees by their respective supervisors. Some time employee engage them in portraying a positive and some time a negative
impression. There are a number of factors like age, experience, education level, demography, organizational environment etc. which affect the employee’s choice of impression management strategies in order to impress their bosses to have better performance scores. The different adopted strategies have different impacts on performance rating of employees. The established impression plays a very important role in rating of employees. This rating can influence the career advancement of individual so one should be very careful about his/her impression formed in the mind of their supervisors. Moreover, no doubt impression management works but one should not rely on impression management only. Performance should also be focused by employees. Merely relying on impression management strategies cannot help them in their career advancement.

5.1. Limitations and guidance for future researchers

Researchers openly acknowledge the following limitations/weaknesses of this research:

− Supervisors are not asked about the use of impression management tactics by their subordinates and their liking for the impression management behaviours.
− Personal problems between subordinates and supervisors have not been taken in consideration.
− Researchers ignored the factor of personal liking and disliking of subordinate by supervisor.
− The study has not accounted for factors like age, education level, gender, work experience, organizational environment that may affect employee use of a particular impression management strategy.
− Demographic similarity also plays a very important role in the performance rating of subordinate by supervisor (Wayne & Liden, 1995). This factor has not been tested during the current study.

Future researchers can include examining the impact of impression management not only on the performance rating of employees but on outcomes like pay and promotion decision as well. It can be tested how impression management help somebody in his/her career advancement. The Organizational Behaviour Experts may use the study of impression management in studying, predicting and evaluating the employee behaviour and based on this they can devise and recommend Human Resource (HR) policies. Moreover it can also be studied that how much impression management compensates someone for unsatisfactory performance.

Future researchers can also make a comparative study on government and private organization. How the employees of both sectors use impression management strategies and what is their impact on performance rating and promotion. Effectiveness of impression management in interviewing can also be tested in future researches.

Studding of relationship between Knowledge sharing and town Health  
(Case Study: National Iranian Oil Refining & Distribution Co) 

Maryam Aliei

Department of Management, Shahrood industrial University, Shahrood, semnan, Iran  

Bozorgmehr Ashrafi  
Department of Management, Shahrood industrial University, Shahrood, semnan, Iran  

Abstract  
Many companies are beginning to feel that the knowledge of their employees is their most valuable asset. They may be right, but few firms have actually begun to actively manage their knowledge assets on a broad scale. Knowledge management has thus far been addressed at either a philosophical or a technological level, with little pragmatic discussion on how knowledge can be managed and used more effectively on a daily basis. At this early stage of knowledge management in business, the most appropriate form of dialogue is not detailed tactics, but rather high-level principles. When an organization decides what principles it agrees upon with respect to knowledge management, it can then create detailed approaches and plans based upon the principles. This paper describes the relationship between a model for applying Knowledge Management (KM) and town Health (TH). This model is designed and introduced as an extension of the Probst/Raub/Romhardt model for KM, particularly in two distinctive levels as strategic and operational. Also required activities, functionalities and I/Os of each level are specified under subsets of the model. The model is verified based on a survey.  

Keywords: Knowledge Management, town Health, KMTH, Statistical Analysis  

Introduction:  
Knowledge is often seen as a rich form of information. This differentiation however is not terribly helpful. A more useful definition of knowledge is that it is about know-how and know-why. A metaphor is that of a cake. An analysis of its molecular constituents is data – for most purposes not very useful – you may not even be able to tell it were a cake. A list of ingredients is information – more useful – an experienced cook could probably make the cake – the data has been given context. The recipe though would be knowledge – written knowledge - explicit knowledge – it tells you how-to make the cake. An inexperienced cook however, even with the recipe might not make a good cake. A person, though, with relevant knowledge, experience, and skill – knowledge in their heads - not easily written down - tacit knowledge – would almost certainly make an excellent cake from the recipe. It is important to note that to make knowledge productive you need information. Knowing how to make a cake is not sufficient – you need the list of ingredients. And to decide what cake to make - you need information – the tastes of the consumers of the cake. Know-why is also important. If an ingredient of the cake was unavailable – knowing the purpose of that ingredient might help a knowledgeable cook substitute an alternative. In fact know-why is often more important than know-how as it allows you to be creative - to fall back on principles – to re-invent your know-how.
Knowledge Management

There are many definitions of Knowledge Management. A common definition is 'The collection of processes that govern the creation, dissemination, and leveraging of knowledge to fulfill organizational objectives.' I feel this definition is inadequate, however, as it limits knowledge management to a set of processes. I prefer what I feel is a more useful definition: "Knowledge Management is a business philosophy. It is an emerging set of principles, processes, organizational structures, and technology applications that help people share and leverage their knowledge to meet their business objectives." This puts focus and responsibility on the individual – the knowledge worker - and on the holistic nature of knowledge management. Also critically it is about meeting business objectives. Knowledge Management is not an end in itself. It is also fundamentally about sharing knowledge and putting that knowledge to use.

Why Sharing Knowledge is Important

Today, the creation and application of new knowledge is essential to the survival of almost all businesses. There are many reasons. They include: - "Intangible products - ideas, processes, information are taking a growing share of global trade from the traditional, tangible goods of the manufacturing economy." Increasingly the only sustainable competitive advantage is continuous innovation. In other words the application of new knowledge. "Increasing turn over of staff. People don't take a job for life any more. When someone leaves an organization their knowledge walks out of the door with them." "Our problem as an organization is that we don't know what we know". Large global or even small geographically dispersed organizations do not know what they know. Expertise learnt and applied in one part of the organization is not leveraged in another "Accelerating change - technology, business and social. As things change so does our knowledge base erode – in some businesses, as much of 50% of what you knew 5 years ago is probably obsolete today. [1]

Seven knowledge-sharing strategies:

Knowledge is no longer a new concept to many businesses, partially due to the rise of the corporate portal as the latest must-have application. The portal has become synonymous with knowledge management. The problem is that technology by itself often doesn't solve a company's inherent problems with intellectual capital, knowledge and information management. Simply put, every solution takes people. Here, Pamela Holloway, a knowledge management practitioner and frequent speaker at KM events, suggests seven strategies for getting people to open up and share what they know. Thinking holds that knowledge sharing is not a natural act. Many KM initiatives focus on how best to cajole unwilling participants into providing information. But how would it change things if we were to start from the premise that knowledge sharing really is a natural act? Just look around. People do it all the time—in the halls, over the phone, through e-mail, at the pub. Awareness is the first step to overcoming this reluctance. Understanding that we carry this baggage with us and recognizing the need to unlearn and rethink our models and paradigms is an essential skill. Ultimately, it doesn't matter whether knowledge sharing is natural or unnatural; it just matters that we do it. Seven knowledge-sharing strategies:

1. Show people how knowledge benefits them personally. It's true: Knowledge does equal power. But there's a new caveat. Knowledge is only powerful or valuable when it is continually refreshed and used. Knowledge sitting idle is worthless. Knowledge has an increasingly short shelf life, and if it's not used, it quickly loses value—period.
2. Revamp reward and recognition systems.
Most reward systems still reward individual effort and knowledge. If we want to create a culture that supports knowledge creation, sharing and re-use, we must reward those behaviors. It's that simple.

3. Show people what knowledge-sharing looks like.
There are "knowledge naturals" in every organization. These are people who live to learn new things and share what they know with others. It is their purpose in life. Identify these people and establish semi-formal roles that recognize these activities as valuable. Elevate the status of informal experts. Give people role models they can pattern their behaviors after.

4. Let people know it's OK to make mistakes.
In many company cultures mistake-making is not allowed, or at least it's not admitted. Neither is not knowing. People are brought up to believe that they are always supposed to have the answer. This approach leaves very little room for learning and growth and shuts the door on knowledge sharing.

5. Make knowledge sharing a job requirement.
Of all the reasons people don't share knowledge, not having enough time is probably the most common. People are just too busy to attend to what looks like an additional work requirement added to an already busy work schedule.

6. Educate people about what knowledge is valuable and how it can be used.
This may sound ridiculous, but one of the reasons people don't share is that they don't know that they have anything to share. Here's an example: Suppose I'm a customer-support agent on a help desk, helping customers resolve PC problems. The knowledge of how to solve a particular problem, the cause of the problem and a host of related information about the customer and product are all extremely valuable bits of knowledge that could be shared and produce great benefit.

7. Make sure the technology works for people, not vice-versa.
Sometimes IT-driven knowledge Management initiatives take on an "if we build it, they will come" attitude. We erect huge knowledge management systems that are not integrated with how people actually work. We are far better served by including users in the development of knowledge tools and building on everyday technology that we already have in place (such as e-mail systems, groupware and the Internet).[2]

Principles of Knowledge Management

principles of knowledge management are listed below:

1. Effective management of knowledge requires hybrid solutions of people and technology
Human beings may be expensive and cantankerous, but they are quite accomplished at certain knowledge skills. When we seek to understand knowledge, to interpret it within a broader context, to combine it with other types of information, or to synthesize various unstructured forms of knowledge, humans are the recommended tool. Computers and communications systems, on the other hand, are good at different types of things. For the capture, transformation, and distribution of highly structured knowledge that changes rapidly, computers are more capable than people.

2. Knowledge management requires knowledge managers
Key business resources like labor and capital have substantial organizational functions devoted to their management. Knowledge won't be well managed until some group within a firm has clear responsibility for the job. Among the tasks that such a group might perform...
are collecting and categorizing knowledge, establishing a knowledge-oriented technology infrastructure, and monitoring the use of knowledge.

3. Knowledge management means improving knowledge work processes

It is important to address and improve the generic knowledge management process, but knowledge is generated, used, and shared intensively in a few specific knowledge work processes. The specific processes vary by firm and industry, but they include market research, product design and development, and even more transactional processes like order configuration and pricing.

6. Sharing and using knowledge are often unnatural acts

If my knowledge is a valuable resource, why should I share it? If my job is to create knowledge, why should I put my job at risk by using yours instead of mine? We would realize that sharing and usage have to be motivated through time-honored techniques like performance evaluation, compensation, for example.[3]

The Knowledge Life Cycle

The Knowledge Life Cycle is described by Mark W. McElroy in 1999.[4]
Individual & Group Learning

Indiv. & Group Learning

Definition
- A process involving human interaction, knowledge claim formulation, and validation by which new individual and/or group knowledge is created.
- Unfolds in accordance with some life cycle process, but at an individual and group level.
- The first step in organizational learning:
  “Organizations learn only through individuals who learn.”
  Peter Senge
  *The Fifth Discipline*

Dynamics
- Influenced by feedback from prior validation efforts.
- Produces input to Knowledge Claim Formulation process.
- Knowledge to some is only information to others until it is validated.

Potential KM Interventions
- Innovation initiatives at the individual and group level.
- Formalized feedback mechanisms between knowledge integration phases and individual and group learning activities.
- Formalized feedback mechanisms to knowledge claim formulation.
- User-driven desktop environments (Demand-side KM technologies).
Information Acquisition

Definition
- A process by which an organization either deliberately or serendipitously acquires knowledge claims or information produced by others external to the organization.

Dynamics
- Plays a fundamental role in the formulation of new knowledge claims at the organizational level in conjunction with knowledge claims put forth by individuals and groups.
- Also influenced by feedback received from knowledge integration activities.

Potential KM Interventions
- Significant involvement in outside initiatives, consortia, think tanks, etc.
- Research Initiatives.
- Industry conferences and outside training programs.
- Targeted subscription services (Garther, etc.).
- In-house IA functions (library services, etc.).
- Highly customized desktop systems that enable self-paced research on an individual basis.
Knowledge Validation

Definition
- A process by which knowledge claims are subjected to organizational criteria to determine their value and validity.

Dynamics
- A managed function which formally evaluates competing knowledge claims when put forth by the Knowledge Claim Formulation process.
- A process which precedes the transformation of organizationally held knowledge in cases where new knowledge claims are deemed to be of a higher value to the firm than currently held rules.

Potential KM Interventions
- Institutionalize validation process as a formalized way of processing new knowledge claims.
- KM practitioners must establish validation criteria (i.e., the rules by which new rules will be evaluated: "meta-rules").
- Requires the maintenance of codified organizational knowledge for use as a backdrop in considering newly formulated knowledge claims ("knowledge structures").
- Initiating Corporate "Memome" projects.

Knowledge Claim Formulation

Definition
- A process involving human interaction by which new organizational knowledge claims are formulated.
- The codification of knowledge claims at an organizational level.

Dynamics
- Consolidates knowledge claims derived from individual and group learning, as well as information acquired from outside sources.
- Results in production of codified knowledge claims for submission to organizational validation process.

Potential KM Interventions
- Create formalized procedure for receipt and codification of individual and group innovations at an enterprise level.
- Formalize concept of "knowledge structures" and associated expressions of knowledge claims (e.g., business process vs. strategy innovations, etc.).
- Formalize with designated people, process, and technology resources.
- Decentralize innovations.
Town Health

Clearly it is a concept (and object) under construction. As theoretical and operational references, we can cite the intense urbanization of the population associated with important intra-urban inequalities. The occurrence of health-related events is associated with the attributes of individuals residing in the “urban place”, as well as with the properties of these individuals in the aggregate (that is, the urban composition). Urban health incorporates another dimension: the role of the physical and social setting of the “place” (the context) in shaping people’s health. The understanding that not all determinants of health-related events can be reduced to attributes limited to the hierarchical level of individual complexity is the focus of recent debate in the field of epidemiology. A new vision and understanding of the methodological complexities and inferences related to studies and variables measured at the group, aggregate, and contextual hierarchical levels has awakened growing interest and reflection on the possible effects, for the health of individuals and populations, of constructs and variables measured at the level of contextual complexity, such as income inequality, social capital, and “neighborhood” characteristics.

In this Forum, Monte-Mór discusses the historical evolution of cities according to Henri Lefèbvre: from the political city to the medieval city and finally to the current industrial city and the double process characterized by the city’s implosion and explosion. This extensive urbanization is spreading beyond city limits, occupying the entire social space. Could this occupation be determinant for the reemergence (in urban areas of Brazil) of diseases traditionally viewed as “rural”, such as human visceral leishmaniasis? Vlahov et al. discuss the concepts “urban health penalty”, “urban sprawl”, and “urban health advantage”. They also pose three that will demand huge effort, creativity, and new
thinking, and it is reasonable to contend that the answers will only be possible from a trans- and interdisciplinary perspective.

Finally, Caiaffa et al. use an ecological methodology to measure the intra-urban geographic variation in various health-related events, such as asthma, dengue, adolescent pregnancy, homicide, and human visceral leishmaniasis, in the context of the municipality of Belo Horizonte, Minas Gerais, Brazil. We hope that the articles will fuel the debate and contribute to the incorporation of the urban health issue into the field of collective health, both in academic institutions and health services[5]

Verification of the KMTH

In order to verify the model of KMTH, three variables for a survey (using questionnaires) are defined as:

- Culture
- Organization
- Information Technology [6]

The survey is performed by distributing questionnaires among 68 experts of TH and KM. According to statistical analysis conducted, 90% among organization and culture variables; 85% among culture and information technology variables, and 70% between the organization and information technology variables are positively correlated. This means that any changes in one of the factors leading to changes in other factors as well.

To determine the effectiveness or lack of each of the variables in KM processes for TH, the mean test of population is used. Given that the spectrum is divided into five questionnaires and number three is placed the middle of this spectrum, averages less than 3 and equal are to the sense of being ineffective and mean values more than 3 mean effective. Assumptions of this test are as follows:

\[
\begin{align*}
H_0 & \geq 3 \\
H_1 & > 3
\end{align*}
\]

Zero: the relevant factors in KM is not effective
Opposite: the relevant factors in KM is effective

Table 1- Test of the effectiveness of Culture

<table>
<thead>
<tr>
<th>Variable</th>
<th>T</th>
<th>df</th>
<th>Sig. (2-tailed)</th>
<th>Mean Difference</th>
<th>95% Confidence Interval of the Difference</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td>Lower</td>
</tr>
<tr>
<td>Culture</td>
<td>2.23</td>
<td>67</td>
<td>0.00</td>
<td>1.54</td>
<td>1.44</td>
</tr>
</tbody>
</table>

As depicted in Table 1 the test significant number(sig) is equal to 0.000 and is smaller than the level of 0.50, therefore zero assumption is rejected and according to positive two upper and lower bounds, the average value is greater than 3 (\( \mu > 3 \)), so in terms of experts, organization is considered as an effective factor of the KMTH. Similar approach is applied for variables of culture and IT, and the results are depicted in Table 2 and 3.
Table 2- Test of the effectiveness of Organization

<table>
<thead>
<tr>
<th>Variable</th>
<th>T</th>
<th>df</th>
<th>Sig. (2-tailed)</th>
<th>Mean Difference</th>
<th>95% Confidence Interval of the Difference</th>
</tr>
</thead>
<tbody>
<tr>
<td>Organization</td>
<td>4.01</td>
<td>67</td>
<td>0.00</td>
<td>1.05</td>
<td>Lower 0.78, Upper 1.32</td>
</tr>
</tbody>
</table>

For these two variables also the test significant number is equal to 0.000 and is smaller than the level of 0.50, therefore zero assumption is rejected and according to positive two upper and lower bounds, the average value is greater than 3 ($\mu > 3$), so in terms of experts, culture and IT are considered as an effective factor of the KMTH too.

Table 3- Test of the effectiveness of IT

<table>

<td>3.23</td>
<td>67</td>
<td>0.00</td>
<td>0.66</td>
<td>Lower 0.37, Upper 0.96</td>
</tr>
</tbody>
</table>

Conclusion

Today Town Health (TH) is a complex and sophisticated term roots not only in physical, emotional, mental and spiritual human needs but in social and global needs. In this paper, the Model of KM for TH (KMTH) is introduced. This model is verified by a survey performed in a population of 95 who are mainly experts of KM and town Health in Iran. They are committed to advancing the state of knowledge management, but in a decentralized company like HP it is not clear what steps should be taken. They discuss whether there are actions they could take beyond facilitating the Knowledge Management Workshop. They feel that knowledge is already exchanged well within work groups and even business units, but there is little support in the culture for sharing across units. However, for ISST to try to change the culture just for the purpose of knowledge management seems like the tail wagging the dog. The most effective way to create a knowledge sharing culture – is first to start to practice it at your level. The higher up the organization the more effective you will be in changing the culture but even if you are low down the hierarchy – you have an influence. Second, put in place the knowledge sharing technology and train and educate people in its effective use. The two together – people with the appropriate knowledge sharing mindset and the appropriate knowledge sharing technology to support them will rapidly bring about a knowledge sharing culture that helps you better meet your business objectives. Managing knowledge in organizations will lead to a variety of new problems and issues. And this type of initiative will face resistance. Knowledge management runs counter to the direction of American society; we prefer television to books, intuition to research, pragmatists to theorists. The serious pursuit of knowledge in organizations will be challenged by an anti-intellectual orientation in the US that has been present since the days of the frontier.

Abstract
The paper examines the impact of long-and short-run interest rates on inflation using time series data (1965 -2010). These two interest rates have never been discussed together before. Call money rate is taken as bank rate for analysis. An efficient technique ARDL is used for analysis. There is cointegration existence for inflation with GDP, government bond rate, broad money and bank rate. Inflation maintains significant relationship with the variables GDP, broad money, and bank rate but insignificant with government bond yield. Bank rate can be used by the policy makers to control inflation in context to Pakistan. CUSUM and CUSUMQ tests indicate stability and model fit of inflation. Granger causality is used for the direction indication. Inflation is having uni-directional causality with GDP, broad money and bank rate.

Key Words: Bank rate, government bond rate, ARDL

1. Introduction
Controlling inflation is the main aim of monetary policy in any country across the world. Money supply is one of the important variables of Pakistan’s monetary policy to control inflation. Leading indicators of inflation are broad money (M2) and credit growth of private sector. Monetary policy cannot be designed without understanding the causes behind inflation.
High inflation continues in the economy due to generation of excess money. Rs266 billion is the government borrowing contributing towards the increase in reserve money during the current fiscal year 2010 which is resulting into high interest rates.
Economic growth seems relatively weak during 2009-10 in Pakistan. But at the same time inflation remains uplift with the persistent behavior. Inflation becomes harmful for the economy when it starts showing persistency as currently its showing. On the other hand, government borrowing from the banks has increased during fiscal year 2010 as compared to 2009. This is due to more fiscal spending and less availability of external debt. After declining in early 2009, CPI inflation has increased in October 2009 and has reached at the trough of 8.9% and showing increasing trend on the consistent basis. Due to excess money supply growth and fiscal prolificacy in 2007, State Bank of Pakistan has started increasing the interest rates from May 2008 like policy rate and Statutory Liquidity Requirement (SLR). After reaching at 15% in November 2008, when country was facing balance of payment crisis, SBP started easing the policy discount rate which was 12.5%.
On the other hand, inflation is expected to increase in future with a 1 percent monthly change in October 2010. Government is relying on SBP for deficit financing which is the main reason of this high inflation. Without controlling government borrowing, it is hard to control inflation.

Consistent dependence of Pakistan’s government on SBP for the borrowing purpose to fund its fiscal shortfall is the main reason of persistent price rise in Pakistan. This inflation results in increased interest rates over the last year (The Central Bank of Pakistan, 2010). Central bank states that the private sector has created the tightening of monetary policy which has now decreased due to excess government borrowing. The main focus will remain to provide the true rationales of inflation and to distinguish the impact of interest rate on inflation with increase in total money supply.

1.1 Significance /Rationale of the Study
There was a bit decline in inflation during 2009 but afterwards it started increasing and reached up to 13.3 percent in April 2010 and still the trend is towards an increase. It is showing persistent behavior. On the other hand, the economic growth recovery seems weak during 2009-10. It is forecasted by the central bank of Pakistan that the interest rates would be increased in order to cope up with inflation. Central bank of Pakistan use inflation to measure the accuracy of monetary policy, so if inflation remained persistent then it would be difficult to maintain the accuracy of monetary policy. (Pakistan Economic Survey, 2009-10)

To control inflation, finding out its causes on continuous basis would be helpful to the policy makers. (Qayyum, 2006)

Economic growth and stability is an important task of central bank which can be negatively affected by high inflation and fiscal deficit. (State Bank of Pakistan, 2010)

1.2 Objectives of the Study
In an attempt to investigate the real causes of price increase in Pakistan’s scenario, the objectives are

1. To analyze inflation with the help of short-run interest rate by considering it as an influencing variable in the light of literature for period 1961-2010

2. To analyze inflation with the help of long-run interest rate by considering it as an influencing variable in the light of literature for period 1961-2010

3. To investigate the factors causing price increase significantly

1.3 Study Outline
The study is outlined in following manner: It starts with introduction of the issue, objectives of the study and the gaps identified from existing literature. Then comes the literature review for this topic. Methodology and data analysis is presented after that. Analysis and discussion of results are interpreted and finally it concludes the whole discussion.

1.4 Gaps Identified from Literature
To control inflation, finding out its causes on continuous basis would be helpful to the policy makers. It is suggested that inflation should be studied with the passage of time so that recent trends’ effects can be revealed (Qayyum, 2006)
The magnitude of change in monetary policy and how it affects inflation, production and the relationship in between the two: understanding of this phenomenon is deficient and it needs fresh inquiry. (Qayyum, 2008)
In order to control money supply and inflation into the market, it is necessary to improve the measurement of money circulation into the market. (Qayyum, 2008)

The associations linking interest rates and price changes have been a matter of significant investigation. Lot of work centers around interest rate study through taking price as one of the independent variables but a little effort have taken made to study prices in context to interest rate changes (Gul and Ekinic, 2006)

An interest rate procedure can recover the performance of interest rates and prices. The links among money development, price increases and interest rates are very untrustworthy. Sufficient space is available for the betterment (Alvarez et al, 2001)

Additional investigation is required to discover whether inflation risk influences further variables which in due course affect the gauge of financial movement (Berument, 1999)

2. Literature Review
Mishkin (1995) tries to reinvestigates the behavior of real interest rates and searches the answer that whether real interest rates are positively or negatively correlated with nominal rate and expected inflation or not. This study of Mishkin tries to find out the performance of interest rates, whether it is changing or not, related to nominal interest rates and inflation. It takes consumer price index and Treasury bill rate as the key variables to test the relationship empirically. The results show negative correlation of real interest rates with inflation and real interest rates are having significant negative relation with the nominal interest rates.
From the viewpoint of an asset-pricing model, the active performance of price in context to interest rate is studied by Pennacchi (1991). The reason behind using this model is that it allows the interdependent of price and interest rates which is justifiable on the empirical basis. His findings indicate that Treasury bill rates and consumer price index are significantly negatively correlated. According to the study, Treasury bill rates also show great volatility and weak mean reversion than expected inflation. In the government policy, the money growth is not leading to change in real return and this is what empirically proved by this study. The results of this research are constant with this policy of government.

Nelson (2008) explains long-term real causes of inflation. According to this, prices and interest rates can be managed by controlling money growth rate. Nelson is responding towards the argument of Woodford which claims that rise in price can be explained through the financial authority’s interest rate policy. Woodford considers short-term interest rate as a key tool to manage inflation. Nelson says about Woodford’s study that its results are accurate but are based on high level assumptions. Nelson is focusing on money growth to determine inflation. The study suggests money supply as a key determinant of inflation.

Dwyer (2001) uses currency, prices and nominal income to measure the relationship between currency and price level. The rationale of the study is to observe whether money supply in terms of broad money determines inflation or not. It takes Treasury bill rate as a short-term rate and broad money to measure relationship. It concludes that in the long run
money growth at first affects nominal income and then inflation. According to Dwyer, money growth explains inflation more than any other variable. Dwyer’s study is limited to inflation. It pays no attention to real income growth. There are many factors related to this limitation. It says that recession is hard to predict which the limitation here is. 

Jayadev and Kumar (2001) analyze the impact of bank rate on commercial paper rates and come up with an important finding that the bank rate which is taken in the form of call money rate has become an important determinant for indicating monetary policy’s position. It guides the market as well as the interest rates to its desired path. Changes in monetary policy bring changes both in short and long run. Bank rate is the rate through which the central bank gives loans to the commercial banks. It acts as benchmark in the money market.

Since early 1970s, central banks in Atlanta are using policy actions to manipulate the nominal quantities of money. Securities, reserve requirements or the interest rates are the policy actions at which reserves are provided to financial mediators. It measures nominal quantity of money through broad money and income. The study suggests a positive relation of price and money in association to income but the nature of this relation is a proportional one.

(Dwyer and Hafer, 1999)

Central banks make the policies to influence the two main things which are asset price and a yield, these two variables in return affects the economy. Due to the reforms in Indian financial sector, bank rate has emerged as an important variable to guide the monetary policy makers. Bank rate is handling interest rates according to the desired trajectory. These are the findings which Jayadev and Kumar (2003) presents in their study in which they are testing the impact of bank rates like ninety-one day treasury bill rate, average call money rate and three month MIBOR on commercial paper rate.

Berument (1999) analysis the relationship between inflation and T-bill rate and verifies that there is long term relationship among T-bill rate, rise in price and inflation risk. This study provides important implications for the government in UK attempting to lower the inflation. It provides the government with the guidance whose objective is to control inflation when positive relation exists between price and bank rates. Fisher’s theory is taken as a base which suggests the existence of relationship between inflation risk and interest rates. It predicts Treasury bill rate an important variable to explain inflation. Berument argues that the relationship between price and bank rates is not defined well in the existing text.

The relationships between interest rates and price changes have been subject to substantial research. Most of the researches focus on impact of price changes on interest rate but only few studies have been taken the impact of changes in interest rate on price. But whether the variation in the interest rate is creating change in inflation or change in inflation is the source of variation in interest rates is still a confusing phenomenon. Interest rates and inflation are the key variables in macroeconomics. Increasing inflation is always an important problem any country face. It says that by increasing interest rate increase an opportunity cost of holding money in hand which decrease money supply into the market which provides access money for the credit. Resultantly prices increase and it encourages people to hold it rather than to spend. It takes whole sale price index to measure inflation. It suggests that a relation exists between bank rate and price in the long-run.
Money demand is an important variable. The factors behind this variable are important for the good performance of monetary policy. The study takes broad money, price level (GDP deflator), nominal income, call money rate, long term bond rate and consumer price index to determine inflation. Qayyum’s (2005) analysis indicates that broad money (M2) is having a long-run constant association with the variables like income, price, bank rate and long-term bond rate.

Qayyum’s study (2006) investigates a relationship of money growth with inflation in Pakistan that there is an upbeat link of surplus money and price. Impact of excess money is at first on GDP and then on price rises. This study supports that inflation is a monetary occurrence in context to Pakistan and is capable of to be managed by stretched monetary policy.

The causal relationship for exchange rate with increase in price and interest rate has been estimated and the study says that inflation can also be controlled by interest rate in economy. Increase in the bank rate decreases M2 and encourage the savings. A close relation exists between inflation and interest rates. These are the main drivers of the economy.

Gul and Ekinci (2006) finds out the relationship between bank rate and increase in price. This study has been done in Turkey. It provides evidence that a relationship exists between these two variables on the long term basis. But whether the changes in interest rates are creating change in inflation or inflation is a source of change in interest rates is still an ambiguous phenomenon. There is a requirement for sufficient investigation on such relationship. Most of the researches concentrate on impact of price change on interest rates but only few studies have been conducted to check effect of interest rates on inflation.

Khan and Schimmelpfennig (2006) explore the causes of price hike in Pakistan. The model includes money supply, credit for private sector, interest rate, wheat support price and exchange rate. It takes consumer price index as inflation, broad money as money supply, 6-month Treasury bill rate as an interest rate, nominal GDP (12-month moving average a year), large scale manufacturing index (LSM) to check the causes of inflation. The study shows that the monetary variables like growth of M2 and private segment debt ratio are explaining inflation by the lags of around twelve months. Khan and Schimmelpfennig say that the state bank of Pakistan should focus to control inflation. They suggest that monetary policy should be forward looking so that it can control inflation.

Alvarez et al (2001) says that an interest rate strategy can make better the short run behavior of interest rates and prices. The short-run relationship among money growth, inflation and interest rates is untrustworthy, so there is much space for betterment. Main instrument of monetary policy is to increase short-run interest rate to direct inflation which is an indirect way to reduce money growth.

Brzezina (2001) takes bank rate which influences the expenditure for business entities, family units and then the prices. It suggests that it’s the money growth which determines price increase in the long-run not the gap between real and natural interest rate. It takes quantity theory of money as its basis. The motive behind the study is to empirically check this theory. It takes consumer price index, GDP deflator, federal fund rate, yield on five year T-bonds, real GDP and expected inflation to measure the relation. It suggests the positive relation between real rates and inflation which reject its theoretical model.
Qayyum (2006) investigates the link between M2 and price rises. It tests that inflation is due to monetary incident. The study suggests in the context of Pakistan that money growth affects real GDP and inflation. It says money growth as an important indicator of inflation. It suggests tight monetary policy to control inflation because price hike is the result of loose monetary policy. It takes consumer price index, real GDP growth, nominal GDP growth, velocity growth and money growth to test the relationship.

3. Methodology
To assess the causes of price increase, lot of work has been done in case of Pakistan. Qayyum’s study (2006) investigates a relationship of money growth with inflation in Pakistan and reveals a positive connection between surplus money growth and price rises. This study supports about price rises to be a monetary incident for Pakistan and can be managed by stretched monetary strategy. Khan and Schimmelpfennig (2006) explore the causes of price hike in Pakistan. The study shows that the monetary variables like M2 and private segment debt ratio are explaining inflation by lags of around twelve months. Khan and Schimmelpfennig say that the state bank of Pakistan should focus to control inflation. They suggest that monetary policy should be forward looking so that it can control inflation. The associations linking interest rates and price changes have been a matter of significant investigation. Lot of work centers around prices with reference to interest rate but very few have taken the influence of changes in the bank rate on price (Gul and Ekinic, 2006)

The study has focused at the behavior of short-term and long-term interest rates that how it influences inflation. The dynamic model of inflation in Pakistan is specified as:

\[
INF = \beta_0 + \beta_1 GDP + \beta_2 M2 + \beta_3 CMR + \beta_4 GBY + \mu \  \cdots \cdots \cdots \cdots \cdots \cdots \cdots \cdots (1)
\]

Where
INF = Rate of Inflation
GDP = Real Income
M2 = Broad Money
CMR = Call Money Rate
GBY = Government Bond Yield
\mu = Random Error

Where INF is rate of inflation; M2 comprising of currency in circulation, demand deposits and time deposits and it is converted into after adjusting for price level. GDP is real gross domestic product, CMR is call money rate, a short-term interest rate which is an interbank rate at which banks do loaning with each other, GBY is a long-term interest rate known as government bond yield used by State Bank of Pakistan and INF is inflation rate. The \( \beta \)’s are income, money supply, call money rate and government bond rate elasticities respectively and \( \mu \) is error term.

Hypothesis
H1: Inflation and GDP are positively and significantly connected to each other.
H2: Inflation and broad money are positively and significantly connected to each other.
H3: Inflation and call money rate are negatively and significantly related to each other.
H4: Inflation and government bond yield are negatively and insignificantly related to each other.

We are using two theories namely quantity theory of money and John Maynard Keynes’ liquidity preference theory. According to the Keynes’s liquidity preference theory, there is an inverse relationship exists between interest rate and inflation. With increasing bank rate (holding all other variables constant), the expected M2 falls and this causes price to fall.
In examining the impact of interest rates on inflation, this study investigates the existence of cointegration between price rises and macroeconomic variables: real GDP, broad money, call money rate and bond rate. To perform cointegration analysis, it is required to find out cointegration order for each variable. However, according to existing literature, relying on the unit root tests, each technique produces unique results. Due to this problem, Pesaran (1997) presents a new efficient way of finding long relation, named the autoregressive distributed lag (ARDL) test. This method has a plus point that it do not demand to make all variables stationary at same order.

However, the ARDL approach is proficient for estimating the contribution of interest rates on price rises for Pakistan. The methodology has a plus point that it do not demand to make all variables stationary at same order (Pesaran 1997). This methodology for long-term relation provides unbiased and efficient results because the method is applicable to a small sample as well. At the same time it approximates long and short-run elements of the model and eliminates omitted variables and autocorrelations troubles by making dependent and explanatory variables prominent. Wald or F-statistic process is made for checking the significance of the factors which are taken into account due to lags in an error correction model (ECM) (Pesaran, 1997).

In the absence of prior theoretical information about the path of the long-term association among the factors under discussion, the error correction (EC) edition of ARDL model based on variables in equation (1) is as follows:

\[
\Delta \ln INF_t = \alpha_0 + \sum_{i=0}^{4} \alpha_i \Delta \ln INF_{t-i} + \sum_{i=0}^{4} \alpha_{2i} \Delta \ln RGDP_{t-i} + \sum_{i=0}^{4} \alpha_{3i} \Delta \ln M2_{t-i} + \sum_{i=0}^{4} \alpha_{4i} \Delta \ln CMR_{t-i} + \sum_{i=0}^{3} \alpha_{5i} \Delta \ln GBY_{t-i} + \gamma_1 \ln INF_{t-1} + \gamma_2 \ln RGDP_{t-2} + \gamma_3 M2_{t-1} + \gamma_4 \ln CMR_{t-1} + \gamma_5 \ln GBY_{t-1} + \varepsilon_t
\]

Which is being tested against an alternative hypothesis \( H1: \gamma_1 \neq 0, \gamma_2 \neq 0, \gamma_3 \neq 0, \) and \( \gamma_4 \neq 0 \) and \( \gamma_5 \neq 0 \) by computing the F-statistics? Well, the distribution of F-test which is asymptotic is of no standard, it doesn’t care whether variables are I (0) or I (1). Pesaran et al. (1996) have arranged sets of critical values in two tables. If the calculated F-statistic lies above the upper level of the band, we will reject \( H_0 \), indicating cointegration. If the calculated value of F-stats is more than the F-critical then, the null will be negated, supporting that there is cointegration.

If the result indicates the existence of cointegration, then two-step process is used for the model estimation. According to Pesaran and Shin (1999), suitable asymptotic deductions on both short and long-run bounds can be made under OLS estimates of an ARDL technique provided the order of the ARDL model is suitably improved to permit for contemporary links between the random elements of the data-generating procedures incorporated in the evaluation.

If the results support the evidence that cointegration exists then equation (1) is analyzed through ARDL and equation (3) is given below:

\[
\ln INF_t = \alpha_0 + \sum_{i=1}^{n} \alpha_i \ln INF_{t-i} + \sum_{i=0}^{n} \alpha_{2i} \ln GDP_{t-i} + \sum_{i=0}^{n} \alpha_{3i} M2_{t-i} + \sum_{i=0}^{n} \alpha_{4i} \ln CMR_{t-i} + \sum_{i=0}^{n} \alpha_{5i} \ln GBY_{t-i} + \omega_t
\] (3)
All variables are similar as mentioned before and the lag orders in the ARDL are chosen through the Schwartz Bayesian criterion (SBC) and the model is analyzed via OLS method. In the existence of cointegration, short-run estimates can also be achieved via building an error correction model of the equation (4) given below:

$$\Delta \ln INF_t = \beta_0 + \sum_{i=1}^{n} \beta_i \Delta \ln INF_{t-i} + \sum_{i=0}^{n} \beta_i \Delta \ln GDP_{t-i} + \sum_{i=0}^{n} \beta_i \Delta \ln M2_{t-i} + \sum_{i=0}^{n} \beta_i \Delta \ln CMR_{t-i} + \sum_{i=0}^{n} \beta_i \Delta \ln GBY_{t-i} + \gamma EC_{t-1} + \theta_t$$

(4)

Where $EC_t$ is the error correction term defined as

$$EC_t = \ln F_t - \alpha_0 + \sum_{i=1}^{m} \alpha_i \ln INF_{t-i} - \sum_{i=0}^{m} \alpha_i \ln GDP_{t-i} - \sum_{i=0}^{m} \alpha_i \ln M2_{t-i} - \sum_{i=0}^{m} \alpha_i \ln CMR_{t-i} + \sum_{i=0}^{m} \alpha_i \ln GBY_{t-i}$$

(5)

In the model $\Delta$ is the first difference machinist whereas $\alpha$ is the coefficients connecting the short-run changes of the model’s junction to balance.

To analyze the working of the estimated model, the analytical tests linked with the model are shown which look at the correlation in series, functionality and heteroscedasticity. In this study also, the model stability is checked with the help of CUSUM (Cumulative Sum) and CUSUMSQ (CUSUM of Squares). These tests are at first presented by Brown et al. (1975).

3.1 Data

To check the role of long and short-run interest rates on inflation in context to Pakistan’s monetary policy, time series data for CPI and real GDP from 1961 to 2010 is taken from various issues of economic survey of Pakistan (2009-10) while for broad money, CMR and GBY from State Bank of Pakistan’s annual Report (2009-10) and handbook of Statistics on Pakistan Economy 2008. The most recent reports are analyzed for data collection. MS excel is used for data estimation.

4. Analysis and Discussion of Results

The following portion contains the results of estimation for the role of long and short-run interest rates on inflation over the time period 1961-2010.

The stationarity of the data is checked through Augmented Dicky fuller test and results are presented in Table 1. The results show that inflation; M2, GDP and CMR and government bond yield are non-stationary at level; however these variables are stationary at first difference. The inflation rate which is rate of change in price level is stationary at level. To find the impact, the null hypothesis with no cointegration is tested against the alternative hypothesis of the existence of cointegration. Therefore, ARDL is suitable to test the cointegration in the model.

The first footstep is the test of cointegration is through the F-stats. The F-stats is responsive to the presence of lags forced on variables which all are having first difference (Pesaran et al., 2001). Therefore, lag selection is made through the Vector Autoregressive Model (VAR) model estimation. The VAR with two lags is selected based on Schwatz Baysian Criteria and Table 2 the results. SBC lag selection a criterion is used which is appropriate and recommended by Pesaran and Shin (1999). The results of the F-stats are presented in Table 3. The result shows that the value of F-stats is greater than the critical value, which demonstrates that there is cointegration between inflation, GDP, broad money, bank rate and government bond yield.

SC: Schwarz information criterion
The second point is the analysis of the short and long run relationship for inflation with real GDP, broad money, bank rate and government bond yield which is through OLS.

The results are presented in Tables 3 and 7. At this stage, considering that inflation, real GDP, broad money, bank rate and government bond yield are related to each other, the error correction model equation 3 is analyzed for capturing the short-run dynamics and the adjustment factor. In Table 6 the columns report the lagged variables’ analysis of coefficients in the ARDL model (short-run coefficient estimates). The understanding is that all coefficients are dynamically adjusted with four variables namely inflation, real GDP, broad money, bank rate but not bond rate.

In Table 7, the long-run relation is presented, following Pesaran and Pesaran (1997). The long-term elasticities are normal. The Table 3 shows analytical results. According to Kremer et al. (1992) error correction is better technique for long-term relation in terms of cointegration.

The presence of an established bond between inflation and the key variables is an essential condition for the establishment of monetary rule. The stability Pesaran et al. (2001) and for the model fit CUSUM and CUSUMSQ tests presented by Brown, Dublin and Evans (1975) are applied. It is evident from the test that model is best fit and shows stable behavior. It is plotted for the break points.
Since the plots of CUSUM and CUSUMSQ statistic for inflation do not cross the critical value lines, it is concluded that inflation determination is stable. A graphical presentation of these two tests is in Figures below.

**Figure 1: Cumulative Sum of Recursive Residual for Inflation**

![CUSUM for Inflation](image1)

**Figure 2: Cumulative Sum of Square Recursive Residual for Inflation**

![CUSUM of Squares for Inflation](image2)
Since the graphs of CUSUM and CUSUMSQ tests for price rises are not crossing the critical line, it is clear and obvious that our model of inflation is stable.

Granger causality is a test used to check real causes of variables. It is used to describe the track of relation. Null hypothesis is rejected when probability is less than 0.10. There is unidirectional causality for inflation with GDP, broad money and call money rate. Inflation, GDP, broad money and call money rate are causing each other but government bond yield and inflation are not causing each other. The results are depicted in table 9.

5. Conclusion

Inflation is an important factor which is consistently affecting the economy. The study can play a role of guideline towards the policy formulation for controlling inflation through healthy monetary policy. This is the reason that many empirical studies have been conducted to study its behavior to find out its root causes. The magnitude of change in monetary policy and how it affects inflation, production and the relationship in between the two: understanding of this phenomenon is deficient and it needs fresh inquiry (Qayyum, 2008).

The paper examines the impact of long-and short-run interest rates on inflation using time series data (1961 -2010). These two interest rates have never been discussed together before. ARDL is used for analysis. Cointegration exists among inflation, GDP, broad money, bank rate and government bond rate. Inflation maintains significant relationship for GDP, broad money, and bank rate but insignificant with government bond rate, which implies that bank rate can be taken as one of important interest rate for inflation control. CUSUM and CUSUMQ tests indicate stability and model fit of inflation. Granger causality is used for the direction indication. Inflation is having unidirectional causality with GDP, broad money and call money rate.

Finally, it is essential to mention that the outcomes of study ought to be taken as preface and requires careful inference. Other variables with literature support must be included in the model like exchange rate in search of real reasons. Yet, the study will be proved to be a guide liner or a beacon house for future investigations being conducted on inflation in context to Pakistan because the factor price rises is and will continue to influence an economy.

Abstract
This study is part of my PhD dissertation titled “Assessing the Relevance of Public Sector Management Training to Workplace: Case Study of National Institutes of Management in Pakistan”. The undercurrent of the study is to provide a baseline to analyze the literature on application of learnt concepts of training in workplace. The contemporary public sector receives considerable pressure to get optimum return on public expenditure on executive coaching and development. It also describes evidences that an assessment of relevance of training to public workplaces is necessary to make a proposed training policy more realistic and achievable. The assessment framework followed for overall research was that of Owen and Rogers (1999, 2006) and known as Proactive Evaluation/Assessment. This part particularly trawls through the available literature in detail, starting right from various definitions of training, relevance and transfer mechanism. Then it focuses on available research on subjects like Proactive Evaluation/Assessment of proposed programs, models of public policy making, concept of learning organization and adapting to innovation as result of changes and modification in existing programs. It is necessary because of two reasons. Firstly to positioning the research problem in appropriate academic framework and secondly to support the proposed research approach with approaches of past theory building and constructs. Finale of the paper deeply analyzes policy needs and consequently the adaptation process of Rogers (2003) to proposed policy changes.

Keywords: Management Training, Proactive Assessments, Policy Framework

1. DEFINITIONS AND OVERVIEW OF TRAINING, DEVELOPMENT, RELEVANCE AND TRANSFER

In literature related to formal job training there are either general perspectives of training or at times it is in context of HRD. Both don’t differ significantly. The training is generally perceived to be aimed at creating a formal process for intentional learning that would improve the skills for current job (Encyclopedia of Adult Education and Training 1996). On the other hand, in pure HRD context, training is defined to be a planned learning environment that focuses on permanent changes in knowledge, skills or/and attitude of workforce (Campbell, Dunnette, Lawler & Weick, 1970). The definition given by Goldstein (1993) aligned training objectives more with those of HRD program as he regarded training as seeking systematic changes in individual’s acquisition of job related learning, skills, concepts, roles and acceptable behaviors to enhance work performance. Moreover the HRD literature draws a delicate line of difference between “training” and “development”. Here training is more concerned with current job requirements while development is focused on preparation for future responsibilities and enhancement of conceptual capabilities of individual. Tziner, Haccoun and Kadish (1991) presented a definition of above concepts
with training to be more concerned with contemporary workplace problems and thus
should be transferable and applicable to work settings. Work of Noe (2003) is first effort of
its kind which differentiates learning experiences and categorized them as training or
development. This work suggests four important dimensions that could help in distinction
of two constructs. These are time allocated, mode of utilization, financial allocation and the
risk involved. The development remains in main HRD agenda and may have a moderate
impact on present job but from an individual viewpoint it needs participative and
interactive learning mode to occur and involves a good deal of both formal and informal
and structured and unstructured patterns of pedagogy. For the study under consideration
both the terms are being used interchangeably as most of the literature do for number of
reasons. Study of Beckett & Hager (2002) supports our argument and posits training and
development more closely knitted and practically situated, though not academically.
According to them training serves as an intervention to achieve broader goal of
development. Taking the same stance Boonying (2007) writes that training is an action,
specific to situation and limited in using tools and means, driven by reflexive evidences and
experiences and aims at “knowing how” but does have an undeniable contribution to
intellectual wisdom required by a specific workplace. Thus training is pronounced to be a
mechanism through which development occurs. Besides, from research evidences the
firmer ground for knitting together the two constructs is that the NIM in Pakistan that is the
case study for this proposed research and consequent target for policy development
provides all above modes of learning in its management training programs and thus
qualifies as imparting both training and development education to public middle level
executives. This lays a foundation of our further work regarding relevance and transfer of
training.

Bhiwajee (2007) in her study on Mauritian public sector management training
investigates the “relevance” of modules being imparted to actual workplace challenges
using the trainee officers’ perceptions as a measure. The famous work of Holton (1998,
2000, and 2003) assesses the relationship of training material being taught to perceived
challenges and problems of workplace as rated by trainees. One of Holton (2003) elements
that influence three training outcomes (synthesized from Kirkpatrick (1994) four levels of
training outcomes) is “content validity”. Holton’s definition of content validity is “the
extent of accurate reflection of requirements of job environment in proposed training
according to judgment of trainees. The same element of “content validity” is reported to
influence motivation to transfer training in recent work of Baharim (2008) in Malaysian
public sector management development training. It is vivid from the discussion that
relevance of training material constitutes an integral part of major construct of transfer of
training to workplace.

Likewise Laker (1990) introduced far and near transfer concepts. According to him near
transfer depicts the ability of trainee to apply the training capabilities to somewhat similar
environment in which the training was imparted for example simulation exercises. Far
transfer is one which is contrarily evenly applicable to a different workplace from where
training occurs or the current job pertains to.
2. OVERVIEW OF PROACTIVE ASSESSMENT/EVALUATION

For a disciplined enquiry, three basic elements are considered necessary i.e. research review, policy analysis and evaluation or assessment of its application (Guba & Lincoln 2001). In this study the focus of proposed assessment is a program (Mid Career Management Training) with reference to particular organization (NIM) as suggested by Owen and Rogers (1999, 2006) in their popular Proactive Evaluation (PE) approach.

According to Owen (2006), logical application of PE can be suggested in two important types of situations. One, where, the decision makers are to be aided to sanction for entirely new program i.e. developed from scratch or a “nothing to something” approach. Other situation is when there is already a program being run in specific organizational context but needs to be reviewed and there is acceptability of major changes as a result of this assessment. The work further emphasizes the most informed decision making by taking account of most recent available research findings about the problem that will be addressed through formulation of policy. Following aspects are basis for proactive assessment approach;

- The extent to which a given population feels the need for a program in a given and concerned area or discipline.
- Obtaining a synthesis focused on that program from related literature and identifying vital issues
- Searching for other locations or work setups where the similar programs are run and critically analyze their approaches

The approach is named proactive because it suggests assessment inputs for concerned decision makers prior to planning process. The role of the evaluator in this form is like an advisor or mentor, who searches for best practice by integrating the concerns of stakeholders of the program and research review. Moreover s/he must suggest systematic change process for the organization and program itself (Owen 2006).

The essential elements of Owen and Rogers’s Proactive Evaluation are summarized in table 2.1. It clearly indicates that orientation of this approach is to probe evidence from past situations to support decision making in synthesis of same program in different setting and population. It depicts three major elements of this sort of assessment; assessing the needs, promoting evidence based practice and establishing benchmarks from review of best practices in literature.

3. TRAINING NEEDS ASSESSMENT/ANALYSIS (TNA)

According to Glorioso (1991), TNA is difference between the current and desired level of competence of organization’s workforce and involves a quest for rigorous information from various diverse sources-focus groups, interviews and surveys etc.

Owen in his work of 2006 based the proactive approach on this formula of needs assessment i.e. difference of desired and current level of competence, and worked out following five basic elements:

- The ideal state of affairs- what ought to be the competence level
- The current and actual state- knowing through realistic analysis
- Differences of desired and actual state
- Underlying reasons of these discrepancies
TABLE 1. ELEMENTS OF PROACTIVE EVALUATION

- Prioritizing the worked-out needs to be addressed through orientation of a program

Symbolically the needs can be defined as:

\[ N = D - A \]

Where N is needs, D is ideal or desired state and A is actual or present state.

4.1 THE SOCIO-POLITICAL DIMENSION OF NEEDS ASSESSMENT IN PAKISTAN

Globally societies are emerging to be knowledge-based. In public sector it is considered a major socio-political development. Decision making processes and investment of public capital receives greater attention. Customers of public managers need a policy that ensures transparent and just administration and encourages public focus i.e. more public participation. In turn it requires vital adjustments of government and public interaction. This adjustment should be of system, philosophy and processes (Boonying, 2007). Successful adjustments are often followed by more public confidence in policies and decision making. It calls for the officials of government sector to be equipped with necessary and favorable knowledge and nuances of participation-oriented governance.

It advocates a strong motive for training needs assessment in management development training in Pakistan. To instilling this philosophy into public sector stakeholders, the past reforms of public bureaucracy in Pakistan remained focused on public participatory orientation in policy development (Iqbal, 2004). It further emphasized: public sector development through strategic planning, provision of advisory system for each government agency to get awareness of public needs especially in community projects or those directly affecting them. The reforms encouraged dissemination of desirable performance among stakeholders. This favorable scenario of socio-political orientation
supports the need for a needs assessment necessary for policy development for public sector management development training program in Pakistan.

4.2 SYNTHESIZING FROM PREVIOUS RESEARCHES

Owen (2006) maintains that a researcher who intends to use past research review to inform a decision making regarding a proposed program must access first the already attempted synthesis of the same type. As this study is about management development training programs, it relies on and derives mostly from a previous work of Cullen & Turnbull (2005), who compiled a Meta review of management training literature from the work of Wexley & Baldwin (1986), Storey (1989), Baldwin and Padgett (1994), Jansen & Van der Velde (2001), O’Connor & Mangan (2004) and Espedal (2005). Moreover a limited number of Pakistani contributions in management training of past decade were also integrated with international literature.

Such thorough reviews are ultimately directed towards establishing benchmarks (Owen 2006). The benchmarks then ought to be evidence-based and data-driven to help in identification and locating of best practices while the evidence and data must be collected directly from the organizations and stakeholders (in our case NIM and its trainee public executives). These efforts are then to be integrated to help giving inputs for drafting of a program policy.

5. REVIEW OF ADOPTED MODEL OF POLICY MAKING

In popular graduate level management book by Koontz; (Essentials of Management), policy is defined to be general guidelines to decision making. They are not specific like rules rather they define the framework or limits within which a manager is given provision to decide. According to Considine (1994) and Dunn (1994), policy analysis and formulation must be backed by critical assessment and communication of relevant knowledge. Ling & Cotter (2002) regards policy to be the designing, implementation and evaluation tool of a field of action. They are “standing plans” that shape the future decisions and keep them consistent with the goals. Dror (1990) furthers it and says that decisions should focus on the relationship of various elements of policy and their mutual fit in context of specific situation and compare it with the possibilities of its application to another but contrary setting. In same work he draws lines of differences between what contents of policy should be and dynamics of its formulation process. For improvement of policy development Dror emphasized two approaches. First is up gradation of policy making process that involves refining process management and organization restructuring/redesigning. This study lays foundation of up gradation by integrating stakeholders (trainees’ inputs) and essence of review of best practices in field of management training. Second approach emphasizes establishment of grand policies guiding the substance of discrete policies.

For drafting of this study’s final product i.e. a policy guideline for management training in public sector, Dror’s (1973, 1987) optimal model is used and set as benchmark. Table 2.2 summarizes three major stages of his optimal model. These are Meta policy making, policy making and post policy making stages and further involve eighteen phases/sub stages.

The model serves as milestone in discipline of public policy analysis and formulation (Boonying, 2007). Its sub stages are dynamically interrelated and depict comprehension as compared to other models that do consider the given stages/phases but as separate policy making units. The last phase of post policy making stage i.e.
communication and feedback channels, stresses iterative approach and redress at various phases if feedback points out any discrepancy.

As this study has to be made operational in limited time and space (as usually case studies are), it was not practically possible to consider all three stages of policy making. Moreover the purpose of this research is sufficiently served with the use of policy making phases as draft of a policy in management development training at institutional level is kept the goal of this research effort (chapter 1). Further, for more realistic and achievable analysis, and consistent with what Dror (1973) stressed, only four basic phases of second stage were taken; sub allocating resources, preparing major set of alternative policies, evaluating the associated costs and benefits of alternative policies. The fourth one was taken from post policy making stage i.e. communication and feedback channels that interconnects all phases.

Table 2. Summary of Dror’s Optimal Model’s Three Stages

<table>
<thead>
<tr>
<th>Stage</th>
<th>Phases or sub stages</th>

</thead>
</table>
| Meta policy making           | • Processing values
                                 | • Processing reality                                                               |
| (seven phases)               | • Processing problems                                                                |
|                              | • Developing resources                                                                |
|                              | • Designing the policy making system                                                 |
|                              | • Allocating problems, values and resources                                          |
|                              | • Determining strategy                                                               |
| Policy making                | • Sub allocating resources                                                           |
| (seven phases)               | • Making and prioritizing operational goals                                          |
|                              | • Making and prioritizing other significant values                                   |
|                              | • Preparing a major set of alternative policies                                       |
|                              | • Predicting costs and benefits of these policies                                    |
|                              | • Identifying the best ones                                                          |
|                              | • Deciding whether the best alternatives may prove to be good policies               |
| Post policy making           | • Motivating the execution of policy                                                |
| (four phases)                | • Executing it                                                                       |
|                              | • Evaluating the results                                                              |
|                              | • Communication and feedback channels interconnecting all phases                    |

Rest of the phases of second stage were omitted as this was practically beyond the scope of this research and sources of researcher to effectively develop alternative policies and this can be left to some future research avenue. Similarly prioritizing operational goals and values also require team effort and a substantial input from field experts. So the focus was kept on making a set of operational and achievable goals and values emerged after integration of adopted qualitative approaches. Following section entails the individual details of four phases under consideration.
5.1 SUB-ALLOCATION OF RESOURCES

This phase actually sequels the phase “allocating problems, values and resources” of stage 1. On institutional level allocation of resources varies greatly. Some are allocated to particular problems or a set of problems, while others may be allocated to sub system or execution of policy. Similarly pure research, surveys, knowledge management, cultural activities, or inputs for system change are other possible avenues for resource allocation. In nutshell, there is set of nine resources that are believed to be allocated to policy making (Caldwell & Spinks 1998) i.e. knowledge, technology, power, material, people, time, assessment, information and finance.

Using this phase and nine given elements, this research attempts to make its framework more informed with past research, practices, policy rationales and guidelines. All this effort is focused on policy development for management development training in National Institute of Management (NIM).

5.2 PREPARATION OF A SET OF ALTERNATIVES AS POLICIES

This phase is optimality focused. This emphasizes the approach that best policy always emerges from a set of workable alternatives. Search for alternatives continues until a policy choice is found whose net benefits outnumber net costs. Dror stresses mobilizing extra resources to search and test more alternative for best possible choice.

This phase is applied in the study to refine and relate a set of policy objectives, guidelines and resources for acquisition of capabilities in management development training programs.

5.3 EVALUATION OF ASSOCIATED BENEFITS AND COSTS OF SELECTED ALTERNATIVES

This phase measures the effectiveness of all those alternatives that are jot out in brain storming for policy search. Dror (1990) regards this stage of measuring alternatives against “goodness standard”. The choices that best qualify these goodness standards should be adopted. Requirements of this standard should be based on following:

- Political and economical feasibility of policy
- Chances of continual improvement and guiding future policies in comparison with the selected one
- Better net expectation in comparison with discarded out alternatives
- Continual development in search techniques and approaches
- Independent simulation, if possible, of selected alternatives
- Making those activities explicitly known that will likely be affected from adoption of this alternative as policy

Furthermore, according to discussion on optimal policy, the selected alternative must provide a provision for individual goodness standards of coalition members of the sector that is likely to be influenced (Dror 1987). This research attempts to fulfill this condition by consulting the public sector figureheads and incorporating their expert views about management development training for public sector executives. Details of this discussion are to be given in chapter 5- data analysis of semi structured interviews.
5.4 CHANNELS OF COMMUNICATION AND FEEDBACK

This phase records aftereffects of formulation of policy and remains interactive among all phases of policy analysis. It reports:

- Immediate responses in terms of the changes being sought as a result of inculcation of a new policy
- Immediate responses in terms of the already prevalent standards and procedures of policy execution
- Immediate responses about the current experiment as being a source of enhancing learning and diffusion of new ideas and this is the ultimate goal of all three stages of optimal model of policy formulation.

Shambaugh & Weinstein (2003) are of the view that all stakeholders in public policy making must be able to clearly communicate their ideas in a viable environment. They should be able to evaluate the alternatives, resolve and discuss differences and make clear and recognizable recommendations. Communication must be elaborate and highly effective as all phases occur within negligible time intervals. Rogers (2003), declares communication to be vital in policy analysis and formulation process for successful diffusion of innovation in work environment.

6. REVIEW OF MANAGEMENT TRAINING AND DEVELOPMENT LITERATURE AND WORKPLACE CONTEXT

According to Lees (1992) and Wexley & Baldwin (1986), an ambiguity continues to surround the proper definition of management development. This ground attracted multiple research perspectives which do not always align and cause confusions in both research and practice. Cullen & Turnbull (2005), in their great effort in working on a Meta review of management development literature defines it as “a meta field that emerged with a multidisciplinary background and drawing its basis primarily from psychology, social sciences and management studies. Moreover they presented the field to be “multivocal” and theoretically “pluralistic”, contrary to popular assumption of it as “disorganized” and “atheoretical”.

Some popular definitions that evolve in course of time and research are summarized in table 2.3 and present a chronological note of management development definitions. Their commonalities are:

- Considering managers as resource of organization and management learning as driven by functional performance. Emphasizing improvement of effectiveness in managerial skills for broad objective of corporate/organizational performance.
- Emphasizing the management development as planned and deliberate activity that should have a strategic orientation.
- Almost all and mostly earlier definitions pronounce management development activity as more of organizational concern rather than a personal motive of individual.

Similarly the definitions posit the management development philosophy to be more inclined to seek improvement, change or development in managers concerned rather than merely seeking an enhancement in their learning curves. A review of Typologies presented in management development research shows a tendency of different models uncovering competency elements expected from MD training. Lees (1992) developed a model, described as 10 faces of MD that are actually rationales why an organization should invest into its management.

</tbody>
</table>

These faces or facets are functional performance, agricultural, functional-defensive, socialization, political reinforcement, organizational inheritance, environmental legitimacy, compensation, psychic defense and ceremonial. Long (2004) usefully contributed by taking account of executive coaching in public organization to be a motivating tool as executives show a positive attitude in enhancing their educational base with the tertiary type management education and that should be reflected in any proposed program of management development. Majority of typologies discussed in Meta review of Cullen & Turnbull (2005) are more concerned with mechanism that how management development “happens” in different organizational and educational settings. Four distinct approaches were adopted in work of Holman (2000) as academic liberalism, experiential liberalism, experiential vocationalism and critical school approach.
Another contribution in workplace context is found in a Dutch study of Jansen and Van der Velde (2001), who distinguished three types of management development approaches i.e. classical management development (typical focus on succession planning and personnel development), formalized and then modern management development. Their further discussion is about basing management development endeavors on two important and fundamental axis i.e. organizational and personal development of trainee. Further discussion includes four general types of learning on executive level, these are administrative, derived, partner and leading management developments. The above discussion on typological axis of MD together with Thomson et al. (2001) contribution to our understanding of MD, this discipline (presented in table 2.4) underlines the intellectual strengthening of management development from having no systematic approach to having strategic practices of corporate policy guidance.

6.1 CORE COMPETENCIES OR GOALS OF MANAGEMENT DEVELOPMENT

Different researchers contributed in spotting the core competencies or the benchmarked goals of an undertaken management development program. Initial clues of such effort are found in work of Wexley and Baldwin (1986), who reviewed the competencies from three angles i.e. management education, management training and on the job experiences. *Management education* examines the formal under or post graduate level competency improvement, with an emphasis on personal development of executives. *Management training* is more related to the work undertaken in areas such as institutional or off the job training, needs analysis, transfer of training to workplace and varying evaluation techniques with varying specific sectors such as managers of small and medium enterprises in Pakistan.

</tr>
</tbody>
</table>

Training of expatriate managers is another popular example. *On the job experiences* is actually related to the learning accumulated by executives as working as attachés and includes action learning, work assignments and mentoring. In Pakistan the under training placements (attachments) of newly passed out public managers i.e. civil servants, is an example. Storey (1990) and Mintzberg (2004) maintains the competence building of management development under the influence of universalistic nostrums instead of context specific approach on organizational and even on wider level. They further argued against the confinement of MD to planned interventions and regarded unplanned true situational experiences as vital to intellectual growth and workplace relevance. They emphasized the separation of development from training as well as education and went beyond these constructs in elaborating five competencies of a management development program. These competencies will serve as basis for further arguments in this thesis regarding the major outcomes of executives training investments. These competencies are;

- Organizational change
- Total quality improvement including cost reduction, continuous capacity building and reaching excellence
Behavioral change and value diffusion
Creating common identities
Stretching managerial capabilities across various sectors

Ahead of this their work suggested three frameworks as an attempt to present a system/interactive view of management development. These are as under;

- The “classic approach” portrays the management development as a system that should primarily derives its input from organizational environment i.e. existing plans and diagnosis of challenges being faced and generates outputs accordingly. These outputs are usually training interventions, succession planning and sub systems of HRD
- The contingency approach that nullifies universalistic nostrums and encourage organization’s intrinsic templates as basis for MD Program designing.
- Alternative conceptualization goes along contingency approach to the extent of executive’s involvement in program design and having greater regard for trainees’ innovation, self diagnosis and ultimately self development.

Thomson et al. (2001) regards the target competencies of management development to be dynamic and highly contingent on specific organizational context particularly since mid of 1980s. Their study further present view of organizational spectrum on MD policy ranging from weak to strong where there are mostly agreements on training issues but wide disagreements on perceptions especially when the issues get more subjective.

Another perspective found in literature of MD, is of the leadership, i.e. use of MD as tool of instilling leadership capabilities in individuals. Two studies of Perren & Burgoyne (2002, 2005) worked out as much as 1013 individual competencies and condensed them to 83 through content analysis. They could finally set 8 metagroups of these competencies. These are strategic thinking, leading team, designing culture, self management, relationship management, information management, resources management and managing quality. Further work of the same authors show these abilities classified as three main capabilities groups i.e. people abilities, thinking abilities and task abilities.

Contrary to the popular perception of management learning and development as individual focus, it always recommends provision of overall learning adoption by organization. The intended change ought to be evident in organization and not merely in individual. Our discussion now moves to learn about learning organization.

7. LEARNING ORGANIZATION

As previous discussion shows and a number of research contributions (such as Harvey & Denton, 1999) agree on the need for organization to be learning instead of merely individuals, there are wide disagreements on the definitions and rationales of “learning organization”. Garvin (1993) defines learning organization as one that can create, acquire and transfer knowledge and such intellectual acquisitions should be evident in its behavior. According to Marsick & Watkins (1994) the learning organization is one that can learn continuously or where acquisition of new knowledge and skills are adopted as continuous processes and serves as measure of organizational performance. They regard the transformation of organizations as another aspect of learning. Further clues of learning organization are people empowerment, encouraging collaborations and team performance, promotion of open dialogue and a consideration for interdependent nature of employees, organizations and community.

Senge’s (1990) landmark work *The Fifth Discipline* proposed five disciplines that a learning organization must adopt to show performance and successful movement along its learning curve. These five disciplines or fields are; systemic thinking, personal competence, mental models, knowledge sharing and team/shared learning. These disciplines attempt to encourage the ability of seeing big picture behind small events i.e. a shift from seeing parts to envision wholes. A shift from thinking of workforce to be helpless actors to a view of empowered human capital that must be active participants. Watkins & Marsick (1993) have an expanded view of learning organizations. They incorporate individual, team, organization and society as four levels of logical learning. Senge (1990) emphasizes organizational self analysis, identification of biases and keeping a private eye on cultural aspects. Schein (1996) augmented Senge’s (1990) work by giving two new insights; adaptive learning and generative learning. The former has an approach to identify the gap problems and hurdles between where the organization stands and where it wants to reach. The efforts are proposed and put and gap is filled. On other hand *generative learning* emphasizes learning innovation or experimenting to aid learners in learning processes.

8. SUMMARY

The chapter discussed briefly the elements that are likely to serve as building blocks for suggesting a policy adoptable at institutional level for better design of management development programs in National Institute of Management training in Pakistan. The focus
remained on 1. Assessment method designed by Owen and Rogers (1999, 2006) in their work titled “Proactive Evaluation”; 2. Policy formulation model and its phases as described by Dror (1978, 1983); 3. A Meta review of management training and development literature of recent past; 4. Learning organizations, as changes are accepted at organizational level. This is expected to provide to position the problem in appropriate framework and justifies the research approach.

Impact of customer demographics on bank selection criteria

A study of banking sector of Okara, Punjab (Pakistan)

Hafiza Hafsa Nayyab, Abila Sehr, Muhammad Adnan, Zufishan Ali

Abstract

Pakistan is an Islamic country. There are six full pledge Islamic banks providing Islamic services to their customers. The purpose of conducting research in Islamic banks of Okara (Pakistan) is basically to examine the impact of demographical variables on bank selection criteria in Islamic banking sector. We are aimed to observe that changes in demography actually affect the bank selection criteria. We have used the regression analysis after controlling the four demographic factors i.e. age, gender, occupation and income. We are given the higher weights to those criteria which are mostly chosen. Our findings show that, Islam is not the only reason to choose the Islamic banks, but some other factors which are mostly selected by the customer. Those factors show their satisfaction level regarding the criterion. Customers give high weight to those criterions, from which they are more satisfied. The results of our study shows that customer mostly choose Islamic banks due to convenience, because most of the customer choose this criteria as their first preference. And the second preferred criterions are cost and benefit and corporal efficiency. Each demographic factor has different criteria for Islamic bank’s selection.

Key words: Islamic banking, customer demography, and customer satisfaction.

Introduction:

In last decade of twentieth century Islamic banking sector was introduced, and now it is flouredished rapidly not only in Islamic country but in all over the world. Growth rate of Islamic banking is 10-15% from 1995-2005. (M. Kabir Hassan June 2009). The assets of global Islamic banking stood at US $700 at the end of 2005 it would grow to US $2.8 trillion at the end of 2015. (M. Kabir Hassan June 2009)

Islamic banking system is based on the Islamic laws and the principles regarding banking and trade. Major point of differentiation in Islamic and conventional banking is that Islamic banks operate on the principle of profit & loss sharing. Due to this principle a large number of non Muslim customers are also adopting Islamic banking.

Another problem that Muslims were facing while dealing with conventional banking, was provision of interest in transactions and loans. Islamic banking system removes this curse from banking system and provides interest free dealings. As Quran says,

‘O ye, who believe! Devour not usury doubling and quadrupling (The sum lent). Observe your duty to Allah, that ye may be successful. (3:130)’
According to Hadith:

“Jabir reported that: Messenger of Allah has cursed the Devourer of usury, its payer, its scribe and its two witnesses, and said they are equal (in sin).”

Another place Quran says in Surah Al Imran Verse 130-2:

“O believer, take not double and redouble interest and fear Allah so that you may prosper. Fear the fire which has been prepared for those who reject faith, and obey Allah and Prophet so that you may receive mercy.”

As Islamic countries are rich in oil resource, that provide opportunity to Islamic countries to introduced a banking system based on Islamic rules and regulations with rest of the world. Initiative in Islamic banking system was taken by Egypt in 1963 and a bank “The Mit Ghamr Bank” was established, but this step had to face failure because of poor marketing and management strategies. (Naveed Azeem Khattak and Kahiful Rehman, 2010)

Then in 1975 Islamic Development Bank (IDB) was established in Judah, Saudi Arabia. 54 states were the member of this bank with the initial capital of 2 billion US$. After that Malaysia was the first Islamic country that work for the development of Islamic banking system.

In Pakistan, Islamic banking sector was introduced in 1980’s. For that purpose PLS account were introduced in conventional banks, but it failed. After that, in December 2001, Meezan bank Ltd. was established as the first stand alone Islamic bank in Pakistan. At the end of 2007, there were 6 full fledge Islamic banks in Pakistan i.e. Al Bakara Islamic Bank Ltd. Dubai Islamic Bank Ltd. Dawood Islamic Bank Ltd. Global Emirate Islamic Banks Ltd. Bank Islamic Ltd., and Meezan Bank Ltd.

In Okara, there are three branches of Islamic banks i.e. Dubai Islamic Bank Ltd., Islamic Bank Ltd., and Meezan Bank Ltd. Many conventional banks have also opened branches which operate according to Islamic laws and principles. In Okara the example of such bank are Al Fallah and Faisal Bank Ltd.

**Literature review**

Increasing diversity and demographic factors have different impact on the bank selection criteria of customer in different region. Customer satisfaction is the core strategy of Islamic banking system. As Islamic banking system had to face a high competition from convention banking system, Islamic banking is trying to improve their quality of services and product continuously to achieve desired customer satisfaction and meet the competition. As compare to conventional banking, there are few studies on Islamic banking on the basis of demographic factors. Examining the effect of demography on bank selection criteria give birth to the new segmentation in market or in Islamic banking sector, it also
shows the behavior of the customers towards the Islamic banks criteria and make positioning easier.

Different studies have conducted in the field of Islamic bank selection by different researches, and they have different findings.

Erol and EL-Bdour et al. (1989) conducted a study. They evaluate the attitude of Jordanian people towards Islamic banking system. They find from their studies that religion is not the basic factor of the selection of Islamic institutions, instead of it, there are other factors which are important for customers while selecting the Islamic financial institutions and the main factor is profitability and return on investment.

Islamic banking system based on the principles of profit and loss sharing which remove the burden from customers that they have to bear it alone but the loss is shared with institutions. Naser and Mountinho in 1997 identified that the profit and loss sharing is a relationship banking tool for Islamic banks, this relationship establish a close link between customers and banks. (Mamunur Rashid and M. Kabir Hassan, June 2009) In 1994, Sudin conduct study in Malaysia, he finds out those facts that are important for Muslim customers while selecting the banks. (Sudin H, Norafifsh A, Planisek L, 1994)

1. The provision of fact and efficient services
2. The speed of transaction
3. The reputation and image of bank.

(Kaynak, 1991) observed difference in bank selection criteria based on gender, age, education and background of customers in Turkey. He reported that male customer gives more preference to the reputation of bank, business hours, parking facility, availability of wide range of services than female customers. The convenience and banking location is important for customers who are under 40. In the field if educational background, educated customers give importance to the fast and efficient transactions and location of branch, while uneducated customers give preference to interest rate only.

Occupation was another demographic factor, which was studied. He reported that most of the white collar households give importance to the reputation of bank, modern facilities and convince. On the other hand, blue collar household give importance to the cost profit issues and core banking. Gender show different results in bank selection criteria, male customer’s emphasis on faster services and convince, but the female customer’s emphasis on longer term aspects related to organization their finances and become more financially secure.

Hegazy L (1995) conducted study in Egypt about the attitude of customers in 1995. He selected the customers of Islamic banks for study and find out that most of customer chooses the Islamic banks due to the efficiency and speed of the service delivery.

H.Saduman Okumus (2005) undertook a survey in Turkey. His study covered the theoretical and practical aspects of Turkish Islamic banking sector. He took a sample of
161 respondents and tried to find out the level of awareness and satisfaction of customer of Islamic banks. He found that most of the customers are familiar only with the few products and services of Islamic banks like Musharkah and Mudarabah but they were not using these products.

The fact was proved by many theories that religion is not the only factor for the selection of Islamic bank, but instead of religion, there are other factors which are non-religion such as cost and benefits, profit and loss sharing principles, efficiency and convenience. In June 2009 by (M. Kabir and Mamunur Rashid, June 2009) a study was conducted, they found that there are demographic factors which effect on the bank selection criteria and the satisfaction level in Bangladesh. Their purpose of study was to find out the effect of demography on bank selection criteria in Islamic banking sector in Bangladesh. In Pakistan, (Jamal ET al.2003) conduct a study at 300 customers of specific banks. He found that there is a strong relationship between service quality and customer satisfaction. In Pakistan, there is no more attention is paid on bank selection criteria and customer satisfaction on the basis of demography. Dushuki and Abdullah (2007) mentioned in their study that Islamic banks not just relay on Islamic rules but also considered the presence of customer quality and efficient customer services. Boyd et al. (1994) put the emphasize of different demographic factors he stated that occupation like blue collar give more importance to cost and benefits, and white collar gives more importance to convenience. He further stated that male put more importance to conveniences whereas female give importance to long term relations with banks. Metawa (1989) and Almossawi they took the sample of 300 customers and identify that Mostly customers choose Islamic banks due to two reasons.

1. Islamic principles
2. Return rate.

Research Methodology

For this study a structured survey questionnaire was used, consist on three parts i.e. demographic information, bank selection criteria, and checking the understanding. Questionnaire covered the demographic variables (gender, age, income and occupation), some decision criterion as independent variable (corporal efficiency, convenience, compliance, and cost-benefit).

Variables

We have selected one independent and one dependent variable. Independent variable is customer demography (age, occupation, income, and gender); there are some decision criteria corporal efficiency, compliance, convenience, and cost-benefit. The dependent variable is bank selection criteria.

**Independent Variable:** Customer Demographic Factors (age, gender, occupation and income)

**Dependent Variable:** Bank Selection Criteria
In above model there is dependent variable (bank selection criteria) on the right side and on the left side there is independent variable (customer demography). There are some bank selection criteria I.e.

**Corporal Efficiency:** corporal efficiency represents the fast transaction and documentation process knowledge of customer business, good and efficient management.

**Compliance:** compliance represents provision of Islamic law and principles, profit and loss sharing, and provision of interest free loans.

**Convenience:** here it shows strong global and local networks, convent branch location, and sufficient transaction time.

**Cost-Benefit:** cost and benefits describe low service charges and good returns.

The respondents of customer while bank selection criteria are described in table 1-5, which show that how demographic responds to different criteria of bank selection.

Placing table 6 here, this shows the ranking of criteria factors evaluation. According to table, respondent ranked the cost and benefit highest then others with mean 4.66, SD 1.046 and median is 5.00. The second highest rank is of convenience with mean 4.46 SD is 1.03 and median 4.50. Respondent ranked corporal efficiency at three (mean 4.40, SD 0.974 and median 4.00). Finally, compliance is in last (mean 4.34, SD 1.075 and median is 4.00).

**Hypotheses:**

**Ho1:** Bank selection for male and female are not different.

**H1:** Bank selection criteria for male and female are different.

**Ho2:** Bank selection criteria for different occupation are not different.

**H2:** Bank selection criteria for different occupation are different.

**Ho3:** Bank selection criteria for different income group are not different.
H3: Bank selection criteria for different income group are different.

H04: Bank selection criteria for different age group are not different.

H4: Bank selection criteria for different age group are different.

Population and Sampling

The total population includes all Islamic banks’ customer in Okara. There are three Islamic banks in Okara i.e. Dubai Islamic Bank Ltd., Islamic Bank Ltd., and Meezan Bank Ltd. The total customers of these three Islamic banks are our population and we are taking the sample of 100 customers randomly from these three banks.

Findings

In this study, 100 questioners were conducted and SPSS was used to interpret data. We used multiple regression analysis to find the satisfaction level of customers regarding criteria of choosing Islamic banks. There are four dependent variables whose satisfaction level is resulted from independent variable. We have four demographic factors in this study such as gender, occupation, age and income.

Results

H1: Bank selection criteria for male and female are different.

In the regression table 7 which is supporting the hypothesis showing statistics about gender that, male gives highest importance to convenience (Beta 0.325) i.e. (strong global and local networks, convent branch location, and sufficient transaction time). Whereas female responds highest to cost and benefit (Beta 0.527) factor i.e. (cost and benefits describe low service charges and good returns). Both of these have significant level P<0.050. The second impotent criterion for male is corporal efficiency (Beta 0.245) (i.e. fast transaction and documentation process knowledge of customer business, good and efficient management) and for female is convenience (Beta 0.269) (i.e. strong global and local networks, convent branch location, and sufficient transaction time). R square for female respondent is 0.482 and for male is 0.259 while choosing Islamic banks.

H2: Bank selection criteria for different occupation are different.

Supporting the hypothesis, table 8 shows the statistics about occupation. The table shows that Private sector employees and Govt. employees give highest responds to convenience (Beta 0.425) and (Beta 0.369). Self employed people prefer more corporal efficiency than other criteria (Beta 0.306). Whereas the second preference of Private employees is Convenience (Beta 0.425), Govt. employees is cost and benefit factor (Beta 0.272) and self employed prefer more Compliance (Beta 0.261), when they choose Islamic banks. More over R square of private employees is 0.305, for self employee is 0.281 and for Govt. employees is 0.470.
H3: Bank selection criteria for different income group are different.

Table 9 supports the hypotheses and shows that people who have income level 20000-30000 give more importance to corporal efficiency (Beta 0.656), people having income level 31000-50000 gives high preference to Convenience (Beta 0.437) and the people who have income level of 50000 or above prefer higher to compliance (Beta 0.452). When people chose Islamic banks with different level of income gives different responds to different criteria. The second important factor for income level 20000-30000 is compliance (Beta 0.494) people having income level 31000-50000 prefer (Beta 0.185) and the people with income level 50000 or above prefer compliance (Beta 0.401). Whereas P<0.050.

H4: Bank selection criteria for different age group are different.

Table 10, supporting the hypothesis, describe that customers within age group 21-30 give higher rank to cost and benefit factor (Beta 0.562) significant level is 0.001. And their second preference is corporal efficiency (Beta 0.287). The customers with the age group 31-40 give more preference to Convenience (Beta 0.375) and the above 41 ages, customers prefer corporal efficiency (Beta 0.169) where P<0.050.

Conclusion

The basic purpose of this study is to find out those bank selection factors that are responded more by customers while selecting Islamic bank in Okara.

Table 11 summarizes the whole story of his study. It shows the most and second most respondent bank selection factors by customer of Islamic banks. Compliance is the less important factor while choosing the Islamic banks. Compliance includes compliance represents provision of Islamic law and principles, profit and loss sharing, and provision of interest free loans. This means, Islam is not the only reason to choose the Islamic banking. Whereas Convenience is the most important factor, corporal efficiency and cost and benefit are the second most important factors while choosing the Islamic banks by customers.

Limitation:
The study is conducted in Okara (Pakistan). The same study can be conducted in any other region in Pakistan. Sample would be less or greater in most of the region. Most of the Islamic banks in Okara have branches in which Islamic banking can be seen, but here those are not included.

Do you know that in Okara banks provide interest-free services?

☐ Not much    ☐ Sufficient knowledge    ☐ Very well

What extent of knowledge you have about Islamic banking and finance?

☐ Not much    ☐ Sufficient knowledge    ☐ Very well

By which source you come to know that in Okara bank offers interest free banking?

☐ Bank employee    ☐ Media (Newspaper, TV)    ☐ Internet
☐ Friends / Family

In what way you categories banking services?

☐ Interest rate/ profit    ☐ Convenience    ☐ Cost of banking
☐ Other; please specify………..

Having what idea you have chosen Islamic banking?

☐ Religion    ☐ Cheap products    ☐ Friends
☐ Conventional bank location    ☐ Other than above, please specify…..

Do you accept that interest-free services are costlier than non-Islamic services?

☐ No    ☐ Not sure

In what way you feel more satisfied, while dealing in Islamic products?

☐ Internet banking    ☐ Telephone banking    ☐ Personal visit

Would you prefer to sustain with Islamic banks, if Islamic products becomes costly?

☐ Yes    ☐ No
The legacy job satisfaction and its impact on performance of the firm: an empirical analysis

Abstract

This study aims to investigate the impact of Herzberg’s (1959) motivator-hygiene factors on the job satisfaction. A sample of 250 University faculty members around the country was selected as a statistical frame. Self-administered questionnaire was used for this study, known as “faculty satisfaction/Dissatisfaction Scale”. To determine the relationships between motivator-hygiene factors and overall satisfaction of the job, Structural Equation Modeling was used to investigate the complex relationships among different variables. The results suggested that job satisfaction of the employees has a positive impact on the overall performance of the firm. The university administrators must improve on Motivators and Hygiene factors along with investigating for further betterment in their system.

Key words: Job satisfaction, Motivator factors, Hygiene factors, organization performance

Introduction and literature review

Contented employees are the productive employees. Employees have attitudes or viewpoints about many aspects of their jobs, their careers, and their organizations (Lise, 2004). According to the definition of (Locke, 1976), “... a pleasurable or positive emotional state resulting from the appraisal of one’s job or job experiences”. Job satisfaction is one of the most important factors in the life of an employee. Similarly for the teachers too, one of the pivotal factors in teaching at higher education level is the job satisfaction of the faculty member that has to be pored over in order to enhance efficacy and productivity of teaching at this academic level. Teachers are the back bone of the educational institutions and the questions of quality of educations are directly related to the performance of the teachers. Dissatisfaction of faculty members with their jobs and/or disregarding the matter related to their work as being central concern can serious endanger the teaching line of work. It would therefore be useful to be in no doubt about the factors specifically the way they are closely related to perceived characteristics of the job, for instance, working environment, advancement in career, recognition and other practices particularly related to the class rooms, are allied with job satisfaction.

An increased waking to the concept of job satisfaction has been witnessed and it being dealt more and more with, practiced and acknowledged by researchers and managers
(Davis, 1971). According to (Rosnowski, 1992) the most essential information would need to have at work place is a corroborated estimation of his/her satisfaction with the job. Moreover, it is said that an improve insight into the job related satisfaction and factors which are related to it prove of a great help in routing the activities of the workers in the direction which is aimed at (Chaudhury, 2004).

The base of satisfaction phenomenon of job related satisfaction got initiated by (Maslow, 1970), who forwarded the concept of 5-step ladder of needs of human beings. The human needs which have been, today, recognized deprivation/gratification proposition, suggest that when one does not see a certain need being fulfilled, one makes efforts to gratify that particular need or one’s energies get directed towards gratifying that need which is to be satiated (Mertler, 1992). Need satisfaction models illustrate that there exist a close relation between the needs of an employee and the degree of their satiation by the environment or the work itself. Both factors are directly proportional i.e. the better is the need satisfaction, the better are the employee reactions. Similarly, the work and environment where desired outcomes are obstructed, dissatisfaction is sure to emerge (Jugdev 1995).

In this research the Herzberg’s Motivator-Hygiene (1959) factors were investigated among university faculty members of universities of Pakistan. In Pakistan where Higher education commission has been established and since its inception it has revolutionized the system of higher education in all respects. (Herzberg, 1959) developed a motivator/hygiene theory which proffers the belief that some factors are there in any work situation which may lead to satisfaction or dissatisfaction among employees of organization and his associates inquired factors which impinge on job attitudes of employees and resulting domino effect show that the factors which stimulate the workers and contributed to job satisfaction have been associated with the content of the work they do. These elements include work itself, responsibility, achievement, recognition and advancement. These factors were named by Herzberg as Motivators. On other hand the factors which instigate dissatisfaction related to the job were five in numbers. He listed them as Supervision, policy/administration, interpersonal relationships, Working conditions and Salary, Supervision, salary, interpersonal relations and working conditions. These factors were named as Hygiene factors.

With the view to measure a job satisfaction of university faculty in agriculture, studies were carried out in various countries (Schultz, 1977). Much of relevant research in education sector insinuates the support of Herzberg theory in education (Padilla-Velez, 1993). According to (Bowen, 1980) comes up with disbelief about the applicability of this theory in agricultural education. Further, (Bowen, 1980) reiterated that ten factors were in direct relation to job satisfaction whereas hygiene ones signified comparative higher proportion of satisfaction score variances than satisfiers ones. The job satisfier factor which had the most predictive power on the overall satisfaction was “work itself” (Schneider and Locke, 1971).The study of (Cano, 1992) reflected job satisfaction of both gender; male and female in state of Ohio. According to him, factors that stimulate the most were work itself. Fugar conducted a research and found that the most foretelling factor which effects the Job satisfaction the most, of clergy of Global Evangelical Church Ghana was work itself.

A lot of work has been done on the issue of job satisfaction of the employees in the past. The most renowned motivational model of Herzberg (1987) made a clear distinction between the extrinsic and intrinsic factors that affect the performance and satisfaction of the employees. The extrinsic factors, like that of handsome salary, arise from some basic need of human that is hunger. Similarly intrinsic factors are also very important for the
satisfaction of the employees that ultimately impact the performance of the overall performance of the organization.

When we talk about teachers in the educational sector, the satisfaction of the teachers is very imperative because that impact the performance of the institution as well as for the students as well. Teachers need job satisfaction because their performance is very much affected by both extrinsic and intrinsic factors. In educational sector intrinsic factors are directly related to job satisfaction. Intrinsic factors involves: the work itself, achievement and responsibility (Herzberg, 1987). Extrinsic factors also called as Dissatisfaction-avoidance: consists of factors that are policy of the organization, status, salary, fringe benefits and working environment. As compared to intrinsic factors, the extrinsic factors have less impact on the job but they always present in the circumstantial. The issue of job satisfaction of the employees has captured substantial consideration by the researchers all around the world (Gautam; Mandal and Dalal, 2006). There is a positive correlation between job performance and job satisfaction of the employees (Bowran and Todd, 1999). When the employees feel themselves satisfied with the job, then their morale will also be elevated, this will ultimately lead the organization towards prosperity and growth (Chaudhary and Banerjee, 2004). The managers and other human resource specialists are very much anxious about how to bring further improvement in job satisfaction (Cranny et al 1992). The theory of job satisfaction or in other words job motivation was first introduced by Maslow, to satisfy the hierarchy of man’s needs. Every individual needs satisfaction through the realization of the needs. In 1990, Eikeland studied those factors that have great influence on the academics like, the intentions of the teacher to leave the institute. He concluded that the relation among the colleagues was the major factor to leave the university. In short he concluded that intrinsic factors were more dominated in pursuing the teachers to leave the university. This conclusion describes the fact that the general environment of the university has a great influence on the job satisfaction of the teachers.

**Job satisfaction and firm’s performance**

A lot of research has been conducted to analyze the impact of job satisfaction on performance of the organization. According to study of (Iaffaldano & Muchinsky, 1985) concluded that job attitude of the employees is positively correlated to the performance of the firm. Same was concluded by the study (Judge, Thoresen, Bono, & Patton, 2001) that job satisfaction is positively correlated with individual performance. In the same way researchers like (Schneider, 2003) found the relation between attitude of the employees and performance. Correspondingly Argyris (1964), Likert (1961), and McGregor (1960) argued that the organizational performance can be judge by the employee’s satisfaction. The relation between job satisfaction and performance was first discussed by the socio-technical schools of thought. This approach suggested that the performance of the organization depends on the social structures of the firm (Emery & Trist, 1960). According to (Likert, 1961; McGregor, 1960) the productivity of the organization and its efficiency can be achieved by the satisfaction of the employees and their attention. The satisfaction of the employees can be achieved by providing the employees with full participation, trust, and decision making authority (Likert, 1961). Therefore if the employees are dissatisfied, it will create hindrance in organization’s way to progress. So we can say that the job satisfaction of the employees is very important in relation to the firm’s performance. Therefore, unhappy employees of the organization will miss the mark to participate in the drive towards the betterment of the organization (Likert, 1961). Another notable research on the relation between job satisfaction level of the employees and the performance of the business unit was conducted by the (Ostroff, 1992) and after examining a sample of more than 350 schools, concluded that job satisfaction is concomitantly related to the performance of the organization and its commitment. The relation between employee’s
attitude, productivity of the firm and satisfaction of the customers were studied by (Ryan, Schmitt, and Johnson 1996). The study conducted by the (Harter et al, 2002), concluded that employees job satisfaction is very important for the organization’s performance. In that study the author examined a positive correlation between satisfaction of the employees and productivity, profit of the organization and customer satisfaction on a data collected form 36 organizations. This study was supported by another study by (Schneider et al, 2003). According to the study, the author found the relation between organization performance which was measured by the return on assets (ROA), earning per share (EPS). According to the study there was a causal relation between organization’s performance and job satisfaction of the employees. Now the question is whether the companies with satisfied and happy workers are performing exceptionally well as compared to those which don’t have satisfied employees? The study of (Schneider et al, 2003) concluded that employees become more motivated by the fact that their firm is performing well and meeting its targets. The happiness of the employees or satisfaction is very much correlated to the organizational performance (Gross and Etzioni, 1985). Here at this point another question arises and that is, what are those factors that make the employees satisfied? The answer is the financial and non-financial enticements like that of training make the employees satisfied. This view is supported by the study of the (Peterson and Luthans, 2006) and found a significant sway on the organization’s profit and satisfaction of the customers too. The study also found that financial inducements have much greater influence of the job satisfaction of the employees.

Problem statement
The ultimate goal of any organization is performance in monetary terms. A lot of research has been carried out in the past to address the issue of job satisfaction of the employees. But a limited research has been done regarding job satisfaction of the faculty members of the universities in relation to performance of that institute. So the focal point of this research was to fill this gap and to find out the relation between job satisfaction of the faculty and performance of that institute.

Purpose of Research and Objectives
The study aims at describing the variances found in job satisfaction in university faculty members in the light of motivator as well as hygiene factors. The following research questions are formulated to ensure the clarity of study route.

1. Describe relationship between factors which motivate the faculty like (Work-Itself, responsibility, achievement, recognition, and growth) and job satisfaction.
2. Describe the relationship between Hygiene factors of the job (relationships, salaries, policy/administration, working condition and supervision) and jobs satisfaction.
3. To investigate the impact of job satisfaction on the performance of the organization?

Conceptual Framework
With the help of literature, the following conceptual framework was developed. As the objective of this research article is to investigate the impact of Motivators and Hygiene factors on the job satisfaction. Secondly the objective of this paper was to find out the impact of the job satisfaction of the employees on the performance of the institute or organization. There were four major variables (Endogenous) that were analyzed. Motivators were operationalized by its constructs (Observed variables) like Achievement, Growth, Recognition, Responsibility and work itself. Similarly the Hygiene (Endogenous) was operationalized by the observed variables like that of Supervision, Salary, Policy,
Relationships and Working conditions. Another variable, Organization performance (Endogenous) was operationalized by the observed variable like return on assets and Profitability.

- **Ha1**: Achievement is significantly associated with motivators
- **Ha2**: Growth is significantly associated with motivators
- **Ha3**: Recognition is significantly associated with motivators
- **Ha4**: Responsibility is significantly associated with motivators
- **Ha5**: Work itself is significantly associated with motivators
- **Ha6**: Supervision is significantly associated with Hygiene
- **Ha7**: Salary is significantly associated with Hygiene
- **Ha8**: Policy of institute is significantly associated with Hygiene
- **Ha9**: Relationship is significantly associated with Hygiene
- **Ha10**: Working conditions is significantly associated with Hygiene
- **Ha11**: Motivators are significantly associated with job satisfaction
- **Ha12**: Hygiene factors are significantly associated with job satisfaction
- **Ha13**: Return on assets and profitability is significantly associated with org. performance.
- **Ha14**: Profitability is significantly impacting organizational performance of the institute
- **Ha15**: Job satisfaction is significantly impacting organizational performance of the institute

Organizational performance = function( motivators, hygiene factors, job satisfaction) ..........................................................(1)

Organizational performance = β₁ + β₁*Motivators + β₂*hygiene factors + β₃*job satisfaction ..........................................................(2)

**Figure 1**
METHODOLOGY

Data Collection

The research was based on primary data, which was collected by means of survey questionnaire, self-administered from University Faculty members around the Pakistan.

Population

The population for this study is faculty members of the universities located in different cities of Pakistan.

Sample

The Sample size for the study is 250 faculty members and cluster sampling was used on the bases of region (Islamabad, Rawalpindi, Lahore, Multan, Gujranwala, Sialkot, Gujrat, Faisalabad, Kasoor, and Sheikhupura). The purpose of this cluster is diversity in culture and back ground of all employees influence the thinking pattern. After making cluster, stratified sampling was used. The sampling frame was divided into non-overlapping groups or strata, e.g. geographical areas, age-groups, genders. Data was collected with the help of self-administered questionnaire from 250 respondents. The response rate remained 80%.

Survey Instrument

The questionnaire was designed with the help of extensive literature review. The questionnaire consisted of 4 parts, each variable consist of 5 constructs except Job satisfaction which has one construct. The respondent were asked to reply on Likert scale (1=strongly agree to 5=strongly disagree). The reason for using Likert scale is that because it is psychometric analysis of respondent’s behavior (Likert, 1932). All the items were close ended because close ended questions allow the respondent to show their degree of agreement or disagreement.

Validity

The initial draft of the questionnaire was floated for the purpose of content validity, for which views were collected from the scholars as well as potential respondendts. Based on their view various items were ommitted, modified. After the changes questionnaire was floated to different organizations for pilot testing. The sample size for pilot testing was 15 and on the basis of results generated internal consistency of data was measured. It was found that all the variables met the cut of value (0.65) (Leech, et al., 2005).

Reliability

Reliability test was used to measure the internal consistency based on computed values of Cronbach alpha (α). Reliability of the sample was measured which shows that all the variables met the cut off value (0.65) that is acceptable for retaining the variables (Leech, et al., 2005).

Factor Analysis

The purpose of using factor analysis is to investigate the large number of relationships among inter-level variables. For factor loading principle component analysis method was used. Less than 0.40 of items values were omitted and did not use for further analysis (Leech, et al., 2005). Table-2 below shows the retained items that met the cut off values i.e. > .40

KMO stands for Kaiser-Meyer-Olkin Measure of Sampling Adequacy (small value of KMO indicates factor analysis is inappropriate and). KMO indicates sufficient items for each factor. All the values are found greater than 0.5 (SPSS user’s guide). If the value of Bartlett Test of Sphericity (to test the null hypothesis that the correlation matrix is an
identity matrix which would indicate that the factor model is inappropriate) is less than .05 then it should be significant and indicates that the correlation matrix is significantly different from an identity matrix, in which correlations between variables are all zero (Leech, et al., 2005). Table 3 shows the values of KMO and Bartlett's Test of Spheric.

Descriptive Analysis

The entire 250 respondents have responded through emails and by visiting the respondents personally. Demographic data indicate that 75.7% were male and 24.3% were female. 73% were having Master degree, 5.7% were having M.Phil./MS, and 21.3% were having PhD. Data collected from public as well as private universities/organizations. Majority of the respondents were in 30-40 age groups (69%). Then come 41-50 age groups (27.7%) and 41-50 age groups (3.3%).

Hypothesis Testing and testing the model

A structural equation modeling technique was utilized to analyze the model. We have used SEM because it is used for testing relationships using different combinations of statistical data and casual assumptions. The LISREL 8.80 program was used for this purpose (Usuel et al., 2008; Jackson et al., 2005). The observed variables used to predict the latent variables in structural equation modeling were obtained by processing the data in the instrument (Jackson et al., 2005). The observed variables like achievement, growth, recognition, responsibility, work itself; supervision, salary, policy, relationships and
working conditions predict the latent/exogenous variables like motivators, hygiene factors and job satisfaction. Similarly observed variables like return on assets and profitability predict the exogenous variable, organization performance. The value of chi-square is 20.91 and the degree of freedom is 9 according to Usluel et al (2008) the chi-square will be divide by degree of freedom then the results generated will be less than 3 i.e. 2.33 which shows model is significant. The value of p is also significant because it is less than 0.05. Figure 3 shows the recommended model. Fit indexes (7) which are commonly used in the literature (χ²/d.f, GFI, AGFI, NNFI, CFI, RMSR, RMSEA) were employed to test model fit. According to Usluel et al. (2008) the best fit were acquired when all the seven fit indexes meet the cutoff values that were acknowledged in the literature. The commonly used measures of model fit, based on results from an analysis of the structural model, are summarized in table. In practice, Chi-square / degrees of freedom less than 3, GFI, NNFI, CFI greater than 0.9, an AGFI greater than 0.8, RMSR less than 0.10, and RMSEA less than 0.06 or 0.08 are considered indicators of good fit. As seen in table, all goodness-of-fit statistics are in the acceptable range (Usluel et al., 2008; Jackson et al., 2005).

Table 4

<table>
<thead>
<tr>
<th>Fit Index</th>

**Findings:**

The results show that our entire hypotheses are accepted. The results show positive and significant relations among observed variables like achievement, growth. Recognition, responsibility and work itself with exogenous variable, Motivator. Moreover motivator is positively and significantly associated with job satisfaction. Similarly observed variables like supervision, salary, policy of the institute, relationships and working conditions are significantly and positively contributing towards the Hygiene. In the same way Hygiene factor is significantly impacting job satisfaction of the employees. Other two observed variables like return on assets and profitability have a significant relation with organization performance. Lastly, job satisfaction has a positive and significant relation with organizational performance.

**Results and discussions**

From the above results or finding, it can be said that job satisfaction of the employees are very much affected by the motivators and hygiene factors. This particular study also validated that achievement of the employees as well as of organization, growth of employees and organization, recognition, responsibility that the employees have, work itself, minimum supervision of the employees, handsome salary, policies of the organization, relationships of employees with other members as well as with the organization and working condition or good environment enhances the satisfaction of the employees regarding their job. Similarly it can be concluded from the results that job satisfaction significantly enhances the performance of the organization in terms of returns on assets and profitability.
Managerial Implications
This study was conducted to analyze the impact of motivators and hygiene factors on job satisfaction of university faculty members. This study can be helpful for the universities as it will possibly enhance the satisfaction of the faculty members regarding their job. They will not change their university frequently, provided that the university improves on the entire above mentioned dimensions fall under the category of motivators and hygiene. This model is equally important for all types of organizations whether public or private other than universities. Beside managerial implications, this study is equally important for the academia world. This model can be added to the syllabus of human resource management subject for better understanding and conceptualization for the students.

Practical Implications
The biggest hurdle in the way of conducting this study was limited time because the questionnaire was self-administered and it took a lot of time to gather the data. Another major hurdle was the non-corporative attitude of the respondents. Last but not the least cost constraint was also a hurdle in materializing this study to its final shape.

Suggestions for future research
Many questions and dimensions remained unanswered for which future research can be initiated. For instance this study can be expanded to other Asian countries. The study still has many gaps which are required to be filled as many other variables were not analyzed like emotional intelligence, commitment, job security and job involvement. The model can be further improved by the addition relevant variables in upcoming researches.

The impact of consumer behavior on FMCG’s
A study of Okara, Punjab (Pakistan)
Hafiza Hafsa Nayyab, Hamna Javed, Ahmad Ibraheem, Lubna Safdar

Abstract
In this report we put an effort to see the impact of consumer behavior on fast moving consumer goods. The consumer behavior is studied through different dimension by understanding demands patterns of the people regarding quality, price, brand loyalty and demographics. These are the independents variables through which the behavior of is gathered regarding different FMCG’s. Different FMCG’s company’s like Unilever, P&G, Continental biscuits, Coca-cola and others products are taken to obtain the behavior of regarding it. Our target market was Okara. The data was collected by the primary source through questionnaire. We used stratified random sampling in the report. The population of Okara is 27,915 and we have selected the sample of about 100 respondents from different classes that includes upper class, middle class and lower class (people having more then 15,000 income). We have seen that people in Okara mostly used Unilever products as they are easily available at near stores. We also saw that they consider quality when they purchase. There is no big retail store for the people. It was also seen that the market share is mostly obtain by multinational companies in Pakistan.

Keywords: Consumer behavior, FMCG’s, Brand loyalty, Demographics

Introduction
Few years back the FMCG companies ignore the small cities market, no interest was given for selling or producing products in Pakistan. That was the initial stage of FMCG companies in Pakistan. As the time passing the marketing strategies of FMCG companies are also changing. Small cities are the best opportunities for FMCG companies in Pakistan as most of the people lives there and also because it is less competitive then big cities (like Lahore, Islamabad and Karachi etc). As the time passing the income level of people is also increasing as well as the demand of FMCG.

FMCG stands for fast moving consumer goods. It is also known as consumer packaged goods and consumer goods. The fast moving consumer goods in Pakistan primarily deals with the production, distribution and marketing of consumer packaged goods. These are the products that can be used at regular intervals. The category of this sector includes foods& beverage, personal care, plastic goods, and household products etc. The FMCG market can be divided into four major consumer categories, namely; Food, Toiletry, Household, and Health categories (FMCG & Retail Report 2008). And the most popular items are soaps, shampoos, detergents, shoes polish, tooth paste, household accessories, packaged food items and many more.

These are the products on which most of the portion of monthly budget is being spend. The returns on this sector are large enough because these are products on which everyone has to spend on as these are the basic necessities of life.

Every company should develop a strong distribution networks to prevent the new entrants in the market. It would be done by developing the strong brand image and spending huge amounts on the promotional of the brands. Most of the companies from which upper class like to purchase are multinational companies in Pakistan because the national or local companies in Pakistan are not providing high quality goods to the consumers. But the lower and middle classes are using the national or local products too. This is the big reason why most of the FMCG companies are multinational that are getting good returns. A lot of multinational companies invested in Pakistan in FMCG sector and they are getting higher
margins. The FMCG Company’s operation was started in Pakistan by UPL in 1958 and then P&G also started its operations in 1991.

**Overview of FMCG sector**

FMCG consumer product companies of Pakistan are 780. These are the products that are available at the local markets. The FMCG sector of Pakistan is providing different jobs to people by both the multinational and national companies. These goods are relatively low in prices and have higher returns. The consumption patterns of upper class are estimated as 20%, middle class as 65%, and lower class as 90% (taken from government statistics, 2005).

Most FMCG companies have reported a downturn in the past few years. Because of inflation, low quality products, low availability of better raw material and also because Pakistan’s economy have recently faced a large scale floods The third quarter of 2007-08 given an average performance from FMCG Companies, which registered a rise in sales by 12% this quarter compared to the corresponding quarter last year (according to a report released by Relegate Securities).

We can simply say that the FMCG sector of Pakistan shows a moderate growth in the recent years and continues in the next years. But the increment in the prices and increasing competition are also the key segments.

**Growth perspective**

Almost all grocery retailing channels enjoyed strong value growth in excess of 5% in current value terms during 2010. The exception to this was other grocery retailers. Growth in 2010 was driven by a combination of improved economic conditions and steady population growth. The Pakistani economy picked up after the slowdown experienced in 2009 as real GDP growth reached 3% in 2010. Although inflation remained high at 11.5%, this was still lower than the inflation figures recorded in 2009 (according to Euromonitor International's Grocery Retailers report Jan 2011).

Better infrastructure will improve the supply chain. And also with the increasing income levels and the consumption patterns, FMCG sector can get more benefits. The increase in the per capita income opens many opportunities for the FMCG companies in Pakistan. Further, if the mindset of the consumers is being changed and offer new products in market it would be a big step forward for the growth of this sector.

**Few positive key factors for FMCG companies in Pakistan**

**Raw material availability**

Pakistan is the fifth largest country in producing milk in the world. As for the diary products its very material and the best FMCG companies get the material and make the products here in Pakistan. The availability of wheat, rice, sugar cane, potatoes, vegetables and fruits makes it more appropriate location for FMCG companies.

**Low labor cost**

Pakistan has an advantage of a vast, low cost source of labor, with wage rates among the lowest in the world. The Werner International 2007 Labor Cost Comparison study shows that Pakistan and Bangladesh have the lowest labor cost in the primary textile industry. However the nominal labor expenses alone cannot determine the competitiveness of the industry. The factor of labor productivity must be added to gain a more meaningful understanding of labor expenses. The potential benefit of low cost labor can be fully realized only if productivity levels are improved, especially in the more labor-intensive garment manufacturing sector. In Pakistan, there is a general shortage of highly skilled labor and good management personnel, particularly at the middle management level. This, likewise, has inhibited product development, innovation and fashion design in Pakistan.

Literature review

Vandana Chandra, 2010 suggested that at first the FMCG companies ignores the rural market but as the time passes they started taking interest in selling the products in rural areas. In order to find the effect of consumer behavior on FMCG’s they have taken few dimensions that are income level of consumers, socio-economic status, demographics and geographical dispersion. They have taken different categories of the FMCG’s and note what consumer want to get. Most of the consumers as they have low income they choose small sachets packs for their use. About one third of population is below 35, so there is a chance of boom in consumption level because of young population. It will make a significant impact on the sector. And also there is huge potential of further consumption of goods and services due to the increased in the income level. But as we see in the rural areas as the consumer don’t have much money to spend on these products so they small or medium packs but however large or family packs are also being used by consumer having high incomes. The 4A’s model of Availability, Affordability, Acceptability and Awareness provide us with a means of developing appropriate strategies to tackle the market (according to Aithal, K Rajesh 2004).

Mayer and Buckley in 1970 suggested that Socio economic class referred to as people having same social or economic status, such as working class, professional class, upper and middle class. In their study on consumer buying behavior resulted that particular life conditions can be differentiated by social classes affects person's place in society, their buying behavior, living styles, opportunities and colors. As in Pakistan there is more population is residing in rural areas can affect the buying of FMCG products.

Aaker in 1991 concluded that under the influence of brand loyalty consumers continue to buy regardless the features, prices and convenience owned by its competitors. The more loyal the consumers are towards the brand, the less vulnerable the customer will be. Based on the practice that repeated purchase is one of the indicators for brand loyalty, Keller (1998). Brand loyalty can be benefited in three ways according to (Aaker, 1991). First, it can help reduce the cost of marketing of organization. Loyal customers have a higher possibility of repeat purchases and it is less costly to retain customers than to get new ones. Second, loyalty to a brand can enhance trade leverage. Some consumers with strong affiliation to one brand would switch to the shop in which a designated brand is sold. Third, loyal customers also can influence the others to purchase the brand. It is important to understand, how much loyal the customers are, to set proper organization strategies.
Martijn Pruijsen (June 2008) suggested that the brand knowledge and brand image and corporate image can less or high effect consumer buying behavior which is very critical finding and it represents that other factors are which also strongly effect the consumer buying behaviour such as family, friends or other reference group influences. Rossiter & Percy (1987, p.113) said that brand awareness increase the ability of buyers to identify and recall brand from memory. Brand awareness is highly affected by the demographics of people such as age, education and gender etc. Keller (1993, p.3) how much the people have strong brand awareness and it easily and quickly comes in mind the likelihood of brand purchase increases. In rural areas of Pakistan there is less literacy rate, which can affect the brand knowledge and thinking styles of whereas consumers, According to my thinking, proper marketing channels can enhance the brand knowledge and awareness to customers.

Basu Purba (2004) suggested that the lifestyles and behavioral patterns of rural consumers are changing. She takes into account the study of National Council for Applied Economic Research (NCAER). According to the NCAER projections, the number of middle and high income households in rural area is expected to grow from 140 million to 190 million by 2007. In Pakistan where the population is increasing day by day which will create huge demand for FMCG products in the future. It is important to consider the different demographics like income, age, education, gender of people which change their life styles.

Edward James Hallam, in 2008, suggested that the two constructs, product quality and satisfaction, are strongly related to each other. For the research in consumers’ satisfaction is seen more as a psychological state, which exhibits an overall feeling of consumers’ purchase and experience they had with the consumption with FMCG. Consumers’ perceived product quality is also theorizing as an antecedent to consumers’ overall levels of satisfaction. For FMCG companies to grow and survive in constantly competitive environment they must have clear understanding of customer perceived quality and expectation. The focus was to investigate customer’s perceived levels of product quality and also the overall level of satisfaction experience by the customer. Product offerings can be held to have common qualities such as safety in use, attractive and/or expensive looking packaging, natural ingredients (no artificial additives), and a well-known brand name (as a quality guarantee) and also meeting the industry standards. A well-known brand and long & stable market reputation are seen as very important elements in assuring high quality for all FMCG products (ACNielsen 2003). According to Anton and Perkins (1997:35), WOM recommendations (i.e., recommendations from friends and relatives) play an important role in consumers’ purchase of a product.

Paula Bennett, Mike Brennan and Zane Kearns, 2003 suggested that the consumer on average select the high priced products when prices in list are given in descending order and when the range of prices are wide rather than narrow. In order to check the affect of price on FMCG’s three categories of prices, price range, price order and number of price points are made to check that average price the respondents are willing to pay. It was noted that there are some other variables like income level of people and the age of the respondents also affects the FMCG’s. The effect on choice of respondent characteristics such as level of income has been noted in another study (Brennan & Laafai, 2003).

Price and quality are the major factors considered while purchasing FMCG products rather than only influence of advertising, are the major findings of the study conducted by Mr. Sukesh Singla, MBA final year student of Chitkara Business School under the guidance of Dr. Sandhir Sharma, Professor at CBS, Chitkara University.
Research objectives

- Evaluate the consumer behavior regarding different FMCG’s
- Evaluate the demand patterns of FMCG’s
- To understand how much the consumer consider the quality of products
- To understand that how the price of FMCG’s effect the consumer behavior
- To understand how demographics affect the demand patterns (age, income and gender) of consumers

Research Methodology

We have selected one independent variable and one dependent variable. The independent variable is the consumer behavior and to obtain the CB we have selected some moderating variables price, demographics (age income education and sex), quality, brand image and loyalty and in the last we have socio-economic status. And the dependent variable is FMCG’S (fast moving consumer goods).

Variables

<table>
<thead>
<tr>
<th>Independent variable</th>
<th>Dependent Variable</th>
</tr>
</thead>
<tbody>
<tr>
<td>Consumer Behavior</td>
<td>FMCG products</td>
</tr>
</tbody>
</table>

Moderating variables

- Price
- Demographics (age, income, gender)
- Quality
- Brand Image & brand loyalty
- Socio-economic status

Model

On one side there is independent variable CB which can be determine from the moderating variables which are given above demographics, price, socio economic status, quality, brand image and loyalty. And on the right side there is dependent variable fast moving consumer goods.
Hypothesis
H1: the consumer behavior is affected by FMCG’s
H2: The buying behavior of consumer regarding FMCG didn’t much affected by the price

Population
The total population of Okara is 27,915 (according to national construction bureau govt. of Pakistan). Out of which 69% people are living in rural areas and 31% in urban area (according to govt. of Punjab, census 2004). As we can see most of the population of is living in rural areas and the literacy rate is also low in these areas as the job opportunities.

Sampling
We are targeting the Okara market. The sample we have taken is of 100 respondents and taken the information from different household, working people (male and female), college students and senior citizens. We have taken data from upper class, middle class and middle class (people having income more than 15,000).

<td>31%</td>
</tr>
</tbody>
</table>

The above table shows the different demographics of the respondents we can see that there 59% of the respondents are male and 41% of the respondents are female it shows that most of the FMCG’s are purchased by males. And there is another factor that as most of the males is the only employed person in the family so they prefer to purchase the products. As we can see in the table that most of the respondents are employed about 56% in which we have male and female both are included. Then we have 37% housewives from which we obtain the data and 7% are the students. We have targeted the market in which most of the respondents live in the city like 52%, 32% are from town, 13% from village and 7% in other areas. We have different age category of the respondents in which we have 20-30 is 1%, 20-30 age group respondents are 33%, 40-50 age group respondents are 34% and 50& above age group respondents are 32%.
The income of different respondents is being showed. The respondents in less than 10,000 categories are 9%, respondents in 10,000-25,000 income are 28%, in 25,000-50,000 are 32% and 50,000 and above are 31%.

Fig 1

Most of the respondents are familiar with the FMCG’s. When the data is taken at the spot they are being told about it also people may not familiar with the name but deals with the concept. About 86% are familiar and about 14% are not.
Above graph shows that about 88% respondents shop for the grocery items and 14% make it sometimes. As we have targeted those respondents who are more than 25 so they do go for shopping.
The above graph shows that about 37% respondents buys the products on the daily basis, 32% buys on the weekly basis and 31% on monthly basis. As most of respondents income is between 10,000- 50,000 but the people buys the products mostly on daily basis.

Fig 4

Are you satisfied with the products you are using?

The above graph shows that most of the respondents are satisfied with the products they are using. It also shows that the respondents are brand loyal. They don’t want to switch to new brands that easy. About 70% are satisfied with the products they are using and about 30% respondents are not satisfied the products they are using. These are the respondents who are not brand loyal.
What do you prefer when shop?

Fig 5

In the above graph the respondents are asked about what people prefer when they shop and most of the people replied with price about 55% and other with quality about 45%. There are other categories but respondents don’t really want to tell the exact answer. Respondents are price conscious because of their low income in this economic situation where prices are so high.
In the above the graph the respondents are asked from where they purchase the products and most of the respondents answer with near store. About 67% answer with near store as there is no big retail store so they have to buy the products from the near store. About 15% buys from the retail stores and 18% from the utility stores.
In the above the respondents are asked if they are brand conscious the people replied with Yes are about 37% as we have mostly people having 25,000 and above and respondents go with No are also about 37% because also people in below then 15,000 income. And few replied with sometimes about 26% because it depends on the product they are purchasing. and also the occupation and education is the factor.
In the graph respondents are asked with the toothpaste they prefer. Most of the respondent answered with Medicam as it is available on the every near store and also because people are price conscious. About 42% respondents go with medicam, 36% go with colgate, 6% with English and 16% uses others in which some imported toothpaste are used and some other toothpaste brands.
The above graph show what lotion/cream do the respondents prefer. About 30% of respondents go with fair & lovely as there about 59% of the women most of them use it and other uses others. About 7% go with pounds and 63% go with others. In which we have dove, Garnier, Vaseline and others.
Fig 10

In the above graph the respondents are asked about the chips they prefer to have and most of the respondents replied with lay’s 59%, kurkure 1%, potato chips 4% and 36% replied with others. In other’s we have cheetos and others but most people have lay’s because it is available in different sizes and everyone can eat it according to their income.

**Findings**

In this report we can see that there are different people to which we have targeted different category people. The people with the income of 10,000 to 50,000 are the mostly people this is the middle class. We also do have the category of the people of upper class but they are not much in Okara. And the people living below poverty line are not targeted because they are spending their life on few pennies and they just want to feed their self regardless of thinking what they have. Different people are using different company’s products so it’s hard to find a particular in Okara. If we see in overall Pakistan we can see that P&G and Unilever is top most companies but if we particularly see our target market then the people are also using the local companies.
In toothpaste we have Marriana international’s medicam which covers the most area in the target market. Then we have the lotion/cream category most of the people use Unilever’s fair & lovely and also some other companies are also there to give them competition like L’Oreal and some local companies. Then in chips most of the market share is obtained by lay’s it’s a multinational company but as it is available in different packs and taste is different most people wants to purchase it. In biscuits we have a local company LU providing different biscuits.

In shampoos, soaps, detergents and cooking oil Unilever is the top most company. In detergents P&G products are also used. In soaps Zulfeqar Industry’s Capri also got some market share. In shampoo’s L’Oreal’s products are also used by the people. In cooking oil a local brand Nemat also cover a good market share. In drinks the most shares is covered by Coca-cola but also sprite, Fanta and dew.

We have obtained the consumer behavior through different dimensions. Different respondent’s data have collected from the primary source. But there is also a thing that people don’t tell or give the right information regarding the questions asked about the income and others.

**Recommendations and suggestions**

The researcher wants to give few suggestions for the upcoming organizations in this field as well as the existing firms.

As we know that the demand of product is affected by its life cycle. If the product is in the introduction stage then it will defiantly be getting sometime to capture the market share and to create the awareness of the brand so it is necessary for the organizations to create brand awareness in the customers for that they can use different marketing strategies like sales promotion, direct marketing and others.

The consumer is trading up to experience the new or what he hasn’t. He’s looking for products with better functionality, quality, value, and so on. What he ‘needs’ is fast getting replaced with what he ‘wants’? A new report by Booz & Company for the Confederation of Indian Industry (CII), called FMCG Roadmap to 2020. Provide the customer with what he actually wants. After the awareness is being created then the promotional activities should be done and remind the customer of what one have.

If we see in the current market there are not enough retail stores to buy the FMCG’s there is a potential in this market. New stores can be opened and the people should be provided good high quality products at low prices. There are not much stores even in the surrounding areas of our target market so some new stores over there can also be built.

The other can be the *4A’s of marketing which may help the firms to make their flourish in this field  

(4A’S= Availability, Affordability, Awareness and Acceptance)

**Limitations**

Sample size- we just chose only 100 people as a sample in our study.

Accuracy- For understand the real facts and data; we conduct this study only to the educated people for accurate results.

Inadequate information- Uneducated people have not the proper knowledge about fast moving consumer’s product

Area of study- Our area of study is very limited having only few nearby locations in Okara district.

1. Questionnaire

A dissertation report on “The impact of Consumer Behavior on FMCG’s”

Name_______________________

Gender a) Male b) female

Occupation a) housewife b) employed c) student d) others

Location a) city b) town c) village d) others

Age a) 20-30 b) 30-40 c) 40-50 d) 50 and above

Monthly income a) Less than 10,000 b) 10,000-25,000 c) 25,000-50,000 d) 50,000 and above

---------------------------------------------------------------

1) Are u familiar with FMCG’S (fast moving consumer goods)?
   a) Yes b) No c) To some extent

2) Do you shop for grocery items?
   a) Yes b) No c) Sometimes

3) When do you prefer to purchase?
   a) Daily base b) weekly base c) Monthly d) others_______

4) Are you satisfied with the products you are using?
   a) Yes b) No c) To some extent

5) Are you brand conscious?
   a) Yes b) No c) Sometime

6) From where you purchase the products?
   a) Near store b) Retail store c) Utility store d) others_______

7) What do you prefer when shop?
   a) Price b) Quality c) Convenience d) Others ________

8) Which soap do you prefer?
   a) Capri b) LUX c) Golden d) Pearl e) Others

9) Which detergents do you prefer?
   a) Aerial b) Surf Excel c) Express d) Others___________
10) Which toothpaste do you prefer?
   a) English       b) Medicam     c) Colgate     d) Others

11) Which shampoo do you prefer?
   a) Pentene       b) Sunsilk     c) Garnier     d) Others

12) Which cream/lotion does u prefer to use?
   a) Fair & lovely b) Care        c) Pounds      d) Others

13) Which pack you prefer to use?
   a) Sachet        b) small pack   c) medium pack d) Large  e) Others

14) Which biscuits do you prefer?
   a) Tuc           b) Café        c) Chocolate chip   d) Others

15) Which chips do you prefer?
   a) Lay’s         b) kurkure     c) Potato chips d) Others

16) Which drink do you prefer?
   a) Coke          b) Sprite      c) Fanta       d) others

17) Which cooking oil do you prefer?
   a) Dalda         b) Mezan       c) Kisan       d) Nemat   e) Others

Any suggestions:

Abstract
The purpose of this study was to investigate the impacts of privatization on the performance of the state-owned enterprises in various sectors of Pakistan. The approach to this paper was to find out the answers of the research questions such as, "What was the background of Privatization in Pakistan?", "What were the basic needs of Privatization in Pakistan?", "What were the effects of Privatization on the performance of various institutions in positive as well as negative manners?" and "What was the impact of privatization on banking sector of Pakistan?". By answering these questions conclusions of this study was drawn about Privatization in south Asian Countries especially in Pakistan and this study acknowledged that privatization is a very useful strategy by the government of Pakistan which has a positive impacts on overall performance of corporate bodies and economy of the state with some counter effects on working and labor conditions. Many options has explored in this study for future studies related to various aspects of privatization of many other sectors in Pakistan and many other developing countries as well.

Keywords: Privatization, Nationalization, Impact of Privatization on Banking Sector.

1. Introduction
Privatization is a way to re-allocate the resources and functions of public sector to private sector and it seems to be a cause which plays an important role in the mission for growth (Filipovic, 2005). Savas (2000); Shah, Haroon-Ur-Rashid, Ullah, and Ahmed (2009) stated that privatization, also called denationalization, is a process in which ownership of the enterprises is transferred to private sector from the government. Moreover, Megginson and Netter (2001) reported that privatization is deliberate sale of state-owned enterprises (SOEs) to private hands by a government. According to Aftab and Nasr (2008), there is a lot of difference between the government and private owned enterprises’ performance and assumed that private ownership performs better then government. Kikeri, Nellis, and Shirley (1992) believed on this fact that the share of government tenure is going to be reducing due to increasing trend towards privatization of various enterprises in developing countries. Subsequently, Joshi (1999) told that when a lucrative public sector enterprise sale out to general public, it attracts others to take interest in privatization process.

Yoganandan (2010) reported that Pakistan has adopted the ‘economic liberalization’ not as a policy for development but as a requirement imposed by International Monetary Fund (IMF) and World Bank and privatization process has faced strong resistance from political entities and trade related unions. The political wagering, the panic of losing jobs and giving additional benefits to nears and dears created havoc to the privatization process (Yoganandan, 2010). Initially, the privatization was considered as an economical issue but later on it became the part of some political hindrances over the country’s real assets.
Privatization demands the government backed employees and supervisors to adjust in a new and sometime a sore environment of privatized company. So the need was to emphasis on managing the entire sector rather then an individual entity by the government (Megginson, 2000). In order to get the goals of privatization, all the government sectors must be accountable and political interference must be curbed with legal hands (ADB, 2008) and in order to get the more cost effective results from the sale of state-owned enterprises, there must be a restructuring policy, regarding various socio-economic issues, before and after the privatization process (Joshi, 1999). This important issue raised various questions to be answered and this study is aims at to address some of these questions.

2. Research Questions

The research questions of the study were:

RQ1  What was the background of Privatization in Pakistan?
RQ2  What were the basic needs of Privatization in Pakistan?
RQ3  What were the affects of Privatization on the performance of various institutions in positive as well as negative manners?
RQ4  What was the impact of privatization on banking sector of Pakistan?

According to a survey report, the transactions amounting $15 billions have been made in South Asia related to privatization process and Pakistan and India have major contributions. While in Pakistan, telecom, banking and production sectors were widely affected by privatization process (Kikeri, Nellis, & Shirley, 1992) and Lieberman, Sukiasyan, Traver and Welch (2003) observed that privatization has reduced the government ownership in finance sector especially in Europe and Central Asia.

3. History of Privatization in Pakistan

The idea of privatization was not new for Pakistani policy makers. In 1950s, Pakistan Industrial Development Corporation (PIDC) was formed for the purpose of development of industrial sector in the country. PIDC established more than 50 industrial entities with successful management and operations and than these undertakings were transferred to the private sector from public sector (Bokhari, 1998). Government of a country involved in the financial system was facing two types of views; development view; and political view. In development view, government intervenes in the financial institutions to give direction to their citizens for the purpose of development in the country. In developing countries, governments started to increase ownership in the financial institutions after observing the importance economic development in the period of 1960s and 1970s (Khalid, 2006) and it mostly government adopt only one type from above stated views.

In 1970s, Pakistani government took a step to redistribute national assets from the private employers to the State of Pakistan. At that time, Government realized that national wealth was in the hands of some families and the rich was becoming richer and the poor was becoming poorer (Ishrat Husain, 2005). Financial sector was nationalized in 1970s under Banks Nationalization Act 1974 (Khalid, 2006). All the entities were nationalized in 1970s in Pakistan (Bokhari, 1998). The step of nationalization was taken with the object to direct the financial institutions and to provide funds to the government (Khalid, 2006) but the size of public owned undertakings were increased unmanageable extent when nationalization policy was adopted in 1970s in Pakistan (Bokhari, 1998). In 1970, after failing to achieve the objectives of nationalization; the government had to reframe its strategies regarding
nationalization process. So, in 1977, the government modernized its policies to encourage the private entrepreneurs to participate in de-nationalization process (Yoganandan, 2010). Privatization process was started in late 1980s, but its full momentum was begun in 1991 when the Government of Pakistan formed “Privatization Commission of Pakistan” to create and support the practices of privatization (Bokhari, 1998).
